Next to the Eyes, Nature has assign'd the most useful Office of Life to the Ears: But Disorders in these latter are the more dangerous; for the Diseases of the Eyes are confin'd to the Parts affected, but Inflammations and Pains of the Ears precipitate the Patient sometimes into Madness, and Death itself. Wherefore we ought to be more careful to apply a Remedy in the Beginning, in order to prevent a greater Danger.

As soon, therefore, as a Person feels a Pain in his Ear, let him betake himself to Abstinence and Rest. On the next Day, if the Disorder be increased, his Head is to be shaved, and anointed with *Unguentum Iridum* hot, and then be cover'd. But a great Pain, with a Fever and Want of Sleep, requires also Phlebotomy. If this be, for some Reasons, judged improper, the Belly is to be evacuated. Hot Cataplasms of Fenugreek, Linseed, or some other mealy Substance boiled in Mulsum, now-and-then changed, have a good Effect. Sponges also wrung out of hot Water, and apply'd at Intervals, are of Service. The Pain being mitigated, a Cerate made of *Unguentum Iridum*, or *Cypripium*, is to be put round the Ear; sometimes what is made of Oil of Roses proves effectual. If the Vehemence of the Inflammation wholly deprives the Patient of Sleep, half the Quantity of bruised Poppy-heads is to be added to the Cataplasma, and these are to be boil'd together in *Passum*, or *Mulsum*.

There ought also to be dropp'd into the Ear some Medicine, which is always to be warm'd, and is most conveniently instill'd by a *Strigil*: When the Ear is sufficiently full, some fine Wool is to be put over it, to keep in the Liqueur. So much is to be done in general.

Particular Medicines are, Rose-water, the Juice of the Roots of Reeds, Oil in which Earth-worms have been boiled, Juice of bitter Almonds, or of Peach-kernels. Compound Remedies for mitigating the Pain and Inflammation, commonly used, are, Castor and Opium bruised together, in equal Quantities, and then mix'd with *Passum*; or equal Quantities of Opium, Saffron, and Myrrh, thus bruised together, and moisten'd at Intervals with Infusions, sometimes of Oil of Roses, sometimes of *Passum*, or the bitter Part of the *Egyptian Bean*; bruised and mix'd with Oil of Roses; to which some add a little Myrrh, or Opium, or Frankincense, with Woman's Milk, or the Juice of bitter Almonds, with Oil of Roses.

Of Pus, and the ill Smell of the EARS.

If the Ears have Pus in them, it will be proper to instil *Lycium* alone, or *Unguentum Iridum*, or the Juice of Leeks with Honey, or the Juice of Centaury with *Passum*, or the Juice of a Pomgranate warm'd in its Shell, with the Addition of a little Myrrh. The following also is a good Medicine:

A U R

Take of that sort of Myrrh call'd *Stacte*, and Saffron, each one Dram two Grains and a half; bitter Almonds, twenty-five; Honey, half a Quarter of a Pint: Pound them together, and, when you use them, let them be warm'd in the Shell of a Pomgranate.

Those Medicines also which are good for an ulcerated Mouth, are effectual for Ulcers in the Ears; but if they are old, and abound with Sanies, or corrupt Matter, the following Remedy, invented by *Erasistratus*, may very fitly be used: It consists of

Pepper, Saffron, each one Dram two Grains and a half; Myrrh, Misy boiled (*coctum*), each two Drams five Grains; burnt Copper, two Drams five Grains: Bruise them in Wine, and, when they are dry, add thereto a Pint and a half of *Passum*, and boil them all together. It is to be used with an Addition of Wine and Honey.

Menophilus's Remedy is also very effectual in this Case: It consists of

Long Pepper, one Dram two Grains and a half; Castor, two Drams five Grains; Myrrh, Saffron, Opium, *Syrian Nard*, Frankincense, Malicorium, the Inside of the *Egyptian Bean*, bitter Almonds, the best Honey, each four Drams ten Grains. While you are bruising them, add thereto some of the strongest Vinegar, till the Whole becomes of the Consistence of *Passum*.

If there be much Pus, with an ill Smell,

Take of Verdegriese, Frankincense, each two Drams five Grains; of Honey, one Sixth of a Pint; of Vinegar, one Third of a Pint: Boil them all together, and use them with an Addition of sweet Wine. The Juice of Henbane also is, of itself, very effectual in this Case.

A common and approved Remedy for all Disorders of the Ears, is the following, which was compos'd by *Asclepiades*:

Take of Cinnamon, Cassia, each one Dram two Grains and a half; the Flowers of the round Juncus, Castor, white and long Pepper, Amomum, Myrobalans, each two Scruples; Male Frankincense, *Syrian Nard*, fat Myrrh, Saffron, Spuma Nitri, each two Drams five Grains: Bruise them first separately, then mix them, and bruise them over again in Vinegar, and so put it by for Use. When you have Occasion to use them, dilute them with Vinegar.

If the Ear run with Sanies, and there be a Tumor, it will not be improper to syringe the Ear with mix'd Wine, and afterwards to instil some austere Wine mix'd with Oil of Roses, to which a little Spodium may be added; or instil Lycium with Milk, or the Juice of the *Herba Sanguinalis* with Rose-water, or the Juice of a Pomgranate with a little Myrrh.

Of a SORDID ULCER of the EARS.

If the Ulcers be sordid or foul, it is best to wash them well with Mulsum, and then use some or other of the Remedies before prescribed, mix'd with Honey. If Pus run the more, the Head is to be shaved, and wash'd with Plenty of hot Water, which is also to be gargled: The Patient must walk till he be tired, and be sparing in his Diet. If a bloody Matter issue from the Ulcer, Lycium with Milk is to be infused into the Ear; or Water boiled with Roses, and mix'd with the Juice of the *Herba Sanguinalis*, or *Atacia*.

If Flesh be grown over the Ulcers, and the same be of an ill Smell, and Blood issues from it, it must be well wash'd with warm Water; after which a Decoction of Frankincense, Verdegriese, Vinegar, and Honey, or a Decoction of Verdegriese and Honey, is to be infused into the Ear; or Squama *Aëris*, beaten up with Sandarach, are to be instill'd into the same through a Pipe.

Of WORMS in the EARS.

Worms bred in the Ears, if they lie near enough, are to be drawn out with an Ear-probe; if they are too remote, you are to destroy them with Medicines, and be careful to prevent their future Breeding. White Hellebore, bruised in Vinegar, is effectual to both these Purposes. The Ear also is to be rinsed with a Decoction of Horehound in Wine, which will cause the dead Worms to slide towards the exterior Parts of the Ear, when they may very easily be taken out.

For an OBSTRUCTION in the AUDITORY PASSAGE.

If the Auditory Passage be stuffed, and a thick Sanies lies within the Cavity, some of the best Honey is to be put into the Ear: If this has but little Effect, you must add to half a Quarter

ter of a Pint of Honey, two Drams five Grains of Verdegriſe, and boil them together for Uſe. Iris, with Honey, is effectual for the ſame Purpoſe, or two Scruples of Honey and Roſewater: Or,

Take of Galbanum, two Drams five Grains; Myrrh, Honey, and Bull's Gall, each two Drams five Grains; Wine enough to dilute the Myrrh.

For THICKNESS of HEARING.

If a Thickneſs of Hearing come upon a Perſon, which commonly happens after an inveterate Head-ach, the Ear is, firſt of all, to be examin'd; for either a Cruſt, ſuch as grows over Ulcers, or a Collection of Sordes; will appear in View. If there be a Cruſt, ſome hot Oil, or Honey and Verdegriſe, or Juice of Leeks, or Muſcum with a little Nitre, muſt be pour'd into the Ear: When the Cruſt is looſen'd, the Ear is to be riſed with warm Water, which may render the mollify'd and ſeparated Matter more eaſy to be extracted by the Ear-probe. If there be Sordes, and thoſe of a ſoft Kind, they are to be extracted with the ſame Probe; if they are hard, Vinegar with a little Nitre is to be injected, and the mollify'd Matter is to be extracted, and the Ear cleanſed as before. If there remains a Heavineſs of the Head, it is to be ſhaved, and rubb'd gently, but for a long time, and anointed with Oil of Iris, or of Bay, a little Vinegar being mix'd with either of theſe Oils. Then the Patient is to walk for a long while together; and, after Uñction, the Head is to be gently fomented with warm Water. The Food muſt be very low, and Aliments of a middle Nature only are to be taken, and Drink much diluted: Gargarifms are ſometimes to be uſed. Injections alſo are to be made into the Ear, of Caſtor with Vinegar, and Oil of Bay, and the Juice of the Rinds of Radishes, or of wild Cucumbers, adding that of Roſe-leaves bruifed. The Juice of unripe Grapes, inſtill'd with Oil of Roſes, is good alſo againſt Deafneſs.

Of a NOISE in the EARS.

There is another Kind of Diſorder, when the Ears ſound within themſelves; whence alſo it comes to paſs, that they are diſabled from receiving external Sounds. The Diſorder is flighteſt, when it proceeds from a Cold; worſe, when it is cauſed by a Diſeaſe, or an inveterate Head-ach; but worſt of all, when it takes its Riſe from the Approach of ſome great Diſeaſe, and eſpecially the Epilepſy.

If the Diſtemper proceeds from a Cold, the Ear muſt be cleanſed; and the Patient muſt hold his Breath, till ſome Humour froth out of his Ears. If a Diſeaſe, or Head-ach, be the Cauſe, the ſame Directions, as to Exerciſe, Friction, Perfuſion, and Gargarization, are to be obſerved as in the preceding Diſorders; and the Patient muſt keep to an extenuating Diet. The Juice of Radish, with Oil of Roſes, or with the Juice of wild Cucumber-roots, or Caſtor in Vinegar and Oil of Bay, are to be injected into the Ear. White Hellebore, bruifed in Vinegar, and afterwards infuſed in boil'd Honey, and made into a Collyrium, is to be put into the Ears. If the Diſorder be owing to none of theſe Cauſes, but terrifies the Patient with an Expectation of ſomething worſe, Caſtor with Vinegar, or with Oil of Iris or Bay, is to be put into the Ear; or Caſtor, mix'd with Oil of Bay, and Juice of bitter Almonds; or Myrrh and Nitre, with Vinegar and Oil of Roſes. But in this Caſe alſo there is more to be expected from a Regimen of Diet, in which the ſame Advice is to be follow'd, only with greater Strictneſs, as was given before; with this Addition, that as long as the Ringing in the Ears continues, the Patient muſt wholly abſtain from Wine.

If the Noiſe be attended with an Inflammation, the Ear muſt be abundantly mollify'd with Oil of Bays, or Oil of bitter Almonds, with which ſome mix Caſtor, or Myrrh.

How to extract Things fallen into the EARS.

Things ſometimes happen to fall into the Ear, ſuch as little Pebbles, or Animals. If a Flea be got into it, a little Wool is to be ſtuffed into the Cavity; into which the Animal may get, and ſo be taken out. If the Flea does not follow, or if be another Animal, take a Probe wrapt in Wool, and, dipping it in ſome very glutinous Reſin, particularly of Turpentine, introduce it into the Ear, and turn it about; by which means you will certainly take hold of the Creature, and ſo pull it out. If there be any thing dead, it muſt be extracted with the Ear-probe, or a blunt Hook, a little bent. If theſe fail, it may be drawn out with Reſin, in the ſame manner as the other. Sternutatories alſo are a convenient means to force it out, or an Ear-clyſter (*Oricularia Clyſtere*), the Water being forcibly impell'd into the Ear.

A Board alſo is ſometimes placed in ſuch a manner, as to be ſupported at each Extremity, and the Patient is bound upon this Board, with the affected Ear towards it, ſo as the Ear does not reach beyond the Board; then that Extremity of the Board, next the Patient's Feet, is to be ſtruck with a Hammer, and

what was in the Ear falls out by the Concuffion. *Celfus, Lib. 6. Cap. 7.*

DISORDERS of the External EAR.

Sometimes there happens a Fracture of the Cartilage of the Ear, in which Caſe, before Pus is found, a conglutinating Medicine is to be apply'd; for it often prevents a Suppuration, and confirms the Ear. Now we ought not to be ignorant, with regard to the preſent Subject as well as the Noſe, that the Cartilage itſelf is not conglutinated, but the Fleſh about it increaſes, and the Place is conſolidated; therefore if the Skin be broken, with the Cartilage; it is ſow'd up on both Sides; but I now ſpeak of a Fracture where the Skin remains entire. In this Caſe, if Pus be already generated, the Skin muſt be open'd in another Part; and the Cartilage againſt it be cut out, making a Wound in Form of a Creſcent (*Lunata Plaga*); after which ſome gentle Styptic muſt be apply'd to ſtop the Blood, ſuch as Lycium dipt in Water. This done, let a Linen Cloth with a Plaiſter be laid on the Place, avoiding all fat Things; and behind the Ear let fine Wool be apply'd, ſufficient to fill the Vacuity between that and the Head: After this, the Wound is to be gently bound up, and on the third Day fomented with a Vapour-bath. Abſtinence is as neceſſary, in the Beginning, in this as well as other Caſes, till the Inflammation ceases. *Celfus, Lib. 8. Cap. 6.*

For a CONTUSION of the EARS.

Hippocrates adviſes to let it alone; but; ſince we are often compell'd by the Patients themſelves to do ſomething;

Take of Myrrh, Aloes, Frankincenſe, Acacia, of each an equal Quantity; and, mixing them with Vinegar, or the White of an Egg, anoint the Part. Or,

Take the Inſide of a hot Loaf, and bruife it in a Mortar with Honey, and ſo apply it. Or,

Take of Bitumen, Frankincenſe, Aloes, the Fleſh of Houſeſnails, African Bulbi, of each an equal Quantity; bruife them in Vinegar, and ſo uſe them.

If an Inflammation ariſe, apply a Cataplaſm of Sefamum, or Alica, boil'd in Vinegar. Let the Cataplaſms be but thin, and not bound on, or but very ſlightly; and put Wool, moiſten'd with Oil, into the Hollow of the Ear. *P. Æginet. Lib. 3. Cap. 23.*

WOUNDS of the External EAR.

Wounds of the external Ear are either to be united and conſolidated by means of agglutinating Plaiſters; or, in Caſes where the Cartilage is quite cut aſunder, by the Aſſiſtance of proper Suture, taking care at the ſame time to dreſs the Part affected with Lint, ſoak'd in ſome vulnerary Balfam, and to ſecure the Dreſſing by proper Bolſters and Bandage. In Wounds of the Ear, happening near the *Meatus Auditorius*, we are to take particular Care, that no Blood, or other Matter, be allow'd to enter it, ſince, by that means, the Membrane of the *Tympanum* could not fail to be injured. In order, then, to prevent this Inconvenience, we ought always, on Occaſions of this Nature, carefully to guard the internal Ear by means of Lint, or Cotton, put into it. *Heiſter. Inſtitut. Chirurg.*

Of an IMPERFORATION of the AUDITORY PASSAGE.

This Defect is from the Birth, the Paſſage of Hearing being ſtopp'd by a Membrane, which ſometimes appears on the Superficies, ſometimes is deeply ſeated. It may alſo happen after the Birth, from a preceding Ulceration of the Parts about the Paſſage, by which means Fleſh grows over it, and ſtops it up.

If the obſtructing Membrane be deeply ſituated, the Undertaking is difficult; we ought, however, to attempt the Cutting it by ſome ſmall Inſtrument: If it lie on the Superficies, we are to cut it with a ſharp Knife, and, if it be neceſſary, take it quite off. If Fleſh be grown over the Paſſage, it muſt alſo be taken off with the Knife that is made for cutting out a Pterygium or Polypus: Afterwards we take a Linen Tent, of a Size adapted to the Paſſage, and, moiſtening it with Water, roll it in Chalcitis powder'd, or ſome other Powder of that Kind, and thruſt it into the Cavity, in order to prevent the Growth of new Fleſh. If there be an Inflammation, we immediately withdraw it; if Blood iſſue from the Paſſage, we apply a Sponge dipp'd in cold Water, and uſe other proper Means. *P. Æginet. Lib. 6. Cap. 23.*

Some Children have the Miſfortune to be brought into the World with the Auditory Paſſage cloſed up, and obſtructed by means of a certain preternatural Coat, which is ſometimes thicker, and ſometimes thinner; ſometimes diſcover'd as ſoon as they are born, and at other times not to be perceived, till the Children growing up, a Privation of Speech too palpably betrays it; for Deafneſs, and an Incapacity of uttering articulate Sounds, are generally inſeparable Attendants upon each other.

other. For this Reason, when we find, that a Child does not begin to speak at the Age in which other Children usually do, we are to take a very minute and careful Survey of his Tongue and Ears; for it frequently happens, that some Fault lies latent in the inner *Ear*, by means of which the natural Capacity of Hearing is prevented and destroy'd; and this Defect is removed with more or less Difficulty, in proportion as it is seated deep and remote in the *Ear*, or near its Entrance: For when the very Entrance of the Passage is closed up by means of a certain Coat, the Cure is soon brought about; but when this Coat lies deeper, the Cure is less certain, and more difficult; because in the last-mention'd Case, in our Attempts to cut or remove the preternatural Coat, the Membrane of the *Tympanum*, which lies immediately behind it, is generally wounded along with it. In Cases where a preternatural Membrane closes up the very Entrance of the Passage, 'tis proper to make a crucial Incision into it, and prevent its Reunion, by means of a Tent kept in it as long as the Circumstances of the Case seem to require. By this Method the deaf Patient, if free from every other Defect, will, in all Probability, receive his Sense of Hearing, together with its natural Consequence, a Capacity of Speech. If, on the contrary, this superfluous and preternatural Membrane should happen to lie so deep, as to be contiguous to the Membrane of the *Tympanum*, the Cure, as I have already said, is generally doubtful and uncertain. But because, in this Case, little, or rather no Relief at all, is to be expected without an Operation, it seems far more advisable, on some Occasions, to attempt a Cure, tho' it should prove unsuccessful, than to suffer the Patient to remain without any Assistance, and abandon him to Despair. And when the Operation is undertaken, this superfluous and preternatural Coat is to be cut, either longitudinally or transversely, as the Circumstances of the Case require; but the Operator ought to have an exact and steady Hand, lest with the Point of his Incision-knife he should wound, or even quite pierce through, the Membrane of the *Tympanum*, which, in the Ears of Children, does not lie very deep.

Of EXTRANEOUS SUBSTANCES in the AUDITORY PASSAGE.

Not only small Pebbles, but Glass, Beans, and Carob-stones, may fall into the Ears. As for Glass and Pebbles, they remain in their proper Bigness; but Beans, and Carob-stones, and other things of that Nature, by imbibing the natural Humidity of the Body, swell, and occasion very great Pain.

Your only way then is, to take them out, either with the Ear-probe Hook, or Forceps, or to get them out by violent Concussion, placing the Ear upon a sort of Circle. I have often extracted such things, as well as Water fallen into the Ears; by Suction with a Reed, putting Wax about the End of the Reed next the Ear, in order to exclude the Air. For Pebbles, and such Matters, I got them out by putting some Wool about a Probe; and after smearing it with Resin of Turpentine, or some other glutinous Substance, gently introducing it into the Chanel of the Ear. If this Way does not succeed, give a Sternutatory, and stop the Mouth and Nostrils; but if this also be ineffectual, we must have recourse to Surgery, before an Inflammation or Convulsions come on, or the Case be dangerous.

Placing therefore the Patient upon the opposite Ear, we make a small lunar Section at the Basis of the Ear, behind the Part called the Lobe, and with the Hollow of the Probe take out the offensive Matter; we then sew up the Wound, and perfect the Cure with Vulneraries. *P. Aeginet. Lib. 6. Cap. 24.*

In what Manner preternatural Substances lodged in the EARS, and Things that have casually fallen into them, are to be extracted.

The Wax of the *Ear*, which was originally designed for excellent Purposes, is sometimes preternaturally indurated; and sometimes extraneous Substances, such as a Pea, a Bean, a small Stone, a Cherry-stone, an Animal of a small Size, or other Things of a like Nature, fall accidentally into the Auditory Passage. Now two very important Reasons concur to render a cautious and expeditious Extraction of such Substances highly proper and necessary: The one is, that the Patient may be speedily freed from those Pains, which, in Cases of this Nature, are sometimes very violent: The other is, that he may not be deprived of his Sense of Hearing.

Which of the above-mention'd Substances is lodged in the *Ear*, may be learn'd not only from the Relation of the Patient himself, but also by an Inspection of the *Ear*, or by introducing proper Instruments, or Probes, for that Purpose. In Cases where the Wax, being preternaturally indurated and dry'd, either renders the Hearing dull, or destroys it altogether, the most proper and efficacious Method which can be taken, is to drop a little of the Oil of Olives, or Almonds, or even a little warm Milk, into the affected *Ear*; ordering the Patient at the same time to recline his Head the opposite Way. A few Mi-

nutes after this, we must introduce a proper Ear-probe, and with it draw out the offending Matter by little and little. And if it should happen, that the Wax is harder than to admit of being soften'd, and extracted by taking these Measures once, they are to be repeated in the same manner again and again, till such time as the obstructing Matter is entirely remov'd. But if a small Stone, or Cherry-stone, is lodged in the *Ear*, the Passage ought carefully to be lubricated, by dropping a little tepid Milk or Oil into it; after which a proper Ear-probe, or such a Forceps as is represented by Letter E in *Tab. 22.* is to be introduced, and the offending Substance extracted with the utmost Caution and Delicacy. If a Pea, a Bean, or any other Substance of a like Nature, should happen to be lodged in the *Ear*, and become turgid, by means of the Humours and Moisture which surround it, our most expeditious Method of Relief, if it can neither be extracted by the Probe nor Forceps, is to introduce a very small Knife, with which we must divide the tumefied Body with all possible Caution, and then extract the several Parts of it one after another.

Sometimes very small Animals, or Insects, are also lodged in the *Ear*, and excite a very troublesome Titillation or Itching, and sometimes very acute Pains, by their Efforts to disentangle themselves from the Wax in which they stick. In this Case, if the Animal or Insect can be discovered by the Eye, it is to be forthwith extracted by the Probe or Forceps. But if it cannot possibly be seen, the most safe and commodious Method we can take is, to drop some Oil of Almonds or Olives, or even some tepid Spirit of Wine, into the Patient's *Ear*; and to order him to recline his Head to the opposite Side, that the Liquor may be retained, till we think the Animal or Insect is killed; for by the above-mentioned Substances all Animalcules or Insects whatever are very speedily destroy'd. Then the Liquor dropt into the *Ear* is to be discharged, and the Passage to be carefully cleaned, by means of a Probe armed with Lint or Cotton. Some Physicians in this Case order bitter Liquors, such as the Decoction of Wormwood, or of Colocynthis, to be dropp'd into the *Ear*, because these Substances also generally kill Animalcules or Insects. But in my Opinion Oils, and Spirit of Wine, are, on these Occasions, preferable to any other Liquors whatever, since some Species of Animalcules are so far from being kill'd by bitter Substances, that they rather delight in them; whereas no Species of Insect can be found, to which Oils, and Spirit of Wine, do not prove mortal.

Of TUBERCLES form'd in the MEATUS AUDITORIUS.

'Tis no uncommon Thing for Tubercles, or certain Excrescences of Flesh, to arise in the auditory Passage, which not only prove very uneasy to the Patient, but also do a considerable Injury to the Sense of Hearing. If this Disorder is recent, the Tubercles, or superfluous Flesh, may, for the most part, be destroy'd by the Use of corroding Medicines: But we must, in this Case, take care, that the deeper and more internal Part of the Passage be sufficiently guarded, and clos'd up with Lint or Cotton; lest, in Consequence of a Neglect of this kind, any Part of the corroding Application should reach the Membrane of the *Tympanum*, and prove injurious to it: For which Reason it seems generally most advisable to use a Knife, or the Scissors, for extirpating Tubercles of this kind, especially when they do not lie deep and remote in the Passage. But when a Protuberance of this Nature lies more conceal'd, and at a greater Distance from the external Orifice of the Passage, we must use small Hooks, and a proper Forceps, for drawing it towards us, and then extirpate it as effectually and safely as we possibly can; after which, 'tis proper to apply the Lapis Infernalis, again and again, to the remaining Roots of the Tubercle, till we have, by little and little, so thoroughly extirpated them, as to leave but small Probability of the Tubercle's rising afresh. If corrosive Medicines do not answer the Intention, and if the Tubercle does not lie too deep and remote, a proper actual Caustery may sometimes be us'd with Success. And, lastly, that Ligatures may be properly and commodiously us'd in the Extirpation and Cure of Tubercles of this kind, is abundantly plain, from the Cases describ'd and illustrated with Figures in *Hildanus, Cent. 3. Obs. 1.* and in the *Chirurgia of Purmannus, p. 280.*

For the Method of burning the *Ear*, in order to cure the Tooth-ach, see ODONTALGIA.

Of ACOUSTIC Instruments, such as are intended to assist the HEARING.

As the Sight is assisted by Spectacles, or other Glasses contriv'd for that Purpose, so the Hearing is sometimes enliven'd, and render'd quick, by means of proper Instruments, which we call *Acoustics*. Tho' these are of very various Figures, and for the most part bear some Resemblance to a Trumpet; yet I have generally found, that those were most commodious, and best answer'd the End, which were like a kind of Pipe, a little bend'd, narrow at the Beginning, but diverging and growing wider, like a Trumpet, at the other Extremity, such as that represented in *Tab. 40. Fig. 2.* Those also describ'd by *Nuck and Deckers,*

Deckers, and represented in Tab. 40. by Fig. 3. and 4. are highly recommended. The two first of these Instruments, represented by Fig. 2. and 3. are us'd, by introducing the slender Part, A, into the Ear, and holding them in that Position by the Handles, B. The third of these Instruments, exhibited in Tab. 40. Fig. 4. being very small, and wreath'd up in form of a spiral Shell, is, by *Deckers*, in *Exercitat. Practicis*, recommended as the most commodious of all others; because, in consequence of its Smallness, it may be so conceal'd under one's Hair, or a Wig, as scarce to be observable; whilst the slender Part, represented by A, is introduc'd into the Ear, and the Chords represented by B B carried round the Ear, in order to secure it. But, after the most accurate Observation, I have found, from Experience, that the two last-mention'd of these Instruments are not so contriv'd, as to answer the Intention so well as the first of these Instruments, represented by Fig. 2. which, besides the Advantage of its Simplicity, I have always found to be more useful, in Cases of this Nature, than the other two. Some Years ago there was a public Report, that one *Truchet*, a French Monk and Mathematician, who, for the singular Excellence of his Genius, was created a Member of the Royal Academy of Paris, had, in that City, contriv'd a certain acoustic Instrument, which was not only so small as that it might be conceal'd within the Ear, without projecting in the least, but also so exquisitely adapted to the Intention, as to prove surprisingly beneficial to the Hearing. But what sort of Instrument this may be, or whether its Use is attended with such uncommon Advantages, are Circumstances of which I have not yet got sufficient Information; tho' I have not only diligently inquir'd after these Particulars, of some German Physicians of my Acquaintance, who resided for some time at Paris, but also endeavour'd to get Satisfaction in this Point, by writing Letters to some Surgeons and Physicians of Paris. It were, however, to be wish'd, that Men of a mechanical Turn were more solicitous and industrious in contriving an Instrument of this kind, since it could not fail to be of singular Use and Advantage to Numbers of their Fellow-creatures. Some Years ago *Reusner*, a Physician of Silesia, in *Ephem. Nat. Cur. Cent. 5. Obs. 6.* recommended the Use of a certain Pipe, made of gilded Silver, and about a Span in Length, in a Difficulty of Hearing, as also in Pains and ringing Noises of the Ears. He order'd this Pipe to be introduc'd into the affected Ear, twice or thrice every Day; and asserted, that, by Suction; the pernicious Air, which, he suppos'd, prov'd injurious to the Ear, and excited the above-mention'd Disorders, might be exhausted. But as 'tis very much to be doubted, whether this pernicious Air is the Cause of these Disorders of the Ears, so neither have I been able to discover, why this Pipe should be made of Silver, rather than any other Metal, why it should be gilt, or what its particular Form or Size should be, since he has not describ'd it. In the mean time, 'till better and more commodious Instruments for assisting the Hearing are found out, I must, from my own Experience, recommend that simple Instrument, almost of the Shape of a Horn, made either of Brass or Silver, and represented by Fig. 2. as the most useful and efficacious in Disorders of this kind.

The Method of boring the LOBES of the EARS.

The Method of boring the Lobes of the Ears is thus: First of all, the Place to be pierced, which ought to be the Middle of the Lobe, is to be mark'd with Ink. Then, taking the Extremity of the Lobe in one Hand, and a common Steel Needle, of a pretty large Size, in the other, you are to perforate the Middle of the Lobe, in the very Part mark'd. Then you are to pass thro' the Perforation a Thread, or round Piece of Lead, such as that represented Tab. 40. Fig. 7. This must be bended into the Form of a Ring, which, for some succeeding Days, must be anointed twice or thrice a Day with Oil of Eggs, or St. John's-wort, and now-and-then gently mov'd backwards and forwards, 'till the Lips of the Perforation are indurated, and healed. But, in performing this Operation, 'tis advisable to perforate a little higher than the Middle or inferior Parts of the Lobe; lest, by the Leaden Ear-rings, or Filaments, its Extremity should be dilacerated. But, for performing this Operation with the greater Accuracy and Expedition, some of the later Physicians have invented an Instrument for this very Purpose, which is represented Tab. 40. Fig. 5. Between the two Plates of this Machine, the Ear is plac'd, in such a Position, that the Hole, B, shall exhibit to the View the Part of the Ear mark'd for Perforation. Then the Ring, A, is to be drawn so far up, as to fix and secure the Lobe sufficiently. Then, by means of a Steel, a Golden, or a Silver Needle, either of the common Form, or, which is better, by one hollow at one of its Extremities, such as that represented in Fig. 6. A B, the Lobe itself is so perforated, that the leaden Filament, represented by Fig. 7. which is inserted within the hollow Part of the Needle, may be left in the Perforation by way of Ear-ring; which, as I have already said, must be gently mov'd backwards and forwards, till the Lips of the Perforation are heal'd. But, instead of this Needle, I think we

may still more commodiously use that represented by Fig. 8. which, at its obtuse Extremity, is divided like a Larding-pin, that it may the better retain and transmit the Leaden Filament, which is to be introduc'd into the Division, after half of the Needle is pass'd thro' the Lobe. But tho' Perforation of the Ears is generally perform'd, rather with a View to gratify the Fair Sex with the additional Ornaments of Ear-rings, than for any medicinal Purposes; yet, if we may believe *Riverius*, *Obs. Medic. 100.* and some other Physicians, it is so noble and effectual a Remedy against some Disorders, that none can possibly exceed it: For, says *Riverius*, if a triangular red-hot Needle is pass'd thro' the Lobe of the Ear; and if, as in a Seton, a Cord of Linen or Silk is introduc'd into the Perforation, in order to keep it open, by drawing it backwards and forwards; 'tis scarce credible what a large Quantity of noxious Humours shall be deriv'd to the Part, and discharg'd, or how successfully the most terrible Disorders of the Eyes, the Teeth, and even the Breast itself, may be cur'd, and the Danger of a Consumption carry'd off by this means. So that 'tis no wonder if some of our modern Physicians, especially such as are employ'd in curing Disorders of the Eyes, have begun by degrees to introduce the Perforation of the Ears into Practice. *M. A. Severinus* [*Lib. de Effic. Medic.*] also asserts, with *Paracelsus*, that this Operation is peculiarly advantageous in a beginning Deafness. *Heister. Institut. Chirurg.*

Explication of the Figures exhibited in Tab. 19. relative to the Organ of HEARING. From Du Verney.

Fig. 1. Represents the temporal Bone as large again as it naturally is, with its squamose Parts cut off, and its long Canal as much abraded as is necessary to give a fair and open View of the *Membrana Tympani*.

A exhibits a fore Prospect of the *Membrana Tympani* in its natural Situation.

B the Manubrium of the Malleus apply'd behind this Membrane.

C the long Branch of the Incus which appears thro' this Membrane, though 'tis situated at a small Distance from it.

D the Head of the Malleus.

E the solid Part of the Incus, with its short Branch.

F these discover'd by this Dissection of the adjacent Parts.

G the bony Canal half abraded.

H the Mastoid Apophysis.

I the Styloide Apophysis.

K the external Muscle of the Malleus in its natural Situation.

L a prick'd Line denoting the slender Apophysis of the *Malleus*, in which this Muscle is inserted.

Fig. 2. Exhibits a lateral Prospect of the *Membrana Tympani*, that its Inclination may be the better observed.

Fig. 3. Exhibits the same Prospect of the *Membrana Tympani* inserted in the Extremity of the bony Canal. It also represents the Manner in which that Side of the bony Canal, which is nearest the Face, lies distant at its lower Extremity from the *Membrana Tympani*, and how it insensibly approaches to it in proportion as it ascends. A, A, A, that Side of the bony Canal which lies nearest the Face.

Fig. 4. Exhibits a lateral View of the Incus and Stapes in their natural Situation.

A represents the solid Part of the Incus:

B its short Branch, of which, in this Disposition of the Parts, we have a fore Prospect.

C its long Branch.

D the Head of the Stapes join'd to the long Branch of the Incus, by means of the fourth small Bone.

Fig. 5. Represents the Rostrum or Beak of the long Branch of the Incus, the fourth small Bone, and the Head of the Stapes with its Cavity; but all four times as large as their natural Bulk.

A the Rostrum of the long Branch of the Incus.

B the fourth small Bone.

C the Head of the Stapes with its Cavity.

Fig. 6. Represents the Stapes five times as large as its natural Bulk.

A the Head of the Stapes.

B its Neck.

C C its Branches fulcated.

D its Basis.

E the Membrane of the Stapes.

Fig. 7. Represents the Basis of the Stapes in the same Situation, in order to shew, that it is also fulcated.

D the Basis of the Stapes.

Fig. 8. Represents the Stapes with its Muscle in their natural Situation.

A the Stapes.

B its Muscle: But both as large again as their natural Bulk.

Fig. 9. Represents the small Bones in the Situation, in which they are seen, when the Eye is apply'd to the Duct, which penetrates into the Mastoide Apophysis.

- A the solid Part of the Incus.
- B a fore View of its short Branch.
- C its long Branch.
- D a posterior View of the Manubrium of the Malleus.
- E represents the superior Part of the Stapes.

Fig. 10. Represents the small Bones in their natural Situation, as they are seen on the opposite Side when the Eye is apply'd to the Duct which goes from the Ear to the Mouth.

- A the Head of the Malleus, which conceals the solid Part of the Incus, and its short Branch.
- B the Manubrium of the Malleus.
- C the long Branch of the Incus.
- D a side View of the Stapes. In this Representation of the small Bones, a small Rod is across, in order to shew what is superior, and what inferior, according to the various Views and Prospects.

Fig. 11. Exhibits a posterior View of the temporal Bone as much abraded as is necessary, to expose the *Membrana Tympani* to the Sight. Upon which Membrane are discover'd the *Malleus* and *Incus* in their posterior and anterior Views, together with that small nervous Branch call'd the *Chorda Tympani*, as also the Tendon of the external Muscle of the Malleus, all in their natural Situation: As also the Cavity which receives the Head of the Malleus; and the solid Part of the Incus.

- A a posterior Prospect of the squamose Part of the Temporal Bone.
- B the Mastoide Apophysis exhibited in the same Situation.
- C C the Os Petrosium abraded.
- D the *Membrana Tympani*.
- E the Malleus.
- F the *Incus*, whose short Branch lies upon the Entrance of the *Meatus*, which penetrates into the Sinuses of the Mastoide Apophysis.
- G the Foramen of the Auditory Nerve.
- 1. the Tendon of the external Muscle of the Malleus.
- 2, 3. the *Chorda Tympani*.

Fig. 12. Represents the half of a Head, less by a third than the natural Bulk, with the whole superior Part of the Cranium taken away, and the remaining Part cut perpendicularly thro' the Middle of the Nose, that the Orifice of the Duct coming from the Ear to the Palate may be discover'd.

- A A the Cavity of the Nose, with its Laminæ.
- B the Bottom of the Palate.
- C the Orifice of the Duct coming from the Ear to the Palate.
- 1. its cartilaginous Side, which forms a Border resembling a Crescent.
- D the Wind-pipe cut thro' the Middle.

Fig. 13. Represents the Temporal Bone as large again as its natural Bulk, and prepar'd in such a manner as to expose to View the *Cochlea*, and the *semicircular Ducts*, in their natural Situation.

- A the Arch of the Vestibulum.
- B the *Fenestra Ovalis*, mark'd by a prick'd Line.
- C the *Fenestra Rotunda* open.
- D the *Spiral Lamina*, mark'd by a prick'd Line, separate from the spiral Canal which covers it; and from the Membrane by which it adheres to the Surface of that Canal.
- 1, 2, 3. the three *semicircular Ducts* in their natural Situation. 1. the Superior. 2. that in the Middle. 3. the Inferior. That in the Middle, and the Inferior, are open, in order to shew, that they are hollow.

Fig. 14. Represents the Covering of the *Cochlea* taken off, and view'd internally, in order to discover the *Spiral, Semioval Canal*.

N. B. This is also represented *Tab. 9. Fig. 2.*

Fig. 15. Represents the *Cochlea* several times larger than the natural Bulk, and view'd according to its Height. In order to view it in this Situation, the anterior Part of its Covering is only raised by a perpendicular Section, which shews in what manner the *Lamina* makes two Circumvolutions and an half round the Spindle; in what manner it adheres to the Surface of the Canal, which serves instead of a Vault to it; and lastly, in what manner the Sides of this Canal, adhering to the Spindle, become as small and slender as the *Lamina* itself.

- A the inferior Portion of the *Vestibulum*, which did not naturally belong to this Figure, but was left in order to shew in what manner the spiral *Lamina* comes out of its Cavity, and passes before the *Fenestra Rotunda*.
- B the *Fenestra Rotunda* shut up by a Membrane as slender as the *Membrana Tympani*.
- 1, 2, 3. the two Turns and an half made by the *spiral Lamina* round the Spindle.

4, 5, 6. the two Turns and an half made by the spiral Duct.

4, 5, 6. the two Turns and an half made by the spiral Duct.

Fig. 16. Represents the spiral *Lamina* suspended in the Air, and several times larger than its natural Bulk, together with the Membrane by which it adheres to the Surface of the Canal.

- 1, 2, 3. the *spiral Lamina* itself.
- 4, 5, 6. the Membrane which adheres to it, and which appears to be separated from it by an intermediate Line.

Fig. 17. Represents the Spindle several times larger than its natural Bulk; upon which we may observe the Traces of the Circumvolutions of the *spiral Lamina*, and *spiral Duct*.

- 1, 2, 3. the Traces of the Circumvolutions of the *spiral Lamina*, which are pierc'd with several small Holes, which give Passage to the Filaments of the auditory Nerve.
- 4, 5, 6. the Traces made by the Edges of the spiral Duct.

Fig. 18. Represents the *Cochlea* in an erect Position, with one half cut off by a perpendicular Section, almost as in *Fig. 3.* except that in this the Bone is more abraded. This Figure is only designed for the Illustration and better understanding the third Figure. It is sufficient to observe, that in this the *Lamina* appears separated from the Surface of the Duct, that the interior Part of this Duct may appear the more conspicuously, and that we may see more distinctly in what manner its Sides are lengthen'd out in order to be join'd to the Spindle.

Fig. 19. Represents the *Vestibulum* and the three *semicircular Ducts* open, in order to discover the Distribution of their Vessels:

- a the arterial Branch, which enters the *Vestibulum*.
- b a small Branch of this Artery, which passes thro' the common Entrance of the *Vestibulum*, and distributes itself to the superior and inferior *Ducts*.
- c the Branch which distributes itself over the middle *Duct*.

Fig. 20. Represents the Arteries of the *Cochlea, Vestibulum*, and three *semicircular Ducts*.

- A the *Fenestra Rotunda*.
- B the Aperture of the Duct affording a Passage for the Vessels; this is at the Entry of the inferior Winding of the *Cochlea*. It appears, that one Part of these Vessels is distributed to all the *Cochlea*, and another to the *Vestibulum*, and three *semicircular Ducts*, which last are represented as suspended in the Air.

Fig. 21. Represents a Portion of the *Vestibulum*, and the three *semicircular Ducts*, suspended in the Air, in order to shew their natural Situation, and their Orifices.

- A the inferior Portion of the *Vestibulum*.
- B the superior *Duct*.
- C the inferior.
- D that in the Middle.
- 1. the Orifice of the superior *semicircular Duct*.
- 2. the first Orifice of the middle *Duct*.
- 3. the Orifice of the inferior *Duct*.
- 4. the other Orifice of the middle *Duct*.
- 5. the common Orifice of the superior and inferior *Ducts*.
- 6. the first Aperture, which affords a Passage to one of the Branches of the soft Portion of the auditory Nerve.
- 7. the second Aperture, which affords a Passage to another Branch of the same Nerve.

Fig. 22. Represents the *Vestibulum* in the same Situation as in the former Figure, with the Nerves of the three *semicircular Ducts* suspended in the Air.

a a Branch of a Nerve which enters the *Vestibulum* by the Opening mark'd 6 in *Fig. 21*. It divides itself into three Branches, of which the first enters the Orifice of the superior *semicircular Canal*, the second the superior Orifice of the middle Canal, and the third, which is the smallest, descends to enter the common Orifice.

b the Branch which enters the Opening mark'd 7 in *Fig. 21*, and which is divided into two Branches, the inferior of which enters the Orifice of the inferior *Duct*, and the other advances into the common Orifice, and unites itself to the third Branch mark'd a. These Nerves are here represented somewhat larger than their natural Size.

AURIS MARINA. A Shell-fish, very common on the Coasts of *Guernsey* and *Normandy*, and those of *Scotland*. It has but one Shell which defends it from Injuries, and is much in the Shape of an Ear. It adheres to the Rocks like a Limpet.

This Fish is not eaten raw, but the People of the Country where it is found usually boil, and then fry it. They are esteemed to make a good *Ericassie*. It is, like all other Shell-fish, an *alcalescent Food*. It is called the *Aurmar*. It tastes somewhat like the Burs of Veal, but not quite so tender. The Shell on the Margin is perforated with five or six small regular Holes; and on the Inside resembles Mother of Pearl.

AURISCALPIUM, from *Auris*, an Ear, and *scalpo* to scratch. An Ear-picker, an Instrument to take Wax, or any other extraneous Body, out of the Ears.

AURORA CONSURGENS: A whimsical Phrase of the Alchymists, by which they would express the Vegetation of their Gold.

AURUM, Offic. Fabr. i. Schrod. 361. Worm. 114. Charlt. Foff. 45. Aldrov. Mus. Metal. 37. Mer. Pin. 208. Schw. 367. Calc. Mus. 436. Kentm. 58. *Aurum, Sol.* Mont. Exot. **GOLD.**

Gold, Aurum in Latin, *χρυσός* in Greek, *Sol* by the Chymists, is the most noble, most perfect, and heaviest of all Metals; ductile, sonorous, and of a reddish-yellow Colour. It is sometimes found pure and unmixed in the Earth, in Rivers, and in the Clefts and Fissures of Stones, either in Dust, or larger Pieces. The Ores from which *Gold* is extracted by Fire, are sometimes a kind of Pyrites, of an ash or purple Colour. It is often found with Orpiment, and is likewise sometimes hid in the Mines of other Metals, especially of Silver, from which it must be separated by various Contrivances. There are many Rivers, among the Sands of which *Gold* is found in small Grains, and there are large *Gold* Mines in *Norway, Hungary, and Guinea*; but the richest are in *Peru and Mexico*.

Gold is the heaviest of all Metals, and of all known Bodies; but withal so soft and ductile, that it may be extended so as to have its Surface increased to 652,500 times. In all common Fires, it remains fixed; and, even when exposed in the Focus of the greatest Burning-glass, it suffers that Heat for a great while, before it begins to evaporate. It never contracts Rust, and is dissoluble in *Aqua Regia*. It is capable of being penetrated by Mercury, and its Texture so far opened, as to be turned into a soft Amalgama. It may be calcin'd by common Sulphur, if set on Fire and flaming. When dissolved by *Aqua Regia*, it may by Oil of Tartar per Deliquium, be precipitated into a blackish Powder, which being gently heated, either by Fire or by Attrition, flies off into the Air with a great Noise; whence it has the Name of *Aurum Fulminans*. The same Effect will happen by using Spirit of Sal Ammoniac, or any other urinous Spirit, instead of Oil of Tartar; but then the Fulmination requires a greater Degree of Fire.

The Analysis or Resolution of this Metal has been hitherto attempted without any Success. The Sulphur and Earth seem to be so strictly united in it, as not to be separable by the common Powers of Fire; and in the Focus of the greatest Burning-glass, intire Parcels of it fly off, without any apparent Resolution into its Principles.

The Use of *Gold* in Physic was unknown to the antient Greeks. The *Arabians* first talked of its Medicinal Virtues, and mixed it in their Compositions, being previously reduced to thin Leaves, upon a Persuasion, that it comforted the Heart, and exhilarated the Spirits; and that therefore it was proper in Palpitations of the Heart, and in Melancholies. The Chymists add farther, that a most powerful fixed Sulphur is contained in *Gold*, which, if it be mixed with the Blood, preserves it from all Corruption, and restores and revivifies human Nature in the same manner as the Sun, the great Original of this Sulphur, enlivens all Nature. Many Authors are of a quite different Opinion, because the Effects of *Gold* are found not to answer these great Pretensions; and it may be reasonably question'd, whether *Gold* be at all useful in Physic. Leaf *Gold* is an Ingredient in the *Confectio Alkermis Regia*, the *Confectio de Hyacintho*, *Pulvis Diamargaritæ Frigidus*, *Pulvis Latificans*, and *Pulvis Pannonicus*, all of *Charas*. It is likewise used to gild Pills and Boluses.

The Virtues of the Chymical Preparations of *Gold* are equally dubious, because they seem to derive their Energy, not from the *Gold*, but from the Menstrua, and other Substances mixed with it. Whence we may conclude, that the most valuable and most precious of all Metals is the most useless in Physic, except when consider'd as an Antidote to Poverty.

The Tincture of *Gold*, or *Aurum Potabile*, made in this manner, is this:

Take of pure *Gold*, half a Dram; of *Aqua Regia*, two Ounces: Make a Solution, and pour upon it the limpid essential Oil of Rosemary, an Ounce. Shake the Mixture well, and the Spirit of Salt will subside, deprived of its yellow Colour, which is retained in the Oil that swims at the Top. Separate this Oil from the Spirit by Inclination. Mix it with four or five Drams of Spirit of Wine highly rectify'd; digest them for a Month, and the Mixture will acquire a purple Colour. This Tincture is Diaphoretic and Sudorific, and is recommended in malignant Fevers. The Dose is from three to fifteen Drops.

But, after all, this is not a genuine Tincture of *Gold*, being only the *Gold* divided into very small Parts, by the Spiculae of the *Aqua Regia*, swimming in the Oil of Rosemary; neither do we know any radical Tincture of *Gold*, which may not, by evaporating the Oil, be reduced to a Powder, and

by melting the Powder into *Gold*. The chief Virtues of this Tincture are owing to the Oil of Rosemary.

The *Aurum Fulminans* is esteemed, not only for its fulminating Quality, but also for the Medicinal Virues attributed to it; and is prepared in this manner:

Take of Spirit of Nitre, an Ounce; dissolve therein a Dram of Sal Ammoniac; throw into this Solution a Dram of *Gold* Dust, and dissolve it by a moderate Heat. Then pour into the Solution by Drops, Oil of Tartar per Deliquium, till the Ebullition ceases. The *Gold* will be precipitated like a yellow Mud: Then having poured off the Liquor by Inclination, wash and edulcorate the Powder, and dry it in the Shade.

This Powder, even by a gentle Attrition, goes off with a violent Noise, and, taken inwardly, is thought to be Diaphoretic; but it may more truly be said to relax the Intestines, as was observed by *Ludovicus* and *Koning*, who affirm, that this Preparation being given in Fevers, in which the Patient inclines to a Diarrhoea, promotes that Discharge, and, on that Account sometimes proves fatal.

Lastly, the Chymists tell us very wonderful Things about the Philosophers Stone, or an universal Tincture; which being projected on the ignobler Metals, penetrates their Parts so intimately, without any visible Shew, that they are in an Instant changed to a Metal, that has the Colour and Weight of *Gold*. They amuse us likewise with an universal Medicine, which cures all Diseases, and purges the Blood from all Disorders by a kind of Irradiation; so that Life and Health may be preserved for a very long Time, if not to Eternity. As I know nothing of this universal Medicine, I can say nothing about it. And for the Philosophers Stone, the Materials from which it is to be prepared are hitherto undetermined, as well as the Method of preparing it, whatever impertinent, ignorant Pretenders may boast. By these Pretensions, however, they have found the Secret, if not of making *Gold*, yet of getting *Gold* already made into their Hands, and for that Reason every prudent Man ought to beware of them. *Geoffroy*.

'Tis obvious to every one conversant in Matters of a physical Nature, that for a great while, especially since Chymistry began to be cultivated and improved with Care and Accuracy, Remedies prepared of *Gold* have been in great Repute, as being of a comforting Quality to the Constitution, and accommodated to the Cure of almost all Diseases; for the Antients imagined, that the Planets had a peculiar Connexion with, and Influence over, the Viscera of the human Body, and, in like manner, over the several Metals lodg'd in the Bowels of the Earth. For this Reason they affixed the Names of the Planets to Metals; and as they observed, that the Sun diffused Warmth, Vigour, Life, and Fruitfulness, to all Animals and Vegetables on our Globe, they imagined that *Gold* was also capable of producing a like Effect. And this common Tradition, or rather Fiction, infatuated not only the Vulgar, but also the *Literati*, and more especially the Physicians, to such a Degree, that they firmly believed, that Medicines, duly prepared from *Gold*, were far superior to all others, and operated like an universal Cordial and Comforter.

This mistaken Notion of *Gold* being able to cure Diseases, proceeded partly from an Ignorance of natural Philosophy, and of the real Manner in which Medicines acted, and partly from the insatiable Avarice of Practitioners; for when these so much extolled Preparations of *Gold* are brought to the Test in a chymical and rational Manner, it will be obvious, that they are so far from doing any Good, that they rather do Harm; for, first, Preparations of *Gold*, whether exhibited in Substance, or in the Form of Crocus, or in Powder, produce no manner of Effect, because nothing in Nature is capable of dissolving *Gold* besides *Aqua Regia*. And as Metals cannot act upon Bodies, till they be first so effectually dissolved, as to be able to enter their Pores; and since no Liquor or Menstruum capable of producing this Effect is found within the Body; 'tis plain that *Gold* in Substance must remain intire and untouched, and consequently can produce no manner of Effect upon the human Body.

Then again, when *Gold* is dissolved, this can be done by no other means than *Aqua Regia*, or common Salt and Nitre. These two last-mentioned Ingredients must be thoroughly boiled with *Gold* Leaves in a sufficient Quantity of Water. But the Solution procured in both these manners assumes a septic and corrosive Nature, though that obtained by the former Process is more remarkably so, than that procured by the other; for as Mercury, Copper, and Silver, when dissolved by Salts, or their Spirits, acquire so strong and virulent a Nature, as by corroding the nervous Coats of the Stomach and Intestines to excite Gripes, Spasms, Anxieties, Purging, and Vomiting; so the same Misfortune attends the Solution of *Gold*; a few Drops of which, exhibited in an aqueous Vehicle, I have often found to excite Gripes, Spasms, and Anxieties of the Præcordia.

For this Reason I think it highly proper to give a Caution with regard to the wary and prudent Use of metallic Medicines, whether

whether Gold or Silver, and to advise the Use of safer Remedies in their stead.

When many of the Chymists and Physicians observed, that when Gold was dissolved with Salts, or acid corrosive Spirits, it was so far from restoring and recruiting Strength in an incomparable and uncommon manner, that it assumed a drastic violent Quality, which was prejudicial and offensive to the Constitution; they began to think, that Gold was to be *radically* dissolved, and that by this means they should obtain a highly promising, and as it were an universal Medicine. By *radical and intimate Solution* they mean no more than a Solution by which the constituent Particles of Gold are so thoroughly and effectually separated and torn from their original Crasis, Union, and Texture, that the highest Attempts of Art shall never afterwards be able to reduce them to true Gold. For this Purpose they thought the common Menstruums entirely insufficient, and imagined that the Effect could only be brought about by some insipid Menstruum of so fine and subtle a Nature, as to enter its smallest Pores, and pervade its minutest Interstices.

But without any Contempt for the Abettors of this Notion, I must, for the Honour of Truth, declare, that I think these Conceits of the Chymists partly pleasing and delusive Chimeras, and partly interested and mercenary Frauds, by means of which they hunt for Fame and Riches; for the Subtlety and intimate Connexion and Adhesion of the Particles of Gold are almost incomprehensible, since one Grain of Gold dissolved is capable of communicating a metallic Taste, and a reddish Colour, to an incredible Quantity of Water. The Fluid then which must dissolve the intimate Commixtion and Adhesion of these minute Particles, must necessarily consist of the most subtle Parts, that it may penetrate into these inconceivably narrow Pores. Now 'tis very much, and at the same time very justly, to be doubted, whether there is in Nature a Substance from which such a Menstruum can be prepared. 'Tis true there is in Quicksilver a highly subtle insipid Fluid, which penetrates the Pores of Gold, but it cannot destroy the Texture of the smallest Corpuscle of that Metal; for, upon the Removal of the Mercury, the Gold is restored to its primitive Form and Nature.

And indeed I cannot help being surpris'd, why the happy Possessors of these wonderful *Arcana* do not talk of a radical Solution of some other Metal, such as Silver, Mercury, or Copper, since their perfect Menstruum ought to be capable of dissolving all Metals, because, being more ignoble than Gold, their Contexture is consequently looser, and the Cohesion of their Parts less; but what Chymist ever yet dared to subject a real Experiment to the Eyes or Judgments of the Intelligent, by means of which a radical Solution of Mercury or Lead might be obtained?

Then again, though it should be granted, that there is in Nature, or that there may be prepared by Art, such a Menstruum as is capable of so thoroughly reducing Gold to its first Principles, that there is no more any Possibility of their being reduced to Gold, yet still a Doubt remains, whether, when the Contexture and Adhesion of the Gold is thus dissolved, it still remains to be Gold, or whether it does not pass into some other Substance of a quite different Nature from that Metal, since it is well known, that the Form and Essence of Bodies depend upon the Disposition of their Pores, and the Cohesion of their Parts; and that all their Virtues and Operations flow from these, as from their original Source. Since then, upon their Hypothesis, so salutary and analeptic Qualities are ascribed to Gold, because it is so agreeable to the Heart, and vital Spirits; and since, when the Texture of that Metal is destroy'd, it is no longer genuine Gold; we may from this justly infer, that the Virtues of a Medicine thus prepared are not to be ascribed to Gold as Gold, but to another Mixture arising from the Dissolution of that Metal; for which Reason, such a Medicine cannot properly be called *Aurum Potabile*.

But still it would be sufficient for their Purpose, if it was absolutely evident, that such a Medicine could possibly be prepared from Gold; for 'tis to be observed, that no one has hitherto produced a fair and unexceptionable Example either of the Reality or Possibility of such a Solution. I have often told these impudent Boasters, that I absolutely deny'd the Existence of an insipid Menstruum, which, without producing a radical Solution, could so much as simply dissolve the more ignoble Metals, much less Gold; and have offered to pay them an hundred Dollars, if, in my Presence, they would exhibit an Experiment of this Kind, assuring them, at the same time, that I should never desire to be let into the Preparation of this mighty *Arcanum*; but I never could, nor ever shall, obtain this uncommon Favour at their Hands. 'Tis, however, a common Practice with these Artists to have recourse to an ingenious and pleasant Subterfuge, by confidently saying, if their *Aurum Potabile* is subjected to a chymical Examination, and no Traces of Gold are to be found in it, that the Metal is radically dissolved, and consequently can never by any Art be reduced to its primitive and natural State.

But as for my own Part, I should not hesitate to prefer a Medicine, the Gold of which could be reduced to its former

State, provided it had sufficient Virtues to recommend it, before a Medicine of less Efficacy, whose Gold could not be restored to its pristine Condition. I do not affirm, that all the Preparations sold for *Aurum Potabile* are absolutely good for nothing, since they may have Virtues lodged in the Menstruum, and other Ingredients, of which they are composed; but that they should be sold for universal Remedies, and at so high a Price, are Circumstances that must inspire every Lover of Truth, and Friend to Society, with just and reasonable Indignation.

These universal Medicines prepared of Gold are often affirmed to be compounded and made up in such a manner, that they may safely be exhibited in any Disease whatever. This I myself may possibly believe; but the grand Question is, Whether it can be demonstrated to skilful and knowing Physicians, that such Preparations have any peculiar Efficacy above other Medicines.

I very readily believe, that many employ Gold in preparing their universal Medicines; but because they are ignorant of a just and rational chymical Theory, they deceive themselves, whilst they foolishly imagine, that the Efficacy of these Medicines depends upon the Gold; for the Whole of the Gold may easily be obtained by one who is perfectly acquainted with the Art of Reduction. But let no one find Fault with me for delivering my Sentiments with regard to these Medicines in so open and candid a manner.

I now come to examine that *cordial solar Tincture*, which is prepared from Gold with the Oil of Cinnamon in the following manner:

Let a well saturated Solution of the purest Gold be in some measure inspissated; then dissolve one Dram of pure Oil of Cinnamon in highly rectify'd Spirit of Wine, and let one Part of the Solution of Gold be mixed with three Parts of this Solution in a small Cucurbit placed in a Sand-heat. By this means these two Solutions are united into a kind of resinous Mass, of a Colour resembling that of Pitch, which, when dissolved in highly rectified Spirit of Wine, forms an Essence of a deep brown Colour, and of a grateful, but somewhat bitterish and subastringent Taste, which may be exhibited with Success, when the Intention is to restore and confirm the Strength of the Patient.

But the Question is, Whether the Virtues of this Medicine depend upon the Gold thus dissolved? I absolutely deny, that they do; because when this Tincture is allowed to stand for a considerable time, a blackish Powder subsides, which, when washed with Spirit of Wine, and dry'd, is by *Aqua Regia* speedily again dissolved into a yellow Liquor, which, when apply'd to the Skin, soon after tinges it with a purple Colour, just as the Solution of Gold does.

The Reason of the Process is plainly this: The *Aqua Regia* concentrated in the Solution of the Gold, intimately uniting itself with the diluted Oil of Cinnamon, by means of an external Heat, constitutes the resinous Mass, into which the Corpuscles of the Gold by no means pass. But this resinous Substance, impregnated with the Oil of Cinnamon, is dissolved in highly rectified Spirit of Wine; and the Particles of the Gold, being by this means disengaged from it, subside to the Bottom of the Glass.

In like manner, that Tincture partakes very little of the Gold, which is commonly prepar'd of Sugar, sufficiently triturated with Leaf-gold, and afterwards calcin'd by a due Degree of Heat; for tho' the Acid of the Sugar may, by its Attacks, induce a certain Change upon the Gold, yet the Tincture, extracted in this Process by the Spirit of Wine, is no more than an Extract of the Sugar gently burnt, just as it usually happens in preparing the Tincture of Coral. Nor is this easily-prepar'd Tincture to be entirely deprived of the Praises due to it; for the sulphureous oily Principle, disengaged and set at Liberty by the gentle Combustion of the Sugar, is capable of imparting a brisker Motion to the languid Mass of Blood and Humours, which is a Circumstance of considerable Moment in Diseases accompany'd with a Defect of Strength, and in Cases where too hot Medicines are not proper: But, at the same time, this Remedy derives none of its Virtues from the Gold, the Whole of which is easily obtain'd from the liquid Sugar.

Others, mixing Gold with Antimony and Salt of Tartar, fuse the Mass, and, towards the End of the Fusion, add a certain Quantity of Sugar. Upon this Mixture, reduced to Powder, they pour tartariz'd Spirit of Wine, and so extract a Tincture of a brownish-red Colour, and a grateful Smell and Taste, which they believe to be the genuine Essence of Gold. 'Tis true, Gold is converted into a Powder, by being treated in this manner with an alkaline sulphureous Salt; but, at the same time, little or none of it is receiv'd into the tartariz'd Spirit of Wine. However, the Tincture obtain'd in this Process, which is partly the Tincture of Sugar, and partly that of Sulphur, can't be said to be altogether useless.

I now come to inquire, whether there is a Possibility of preparing, from Gold, a Medicine which shall be possess'd of any singular and uncommon Efficacy. And, indeed, I am of Opinion, that this may be done; for tho' Gold, consider'd as a Metal of a close and firm Texture, and which acquires a corrosive Quality from Salts, seems to promise very little in the Cure of Diseases, it nevertheless has a peculiar Use; as yet known to few, when skilfully treated with Mercury, or with Regulus of Antimony, which is of a mercurial Nature; for 'tis sufficiently known, that the penetrating active Quality of Mercury puts the Lymph of a human Body into strong Commotions. Nor are we ignorant of the active and violently emetic Qualities of the Regulus of Antimony; for these two Minerals, being easily soluble by an Admixture of any Salt, in Consequence of the Minuteness of their component Parts, penetrate very far, especially into the nervous and membranous Systems; where, producing violent Motions, they excite uncommon Tumults in the natural Functions; and, when judiciously used, are remarkably efficacious in obstinate Chronical Disorders.

Now, that Excess of Volatility, which, in Mercury and Regulus of Antimony, proves so prejudicial to those Parts of our Bodies which are destin'd for the Purposes of Sensation and Motion, cannot be more properly corrected, subdued, and balanced, than by an intimate Mixture of Gold with these Minerals; for, by this means, the excessive Minuteness of the Parts of Mercury, and Regulus of Antimony, is not only prevented by the more fixed Substance of the Gold, but their pernicious Solution on the Admixture of Salts is hindered in the Body; and because Gold itself is nothing more than a very fixed Mercury, hence it happens, that by the Addition of a more volatile Mercury it is put in Motion, and a Medicine is produced, which, when exhibited in gentle Doses, restores the languid Motions by mildly corroborating the Nervous System, an Effect of the last Importance in many Diseases both of the chronical and acute Kind.

But the purer the Mercury is, and the more thoroughly it is separated from its phlogistic and heterogeneous Substance by various Amalgamations with Silver and the Regulus of Antimony, by Triturations, Lotions, and Sublimations, the more easily and quickly it admits of a Conjunction with Gold, and affords a highly valuable Medicine. Now 'tis a sure Sign, that Mercury is pure and animated, when few Parts, four or five for Instance, to one of the Gold, are sufficient for its Amalgamation, or Solution, and when the Mercury becomes warm upon its being mixed with the Gold.

Then, again, another excellent Medicine is prepared from Gold, by mixing two Parts of the Regulus of Antimony with one Part of Gold in a proper Fire, and converting the Powder into a purple-colour'd Calx in a Glass Phial, by means of a circulatory Fire. This Powder, when duly prepared, is, on account of its diaphoretic Virtues, preferable to all the other Solar Preparations whatever.

I must, in the last Place, subjoin this Advice, that when People intend to prepare Medicines from Gold, they ought to make Choice of the purest and most free from all Alloy of Silver and Copper, with which, to use the chymical Term, it uses to be associated; for 'tis absolutely false, that the Gold of which the Ducats are coin'd is the purest, since in twenty-four Parts of the Gold there is one of Silver and Copper. But since the Copper passes into the Aqua Regia along with the Gold, and since we are well enough apprised of the virulent Qualities even of its minutest Particles, we may plainly perceive, that, in consequence of this, Solar Preparations must assume a hurtful and prejudicial Quality.

Aurum Fulminans, when prepared of impure Gold, as it commonly is, excites violent Gripes, and is not altogether free from a septic Quality, especially when it has not been wash'd with Rain-water; whereas no such hurtful Effect is to be dreaded from it, when prepared with the purest and most carefully edulcorated Gold.

Now there is no better Method of purifying Gold than by what Chymists call the *Fourth Treatment*, in which one Part of Gold is fused with three Parts of Silver, which when dissolved in Aqua Fortis, the pure Portion of the Gold remains in the Bottom of the Vessel. Then this Gold is to be dissolved in Aqua Regia, till it is so thoroughly saturated with it, that it can receive no more of the Gold; but the Aqua Regia ought to be of the best Kind, which is prepared by drawing Aqua Fortis off common Salt, or Sal Ammoniac. *Hoffmanni Obs. Chym.*

There is a Method of making Gold potable, which is specified under the Article *Æther*. One Drop of this is said to be a very great Cordial, inasmuch that, in some Parts of Germany, even things little less than miraculous are reported of its reviving Qualities; and I am well informed, it has been frequently sold in that Country for a Ducat a Drop.

Glauber gives a very great Character of a mercurial Medicine, which he calls *Aurum Horizontale*, which *Helmont* had before him taken Notice of, not without great Encomiums.

If these whimsical Writers were possessed of such a Medicine, Vol. I.

as there is some Reason to believe they were, they deserve very ill of Mankind for not giving the Process more intelligibly, and for depriving the World of so valuable a Remedy.

Helmont, in some Parts of his Works, seems to insinuate a Reason for his Conduct in this Particular, which, however, does not appear to be very satisfactory. He complains, that the Physicians, instead of giving him the Honour due to his Industry, loaded him with Reproaches, and persecuted him with Virulence, so as to endeavour to have his Book (*de Febribus*) prohibited. It is possible, that a Resentment of such Treatment might induce him to conceal, what it would have been much the Interest of his Enemies to have divulged.

Glauber's Account of the *Aurum Horizontale*, is thus:

First, vulgar Mercury, by the Help of our secret *Salmiac*, may be so purified in the Space of one Day, as the Day following, by one only Abstraction of the Water of *Saltaberis*, it may be coagulated into a red fixed Medicine. Which swift Mortification, Coagulation, or Fixation, was highly esteemed by *Paracelsus* and *Helmont*. This Mercury *Paracelsus* insignized with the Title of *Coralline Mercury*, and celebrated the same with this illustrious Phrase; That, in the whole Nature of Things, there was not any Remedy more excellent for yielding Relief in the Gout and French Disease, adding that it recreates the Mind of the Artist, because it hath Entrance into Gold, and with the same is converted into Gold, and so not a few impoverished Chymists may again be stored with Riches. But, since the Death of this Philosopher, you shall not find, that there hath been one or other of the Professors of Chymistry unto this Day, who could prepare such a red fixed Mercury. The Reason hereof is, because none of the Sons of Art could comprehend the Water of *Saltaberis*, by which Mercury is to be brought to a fixed Redness; none, I say, until *Helmont*, that most learned Philosopher of our Age, discovered himself, witnessing that he also could prepare such Mercury, which he insignized with the Name of *Horizontal Gold*, affirming it would sufficiently supply whatsoever the Physician and Surgeon should need.

In like manner, that most expert Philosopher *Nuysemantius* wrote of such a Mercury, testifying that two or three Grains of it only being taken in some Confortative, would purge out all Impurities from the human Body. Indeed *Helmont* expresses this in other Words, yet by them intimates, that it purgeth out all Filths from the Veins. Behold three famous Men, serving instead of the *Marpesian Columns* of all Hermetic Philosophy, and Medicine; for they have excellently written of this Mercury: Yet to the Inventions of these none of their Successors have added any thing, but have been still and quiet, shunning the Labour of preparing an Universal Medicine. Whosoever is seized with a Desire of succouring the Misery of the Sick, he will do better for publick Good, in using such a fixed Mercury, rather for expelling the Cruelty of a tyrannical Gout, and the French Disease, than for Gold making, unless so far as he hath need to use the same for necessary Aliments. *Glauber.*

AUSTER, *νῦστος*, the South Wind, which is hot and moist, and very productive of Diseases, according to *Hippocrates*, *Aphorism 5. Book 3.* For this *Galen*, *Com. 2. in Lib. 1. Epid. t. 62.* renders a Reason: "Because, says he, the South Wind causes a Dissolution of Bodies, and a Fusion of the Humours; whereby they are subject to putrefy, especially if this Wind be attended with great Rains." The Disposition of the Season of the Year in which the South Wind most frequently blows, is called *Notia*, *νῦστα*, *Australis*, or *Austrina*, *Austral*.

AUSTERUS, in *Scribonius Largus*, No. 188.

AUSTER, *αυστρός*, austere, a kind of Taste, which, according to *Galen*, *Lib. 1. de Sim. Fac. Cap. 37.* belongs to an earthy, mixed with a tartareous saline Substance, having an astringent Quality, and differing from the *Acerbus*, tart, only in Intensity. The *Cartesians* suppose Austere to consist in having obtusangular Particles, like a blunt Saw. Things of an austere Taste are supposed by some, from their glutinous and tenacious Quality, which obstruct the Course of the Fluids, to generate the Stone, though they are not without their good Effects.

AUSTROMANTIA, a pretending to foretel Events from a superstitious Observation of the Winds. *Rulandus.*

AUTARCIA, *αὐτάρκεια*, from *αὐτός*, himself, and *ἀρκέω*, to be sufficient. Self-sufficiency, Contentment with our own Condition; it is opposed to *Aplestia*, Insatiability. *Castellus.*

AUTETES, *αὐτέτης*, the same as AUTITES, which see.

AUTHADES, *αὐθάδης*, from *αὐτός*, himself. One who sets a high Value upon himself, and despises others.

AUTHEMERON, *αὐθεμερον*, from *αὐτός*, the same, and *ἡμέρα*, a Day. The very same Day, *Hippocrates*, 4. *Aph. Book 3.* Hence a Medicine is called *Authemerom*, which gives Relief on the same Day it is taken. There are two Remedies of this Kind for Disorders of the Spleen; in *Galen de C. M. S. L. Lib. 9. Cap. 2.* and in *Actius Tetrab. 3. Lib. 2.* there is a Phœnigmus Authemerom for a scirrhus Spleen.

AUTHIS, αὐθις, again. In *Hippocrates, Lib. Epid.* it signifies hereafter, as ὁ δὲ πυρετός αὐθις ἐκ ἐπεί, "the Fever afterwards never left (her)."

AUTITES, αὐτίτης, is by some derived from αὐτός, the same, and ἔτος, a Year. Thus αὐτίτης διῶς, is expounded in *Galen's Exegesis on Hippocrates*, by ὁ αὐτοῦ ἐτὸς, ὁ ἐκ τῆ ἐν ἐστὶ ἐτος, "Wine of this present Year." *Pollux* expounds αὐτίτης διῶς, by ὁ ἐκ τῆ αὐτῆς, "Wine of the same Country;" and *Suidas* by αὐτογενής, "the Product of the same Country." Others explain it by ὁ αὐτὸς καὶ ὁ ἕτερος παρὰ τοῦ αὐτοῦ, "undiluted, and without being diluted;" and *Erotian* by ἀπαρῆχτος, "undiluted."

AUTOCINETOS, αὐτοκίνητος, from αὐτός, itself, and κίνησις, to move; self-moved; a Word by which *Galen* expounds αὐτοδρόμος in *Hippocrates*.

AUTODROMOS, αὐτοδρόμος, from αὐτός, and δρόμος, to run. See the preceding Word.

AUTOGENES, αὐτογενής, from αὐτός, itself, and γίνομαι, to be produced. An Epithet of the *Narcissus* with a white Flower, because its bulbous Root, before it is set under Earth, puts forth Leaves, so that the Plant in one Sense seems to spring from itself. *Blancard*.

AUTOLITHOTOMOS, αὐτολιθοτόμος, from αὐτός, himself, λίθος, a Stone, and τέμνω, to cut. A Name bestowed on one who had the extraordinary Dexterity to cut himself for the Stone. *Castellus*.

AUTOMATOS, αὐτόματος, spontaneous. Things are said by *Hippocrates* to be done αὐτόματος, which are owing to the Efforts of Nature rather than the Violence of the Disease, or the Assistance of the Physician, *Aph. 2. Lib. 1. and Lib. πρὸς χυμῶν*. Thus again, *Aph. 2. Lib. 4. αὐτόματα ἰσθία*, signifies such Things as pass off naturally, or which Nature spontaneously discharges. *Ἀπὸ ταυτομάτης, Aph. 77. Lib. 4.* signifies, according to *Galen*, ἐξαίρτως, "suddenly," or ἀνευ φανεράς αἰτίας, "without manifest Cause." *Αὐτόματος, Lib. πρὸς τήχυνος*, denotes any thing that is supposed to happen merely by Chance, and spontaneously. The same Word, in *Lib. πρὸς φυσῶν*, is applied to a Flatus that passes off easily without being forced, and to the Air that insinuates itself insensibly into the Veins. *Αὐτόματα χυμοί, in Lib. πρὸς τερψῆς*, "spontaneous Juices," are such as we spontaneously, and for that very Purpose, provide for our Nutrition, and about which human Art and Industry are employ'd. So αὐτόματος imports the same as ἐκείναις, voluntarily, and of set Purpose; as ἐκείναις ἐκείναις are spontaneous Ulcerations, which have some external Cause.

AUTOPHOSPHORUS, αὐτοφωσφόρος, the same as PHOSPHORUS, which see.

AUTOPSIA, αὐτοψία, from αὐτός, himself, and ὥσπερ, to see; ocular Evidence. *Autopsia* was a Word formerly proper to the Empiric Sect, by which they meant the Memory of those Things which they had often seen, and in the same Manner. This *Autopsia*, or the Observation and Memory of what every one sees with his own Eyes, is also highly necessary in the Dogmatical or Rational Physic. *Gal. de Part. Art. Med. Cap. 2.*

AUTOPYROS, αὐτοπυρός. See **ARTOS**.

AUTOS, αὐτός.

Αὐτός ἐαυτὸν γινέσθαι, in Hippocrates, Lib. 7. Epid. signifies to come to himself, or to his Senses. Thus, in the same way of speaking, ἐξ ἐαυτοῦ εἶναι is to be out of his Senses; and αὐτός αὐτὸν εἶναι, in the same Book, is to be in his right Mind or Senses.

Αὐτός, in Galen's Exegesis, is expounded by μάταιος, vainly, rashly. *Hesychius* also expounds it by μάτην, in vain.

AUTOUR, a sort of Bark, in Shape and Colour much resembling Cinnamon, only a little thicker and paler; the Inside is of the Colour of a broken Nutmeg, with a Multitude of Spangles. It is almost insipid, and has no Smell at all. We have it from the *Levant*; and it is one of the Ingredients in the Carmine Dye. *Remery des Drogues*.

AUTUMNUS, φθινόπωρον, ὁ πῶς, the Autumn. The Diseases particularly incident to this Season are, Fevers of an anomalous Kind, Pain of the Spleen, Dropsy, a Consumption, which the *Greeks* call φθίσις (Phthisis), a Difficulty of Urine, which they call σπυγγία (Strangury), that Disease of the small Intestine, called by them ἐλκός (the Iliac Passion); besides a Flux (*Levitas Intestinorum*), called λευκίτις (a Lientery), Sciaticas (*Coxa Doloris*), and Epilepsies. This Season is also liable to long and tedious Distempers, and proves mortal to those who have lingered under Distempers during the preceding Summer. Some it destroys with new Diseases, and involves others in very lasting ones, and particularly Quartans, which hold all the Winter. Nor is there any other Season of the Year more subject to pestilential Distempers of all sorts, and of all Degrees of Malignity. *Celsus, Lib. 2. Cap. 1.*

The greatest Danger is in Autumn, because of the Variety of Weather; therefore never go abroad without (good warm) Garments and Shoes, especially on a cold Day; nor sleep in the open Air, at least without being well covered. You are now

allowed to eat somewhat plentifully, and to drink your Wine less diluted, but in smaller Quantities. Some think Apples hurtful, which are commonly eaten in immoderate Quantities all the Day long, without lessening that Proportion of more solid Food; so that not the Apples, but the Sum of all that is eaten, taken together, does the Mischief, in which, however, the Apples are the least concerned. But it is not proper to eat these more frequently than other Food; and, in short, it is necessary, when they come in Use, to diminish our Allowance of more solid Food. *Celsus, Lib. 1. Cap. 3.*

The Autumn being an unequal and disorderly Season, which produces all Kinds of Diseases, great Care is to be taken of the Diet and way of Living, that no Error may be committed in Concoction, the Use of Veneries, or drinking cold Liquors, but that Men should be temperate in all things. To this End, we are to avoid the Intemperance of the Air, which in the Morning is cold, and sultry at Noon, and not fill ourselves with Autumnal Fruits, which are prejudicial, not only on account of the Plenty, but Malignity of the Humours and Flatulencies, which they generate, since the best of them, which are Figs and Grapes, breed Flatulencies, and corrupt the rest of the Aliment, except they be taken before other Food, in which Case they have no such ill Effects. As the Air grows colder, the Body is to be heated in proportion, and we are to manage in all things with an Eye to the Approach of Winter. After the Equinox, it will be convenient to make use of some evacuating Medicine; that no superfluous Humours may create Disturbance, and interrupt our Health, during the Winter. *Oribas. Euporist. Lib. 1. Cap. 10.*

AUVER, pure, or soft Water. *Rulandus*.

AVULSUM, **AVULSIO**, ἀποσπασίς, ἀποσπάσις. See **APOSPASMATA**.

AUXESIS, αὐξήσις, from αὐξάνω, to increase. The same as **AUGMENTUM**, which see.

AUXILIUM, βόηθημα, βόηθεια, Assistance; in a medicinal Sense, whatever assists Nature against a Disease; and so is the same as *Remedium*, or *Medicamentum*.

Celsus, in Answer to those who said, *Omne Auxilium necessarium esse incrementibus Morbis, non cum jam per se finiuntur*, "That Assistance was always necessary in the Growth of Diseases, but superfluous in their Decline; when, if let alone, they would terminate of themselves," asserts the Case to be otherwise; because, says he, a Disease, which would of itself terminate, may yet be sooner taken off by proper Assistance, which is necessary for two Reasons: First, that the Health may be re-established as soon as possible; and next, that the Remains of the Disease may not, on some slight Occasion, be exasperated. For a Disease may be less troublesome than before, and yet not quit the Patient, but hold fast by Reliques, which by Assistance may be dissolved. *Celsus, Lib. 2. Cap. 14.*

In a quite desperate Case, it would be a Piece of Weakness to expose, by Trial, the most successful Remedies to the Reproach of ignorant and unskilful Pretenders. I know some Physicians unacquainted with Method, who, thinking to imitate our Practice, have tried our Medicines upon Persons who were almost dead, and so rendered the reasonable Use of them suspected and dreaded. *Actius, Tet. 2. Serm. 1. Cap. 78.*

AUXYRIS, a corrupt Word for **OSYRIS**, Poets Rosemary, which see.

AXEA COMMISSURA, τερχωσθῆς. A sort of Articulation. See **TROCHOIDES**.

AXEDO, a Spell, in *Marcellus Empiricus, Cap. 33*, to render a Person impotent.

AXICULUS, a Roller or Cylinder. *Rulandus*.

AXILLA, μαχαλή, μαχαλίς. The Cavity under the Arm, called the *Armhole*, or *Armpit*.

AXILLARIS VENA, ἡ διὰ τῆς μαχαλῆς περνούσα φλέβη, the Vein that passes through the Armpit. *Galen*. The Axillary Vein. See **VENA**.

AXIOLOGOS, αξιόλογος, from αξίος, worthy, and λόγος, a Word. Worthy of Notice. *Hippocrates*, in his *Coac. Praenotiones*, applies this to ἀπόστημα, Apofistematation, where it imports, considerable, sufficient for a Crisis.

AXIOMA, αξίωμα, an Axiom. This signifies a Proposition which neither requires, nor admits of, Demonstration. But the Art of Physic has the Misfortune to have a great many Propositions laid down as Axioms relative to it, which greatly require, but, however, do not admit of, Demonstration.

AXIOPISTIA, αξιοπιστία, from αξίος, worthy, and πίστις, Faith, Confidence. It imports Authority.

AXIRNACH, superfluous Fat, which sometimes grows in the Tunics of the upper Eye-lids; this frequently is found in Children. *Castellus* from *Albucasis*.

AXIS, ἄξων, a Name given to a Tooth-like Eminence in the second Vertebra of the Neck. See **VERTEBRÆ**.

AXUNGIA, ἄξυνσις, ἄξυνσις, ὀξύσις, signifies strictly old Hogs Lard, or, in general, old Lard, or Suet of any other Animal. See **ADEPS**.

AXUNGIA DE MUMIA, is Marrow.

AXUNGIA

A Z O

AXUNGIA VITRI, is Sandiver, or Salt of Glafs. A kind of Salt which separates from the Metal of Glafs whilst in Fusion. It is of an acrimonious and biting Taste. The Farriers use it for clearing the Eyes of Horses. It is also used for cleaning the Teeth; and is sometimes applied to running Ulcers, a Herpes, or the Itch, by way of Dedicative.

AXYRIS, the same as **AUXYRIS**, which see.

AYBORZAT, Galbanum. *Johnson.*

AYCOPHOS, burnt Brass. *Rulandus.*

AZAA. *Rulandus* explains this by *Magra, Terra rubea*. I suppose he means *Marga*, Marl. Red Marl.

AZAGOR, Verdigrise. *Rulandus.*

AZAMAR, Vermilion, or Native Cinnabar. *Ruland.*

AZAMO. *Rulandus* explains this by *Color Indus*, but I cannot tell what he means, unless black; or a Mixture of Blue and Purple, which is the *Indicum* of *Pliny*.

AZANEC. The same Author explains this by

ARMONIACUS. I suppose he means the Salt.

AZANITÆ ACOPON, the Name of an Acopon or Ointment in *Paulus Ægineta*.

AZANITÆ CERATUM, the Name of a Cerate in *Oribasius*.

AZARNET, Auripigmentum. *Rulandus.*

AZAROLUS. A Name for the *Mespilus Aronia*. *Neapolitan Medlar.*

AZCI, Ink. *Rulandus.*

AZEC, green Ink. *Ibidem.*

AZEDARACH, *Pseudosycamoros*, Offic. Mont. Ind. 37. *Azedarach*, Tourn. Inst. 616. Elem. Bot. 489. Boerh. Ind. A. 2. 236. *Azedarach Avicennæ*, Park. Theat. 1442. *Azedarach arbor Fraxini folio, flore cæruleo*, Raii Hist. 2. 1546. *Azedaracheni arbor*, J. B. 1. 554. Chab. 44. *Arbor Fraxini folio, flore cæruleo*, C. B. Pin. 415. *Zizipha candida*, Ger. 1307. Emac. 1491. **THE BEAD-TREE.**

The Flowers of this Tree are said, by some, to be aperient and deobstruent; but others say they are poisonous.

AZEDEGRIN, the Lapis Hæmatites. *Rulandus.*

AZEFF, Scissile Alum. *Ibidem.*

AZEG, Vitriol. *Ibidem.*

AZEGI, the same as **ASAGI**.

AZEM, or **AZOM**. *Rulandus* explains this by *Butyrum coctum*.

AZEMASOR, Native Cinnabar. *Ibidem.*

AZENSALI, a sort of black Stone found amongst Gold. It signifies also a sort of Moss which grows on Rocks.

AZERNEC, the same as **ALFATIDA**, which see.

AZIMAR, Flos Æris, or Æs Ustum. See Æs.

AZIUS LAPIS. See **ASSIUS LAPIS**.

AZOB. *Rulandus* explains this by *Alumen Saccharinum*.

AZOCK, **AZOTH**. Barbarous Names given by *Paracelsus* to the *Mercurius Philosophorum*, that is, Quick-silver extracted from any metalline Body, which is the proper

A Z Y

corporeal Mercury. In another Sense, *Azoth*, in *Paracelsus*, signifies the universal Remedy prepared of Mercury, the Sun, and Moon, void of all specific Differences; and endued with a most intense Efficacy, and a most general kind of central Virtue, including all other Remedies in itself, in the same manner as the *Substantia Prima*, or first Substance, includes all the rest, excluding Accidents. This *Paracelsus* was reported to have carried about with him in the Pomel of his Sword. *Rulandus.*

AZOTH is also taken for the Liquor of sublimed Mercury, (or Quicksilver mixed with Vitriol and Salt, and so sublimed) which is also called *Aqua Permanens*, *Crystallus Philosophorum*, *Luna Physica*, or by whatever other mystical Name they please to give it. *Libavius.*

AZOTH is also the same as *Laton*, that is, Copper tinctur'd with a Gold Colour by its Mixture with Lapis Calaminaris, which is the same as Aurichalcum or Brass. *Johnson.*

AZRAGAR, Verdigrise. *Rulandus.*

AZUB, Alum. *Ibidem.*

AZUBO. *Rulandus* explains this by *Vas Chymicum*: But I do not know whether he means some particular Chymical Vessel, or a Chymical Vessel in general.

AZUR, Red Coral. *Rulandus.*

AZURIUM, the Name of a Chymical Preparation described by *Albertus Magnus*. It consists of two Parts of Mercury, one third of Sulphur, and one fourth of Sal Ammoniac; these are to be mixed together in a Mortar, and put into a Glafs Vessel, which is to be set over the Fire till a bluish Smoke arises; then it is to be taken from the Fire, the Glafs is to be broken, and the Contents are to be powdered, which is the *Azurium*.

AZYGES, ἀζυγες. A Name for the *Os Sphenoides*.

AZYGOS, ἀζυγος, from a Negative, and ζυγος, a Pair. A Vein situated within the Thorax on the Right Side, having no Fellow on the Left; whence it is denominated *Azygos*, or *Vena sine Pari*. See **VENÆ**.

AZYMAR, Native Cinnabar. Vermilion.

AZYMOS, ἀζυμος, from a Negative, and ζυμος, Ferment. It generally signifies unfermented Bread, such as *Sea Biscuit*, which, *Galen* very justly observes, is extremely unwholesome. Every one is sensible, that, by mixing Water with Flour, a viscid and tenacious Paste is form'd; and *Sea-biscuit*, when moisten'd in the Stomach, is very likely to form the same kind of viscid Substance, unless the digestive Powers are excessively strong. But Fermentation destroys this Viscidity, and renders farinaceous Vegetables more easily digestible; but at the same time inclines the Substances fermented to Acidity. For this Reason unfermented Bread can only be proper, when the Stomach abounds with Acidities.

This Account of unfermented Bread I thought the more necessary; because *Sea-biscuit*, a very unwholesome Food, has of late been much in Use; and I find is, by some, very erroneously esteem'd preferable to Bread which has been fermented with Leaven.

B.

B A C

B in the Chymical Alphabet, signifies Mercury, according to *Raymond Lully*.

BABUZICARIUS, βαβυζικαριος, from βαβυζω, to speak inarticulately. The Incubus, or Night-mare.

BACANON, βακανον. This Word is used by *Trallian*, and *Paulus Ægineta*; and signifies the Seeds of Cabbage. There is in *Myrepsus*, C. 150. an Antidote which takes its Name from *Bacanon*; and is said to be a good Hepatic Medicine.

BACAR. *Castellus*, from *Rulandus*, says, this is the same as *Pondus*, a Weight.

BACCA, that is, a Berry, is a round Fruit, for the most part soft, and covered with a thin Skin, containing Seeds in a pulpy Substance; but if it be harder, and cover'd with a thicker Skin, it is call'd *Pomum*, that is, an Apple.

BACCÆ are small roundish Fruits, that grow scattering upon Trees and Shrubs, and in that are distinguish'd from *Acini*, which are Berries hanging in Clusters.

Baccæ, in a more strict Sense, are used for a smaller thin-skinn'd Fruit, of a soft Pulp and Flesh, including moist Seeds in a thinner Membrane. Hence,

BACCIFEROUS, (*Baccifer*, Lat. of *Bacca*, a Berry, and *fero*, I bear) is an Epithet added to the Names of any Trees, Shrubs, or Plants, that bear Berries, as *Bryony*, Dwarf Honey-

B A C

suckle, Lily of the Valley, Asparagus, Butchers-broom, Nightshade, Solomon's-seal, and many others. *Miller's Dictionary.*

BACCÆ BERMUDENSES, *Pilula Saponariae Anglorum*.

This Fruit, when fresh, is of a black Colour, inclining to Red, and something transparent. As it grows old, it turns still blacker. It contains a yellowish Kernel; the Taste of which is disagreeable. This Kernel, steep'd in Water, raises a Froth like Soap; and this Infusion is used in *Ghloroses*, and in Obstructions of the Liver. *Geoffroy.*

They are the Fruit of the **ARBOR SAPONARIA**.

BACCHARIS, Offic. *Monspeliensium*, Ger. 647. Emac. 792. Raii Synop. 83. Parkinson, 114. Dill. Cat. 149. *Conyza major*, Schw. 55. *Conyza major vulgaris*, C. B. 265. Raii Hist. 1. 292. Tourn. Inst. 454. Boerh. Ind. A. 116. Buxb. 81. *Conyza major Matthioli*, *Baccharis quibusdam*, J. B. 2. 1051. *Conyza majoris genus*, *Baccharis quibusdam*, Chab. 327. *Eupatorium montanum Verbasci folio, vulgaris Baccharis dictum*, Hist. Oxon. 3. 99. **PLOWMAN'S SPIKENARD.**

Some call it *Baccar*.

Baccharis is a sweet-scented shrubby Plant, of which they use to make Garlands. The Leaves are rough, and of a Size between those of the Violet and Mullein. The Stalk is bent into

into Angles, and rises to the Height of a Cubit, is somewhat rough, and not without Suckers. The Flowers are of a purple Colour, inclining to White, and have a fragrant Smell; and the Roots are like those of black Hellebore, and smell like Cinnamon. It delights in a rough dry Soil.

The Root, boil'd in Water, is effectual in Convulsions, Ruptures, Falls, Difficulty of Breathing, old Coughs; and a Difficulty of Urine; it provokes the Menfes, and, given in Wine, is good against the Bites of venomous Creatures. One of the tender Roots, used as a Pessary, brings away the Birth; and the Decoction thereof is of Service, by way of Inseffion, for Women in Child-bed. It is a very proper Ingredient in a *Diapasm*, on account of its extraordinary Fragrancy. The Leaves, which have an Astringency, make a proper Cataplasim for Pains of the Head, an Inflammation of the Eyes, a beginning *Egileps*, an Inflammation of the Breasts after Delivery, and an *Erysipelas*: The very Smell of it provokes Sleep. *Dioscorides*, Lib. 3. Cap. 51.

From a branch'd woody Root, shooting forth many Fibres, this Plant sends out several round, softish, hairy Stalks, three or four Foot high; the lower Leaves grow on long Foot-stalks, being about three or four Inches long, and about half as broad, hairy, indented about the Edges, and blunt-pointed; the Leaves which grow on the Stalks are narrower. The Stalks are pretty much divided toward the Top, bearing a great Number of naked yellowish Flowers in scaly Calices, which pass away in Down; the Seed is long and slender; the Leaves and Flowers have a strong pleasant Smell. It grows in hilly chalky Places, and flowers in July.

Tho' this Plant is but rarely used, yet some account it a good Vulnerary, and useful in Bruises, Contusions, Ruptures, and inward Wounds, Pains in the Side, and Difficulty of Breathing. *Miller's Bot. Off.*

We learn from *Aristophanes*, *Pliny*, and *Athenæus*, that a precious Ointment, much esteem'd amongst the Antients, was call'd *βάρχαα*, probably from this Herb being a principal Ingredient in it. *Hesychius* says it was also call'd *Myrtle Ointment*, and *Lydian Ointment*; and *Galen* explains it a *Sort of Lydian Ointment*.

Hippocrates, in his Treatise *De Natura Muliebri*, describes a Case, which seems to be an Abscess in the Uterus, and is much like the Case related by *La Motte*, *Observation 429*, wherein, as related by *Hippocrates*, a Hardness is perceived in the *Ilia*, and a Pain in the Bottom of the Belly. When this happens, he advises the Patient to lie on the Side least affected, and to apply this Ointment (*βάρχαα*) to the same Side, or what he calls the *White Oil*. He also takes Notice of the same Ointment in other Places of his Treatises on the Disorders of Women.

BACCHICA. The same as *Hedera*, the Ivy. *Blancard*.

BACCHUS, Wine. It also signifies a sort of Fish, the same as *Mugil*, the Mullet. *Castellus*.

BACCINIA, the same as *VACCINIA*, which see. *Blanc*.

BACHARIS, the same as *Baccharis*.

BACILLUM, a small Stick, or any thing in the Shape of one. Thus a sort of Troche, made of pectoral Ingredients, round and long, that is, in the Form of a small Stick, are call'd *Bacilla*, or improperly *Bacilli*. Many Iron Instruments of the same Form, which are used in Chymistry, are also thus call'd.

The *Aves Cypria*, or perfum'd Candles, are from their Shape also call'd thus.

BACULUS. The same as *Bacillum*, and is more generally used to express the same thing.

BADISIS, *πάδιον*. The Action of Walking.

BADITIS. A Name for the Nymphæa, or *Clava Herculis*, in *Marcellus Empiricus*; who says the Root of this, bruised, and eaten with Vinegar, for ten Days, by a Boy, makes him an Eunuch, without Excision.

BADUKKA. The proper Name for the *Capparis arboreseens Indica*, *Flore tetrapetala*.

The Juice of the Leaves, mix'd with the Fat of wild Boars, makes a Liniment for the Gout. A Decoction of the Leaves and Flowers affords a Liqueur, which, drank, purges the Belly; and the Steam thereof, received into the Mouth, deterges Ulcers therein. The Fruit, taken in Milk, causes Impotence. *Raii Hist. Plant.*

BÆOS, *βαῖος*, in *Hippocrates*, signifies few. *Baidy* is an Epithet for a Malagma, in *Paulus Ægineta*, Lib. 7. C. 18.

BAGEDIA, a Pound of twelve Ounces. *Johnson*.

BAHEI COYOLLI. This, in the Opinion of *Ray*, is the same as the *Arica*, or *Fausel*.

BAHEL SCHULLI. An Indian Tree, call'd also *Genista spinosa Indica verticillata, flore purpureo-ceruleo*.

It is a thorny Shrub, that grows in watry Places; but there is another Species of it, which grows in sandy Ground, with Stalks and Leaves of a bright Green, and white Flowers, inclining somewhat to a Sky-blue.

The Decoction of the Root provokes Urine, and frees the Patient labouring under a Suppression of the same; whence it

cures the Dropsy, especially if it be boil'd with the Oil of the *Ficus infernalis*. The Leaves, boil'd, and pickled in Vinegar, have the same Effects. They make a Powder of the Leaves, which, drank with the Oil express'd from the Flowers of the *Ficus infernalis*, helps to discuss a Tumor in the Pudenda of the Male Sex. *Ray. Hist. Plant.*

BAIAC, *Cerufs. Rulandus*.

BALA, a Name for the *Musa*, or *Musa Arbor*. *Raii Hist.*

BALÆNA, *Offic. Recch. Hist. Mex. 568. Balæna vulgaris*, *Aldrov. de Pisc. 688. Jonf. de Pisc. 152. Charlt. Pisc. 46. Balæna vulgaris edentula, dorso non pinnato*, *Raii Synop. Pisc. 6. Balæna major, laminas in superiore maxilla habens; bipennis, fistula carens*, *Sib. Phal. 27. Balæna vulgo dicta sive Musculus*, *Rondel de Pisc. 1. 475. Balæna vulgo dicta sive Mystecetus Aristotelis, Musculus Plinii*, *Gefn. de Aquat. 114. Cetus*, *Schrod. THE WHALE*.

The Fat of a Whale is said, by *Schroder*, to be a good Topic for the Itch. The Oil is more used in Mechanics than Medicine. It is call'd *Train-oil*. *Pomet* gives the following Account of the Whale.

The Whale is the largest of all Fish, and is to be found in the Northern and North-west Seas. The Skeleton of one was shewn at *Paris* in 1658, whose Skull was between sixteen and seventeen Foot long, weighing four thousand six hundred Pounds; the Jaws ten Foot wide, and fourteen Foot long, weighing eleven hundred Pounds each; the Fins, which look like Hands, weighing each six hundred Pounds; the Joints of the Back, from the Head to the End of the Tail, forty-five Foot long; the first Joints weighing fifty Pounds, and the others less, according as they came nearer the End. I shall not trouble myself to give an Account of all that relates to that Animal, or the Manner of taking him, because several Authors have treated of it; but I shall only say, that there are two sorts of Whales; the one is call'd *Cachalot*, which differs from that which is call'd the *Whale*, in that the Mouth of the *Cachalot* is furnish'd with little flat Teeth, without a Beard or Whiskers; which is contrary to that which bears the Name of the *Whale*, which has nothing but Whiskers. 'Tis from the Fat or Lard of these Animals, that they draw *Whale-oil*, which is a very great Commodity, especially in Times of Peace, by reason of the great Use they have for it in *France*, as well for burning as several other Uses, wherein it is very necessary, particularly for refining Sulphur; and preparing some sorts of Skins for Leather. We have two sorts of *Whale-oil* come to *Paris*, the best of which is, that which we call *Huile de Grande Bale*, which is, by the *French*, made of the Fat immediately after it is taken from the *Whale*; whence the *French* Oils do not smell so ill as those made in *Holland*; because the *Dutch* do not make their Oils from the Fat so soon as it is drawn from the *Whale*, but bring it into *Holland* to be melted: Wherefore we ought to prefer the *French* Oils to those of *Holland*, which are easily known, because the *Dutch* are red and stinking, and yet are clear. The great Quantities we have of *Whale-oil* come from the Northern Sea, especially *Greenland*, from whence the *Hollanders* are supplied. *Pomet*.

The *Sperma Ceti* is, on all hands, agreed to be the Product of another sort of Whale, which is call'd

Cetus, *Offic. Cete admirabile aliud*, *Clus. Exot. 131. Balæna*, *Mer. Pin. 190. Balæna macrocephala, quæ binas tantum pinnas laterales habet*, *Sib. Phal. 12. Balæna major, inferiore tantum maxilla dentata, macrocephala bipennis*, *Raii Synop. Pisc. 15. Balæna*, *Ejusd. Ichth. Tab. A. f. 3. Cete*, *41. Cete*, *Jonf. Tab. 42. Trompa*, *Park. Theat. 1607. Sperma Ceti falso dicta*, *THE PARMASITTY WHALE. Dale*.

It has been long disputed what the *Sperma Ceti* is; but *Pomet's* Account of it is the most satisfactory I have met with, as to its Preparation, as he has seen it made, and done it himself.

The *Sperma Ceti* is the Brain of a sort of *Whale* call'd *Byaris*, and, by the People of *St. John de Luz*, *Cachalot*. This Animal is named; by some, the *Male Whale*, and, in *Latin*, *Orca*. It is about twenty-five Foot long, and twelve Foot high; each of the Teeth weighing one Pound, which are very useful for several sorts of Works. These Creatures are very common at *Cape Finistre*, on the Coast of *Galicia*, and in *Norway*. In the Year 1688, there was one taken by a *Spanish* Ship that carried it to *St. Sebastian's*, from the Head of which were taken twenty-four Barrels of Brain, and from the Body ninety-six Barrels of Fat. They ought then to be undeceived, who believe, that *Sperma Ceti* is any thing else but the Brain of the *Cachalot*; and I can affirm this with Certainty, not having only seen this prepar'd, but having prepar'd it myself.

This *Sperma Ceti* is usually prepar'd at *Bayonne*, and *St. John de Luz*; and this Work is so rare in *France*, that there are not above two Persons at the latter Place who know how to prepare it. Those who prepare, take the Brain as aforesaid; and melt it over a gentle Fire; then they cast it into Moulds, like those wherein they refine Sugar; and after it is cool'd, and drain'd from the Oil, they take and melt it again, and proceed after the

same manner, till such time as it be well purified, and very white; then with a Knife, made for the Purpose, they cut it into Scales or Flakes, just so as it appears when brought to us. As this Commodity is of some Consequence, by reason of its Price, I must observe, that we ought to chuse such as is in fine white Flakes or Scales, that are clear and transparent, of a fishy Smell; and take care, that it be not augmented with white Wax, as it happens but too often, which is easy to distinguish, as well from the Smell of the Wax, as because it is very thin, and of a more unpolish'd White; for we have no Commodity which is so sensible of the Air as this, which is the Reason why it ought to be carefully kept in Glasses, or in Barrels, close stopp'd from the Entrance of any Air, lest it turn yellow. *Pomet.*

Pomet may possibly be right, as to the Process generally used for making *Sperma Ceti*; but I have seen *Sperma Ceti* which has undergone no Treatment at all, except being put into Paper Bags, so that the Oil which adheres to it, may be absorb'd. The true *Sperma Ceti* is very white, and in very small Flakes, not much larger than the Crystals of Tartar: It dissolves by rubbing upon the Hand into a sort of Oil; and does not adhere to the Palate when chew'd, as the common Sort will; which makes me suspect, that it is mix'd with some other Substance, perhaps Wax, by those who make it for Sale: I can affirm with Certainty, that *Sperma Ceti* is neither the Oil, Brain, nor Sperm of the Whale, but a particular Substance found principally in the Head of the Fish; and flakes like boil'd Salmon, or Cod, when taken out. It is also found in other Parts of the Fish, but not in so large Quantities, or so good, as in the Head.

It is a noble Medicine in many Cases, tho' principally used in Bruises, inward Hurts, and after Delivery. It is an excellent Balsamic in many Distempers of the Breast; and gently deterges and heals. In Coughs, from sharp Rheums, Erosions, and Ulcerations, it is very safe, pleasant, and effectual; as also in Pleurifies, and inward Impostumations. Where the Mucus of the Bowels has been abraded by Acrimony and Cholera, as in Diarrhoeas, and Dysenteries, this is a very good Healer. In Ulcerations of the Kidneys, and bloody Urine, it is likewise a very suitable Medicine; and, by softening and relaxing the Fibres, it contributes frequently to the Expulsion of Gravel, by enlarging the Passages. It is most conveniently made up into the Forms of Electuaries and Boles, with proper Conserves, and Things of the like Kind: And in such Forms, if it be skilfully mix'd, it gives them an agreeable Smoothness, and is not discoverable by the Patient. It is also very properly dissolv'd in a Draught, by the Help of the Yolk of an Egg; or it is made into an Emulsion by the same Management. The usual Dose is about half a Dram.

It is emollient and healing, outwardly used; but its greatest Use that way is in the Small-pox, melted with Oil of Almonds: With this the Pustules are just kept moist, when they begin to harden; and it wonderfully prevents those Scars they are apt to leave, by softening, and healing them up smooth. Altho' this is but a modern Practice in this Distemper, yet *Schroder* takes Notice of its Use in his Time, in smoothing and filling up the Fissures, or Cavities, made by Blotches and Scabs.

It is sometimes used as a Cosmetic, both in Paints, and in Pastes, to wash the Hands with.

BALAM PULLI. A Name for the Tamarind-tree. *Raii Hist. Plant.*

BALANDA, and **VALANIDA**, are Names for the *Æsculus*, or Beech. *Blancard.*

BALANDINA, a fictitious Stone mention'd by *Raymond Lully*. As I do not understand the Original, it would be somewhat difficult to translate it. I shall therefore give it, as he has done, in *Latin*, in hopes, that those whom it may concern may understand it better than myself.

BALANDINA componitur ex argento vivo ferri. & est coloris rubei valde, & resplendet ratione sulphuris decocta & conversa in naturam aquæ aeræ ignitæ respiciens naturam argenti vivi; & quia sua natura est ex aere, ideo restringit sanguinem. Recipe ergo de aqua acerea ferri, & imple mollem ceream post virtutem restrictivam acceptam, & indura illam in aqua terrestri restrictiva ferri, & prosequere per informationes supradictas.

BALANI, or **GLANDES**. A sort of Shell-fish, so call'd from their Shape, which is like that of an Acorn: They are also call'd *Pollicipedes*. Of these there are many Sorts, which are found adhering to the Rocks on the Coasts of *Spain*, *Brittany*, and *Normandy*.

As a Food, they are esteem'd aperitive.

BALANOCASTANUM. The same as **BULBOCASTANUM**, which see.

BALANOS, βάλανος, properly signifies an Acorn; but *Hippocrates*, in his Treatise *De Affectionibus*, uses it to express an Oak. It is also made use of sometimes, as in *Theophrastus*, to signify any glandiferous Tree.

Hence, from the Similitude of Form, *Balanos* (βάλανος) is frequently used to express Suppositories and Pessaries.

Balanos also signifies the *Glans Penis*.

VOL. I.

BALANUS MYREPSICA.

Ben, Balanus myrepsica, Offic. *Balanus myrepsica*, Ind. Med. 17. *Balanus myrepsica*, *Glans unguentaria*, *Nux Ben*, Mont. Exot. 9. Commel. Plant. Zeyl. 62. *Moringon*, Hort. Mal. 6. 19. Tab. 9. *Coastis*, quam alii *Tlapalex-palli*, &c. vocant, Jonsl. Dendr. 291. Herm. 119. *Lignum nephriticum*, Rech. in not. ib. *Coastis*, alius *Tlapalex-palli*, Laet. Ind. Occid. 227. *Lignum nephriticum*, Park. Theat. 1664. Ind. Med. 68. Mont. Exot. 8. *Raii Hist.* 2. 1804. *Lignum nephriticum cœrulea & flavo tingens*, J. B. 1. 492. *Chab.* 37. *Lignum peregrinum aquam cœruleam reddens*, C. B. Pin. 416. The BEN-NUT, NEPHRITIC WOOD.

According to *Dale*, the *Lignum nephriticum* is the Wood, and the *Balanus myrepsica* the Fruit of this Tree. See NEPHRITICUM LIGNUM.

Dioscorides gives the following Account of the Virtues of the *Balanus Myrepsica*.

A Dram of the Powder, drank in Oxycras, consumes the Spleen. It is apply'd to the same Part by way of Cataplasm, being mixed with Meal of Darnel; and with Hydromel it makes a Cataplasm for the Gout. Boil'd in Vinegar, it deterges the Psoa and Lepra; with Nitre, it cleanses the Alphi, and black Ulcers; and in Urine, it clears the Face of Freckles, Spots, Sun-burns, and Pimples. Drank in Hydromel, it excites Vomiting; and loosens the Belly, but is very bad for the Stomach. The expressed Oil thereof, drank, works by Stool, but its Shell (σκαίδας αὐτῆς) is more astringent. The Dregs that remain after Contusion and Expression, enter the Composition of Smegmas adapted for the Detersion of Asperities and Itchings. *Dioscorides*, Lib. 4. Cap. 160.

The *Ben*, or *Balanus Myrepsica*, is a triangular Fruit of different Colours, of the Size of a Hazel-nut, being white or greyish, in which is found a white Almond, of a sweet Taste, disagreeable enough.

Chuse such Kernels as are white, fresh, and the heaviest you can get. They are of no other Use, that I know of, but to make Oil of, which has a great many good Qualities. The first is, that it has neither Taste nor Smell, and never grows rancid, which makes it of great Use to the Perfumers and others, for preserving the Scents of Flowers, as Jessamin, Oranges, Tuberose, and the like. With this Oil they make all their sweet Essences, adding to the Flowers afore-named, as they fancy, Ambergrise, Musk, Civet, Benjamin, Storax, or Balsam of Peru. They grow in *Spain*, *Arabia*, *Ethiopia*, and *India*, where they come to Perfection, which they scarcely ever do in Europe.

The whole Nut is of a purging Quality, and the dry Pressing, or Powder, after the Oil is taken out, of a cleansing and drying Nature; the Shells or Husks bind extremely; the Kernels bruised, and drank with a little Ale, purge the Body from gross and thin Phlegm; the Oil, which is drawn out of the Nut, does the same, provokes Vomiting, and cleanses the Stomach of much foul Matter gather'd therein; but the Nut itself, in its gross Body, does much more trouble the Stomach, unless it be roasted at the Fire: for then they lose much of their emetic Quality, and only purge downwards; and they are given in Clysters, with very good Effect, to cleanse the Bowels, and cure the Colic. The Kernels, taken in Posset-drink to a Dram, mollify the Hardness of the Liver and Spleen. The Oil, besides its excellent Use to the Perfumers, is employ'd by the Glovers and Skinners, to preserve their Leather from Spots or Stains, or from ever growing mouldy, as those perfumed with Oil of Almonds do. It more easily extracts, and longer retains, the Perfume of any thing infus'd in it, than any other Oil whatsoever. Being dropt into the Ears, it helps the Noise in them, and Deafness also. The Kernel, used with Vinegar and Nitre, is good against the Itch, Leprosy, running Sores, Scabs, Pimples, and other Defections of the Skin. Mix'd with Meal of Orobus, and apply'd Plaisterwise to the Side, it helps the Spleen, and eases the Gout, and Nerves which are pain'd with Cramps, Spasms, Colds, and Bruises. Mix'd with Honey, it dissolves Nodes, Tophes, Knots, and hard Tumors. *Pomet.*

The Oil of the *Balanus Myrepsica*, is sometimes called *Oleum Balaninum*.

This Fruit was termed *Glans Unguentaria*, because it yields an Oil by Expression, used by Perfumers in perfuming other Oils.

Oils, and never turns rancid. It is thought proper in the Itch, and some other cutaneous Diseases, as being a good Detergent; and is sometimes mixed with Bismuth and white Precipitate. Some say, that this Oil, mixed with a Hazel-nut, or Filbert, and taken in this manner, will purge upward and downward; and it is certain, that the Fruit itself, made into an Emulsion, is purgative. *Geoffrey*.

There is another Species of *Ben*, which is much larger than the preceding. It is call'd by *Monardus*, in his History of Drugs, *Ben magnum, seu Avellana purgatrix*, the great *Ben*, or purging *Filbert*. It grows in *America*, and is brought sometimes from *St. Domingo*, but is very scarce.

It purges upwards and downwards. The *Indians* use it for the Wind-colic. The Dose from half a Dram to a Dram. They weaken its Force by roasting it. *Lemery de Drogues*.

BALASIUS. A Gem of a purple or rosy Colour. It is a sort of Carbuncle. *Rulandus* relates some wonderful Effects of this precious Stone, which are not worth farther Notice, because utterly fabulous.

BALATRO, according to *Blancard*, is the same as **BAMBALIO**, which see.

BALAUSTIA, *Balaustines*. These are the Flowers of the *Balaustia*, *Offic. Ger. 1262. Emac. 1450. Balaustia Hispanica*, J. B. 1. 82. Chab. 3. *Balaustia flore pleno majore*, C. B. Pin. 438. *Balaustium*, Mont. Ind. 37. *Aldrov. Dendr. 579. Malus Punica sylvestris major, seu Balaustium majus*, Park. Theat. 1511. Raii Hist. 2. 1463. *Balaustium majus seu Malus Punica sylvestris major*, Park. Parad. 430. *Punica flore pleno majore*, Tourn. Inst. 636. Boerh. Ind. A. 2. 450. *Malus Punica pleniflora*, Jons. Dendr. 29. The **BALAU-STINE-TREE**.

The *Balaustine* is the Flower of the wild Pomgranate, of which there are several Kinds; for you meet with the white, the red, and the Rose-colour'd. It is like the *Cytinum* (Flower) of the Garden Pomgranate, and the Juice thereof is extracted in the same manner as *Hypocistis*.

It is of an astringent Quality, and effectual to the same Purposes as the *Hypocistis* and the *Cytinum*. *Dioscorides, Lib. 1. Cap. 154.*

There are two Sorts of *Balaustines* sold, the fine and the common: By the fine are meant the Husks, together with their Flowers; by the common, those which have nothing but the Husk. *Pomet.*

The *Balaustines*, as well as the *Cytines*, are of an earthy Nature, very astringent, inspissating, refrigerating, and drying; whence they are very often used for all Kinds of Fluxes, as the *Diarrhoea*, *Dysentery*, the *Uterine Flux*, and others; and for stopping of *Hæmorrhages* from Wounds. *Dale from Schroder.*

BALBIS, *βάλβις*, is explained by *Galen* in his *Exegesis*, an oblong Cavity; hence *βαλβιτῆδες*, in *Hippocrates*, in his *Treatise de Articulis*, is spoken of the Cavity at the Extremity of the *Humerus*, to which the *Ulna* is articulated.

BALBUTIES. A Defect in the Speech. Properly that Sort of Stammering, where a Person sometimes hesitates, and immediately after speaks precipitately.

BALISTÆ OS. The *ASTRAGALUS*, which see.

BALITISTERA. *Rulandus* explains this by *Terra Rubra*.

BALLERUS. A small River-fish taken Notice of by *Aldrovandus* and *Lemery*, which is used in Food, but has no Medicinal Virtues attributed to it.

BALLOTE.

Marrubium nigrum Ballote, *Offic. Marrubium nigrum, STINKING HOREHOUND*, *Ger. 566. Emac. 701. Raii Hist. 1. 571. Mer. Pin. 75. Marrubium nigrum, seu Ballote*, J. B. 3. 318. Chab. 436. *Marrubium nigrum fætidum Ballote dictum*, Park. Theat. 1230. *Marrubium nigrum fætidum, Ballote Dioscoridis*, C. B. Pin. 230. Hist. Oxon. 3. 377. *Marrubiastrum*, Rivin. Irr. Mon. *Ballote*, Tourn. Inst. 185. Elem. Bot. 153. Raii Synop. 3. 244. Boerh. Ind. A. 175. Rupp. Flor. Jen. 183. Dill. Cat. Giff. 135. Buxb. 35. *Ballote, Marrubium nigrum fætidum*, Merc. Bot. 1. 23. Phyt. Brit. 14. **BLACK HOREHOUND**.

Ballote, or black Horehound, shoots up from one Root in numerous, black, square, and somewhat hairy Stalks. The Leaves are like those of the common Horehound, but larger and rounder, black, and hairy, and set at Distances about the Stalk like those of the *Melissophyllum*, for which Reason some give it that Name. The Flowers are white, and grow about the Stalk in Whorles.

A Cataplasm of the Leaves, with Salt, is of Efficacy against the Bite of a Dog, and, dry'd over hot Cinders till they are wither'd, are good to repress a *Condyloma*; and used with Honey, deterge foul Ulcers. *Dioscorides, Lib. 3. Cap. 117.*

The black Horehound grows better, and more branched than the white, having square, hairy Stalks, and larger, darker Leaves, which more resemble those of dead Nettle, but are somewhat softer in handling, of a strong earthy Smell. The

Flowers grow among the Leaves, in two Clusters, on each Side of the Stalk, towards the Fore-part of it; each Cluster on a common Foot-stalk, and every Flower in a wide-mouth'd, five-corner'd, large Calyx, of a red Colour, being galeated and labiated, appearing but little above the Calyx, in the Bottom of which grow four small oblong Seeds. The Root is long, stringy, and spreading much. It grows by Path-ways, and in Hedges, and flowers in July.

The Leaves and Tops are used, tho' but seldom. Dr. *Powle* commends it as a singular Remedy against hysterical and hypochondriac Affections. *Miller's Bot. Off. p. 285.*

It contains a great deal of Oil half exalted, and essential and volatile Salt. *Lemery des Drogues.*

Its Leaves are bitter, stinking, and give no Tincture of Red to the blue Paper, which makes us conjecture, that the natural Salt of the Earth is involved in it by a great deal of fetid Oil. Mr. *Ray* recommends a strong Decoction of it in hysterical and hypochondriac Cases. Make a Tea of equal Parts of white Horehound, stinking Horehound, and Betony-leaves, and drink every Day three or four Cups of it, in order to prevent the Gout, or render its Attacks the less violent. *Martyn's Tournefort.*

BALNEABILIS. An Epithet for such Waters as are proper for Bathing.

BALNEA, Baths.

These have in all Ages been used with a View to Cleanliness and Decency. Hence, probably their Medicinal Virtues were first discover'd. And it is remarkable, that frequent Ab-lutions have been injoin'd as a Duty, by most Religions which have been established in the East. At this Day the Orientals reproach the *Europeans* with Beastliness, on account of their neglecting to bathe; and, it must be confessed, with too much Reason.

Medea is said to be the first who employ'd warm Baths with a View to Health, and this gave Rise to the Fable, that she boil'd People alive.

Pelias, an old King of *Theffaly*, having an Inclination to try what Effects this new Medicine would have upon him, dy'd under the Experiment, which might add Credit to the Fable.

Melampus bath'd the Daughters of *Prætus*, in order to cure them of Madnefs.

The *Lacedæmonians* immers'd their Children in Wine, as soon as ever they were born, tho' they were sensible, that it would make them die of *Epileptic Fits*, in case they were of a weak Constitution.

Those Robbers in foreign Parts, which are called *Bohemians*, a sort of *Banditti*, not unlike our *Gypsies*, wash their Children, as soon as born, in the next Fountain, to try their Strength.

Virgil says the same of the antient *Latins*.

Durum a stirpe genus, natos ad flumina primum, Deferimus, sævoque gelu duramus & undis.

Asclepiades recommended cold Baths. *Dion Cassius, Lib. 53.* informs us, that *Augustus* being extremely ill; and not able to take Medicines, having an Aversion to them, *Antonius Musa* advis'd him to use cold Bathing, and to drink cold Water. This cur'd the Emperor; and besides other great Rewards from *Augustus* and the Senate, *Musa* for this was allow'd to wear a Gold Ring, a Privilege none before, enjoy'd by nefs Men of the first Quality in *Rome*.

The same Privilege was also granted to all those of his Profession; and they were farther granted an Immunity from all Taxes for ever.

But afterwards *Musa* treating *Marcellus* in the same manner, it cost that young Prince his Life. And upon this Account *Musa* was censur'd, as if *Livia* had bribed him to advise cold Bathing to this Prince improperly.

Those who consider what good Effects cold Baths may have upon People in Years, or such whose Fibres are relaxed; and, on the contrary, of what ill Consequence they may be, in young People, whose Fibres are in full Elasticity, will easily account for the different Effects of the cold Bath upon *Augustus* and his Nephew.

Suetonius in Augusto, Cap. 59. and 81. tells us, that the Senate decreed *Antonius Musa* a Statue of Brass, and set it next to that of *Æsculapius*.

He says also, that *Augustus*, at his Return from his Expedition to *Biscay*, having a Disorder in the Liver, consequent to a long Fluxion; *Antonius Musa* propos'd a hazardous Remedy, and quite contrary to those that had been try'd, which was to change his warm Fomentations for cold ones.

Pliny says, that before the Time of *Musa*, none but warm Baths were made use of; and that *Antonius Musa* brought cold ones into Credit.

Horace informs us, that he was forbid going to *Baie*, by *Antonius Musa*, and order'd to wash in cold Water, tho' in the

the Middle of Winter; and that the People of *Baia* complain'd of the Sick, who left them, and expos'd their Heads and Stomachs to the cold Fountains at *Clusium* and *Gabii*.

Antonius Musa had a Brother, whose Name was *Euphorbus*, who was Physician to the second *Juba*, according to *Pliny*, and shared with the former the Credit of the Invention of cold Baths. *Pliny*, however, is mistaken when he tel's us, that *Antonius Musa* and *Euphorbus* were the Inventors of cold Baths, because they were recommended by *Asclepiades*, who liv'd before them.

Pliny, *Lib. 29. Cap. 1.* gives an Account of a Physician of *Marsillus*, whose Name was *Charmis*. He came to fix at *Rome*, in the Reign of *Nero*, and made a great Fortune. He recommended much cold Baths in the Middle of Winter.

Plutarch in his *Symposiacks*, *Lib. 8. Quæst. 9.* gives us a very disadvantageous Idea of the *Roman* warm Baths. He says, that nothing contributes so much to change the Body, and produce new Diseases, as the Variety of Baths that were in his Time made use of; by which the Body is first soften'd like Iron by Heat, and then again harden'd by dipping into cold Water, like Steel. Any one, says he, who had liv'd a few Years before us, if he was to look into our Baths, would say,

Ἐντα ῥῶς ἐν Ἀχέρεια Περσέλειδαν τε βίον.

He adds, that their Ancestors used mild Baths, inasmuch that *Alexander* the Great, when he had a Fever, slept in one; and the Women amongst the *Galatæ* eat with their Children whilst they bath'd: But that in his Days, the Air that they respir'd in Breathing, was a Mixture of Moisture and Fire; which suffer'd not one Particle of the Body to be at Rest, but mov'd all out of their proper Situations, till they extinguish'd themselves, as it were flaming from the Bath.

Baths are properly enough distinguished into *hot* and *cold*; and both these differ extremely, according to the different Degrees of Heat and Coldness, and according to the various Contents of the Waters made use of.

Baths again are universal, that is, such as the whole Body is immers'd in; or particular, that is, such as are apply'd to some Parts, as *Semicupia*, *Pediluvia*, and some Sorts of Fomentations.

It is well known in natural Philosophy, that Heat relaxes; and that Cold, on the contrary, contracts and braces the Bodies it is apply'd to. This must necessarily render warm Baths very different from those which are cold in their Effects.

We find a great deal in *Hippocrates*, with respect to the Use of Baths, both warm and cold; and both as Preservatives against, and Remedies for Distempers. But in his Treatise on *Regimen in acute Diseases*, he informs us, that *Conveniences for Bathing were to be met with in very few Houses*. Whence *Galen* infers, that Bathing was not so universal in the Time of *Hippocrates*, as afterwards.

The Uses of Bathing in particular Distempers, according to *Hippocrates*, are specify'd under their respective Articles; meantime, his general Rules are, that the Patient who uses this Remedy should remain without moving from his Place, that he should not speak, but allow those who either bathe him, or pour Water on his Head, or rub him, to perform their several Offices: That Sponges should be used in rubbing him, and not the Instrument called *Strigil*: That the Patient should with great Precaution guard against Cold: That the Bath should not be used immediately after eating or drinking; and that both these were also to be abstained from immediately after coming out of the Bath: That it ought to be considered, whether the Patient used the Bath when in Health; and if he did, whether he reaped Advantage, or sustained any Injury by it: And, lastly, that the Bath should not be used by People who are either too soluble, or too costive, in their Bellies, nor by Persons who have not made a previous Discharge of their Excrements, nor by those who are too weak, who have an Inclination to vomit, a Nausea, or a Bleeding at the Nose.

According to *Hippocrates*, the Use of the Bath is to refresh and moisten, to remove Weariness, to soften the Skin and Joints, to provoke Urine, to dispel Heaviness of the Head, and to render the Nostrils and other open Ducts of the Body moist. He allows two Baths a Day for such Patients as have been accustomed to bathing during their Health.

Celsus gives the following Directions with respect to Bathing.

Bathing is useful on two Accounts; for sometimes, after the Fever is gone, it makes way for Health, by enabling the Patient to use a more plentiful Diet, and richer Wines; sometimes it takes off the Fever itself. It is commonly advis'd, when the outer Skin wants to be relaxed, the corrupt Humours to be attracted from the inward Parts, and the Habit of the Body to be changed.

The Antients were pretty cautious in the Use of Bathing, *Asclepiades* more free; nor indeed is it a thing to be dreaded, provided it be seasonable, otherwise it is pernicious. If a Person get rid of a Fever, so as to be free for a whole Day, he may on the next, after the usual Time of the Fit, safely venture to bathe. But if the Fever be periodical, so as to return the third or fourth Day, whenever it fails to make its usual Visit, Bathing may be safely used. While a Fever continues, if it be but gentle, and the Patient labour under an inveterate Disorder of the Spleen, the Bath is a wholesome Medicine, with this Caution, however, that there be no Hardness or Swelling about the Præcordia, no Roughness of the Tongue, no Pain in the Head, or middle Parts of the Body, and that the Fever does riot at the same time increase.

In periodical Fevers there are two Seasons for Bathing; one before the Shivering, the other after the Fever is gone; but for those who have been long molested with slow Intermittents, the proper Time is, when the Access is entirely over, or, if that does not happen, at least when it is mitigated, and the Body in as good a State as can be expected in that kind of Illness.

A weak Person, who is to go into the Bath, must be careful, that he takes no Cold before his Entrance. When he is there, let him stop a while, and examine whether he perceives any Stricture about his Temples, and whether any Sweat arises. If the former happens, and the other does not follow, Bathing that Day will be of no Service; but the Patient is to be gently anointed all over, and so carry'd back, and Cold is by all means to be avoided, and Abstinence is to be used. If there be no Alteration at the Temples, but a Sweat breaks out, first in those Parts, and afterwards in other Places, the Mouth is to be fomented with hot Water, and he is then to sit in the *Solium*. There he is also to mind whether his outer Skin shivers at the first Contact of the hot Water, which, though it can scarce happen where all things previous are right, is a certain Sign that Bathing will prove of no Effect.

A Person may know whether Uction ought to be perform'd before or after he goes into the hot Water, by considering his State of Health. But generally (except in particular Instances) after raising a Sweat, the Body is first to be gently and thoroughly anointed, and afterwards to be put into the hot Water. And here Regard also is to be had to the Strength; for the Patient must not be suffered to fall into a fainting Fit through Excess of Heat; but the same is to be seasonably moderated, and the Body to be carefully covered with Cloaths, for its Defence against cold Blasts; and there also the Patient is to sweat before he takes any thing. *Celsus*, *Lib. 2. Cap. 17.*

The preceding Directions relate only to warm Baths.

Hoffman has collected several Particulars relative to the Uses of Bathing, which are of too much Importance to be omitted.

The salutary Effects produced by the external Application of Water are no less conspicuous, than the Advantages arising from its internal Use. As a Proof of this, we need only direct our Views to Baths, the principal Basis and most material Ingredient of which is simple Water; a Fluid, which, when pure, light, and without any adventitious Mixture, is possessed of highly medicinal and salutary Qualities. In all Ages, the more sagacious and skilful Physicians seem to have been sensible of this. Accordingly *Hippocrates*, *Galen*, *Cælius Aurelianus*, *Arætaus*, *Celsus*, and *Trallian*, inform us, that in their respective Times Baths of sweet and pure Water were much used in the most violent internal Distempers, especially in the most formidable Disorders of the Head, such as racking Pains and Madness, whether accompany'd with Melancholy and Dejectedness, or with Rage and Fury. The Antients used these Baths with uncommon Success. And *Alexander Trallianus* [*Lib. 1.*] affirms, "That a Bath of pure and sweet Water is of all other things the best calculated for the Relief of the Melancholy; but 'tis necessary they should remain in it for a considerable time, even in the Summer."

Arætaus approves of this Practice, and orders melancholy Patients to go often into Waters that are naturally hot, and remain in them for a considerable time, subjoining this as a Reason, that in those labouring under Melancholy the Muscles are dry and tense; and that a more proper Step cannot be taken to remove their Disorder, than to render them lax and soft by Bathing.

Cælius Aurelianus also warmly recommends the Use of natural Waters in maniacal Cases.

And *Prosper Alpinus* [*de Medicina Ægyptiorum*] informs us, that many melancholy Patients were perfectly cured by the Use of moderately warm Baths.

In case of violent Pains arising from a Stone in the Kidneys, *Alexander Trallianus* and *Arætaus* highly recommend sitting up to the Navel in warm Baths.

I myself also, from repeated Experience, can affirm, that in violent Disorders of the Head, such as Madness, Melancholy, preternatural Stupidity and Torpor of Mind, disturbed Sleep, attended with frightful Dreams, Hemisrania, Vertigos, Dimness of Sight, violent Tooth-achs, racking Pains of the nervous Parts,

Parts, Cardialgias, Iliac Passions, Colics, and Pains arising from the Stone in the Kidneys, Baths of the *Toplitz Waters*, as also sitting in pure Water moderately warm, have afforded instantaneous Relief, even during the Paroxysm itself, and under the immediate Attack of the Symptoms; for so surprising is the Efficacy of Baths in alleviating Pain, and relaxing spasmodic Strictures, that so long as the Patients remain in them, their Complaints cease, and their racking Spasms are not felt; but make a fresh Attack when they quit them. The Antients also, according to *Celsus*, and the *Egyptians*, according to *Alpinus*, used Baths no less frequently and successfully in all Fevers, except pestilential, whether of the continued or intermitting Kind, though they did not approve of them in the first Stages, and greatest Vigour, but only in the Declension of the Disease. And I myself have more than once successfully ordered emollient and nervous Baths to be used by old People labouring under Quartan Fevers, on their Days of Respite.

But Baths of pure and sweet Water not only soften and relax the Fibres when rigid, tense, and constricted with Spasms, and derive the Blood and Humours from the Head, and superior Parts, to others that are less noble and delicate, but also wonderfully assist the Circulation of the Blood and Juices, and promote cutaneous Secretion; for by their Humidity they relax the Fibres and Pores of the Skin; and by their Warmth they expand the Blood, and augment the Dilatation, and consequently the Contraction of the Heart and Arteries. Hence the Pulse is rendered fuller and quicker, and the Circulation of the Juices accelerated, by which means the Blood becoming more thin and fluid, is quickly conveyed to the most remote Tubes of the Body, and to all the Parts of its Surface; and the Elimination of the most subtle and noxious Sordes is promoted; which End will be still more effectually answered, if the Patient betake himself to Bed immediately after the Use of the Bath; because the Matter to be eliminated by the Pores of the Skin is restrained and pent up by the Gravitation and Pressure of the circumambient Water, so long as the Patient remains in the Bath. But when this Gravitation and Pressure are removed, that is, when the Patient comes out of the Bath, has his Body dry'd, and goes to Bed, so great a Quantity of Serum is discharged from the opened and expanded Tubuli, that the whole Surface of the Body is sometimes covered with a plentiful, but kindly Sweat.

Besides, Baths and *Semicupiums* (Half-baths) have a peculiar Efficacy in augmenting the Virtues, and assisting the Operations, of the more generous Medicines, as they are call'd, in the Cure of the most terrible Disorders; for 'tis sufficiently known, that the drinking acidulated or other wholesome Waters for the Cure of stubborn and chronic Disorders is attended with much happier Consequences, when Baths are used in Conjunction with them, than when they are drank without such Assistance. Thus the Efficacy of the *Caroline Waters*, and those of *Egra*, especially in curing spasmodic and hypochondriac Disorders, and Persons whose nervous Systems are weakened and impaired, appears more conspicuous and surprising, if after drinking them the Patients go into the warm Baths of *Toplitz*, and use them in a due manner, and for a proper time; for these Waters are very light, subtle, and pure, as appears both from statical Experiments, and from Evaporation, by which scarcely any thing of a solid Nature is left; so that by reason of their Subtlety and Purity, they wonderfully penetrate into the smallest Interstices of the solid Parts and Fibres, which are tense and contracted; and by their relaxing and emollient Nature, reduce them to their natural State.

Baths are of singular Efficacy in the Cure of a virulent *Lues Venerea*, attended with its most formidable Symptoms, provided the Patients go almost daily into them, and from thence to Bed with a View to Sweat; but the Body must first be prepared by Venesection, Laxatives, and such Medicines as sweeten the Blood, and proper Preparations of Mercury duly exhibited, whether with a View to promote Sweat, or excite a Flux of the Saliva. Decoctions also of the Roots and Woods recommended for purifying the Blood in cutaneous Disorders, Pains, Exulcerations, and such Distempers as draw their Origin from an excessive Acrimony of the Juices, produce much more speedy and happy Effects, if Baths are used along with them. And indeed 'tis scarce credible what a large Quantity of thick Fat, and fetid Sordes, is extracted from the most minute Tubuli of the Skin by Baths, and left swimming in the Water. If we have a Mind to prescribe the stronger Purgatives, or Substances of an acrid Nature, for exciting a Discharge of the Urine, these things are more safely exhibited after a previous Use of Baths. Though 'tis plain, that the Antients performed very wonderful Cures in obstinate Disorders, by means of white Hellebore; yet we find they never used that Remedy, 'till after the Patient had used the Bath; for by this means the Juices are not only rendered more fluid and moveable, and the excretory Ducts opened, that the peccant Matter may be eliminated with the greater Ease, but the Fibres also of the solid Parts are relaxed, and by that means the violent Spasms, the Strictures, and all

the other bad Effects produced by such a drastic and herculean Medicine are prevented. The Bath is also used in taking Vomits, which, according to *Alpinus*, [*de Medicin. Meth.*] the *Egyptians* used every Month as a Preservative, but not except in a Bath.

When Diseases arising from Affections of the Uterus, and from a Relaxation or Stricture of its Vessels, are to be cured, such as the Fluor Albus, when Abortion is to be prevented; when fleshy Concretions, resembling a Polypus, or Moles, the frequent Causes of Abortions, are to be expell'd; or when the Menstrues, flowing irregularly, are to be reduced to their natural and stated Periods, I always prescribe, and that with the desired Success, the frequent Use of Baths, in Conjunction with proper internal uterine Medicines, Emmenagogues, Balsamics, and Purgatives. Preparations of Steel, especially in a liquid Form, as also Infusions of the Peruvian Bark, or Decoctions of it in Wine, by their mild and balsamic Astringency, produce very remarkable and happy Effects by corroborating and strengthening the Tone of the Parts in Cachexies, in inveterate intermitting Fevers, and in that Species of the hypochondriac Affection, which draws its Origin from a Weakness of the peristaltic Motion of the Intestines. But still these Medicines will operate with more Safety and Success, if during the Time they are used the Body is duly exercised, or frequently softened and relaxed by Bathing. The Facts I now mention are sufficiently confirmed by long Experience.

But for Baths of this Kind we are not to use Spring-waters, nor such as are hard, heavy, or impregnated with a calcarious Earth; but must make Choice of those that are light and subtle, of which Kind is Rain-water and River-water, especially immediately after a Fall of Rain. Those Waters are also to be esteem'd most proper for Bathing; which, in Washing, soonest take Stains out of Linen Cloths; which, in the Preparation of Victuals, easily and thoroughly soften Roots and Pot-herbs; which, upon Evaporation, leave little or no Matter behind; and which, when pour'd hot upon Tea, or any other Substance of a like Nature, quickly enter their Pores, and extract their Virtues. But if such cannot be had, those we can come at must be corrected, and render'd soft by Art; which is most conveniently and effectually done by adding to them some Lixivium, or Venice Soap, or by pouring into them a sufficient Quantity of Milk, or by mixing with them a Decoction of wheaten Bran, of the Flowers or Leaves of Chamomile, or of the Flowers and Roots of white Lilies. The Antients, as appears from *Caelius Aurelianus*, added Oils, and used Baths thus prepared, for alleviating Pains, and curing those Suppressions of Urine which proceed from spasmodic Strictures of the Sphincter Muscles placed at the Orifice of the Bladder. And emollient Baths made up in this manner are of singular Service for facilitating Delivery, especially in Women with their first Child, or such as are a little advanced in Years, or of a dry Constitution, if used in the last Months of Gestation. In the *Tabes Dorsalis* of Children, as also in the Rickets, these Baths are likewise of unspeakable Service; for they open the obstructed and constricted Ducts, and, by rendering the nutritious Juices more fluid, occasion by that means a freer and more equable Distribution of them to the several Parts of the Body.

Quite different are the Effects of those natural Baths, which, by reason of the chalybeate Principle they contain, are so far from softening and relaxing, that they rather brace up and harden the Pores of the Body. Chalybeate Waters, of this Kind, are now discover'd in a great many Parts of Germany; but those of the greatest Note are, the Waters of *Freyenwald*, in the Marquisate of *Brandenburg*; those of *Bebrun* in *Turingen*; those of *Radeberg*; those of *Lauchstade* in *Meissne*, discover'd by myself; and those of *Eppag* and *Weissenburg* in *Franconia*. Tho' all these Fountains yield a light and subtle Water, yet by reason of that most fine and sulphureous Crocus of Mars, which they deposit after standing some time, and by which they tinge, with a yellow Colour, Linen or Eggs thrown into the Bath, are of a somewhat astringent Taste; and may by a skilful Physician be prescrib'd internally with Success, in those Cases where chalybeate Preparations are proper. But their external Use in Bathing is much more highly extoll'd, as being of singular Service to those who have phlegmatic Constitutions, a spongy State of the Fibres, and small full Vessels. They are also of Service in Cases where, by reason of a too slow Circulation of the Blood, the Juices are inspissated, become foul, and contract a scorbutic Impurity, whence arise Langours, rheumatic Pains, Gouts, oedematous Tumors, Contractions, and also in Weaknesses, and Refrigerations of the Joints; in all which Cases these corroborating Baths are highly serviceable, by means of their subtle sulphureous and chalybeate Principle, by which they impart Strength and Elasticity to the languid Parts, and brace up the relax'd and weaken'd Fibres.

And tho' such is the Nature and Genius of these astringent chalybeate Baths, that they ought only to be used when tepid and moderately warm, since, when too hot, they prove very hurtful to the Body, throw the Blood into preternatural Com-

motions, excite Head-achs, and induce Languors of the Parts; yet when the Patient, immediately after a tepid Bath of this Kind, in which the superior Part of the Water is rather cold than hot, is laid in Bed, he becomes warm, his Pulse beats strong, and often a plentiful Sweat is discharged from all the Parts of his Body, by which his Strength is considerably increased, and the external Parts are corroborated.

There are also artificial Baths of a more gently corroborating Nature, which are made of cephalic and nervous Powders, boil'd in light and pure Water, and are of very singular Efficacy. For preparing Baths of this Kind we principally make use of Bay-leaves, the Herb Baum, Southernwood, Marjoram, Origanum, wild Thyme, Thyme, Rosemary, Hyssop, Clary, dry'd Mint, Catmint, Pennyroyal, Feverfew, and Flowers of common Chamomile and Rosemary; all which put into a Bag, with the Addition of some Handfuls of common Salt and Potash, are to be gently boil'd in the Water. Washing the Body with medicated Waters of this Kind, in a Bathing-tub, produces very happy and salutary Effects in Paralytic Disorders, Imbecillity, and Weakness of the Joints; and proves very serviceable to weak, cachectic, and cold Constitutions; and to old Men, who, by the Violence of Distempers, have their Strength impair'd, their Nerves weaken'd, and the Tone of the Ligaments of their Joints in some measure destroy'd. They are no less remarkably beneficial in all Disorders of the Uterus, occasion'd by Abortion, difficult Births, or even Labours of any Kind: As also in Cases where the Compages of the Uterus is drench'd with two luxuriant Humidity; or where a white viscid Humour, discharged from the Pudenda, occasions Sterility. They also wonderfully promote the obstructed Menfes; and the Hæmorrhoids in Men, when stopp'd.

There are also Baths of another Kind, call'd Vapour-Baths, or *Lætic* Baths. In these the Vapours, whether hot and dry, such as these exhaling from kindled Spirits of Wine; or hot and moist, such as these arising from Herbs boil'd in Wine or Water, have immediate Access, either to the whole Body; or only to some particular Parts of it. These warm Exhalations are of singular Efficacy in promoting Sweat, opening the subcutaneous Ducts, softening the harden'd Parts, relaxing such as are tense and rigid, and dissolving viscid and tenacious Humours; and that the Horns and hardest Bones of Animals may be soften'd, and render'd pliable, by means of the warm Steams of Water alone, is a Fact known even to Cooks and Druggists. For this Reason, Vapour-Baths are of singular Service in cold Distempers, Anasarca, cedematous Tumors, Cases where the Limbs are become paralytic, the Lues Venerea, and Swellings of the Testicles: They are likewise very beneficial in repressing a Prolapsus either of the Uterus or Anus, and may be prepar'd of different Materials, according to the Nature and Genius of the Distemper they are intended to relieve. In that terrible Species of Tenesmus, which generally accompanies a Dysentery, the Steams of Milk, in which Elder-flowers have been boil'd, afford instantaneous Relief. Vapour-Baths of this Kind are also useful in provoking the Hæmorrhoidal Discharge, and even necessary, in this Case, before the Application of Leeches; and, because they are excellently calculated for clearing the Mouths of the Uterine Veins, when block'd up with a preternatural Mucus, they are used with Success in Cases where the Menfes are either entirely obstructed, or discharged in too small a Quantity.

But as the most valuable and powerful Remedies produce the most dismal and fatal Effects, when used unskilfully, and without Circumspection; so the rash and unwary Use of Baths is more injurious than advantageous to the Patient. For this very Reason *Galen* lays down three Rules to be observed, with regard to Bathing: First, That those who are subject to Shivering, should by no means use Baths. Secondly, That those who have any of their Viscera weak, or unsound, should also avoid it. And thirdly, That such as have their *Primæ Viæ* clogg'd and encumber'd with Humours, should carefully avoid it. But the following Rules, with regard to the Use of the Bath, are better and more explicit: In case, then, of a *Plethora*, it is to be removed, and the Belly is to be render'd lax, before the warm Bath be used; lest, by the Heat, Congestions of the Blood and Humours should be produced in the Head and Breast, and those Parts sustain an irreparable Injury upon that Account.

In the next Place, we are to be very careful, lest, by the too great Heat of the Bath, our Bodies be so overheated, and as it were boil'd, as to discharge the Sweat too profusely, and in too large a Quantity; for this unwary Practice generally brings on Faintings, a Head-ach, Weariness of the whole Body, Torpor of Mind, Dryness of the Mouth, and Thirst, which if any one attempts to remove by Draughts of any cold Liquor, he may very readily draw upon himself a Disorder of a still more terrible Nature.

The most proper Time for using the hot Bath is the Morning, after the Body is refresh'd with Sleep, the Concoctions finish'd, and the Stomach empty; especially if proper Purgatives have been previously used. It is also expedient, not to plunge the Body all at once into the Bath, but to immerse it gradually,

by first introducing the Legs, then the Thighs, then the Abdomen, as far as the *Scrobiculum Cordis*, augmenting at the same time, by little and little, the Heat of the Water. Nor are we to remain too long in hot Baths, especially of the chalybeate Kind, lest by that means our Strength should be impair'd. After using the Bath, the Patient is to be laid in Bed, with a View to sweat; which Design may also be assisted by proper Broths, Decoctions, or Infusions. But in natural warm Baths, such as those of *Wolkenstein* and *Wisenbad* in *Meissne*; the Patient must often remain for some Hours, especially when the Disease is of a violent and obstinate Nature, arising from spasmodic Constrictions of the nervous Parts, when the Mind suffers by means of Hypochondriacal or Hysterical Disorders; or when the Parts are constricted, in consequence of an excessive Rigidity of the Ligaments and Nerves.

Those who have tender Heads, who are afflicted with Catarrhs and Coryzas, who are subject to Asthmias and Faintings, or who languish under slow Hectic Disorders, ought to abstain from all Baths; much more from Vapour-Baths, especially when consisting of kindled Spirits of Wine; for these throw the Blood into strong Commotions, and prove very hurtful to those of plethoric and cacochymic Habits; and, as Experience teaches us, by being imprudently used, bring on Disorders of the Head, Drowiness, Apoplexies, Epilepsies, Dimness of Sight, and Gutta Serenas. In like manner Baths are prejudicial to People after a sharp Fit of Anger; and I myself remember some Cases of this Nature, where the Use of Baths has brought on Hectic Fevers, incurable Pains of the Parts, and even Palsies. And as the Colic often arises from the Blood stagnating within the Coats of the Intestines, whilst it is endeavouring to find a Passage thro' the Veins of the Anus, and as a Plethora often attends the racking Pains excited by the Stone, we are therefore, in these Cases, to beware of prescribing such warm Baths as these, which are not to be used till the Plethora; or too great Fulness of the Vessels, is removed. *Hoffman*.

Warm Bathing is a very powerful Remedy in that terrible Disease the *Hydrophobia*, arising from the Bite of a mad Dog, and creating at once an insatiable Thirst, and an unaccountable Dread of Water. The only known Remedy, in this Case, is *Bathing*, which was used by the Antients with this very Intention. Thus *Celsus* informs us; "That with some, immediately after receiving the Bite, it was customary to plunge the Patient into a Bath, and sweat him as long as his Strength would permit; taking care at the same time to open the Wound, that the Poison might be the more freely discharg'd from it. Then they bathe the Part affected with a large Quantity of pure and unmix'd Wine, which is esteem'd an Antidote against all Poisons whatsoever."

A Physician of *Duderstad*, some time ago, inform'd me, that a mad Wolf, sallying out of the Woods, bit several Persons, who died of the Bites they received: But at last, by the Advice and Persuasion of a common Countryman; some others, who had been bit, were prevail'd on to use a moderately warm Bath; after taking a Dose of *Venice Treacle*, and the Fungus of the Dog-rose, by the daily Repetition of which they were freed from Danger; for, in this Case, *warm Bathing* becomes serviceable, by drawing the subtle Poison to the Surface of the Body, and procuring it a free and uninterrupted Exit, when 'tis brought thither. On this Occasion a very considerable Difficulty may be started, which is, that with the same Intention the Antients used *cold Baths*, which, by bracing up the Pores, seem not only to prevent the Elimination of the Poison, but to repel it to the internal Parts. As for my own Share, I am of Opinion, that the *cold Bath* is not, in this Case, to be absolutely condemn'd; tho', at the same time, I look upon it as precarious, and not to be depended upon: However, if the Use of the cold Bath is succeeded by an intense Heat of the internal Parts, accompany'd with a quick Pulse, and profuse Sweats, which is often the Case, a considerable Benefit must be produced by it: But if, instead of these Consequences, the Nerves should be diffident, and render'd rigid by the Cold, 'tis attended with imminent Danger. *Hoffman*.

There is a very singular Case related in *Misc. Nat. Cur. Dec. 2. Ann. 6. Obs. 239*.

A Woman frequently afflicted with an insupportable Pain of her Loins, having in vain used a great Variety of Remedies for its Removal, at last found, that nothing was so effectual for procuring Ease as the *warm Bath*; which having used for some time, she began gradually to recover; and every time she came out of the Bath, a thick unctuous Substance was found swimming in the Water, and might have been separated from it by means of a Spoon.

There is also another very remarkable Case to be found in the above-quoted Work:

A certain Man, terribly afflicted with Hypochondriac Disorders, having for some time used a Sweet-water Bath, the Water at last began to assume a strong and fetid Smell; and a thick blackish Matter was observed to swim in it. In short, the putrid Matter floating in the Bath, and the nauseous Smell, and acrid Quality of the Water, increasing gradually to such a Degree,

as to vellicate the Hands of the *Waiter*, there was a Necessity for a daily Supply of fresh Herbs, till the Patient was thoroughly recover'd. By the same means the learned *Volckhamer* cured a Widow Woman, whose Body every Day deposited in the Water more than three Handfuls of a like fetid Substance. *Hoffman*.

Tho' in hot Countries the frequent Use of Baths is exceedingly proper, yet they ought to be less frequently, and more sparingly, used in Climates where the Air is cold and moist. *Hoffman*.

Mr. *Lemery*, finding one of his Patients to have all the Symptoms of the Small-pox, and perceiving at the same time, that they made no Eruption, put him into a Bath of warm Water, which made them come out in great Abundance. His Intention was to remove the Dryness and Hardness of the Skin: There is something very remarkable in this uncommon and bold Piece of Practice. *Hist. A. 1711*.

Mr. *Homburg* advances what, to some, may appear a Paradox, That the Rheumatism may be cured by a Bath of cold Water, more effectually than by the warm Bath, or by Sweating: In order to prove his Assertion, he reasons in the following manner.

The Rheumatism is produced by an *acid Serum*, become so subtle as to make its Way thro' the Coats of the Veins, from which conveying itself into the Muscles, it stimulates their Fibres, and incommodes their Action.

In Consequence of the great Subtlety of this Serum, it diffuses itself very far, and cannot be again absorb'd by the Veins from which it was discharged.

The Disorder it occasions may be carried off either by procuring its total Discharge from the Body, or by forcing its Return into the Vessels from which it originally came.

A sufficient Heat will carry it quite out of the Body by Transpiration. A sufficient Degree of Cold will, on the other hand, condense it, and dispose it for entering again into the Veins. It is in this Case, perhaps, sufficient, that the Cold prevent a fresh Discharge of Serum, since the former will necessarily be attenuated and dissipated; whereas Heat, tho' it carry off the peccant Matter, yet disposes the Veins to a fresh Discharge of the offending Serum. *Hist. A. 1710*.

Sir *John Floyer* recommends cold Baths in the following Distempers:

Abortion,
Agues,
Apoplexy,
Appetite lost,
Asthma,
Barrenness,
Biting of mad Dogs,
Bleeding at Nose, or,
Bruises,
Cancers,
Catarrhs,
Corns,
Consumptions in the Beginning,
Convulsions,
Costiveness,
Diabetes,
Dimness of Sight,
Deafness,
Weak Digestion,
Dropries,
Erysipelas, or Wild-fire,
All Fluxes by Sweat, Spitting,
Fluor Albus,
To prevent Gangrenes,
Gonorrhoea,
Green-sickness,
Gravel,
Gout,
Giddiness,
Head-ach,
Heart-burning,
Hectic Fevers,
Hickup,
Hoarseness,
Jaundice,
Itch,
Inflammations,
Incontinence of Urine,
King's-evil,
Kidneys stop'd, or inflamed.
Lethargy,
Leprosy,

Madness,
Melancholy,
Morphew,
Sore Mouth,
Fits of the Mother,
Nodes, or scirrhus Tumors,
Noise in the Ears,
Numbness in the Limbs,
Obesity, or being over-fat,
Obstructions of Urine, Stools and Menes,
Ophthalmy, or sore Eyes,
Palsy of the Tongue, Lip, or any Member,
Pains, Hysterical or Rheumatic, or hot windy running Pains,
Palpitation of the Heart,
Against all Infections of the Plague,
Small-pox,
Piles,
Priapism,
Quartans,
Quinsies,
Redness of the Face,
Rickets,
Rheumatisms,
Ruptures,
Sciatica,
Scald Head,
Scurvy,
Stone,
Stitches,
Strangury,
Swell'd Veins in the Leg,
Stiffness in the Limbs,
Tetters,
Tooth-ach,
Thirst,
Thrush,
Tympany,
Windiness in any Part.

1. To bleed and purge, and use such proper Diet and Medicines, both before and after Bathing, which a rational Phy-

lician knows to be suitable to the Disease, and the Constitution of the Patient.

2. Not to bathe when hot and sweating, but cool; not to stay in the Bath above two or three Minutes, as the Patient can easily bear it; and to go in and out immediately, as on the first Bathing; after an Immersion of the whole Body.
3. To use the cold Bath before Dinner, fasting; or else in the Afternoon, towards Four or Five o'Clock: 'Tis dangerous to go in after plentiful Drinking and Eating.
4. Continue to bathe nine or ten times, at least two or three times in a Week.
5. To use Sweating, with cold Bathing, in Palsies and Rickets, and several Diseases affecting the Nerves, with Obstructions.
6. In Windiness; or Sickness of the Humours, or their Flatulency, no Sweating is necessary; nor where Bathing is used for Preservation of Health, or the invigorating of the Animal Spirits.

That we may conceive a right Notion of the mechanical Action of Baths on the Body, I shall give Dr. *Wainwright's* Dissertation on this Subject, as it is very distinct, and has the Appearance of Truth to recommend it.

Sanctorius tells us, That Swimming in cold Water hinders Perspiration: And,

That the Flux of the Belly is cured by promoting Perspiration, that is, by warm Bathing:

That Hypochondriacal Persons are much eased, if their Bodies be render'd perspirable by frequent Bathing: And,

That Washing with cold Water heats robust Bodies, and refrigerates weak ones: And,

Warm Bathing, unless Crudities withstand, helps Perspiration, and refrigerates the internal Bowels.

Bathing hath been often used with Success in the Scab, the Leprosy, Elephantiasis, and most Defections of the Skin. In Variety of Pains, as Chronical Rheumatisms, Gout, Sciatica, Lameness, from either too great Contraction or Relaxation of the Tendons.

I sent a Gentlewoman to St. *Mongath's* Well, who was cured of an oedematous Tumor in her Ankle by Bathing, which would not yield to any Method that had been used, as Plaisters, discussive Fomentations, with Sal Ammoniac dissolv'd in them, Tinctures of Myrrh and Camphire, Oil of Tartar per Deliquium, laced Stockings, &c. She bathed her whole Body once a Day, to give a general Contraction and Tensity to all the Vessels, and promote a Dissolution and better Circulation to all the Humours; but bathed her swell'd Leg several times every Day, and kept it not too long in the Water at a time, for fear of chilling it; so that the Vibrations of the Fibres being made stronger and quicker so often in a Day, the obstructing Matter was removed, and the Vessels enabled to resist the distending Power of fresh Humours.

I am persuaded, that a prudent Management of the cold Bath would be very powerful in the Relief of Cachectic and Hydropic People, provided the Distempers be not too far advanced; and some dangerous Symptoms in a Consumption, if the Lungs be sound, would better be removed this way than any other: But this is not to be attempted, without the Advice of some judicious Physician. 'Tis a Specific in the Rickets. Hemorrhages, whether from the Nose, Guts, or Uterus, are not only stopp'd by cold Bathing, but the Return prevented. Nothing more certainly gives Ease, and effectually promotes the passing of Stones in a Nephritic Fit, than warm Bathing. And *Baglivi* tells us, that *Dolor Colicus fere semper mitescit in Semicupio*, Colic Pains are almost always relieved in a Semicupium.

Bathing will always act the Part of a Diuretic. And plunging over the Head in cold Water, especially in Sea-water, will do more in the Cure of Melancholy, Madness, and particularly of that occasioned by the Bite of a mad Dog, than any other Medicine. There is nothing more adapted to the Cure of Frigidity, when owing to a former Excess of Venery, than the cold Bath.

It will also contribute its Share to the Cure both of a simple Gonorrhoea, and Fluor Albus. 'Tis often successful in a Palsy; and they who use it much are very little affected with the Change of Weather: And yet the Abuse of Bathing is very prejudicial; for Bath-guides are generally of a pale and ghastly Countenance, of a bloated Habit of Body, with ulcerated and swell'd Legs, which often end in a Dropsy.

Tho' Bathing hath been used with Advantage in all the Cases I have mention'd, yet there is scarce any of them all, but, in some Circumstances, it would be prejudicial: So that, to reap the best Advantage we can by reading the History of Cures perform'd by it, it is fit we should inquire, what Alterations are made by it in a human Body, that so we may know in what Conditions to order it, and what not.

Our Bodies are press'd upon by a Weight of Air, when the Mercury stands highest in the Barometer, equal to 30900 Pounds Troy. Now, if this Weight be either considerably increased or lessen'd, as 'tis often upon the Change of Weather, and

and the Influence of the Planets, it will certainly make a great Alteration in the Fluids of our Bodies. But this Pressure is never so much augmented as when we bathe ourselves: For Water, being above 800 times heavier than Air, must necessarily greatly increase the Pressure: And a Body, sunk 35 Feet in Water, sustains double the Weight it does in the Air; and tho', when we are near the Top, the Pressure upon our Bodies is mightily lessen'd, yet 'tis much greater than in the open Air; so that all the Consequents of a greater Pressure will happen upon Bathing.

The tender Fibrillæ, of which the Skin is compos'd, being unequal in Strength and Tensity, some of them will more resist the Pressure of the Water than others; from whence proceeds that Rugosity of the Skin upon Bathing. 'Tis certain, that the Surface of the Body, and those Parts adjoining to it, will be the most and first compress'd, and those at the Centre the least and latest; so that the Blood will be forced, in great Plenty, upon the Viscera, where there is the least Resistance. For this Reason, it is never safe for those to bathe who have weak or ulcerated Bowels; nor can they, without Danger of Life, or Swooning at least, who have a very weak Pulse, enter into a cold Bath. The fourth Aphorism is only accounted for this way, that is, *That cold Bathing heats robust Bodies; and refrigerates weak ones*: For the Contraction of the Heart, in robust Bodies, being strong, makes the greater Conflict with the Resistance it meets with, in promoting the Circulation of the Blood, in such as enter the cold Bath; whereby the Blood is more broken, and the hot Particles set at Liberty. On the contrary, in those who are weak, the Contraction of the Heart is but just able to continue the Blood in its Circulation, which will, by reason of the Resistance it meets with, be slower than before; and therefore they will have a Sense of Cold, or be refrigerated.

One that goes into a cold Bath, if he plunge not himself over Head, is subject to the Head-ach: The Reason of this is plain from what I have observed before; for there being the least Resistance to the circulating Blood in the Head, which is press'd upon only by the Weight of the Air, it will run in such Plenty thither, as to distend the Vessels beyond their usual Tone, and thereby occasion a Sense of Pain. And why People are so chearful, brisk, and lively after Bathing, is not only because the perspirable Matter is thrown off more plentifully, (according to *Sanctorius's* Observations, that is, *Melancholy is overcome by a free Perspiration*; and *Chearfulness, without an evident Cause, proceeds from Perspiration succeeding well*) but also from a Sense of less Weight upon the Body. A Person two Feet under Water (as they often are who use Bathing) sustains a Weight of Water, added to that of Air, (supposing still the Area of his Skin to be equal to 15 square Feet) equal to 2280 Pounds; for, 2, the Number of cubical Feet of Water, pressing upon a Foot square of the Skin $\times 76$, the Number of Pounds in a cubical Foot of Water is $= 152$, $\times 15$, the supposed Number of square Feet on the Surface of the Body is $= 2280$ Pounds Troy.

So that the first and most obvious Consequence of Bathing is, by a greater Pressure upon our Bodies, to straiten the Vessels, and thereby dissolve the Humours, and make them fitter to pass the Glands to be evacuated; as also to squeeze out any viscid obstructing Matter, that sticks to the Sides of the Vessels, and render the Motion of the Fluids of our Bodies more free and easy. In the next Place, they who enter into the Bath have the Quantity of their Blood mightily increased in the Brain and Viscera, being forced thither, where there is the least Resistance; and the Quantity of separated Matter in any Gland being as the Quantity of Blood multiply'd into its Celerity, at the respective Glands, the Quantity of Animal Spirits, of Urine, of Gali, Succus Pancreatis, &c. will be mightily increased, and any Impediment to the Secretion of these Fluids, will probably be removed, these Liquors flowing with a greater Celerity. So that,

1. If we would have the Blood dissolved;
2. Or any viscid Matter, adhering to the Sides of the Vessels, removed;
3. Or the Glands scour'd;
4. Or a greater Quantity of Spirits generated, and moved with greater Celerity thro' the Nerves;
5. Or would force the Urine;
6. Or remove Obstructions in the Liver, Spleen, Pancreas, and Mesentery, if they be not grown too obstinate (in which Case 'tis dangerous); we ought to order Bathing.

It is for the first, second, and third Reason, that it cures the Itch, Leprosy, and Elephantiasis: It is for the fourth Reason, together with the former, that it cures the Palsy, Melancholy, Madness, and the Bite of a mad Dog: It is for the fifth, that it helps the Passage of Gravel: For the sixth, join'd with the other, that it helps Cachectic, Icteric, and Hydropic People, before the Distempers be too far advanced.

These Ends, which are compass'd by a greater Pressure, are more effectually obtained by whatever increases the Weight of the Water, or contracts the Fibres of our Bodies; it is the

Salt in the Sea Water whereby its Weight is increased, that makes it more useful in the Cure of those who are bit by a mad Dog; and the deeper you plunge them, the more effectual it will be, for a Reason that I have given before.

We know by Experience, that Cold contracts; and the more suddenly it is applied to our Bodies, the more violently it operates; but how much it contributes to the obtaining of the forementioned Ends, we cannot certainly know, having no Rule by which we may measure the Contraction caused by it.

But, that it is very considerable, we need not doubt, having so many Experiments to prove it. The Contraction of the Fibres is propagated throughout the whole Body, upon which score all the Humours in the Body must be propelled with greater Force through the Vessels in which they circulate; besides that the Tensity of the Fibres being greater, their Vibration will both be quicker and stronger, and that in proportion to their increased Tensity; so that the Blood and Spirits will not only move more swiftly through the Canals, but also be extremely ground and broken; from whence all the Effects of more fluid Blood and Spirits, moving with greater Velocity, will necessarily ensue upon using the cold Bath. These things which I have said, compared with the Constitution of the Patient; to whom Bathing is prescribed, will give you the Time he ought to stay in it; the Number of Times (with the Intervals between them) he ought to use it, the necessary Preparations for it, and what is to be done after it.

It is upon the Account of the contracting Power of the cold Bath principally, that it stops Hæmorrhages, Gonorrhœas, and the Fluor Albus, as also that it cures Venereal Impotency.

Where the peccant Matter hath been made more fluxil, either by Medicines, Diet, or a regular Use of the warm or temperate Bath, in chronical Rheumatisms, Gout, Sciatica, Lameness, &c. the violent contracting Power of the cold Bath will often perfect the Cure. A nervous Atrophy, which *Baglivi* probably conjectures to be owing to an universal Relaxation of the Nerves, which terminate in the Skin, is as likely to yield to the cold Bath as any other Method, provided the Pores, by Contraction, were not shut up too suddenly; for it would then throw the detained Matter upon some other Glands, whereby an Evacuation more dangerous might succeed.

The next Property of the Bath, distinct from its Weight and Coldness, depends upon its being moist; and by this Quality of the Water, it softens, relaxes, and makes pliable all the Parts of our Body, as sufficiently appears by steeping any Part of an animal Body in Water; even the Horns and Hoofs of Beasts will become soft and flexible, by a long Immersion in Water, especially if warm.

And that Water, as moist, hath a Property of relaxing, as 'tis proved by Experiment, so 'tis no way inconsistent with what I have said of the Pressure of Water in general, nor the contracting Force of the cold Bath in particular. The Pressure of the Water is consistent enough with relaxing and softening of Bodies that are immersed in it; for the Weight of the Water will enable it to insinuate itself into the Pores of the immersed Body, whereby it will become more soft and flexible; and yet, before it hath done this, will force together the Sides of any yielding Vessel, such as those of a human Body are, and thereby press out their Contents with a Velocity proportionable to the Weight incumbent on them; so that, after the Humours have been put in violent Motion by the Pressure of Bath Water, if the Person stay any considerable time in, he will have the solid Parts of his Body softened, relaxed, and made flexible. This Hint is of great Use to determine the Time our Patients ought to stay in the Bath in some Distempers more than others.

Now I shall inquire how the contracting Power of Cold, and the relaxing Power of Moisture, can agree in the same Subject. That they cannot act intensely at the same time, but their Actions will destroy the Effect one of another, is evident to any who consider, that contrary Qualities are inconsistent in the same Subject at the same time; but, as I observed in the last Section, Moisture acts very slowly, and must be a long time in performing its Work, whereas Cold acts quickly, and on a sudden, as we know by a Multitude of Experiments: Wherefore, though the cold Bath may contract at first, yet by staying too long in it, it would relax; but there are none who are able to bear the Cold so long as to produce the latter Effect. The principal Reason why Cold so violently contracts the Membranes of our Bodies, is by making an ungrateful Sensation; for such is the Frame and Constitution of the Animal Economy, that the Soul has a Power of contracting, or relaxing, the Membranes and Vessels of the Body, so as best to serve the Purposes of Life; and though we know not how the Soul operates upon the Body, yet would it be the greatest Folly to deny that which we daily experience to be true. We every Day observe, by the Command of our Wills, that the Members of our Bodies are moved a thousand different ways; and 'tis as easy to imagine the Soul acts immediately upon the Nerves, and other solid Parts of the Body, as upon the Animal Spirits, being that Spirit can act as easily upon solid Matter, as that which is fluid,

the Mode of its operating being altogether unknown to us. In a relaxed State the Body is weak, feeble and unactive, and in this Condition it is, in all the Passions which are attended with Pleasure: On the contrary, whatever Passions of the Mind are attended with Pain, Grief, or any kind of Uneasiness, as Malice, Revenge, Fear, a Fright, or Surprise, put the whole Body into a contracted State, as appears by the Shrinking of the Veins, Sparkling of the Eyes, Contraction of the Pupil, Paleness of the Face, and especially of the Lips; and this is none of the meanest Displays of infinite Wisdom and Goodness, for the Preservation of Man: For by this means he is strongest when he has the most Occasion for it, either in resisting Force when he thinks he can overcome it, or else in flying from it; in doing of which upon a Fright, some have exerted such Agility of Body as is almost past Credit, were it not the common Observation of Mankind, how vigorous and active we are in such Circumstances. The Reason of this excessive Strength, when the Vessels of the Body are contracted, is evident from Dr. Cheyne's Proposition about the Strength of Animals, that is, "That 'tis in a triplicate Proportion to the Quantity of Blood running in the Vessels." Now the Quantity of Blood is mightily increased, in the Proportion it bears to its Vessels, when they are contracted, to what it is when relaxed; for 'tis the same thing to all Intents and Purposes, whether the Vessels continue of the same Wideness, and the Quantity of Blood be increased, or the Quantity of Blood continue the same, and the Vessels in which it runs be straitened or contracted; so that we may expect the same Strength in an Animal whose Vessels are contracted to half their Wideness; as we may from an Animal whose Vessels are in their former Condition, and the Quantity of his Blood doubled; so that besides the Advantages common to all Sorts of Bathing, there is this peculiar in the cold Bath, that it gives a violent and universal Contraction to all the Membranes and Vessels of the Body, and there is nothing so surprising in the sudden Cures it performs, but what is accountable for from this Cause.

But Water hath certainly a softening, relaxing Property, when applied to our Bodies; and by means of this 'tis able to bring about great Alterations; and as the Pressure of the Water is made more effectual by Cold, so is its relaxing Power by a moderate Warmth: For a gentle Heat always relaxes the Fibres of our Body, by being pleasing and agreeable to the Sense of Feeling: So that when we would have the Benefit of an universal Relaxation, we ought to go into the temperate Bath, such as *Buxton*, being the most temperate of any that I know of in *England*. The first Advantage that many receive from the Use of this Bath, is an entire Refreshment after Weariness with a Journey. 'Tis a common Custom for Persons wearied with Riding, as soon as they alight, to go into the Bath for a little time, by which means they become as lively and brisk as they were in the Morning; for Weariness being nothing but an overstretching, or too great a Tensity, of the Fibres, occasioned by using them too long, or too violently, must, upon their being relaxed, go off again: 'Tis for the same Reason that Sleep takes off Weariness.

This universal Relaxation caused by Bathing will so widen the Pores, that a vast Quantity of perspirable Matter will be carried off, more than at another time. 'Tis for this Reason, that some corpulent People have, in a Fortnight's time, lost above two Stone Weight by using of this Bath; and all the Advantages of a free Perspiration may be gained this way; tho' it be true, we are more obnoxious to catch Cold afterwards: Yet I think a cautious Use of the cold Bath after the hot, might not only prevent that Inconveniency, but, in many Cases, render it much more beneficial. I have known that Bath I am speaking of, to remove violent Pains in the Head, Back, and Joints. A Gentleman of my Acquaintance had a fixed Pain in his Breast for almost two Years, and was relieved by four or five times Bathing in this Bath. It helps a chronical Rheumatism, Gout, and the Colic, Lameness, Contraction of the Tendons, &c. and how all these are performed, is easily known by the foregoing Theory. But, all the Effects of warm Bathing are better brought about by the Water insinuating itself into the Body through the Skin; for being mixed with the Blood, it dilutes and dissolves the acid Salts in the Serum, by which they are better carried off through the proper Glands designed for their Evacuation: So that 'tis useful in all Distempers where too much Salt abounds, as the Scurvy, and most cutaneous Diseases.

Though it be a generally received Notion, that Bath Water enters into the Body, and so mixes itself with the Blood, yet most believe it upon very indifferent Grounds, or having never examined the Reason of the Thing, nor considered the Objections against it. That Water hath a wonderful Power of insinuating itself into any contiguous Body, appears from several Experiments. We see how Deal Boards will swell against rainy Weather; the watery Particles floating in the Air, by the Pressure of the Air upon them, are forced into the slender Tubes of the Wood, where they meet with no Resistance, the Particles of Air being too large to enter the same. It is certain,

however true the contrary may appear to be, that the compounding Particles of Water are less than those of Air, because the former will pass through several Bodies that the other will not. It will force itself through the Skins of Animals, even after they are dried; and converted into Leather. *Bellini* tried the Experiment upon the Skin of a Man's Head, which, after it was moderately dried; he suspended with a Stone in it, to sink it in the Water, and in a few Hours time the Water had forced its Passage through it. But nothing shews more the Force of Water to enter into contiguous Bodies than the following Experiment.

Fasten a Piece of Whip-cord, or a strong Rope, of what Length you please, (but the longer, the more visible will the Experiment be) to a Hook or Staple, and at the Bottom of the Cord hang any Weight, short of what will break it, though never so great; you will find, that the Weight will rise in moist Weather, and sink lower in the dry: You may also raise the Weight by moistening the Sides of the Cord by a wet Sponge; by this means a few Particles of Water may overcome any finite Resistance, if the Cord would bear it. Now, since there is but a little Quantity of Water, and that driven into the Sides of the Cord, with a Force no greater than the Weight of a Cylinder of Air incumbent upon the Water; therefore must the Water act by some Property whereby its Force is greatly augmented, and that can be no other than that of the *Cuneus*; and the Forces of Wedges are to one another reciprocally proportional to the Angles their Edges make; but in Spheres the greater or lesser Degree of Curvity is to be considered as their Angles; when Spheres are considered as Wedges, and the Degrees of Curvity in Spheres are reciprocally as their Radii. Now the Particles of Water, being so infinitely small, less by much than those of Air, must, when acting as Wedges, have their Powers infinitely increased, so as to overcome any finite Resistance: Now let the Resistance the Water meets with, in entering into our Bodies, be what it will, yet 'tis hard to believe it is greater than what I have mentioned; which yet a little Quantity of Water will overcome. The Experiments I have taken Notice of were made upon the Skins of dead Men, or Beasts, which would have put the Matter beyond Dispute, had they been made upon such as were alive. The only Difference then being, that, in the Living, Steams or Vapours are constantly raised into the Air, through the Pores of the Skin, in insensible Perspiration, which is not so in those that are Dead, these Vapours, though raised with a considerable Force, are yet unable to withstand the Impetus, with which Water endeavours to insinuate itself into contiguous Bodies, being so great as I have explained. And though the Quantity of perspirable Matter is very great in twenty-four Hours, being five Eighths of the Meat and Drink a Man takes in a Day; yet, if we compute the Quantity that perspires from any Part of the Skin, in a given Time, we shall find it too little by far to hinder the Entrance of Water into the Body, when we go into a Bath. For Dr. *Pitcairn* hath demonstrated, that the Matter of insensible Perspiration in a Minute, is the 1200 Part of the Place it comes from, that is, one Scruple of the Skin perspires $\frac{1}{200}$ Part of a Scruple in a Minute, and consequently one Dram of the Skin perspires $\frac{1}{200}$ Part of a Dram in a Minute. Now, suppose a square Inch of the Skin weigh one Dram, then a square Inch perspires $\frac{1}{200}$ Part of a Dram in a Minute; but a square Inch of the Skin is pressed upon by a Weight when we bathe, more than in the open Air, equal to ninety-six Drams. For we may conclude, that our Bodies, taking one Part with another, are two Feet under Water when we bathe ourselves; so that every square Inch of our Skin must bear the Weight of twenty-four cubical Inches of Water equal to ninety-six Drams; for a cubical Inch of Water being four Drams $\frac{1}{4}$, throwing away the Fraction, twenty-four cubical Inches must be ninety-six Drams. Now since only the $\frac{1}{200}$ Part of a Dram of Matter is perspired through a square Inch of the Skin in a Minute, therefore is the Elevation of the perspirable Matter resisted by a Weight 115200 times greater than itself; for $1200 \times 96 = 115200$. How great then must be the Celerity with which the perspirable Matter moves, if we imagine it able to raise a Body 115200 times heavier than itself? Thus would it be, if the whole Quantity of perspirable Matter, evacuated in a Minute, was to exert its Force at once upon the incumbent Weight of Water; but it is so far from doing that, that if the Exhalation of the Steams be not continual, as the Pressure of the Water is, yet the Intervals betwixt the Times they are propell'd from the Body are very short; suppose sixty of them in a Minute, being about the Number of Pulses that a healthful Man's Artery beats in the same time; then will the Quantity of Vapour, which exerts its Force at once against the incumbent Water, be sixty times less than what I first assigned; which being multiplied by 1200 = 72000, the Number of Parts into which a Dram of perspirable Matter is divided, one Part only of which exerts its Force against ninety-six Drams of Water in a Second; so that the perspirable Matter that rises, every Second must raise a Weight 6912000 times greater than itself, if it resist the Entrance of the incumbent

bent Water; for thirty, the Number of Drams of Water; incumbent upon an Inch square on the Skin, multiplied by 72000, the Number of Parts into which a Dram of perspirable Matter is divided, is = 6912000, the Difference between the Quantity of Matter perspired in a Second, and the Quantity of Water by which its Motion is resisted.

I think by this time it sufficiently appears, that the Bath Water will mix itself with the Humours of the Body; so that there is nothing so wonderful in Bathing, but what may be accounted for from some of these Properties of Water I have mentioned, without having recourse to the Salts with which Bath Waters are impregnated, which yet may contribute their Share in the Cure of some Distempers. What I have said about Bathing, as 'tis mostly new, so are my Reasons founded upon known Experiments; and how just my Inferences from them are, I leave to the Judgment of my Reader (supposing him to have the necessary Qualifications, and a moderate Attention) to determine. *Wainwright.*

Dr. *Wainwright* has left me very little to say on the Subject of Bathing. I shall only farther remark, with respect to cold Bathing, that as Cold contracts the Vessels of the Body, the Solids act with more Vigour upon the Fluids, which contributes to the Attenuation of the latter; the Attrition betwixt the Solids and Fluids is also increased, and thence a Person feels himself warm, when he comes out of a cold Bath. In Consequence also of an increased Action of the Solids upon the Fluids, the Circulation is accelerated, and for this Reason all the Secretions are increased, amongst which are Sweat, Perspiration, and Urine.

But in order to the Production of these salutary Effects, we must suppose a certain Degree of Elasticity, or Power of Contraction in the Animal Fibres; otherwise, the cold Water will refrigerate, and consequently coagulate in some Degree the Juices, without adding any new Force to the Solids, in order to promote their Attenuation. Hence, in Cases attended with a certain Degree of Relaxation and Debility, a cold Bath should seem to be certain Death.

I believe all Physicians, who attend any considerable Number of Patients, frequently hear some of them complain of erratic Pains about the Breast, which reside in the Muscles, though I have sometimes known them mistaken so far as to be esteemed internal, and consider'd as proceeding from the Lungs; and it is possible, that a Sensation of Weight on the Breast, and a certain Difficulty of Breathing, tho' in a small Degree, may have laid the Foundation for this Error. I take the Liberty of recommending, in these Cases, from my own Experience, the cold Bath, as the most effectual Remedy I am acquainted with. It should be used about every other Day, for a few Weeks; and the Patient should only just immerse himself under Water, and immediately come out again, and repeat this two or three times. When the Disorder is removed, the Remedy should be laid aside. And indeed, in all Cases, great Care should be taken not to make the cold Bath so habitual, as to render its continual Use absolutely necessary. This Caution is of equal Force with respect to all Remedies of Importance, especially Opium, and the Bark, by the incautious and unnecessarily continued Use of which, many Constitutions have been utterly destroyed.

Lastly, it has been remarked, that in Disorders of the Lungs, where there is a Tendency to a Consumption, cold Bathing is noxious, as it accelerates the Inflammation of the Tubercles formed in the Lungs, and the consequent Suppuration.

Willis, in his Treatise on a Phrenitis, gives a very remarkable Case of a Girl who was cur'd of this Distemper by Immersion into cold Water, which deserves to be taken Notice of.

Some time ago, says he, I was called to the Relief of a robust and vigorous Servant Maid, who being seized with a Fever, became so furious and mad, that there was a Necessity for keeping her continually bound in Bed. I took a large Quantity of Blood from her at two different times, rendered her Body soluble by repeated Clysters, and prescribed her such other Remedies as are usually exhibited in Cases of a like Nature. I also ordered, that she should have Juleps, Emulsions, and hypnotic Draughts. But all these were of little or no Service to her; for she remain'd without Sleep, and very furious, for the Space of seven or eight Days, crying and roaring incessantly for some cold Liquor to drink; for which Reason she was allowed as much Water as she pleased; but was neither rendered more calm, nor less thirsty, by that means. As it was the Summer-time, I ordered her to be taken up in the Middle of the Night by Women, and carried to a Boat, where her Cloaths being taken off, and the Cords, with which she was bound, untied, she was plunged in a deep River, having previously tied a Rope about the Trunk of her Body, lest she should happen to be drowned. But there was no Occasion for this Expedient; for the Girl naturally swam with so much Dexterity, that a Man who is very expert in that Exercise, could have scarce acted his Part better. About twenty or fifteen Minutes after, she was taken out of the Water, sober and in her Senses. Upon which, being laid in Bed, she slept, fell in-

to a plentiful Sweat, and was thoroughly recovered without the Use of any other Remedy whatever. This Cure succeeded so happily, and so suddenly, because the Excesses of the vital and animal Heat, which were both highly increased at one and the same time, were removed by a Remedy proper for intense and burning Heats, that is, Humectation and Refrigeration by Water. *Willis de Delirio & Phrenitide.*

In Confirmation of the Truth of this History, I must relate one which was told me by the late Sir *John Floyer*, and a Lady of Honour and Veracity, who was a more immediate Witness of the Fact than Sir *John*, though he attended the Woman, whose Case is the Subject of this History.

Sir *John* was called to a Farmer's Wife at a Village about four Miles from *Lichfield*, who was ill of a Fever, attended with a Delirium, and an utter Privation of Sleep. It happened one Night, that the Patient lay for a little time pretty still, and the Nurse took that Opportunity of going softly out of the Room for a few Minutes, upon some necessary Occasion. When she return'd, she found all still and quiet, and sat down by the Bed-side for at least a quarter of an Hour; but observing, that she did not hear the Woman breathe, she put back the Curtains, suspecting she was dead; but was much surprised to find she was not in Bed. After searching the Room to no Purpose, she alarmed the People in the House, who, after some time, found the Woman in the Yard up to the Chin in Water, in the Well, which was, as is usual in that Country, not much above five Feet deep, and near full of Water. The Woman was instantly taken out, and put to Bed, and immediately fell asleep. Soon after, a profuse Sweat broke out, which continued for many Hours. She awaked without any Delirium, and recovered without any farther Trouble.

The Chymists have applied the Word *BALNEUM* to several things relative to their Art. Thus the old Chymists mention a *BALNEUM ARENÆ*, or Sand Heat, for the Purification of Mercury.

BALNEUM MARIS, or *MARIS*, as it is sometimes written, imports the Heat of boiling Water. In this Encheiridion, the Vessel containing the Ingredients to be distilled, digested, or acted upon, is put into a Vessel of Water, which is made to boil; so that no greater a Heat than that of boiling Water, can be communicated to the Substance to be treated.

It is customary with the Chymists to give grand and sounding Names to all the Instruments used, and Phenomena occurring, in their Art. Thus *Explosion*, with the Vulgar, is, with them, *Fulmination*; and the Heat of boiling Water, is *The Bath of the Blessed Virgin Mary*.

BALNEUM SICCU, or a dry Bath, is, when Sand, Ashes, or Filings of Steel, are heated, and the Vessel, containing the Substances to be acted upon, is placed therein.

BALNEUM VAPORIS, a Vapour Bath, imports the Heat of the Vapour, or Steam of Water.

As some Account of the *Bath Waters* may be expected from me under this Article, I shall give it in the Words of Dr. *Cheyne*, because it is much the most distinct I have met with.

Of BATH WATERS.

The Learned have been divided, and much perplexed, about the Heat of *Bath Waters*. I have always endeavour'd to account to myself for it, from the common Experiment of mixing Filings of Steel, and Powder of Sulphur, working them into a Paste with Water, and putting them into a Cellar, under a Cock, dropping Water slowly and regularly; the Paste will ferment to such a Degree, that the Water running from it shall be of the same Heat and Virtue with the *Bath Waters*, though not so pleasant, nor so well fitted to human Bodies. This is a common Experiment, and these are the only natural Bodies known, which, meeting together, will produce Heat in Water, without artificial Fires. *Tournesfort* says, " 'Tis certain, that Filings of Iron, steep'd in common Water, will grow considerably warm, and much more so in Sea Water; And if you mingle therewith some Sulphur powdered, you will see this Mixture really burn." Sir *Isaac Newton*, in his last Edition of his *Optics*, p. 354. says, " That even the gross Body of Sulphur powdered, and with an equal Weight of Iron Filings, and a little Water made into a Paste, acts upon the Iron; and in five or six Hours grows too hot to be touched, and emits a Flame." That the Heat of the *Bath Waters* is owing to a Principle within themselves, is evident, from their retaining it longer than any other Water, heated to the same Degree, will. Wherefore there can be no Necessity of having recourse to Vulcanos, or subterraneous Fires, to account for this Appearance. There are no burning Mountains known in this our Northern Climate; and 'tis pretty hard to conceive, how Fires should have burned so long under Ground without a Vent, or any other remarkable Sign. The Sulphur in the *Bath Waters* is evident to the Senses, swimming in large Clusters on the Tops of the Baths mixed with Earth, and some mineral Substances, where with the Guides commonly gild Silver; and is found an excellent Remedy in Scurvies, Leprosies, Ringworms, and other Foulness of the Skin. The Steel is manifested

by the bluish Tincture given to the Water from the Pump, by an Infusion of Nut-gall. It is true, this Tincture is neither so deep, nor is it to be had from the Water, in any short time after it comes hot from the Pump, thereby to manifest any great Quantity of Steel in the Composition, such as can have the full Proportion to the Experiment now mentioned. But, to set this in a clearer Light, let us put together these Considerations: First, that upon Distillation of *Bath Water*, there remains little in the Bottom of the Glass but the common Calx, or Sea Salt, that is found in the Distillation of Spring Water, if we except some Sand or Earth, that is forced up by the Violence of the Pump; wherefore the *Bath Waters* not being impregnated with any Quantity of a saline Mixture, can retain nothing in their own proper Substance but the lightest Parts of the Steel and Sulphur. Secondly, that this Water is as fully impregnated with Sulphur, as it can bear. And that there must be a greater Proportion of Steel in *Bath Water* than is manifested to the Senses, or discovered by any Experiment hitherto made, is evident from its healing Effects, which no known Medicine but Steel can bring about, or account for. None but those who have seen it, can believe the wonderful Efficacy it has, in most chronical Cases. What but Steel, in a few Weeks, can make the Blood, from a white bluish, or tallow Hue, resisting the Knife, like Glew, swimming in its Serum, like an Island amidst the Ocean, look all of a Piece, of a scarlet Colour, and a due Proportion between its nourishing and its watery Parts? Nothing but Steel can make a pale ash-coloured Countenance, hollow and deep Eyes, no Appetite, little Strength, and less Sleep, eat and drink, and sleep, look gay and sleek, like the best Health. Thousands of such Instances may be seen every Season at these healthful Springs. Thirdly, the Effect of Sulphur in bridling the sensible Appearances and Operations of most active Medicines, is very well known. Instances of which, in natural Bodies, are Antimony, and Native Cinnabar; in artificial ones, *Æthiops Mineral*, and Cinnabar of Antimony; in all which the Mercury is so bridled up by the Sulphur, that none of their sensible Operations and Appearances are felt, while they produce the most wonderful Changes on Animal Bodies.

Since the *Bath Waters* derive their Heat from a Principle within themselves; since no natural Body, but Sulphur and Iron, can produce such a Degree of Heat, as is in them; since nothing but Steel can produce those wonderful Cures on human Bodies, which *Bath Waters* do; since Sulphur will lock up and bridle the sensible Appearances and Effects of the most active Bodies, and yet not destroy their healthful and medicinal Virtues; it is plain, that *Bath Waters* must owe their Heat to a Mixture of steely and sulphureous Particles, and their healthful Effects to a greater Proportion of Steel, than is sensible, or easily discoverable by any Experiment hitherto made, join'd to a light Sulphur, whose Virtues and Efficacy in all chronical Cases we have already shewn. The Mountains which surround the Place, which every body now knows to be but the Nefts of Minerals, and the Receptacles of the Waters, which feed the Springs, (which Mountains are continued even to the Sea) confirm this Opinion.

All hot Waters seem chiefly to consist of these two Principles, and to differ only as the Sulphur or Steel predominates in them. Where the Sulphur predominates, they are hotter, more nauseous, and more purgative. Of the three hot *European Waters* of Note, the *Aix la Chapelle*, *Bourbon*, and *Bath*, the first abounds more eminently in Sulphur, which makes its Heat, Nauseousness, and purgative Faculty, so great, that few weak Stomachs can bear its Heat and Nauseousness, and fewer weak Constitutions the Violence of its Purgings. The *Bourbon* are of a middle Nature between the *Aix la Chapelle* and the *Bath Waters*, and are less hot, nauseous, and purgative, than the *Aix la Chapelle*, but more than the *Bath Waters*. The *Bath* partake less of the Sulphur, and more of the Steel, than either of these two, and are by far the most pleasant, of a milky Taste, never purge, except they be drank either too fast, or in too great Quantities, and always mend the Appetite, and raise the Spirits. The weakest hot Waters are but of little Use, except in the lowest Cases, and hectic or consumptive Constitutions; but, for Medicinal Uses, the weaker hot Waters may be made pretty near equal to the stronger by Evaporation, as to the sulphureous Principle; as the stronger may be brought down to the weaker by Dilution, as I have experienced, tho' Nature be always the wisest and most perfect Operator. But neither the same Proportion of Steel, nor Sulphur, nor Heat, indifferently fit all Constitutions. Generally the Strength (that is, the Quantity of Steel and Sulphur) of the same hot Waters, is in proportion to their Heat; and therefore, to fit the same Waters to weaker Constitutions, they need only be drank proportionably cooler.

The *Bath Waters* having such an Origin, and such Qualities, must needs be an excellent Remedy in the Gout, and other chronical Cases, for those Reasons: (1.) Because of their Warmth, just suited to the Wants of Nature, and a little above the Heat of human Bodies, sufficient to introduce a foreign

Warmth and Motion to cold and decayed Bowels and Fluids; whereby the natural Warmth, and slow Circulation, is increased and enlivened. (2.) This, with its agreeable Taste, and milky Softness, makes it fit so easily on the Stomach, and become so excellent a Vehicle, to wash into the Blood other proper and specific Medicines without that Nauseousness, and Fret on the Spirits, which all other hot Waters, hitherto known, or that Chilliness and Damp, which all cold Mineral Waters give, whereby they are rendered useless or hurtful in some low and nervous Cases. To these add, (3.) Their chalybeate Principle, so peculiarly locked up in Sulphur, that the Patient reaps all the Benefit, and healthful Effects, of the best Preparations of this Medicine, (and what are not two such powerful Medicines, combined, able to effect?) without the nauseous Taste, and frequent Disorders upon the Stomach, that every other way of giving Steel produces. (4.) The Sulphur, united with the Steel, makes it a natural kind of Soap, for cleansing the Insides of Vessels from the Foulness that cleaves to them, and for opening the Obstructions of the small Vessels. But, (5.) That which, together with the others, makes it specific in the Gout, is, its relaxing Quality, whereby it softens and supple the rigid and stiff Fibres, so as the gouty Humours may pass freely by Perspiration. Much more might be said of this wonderful Remedy provided by the Hand of Nature, to relieve the Miseries of human Life; but this the innumerable Crouds of Cripples of all Sorts, and those other Persons made miserable by chronical Distempers, sent thence every Year, cured or relieved, do witness more convincingly, than either Philosophy or Rhetoric can.

It is capable of Demonstration, that the Force, Pressure, and Weight of the *Bath Waters* in Bathing, are sufficient to counteract the Force of the Perspiration some Millions of times; and consequently, that these Waters, relaxing the Fibres of all the Vessels, and soaking through the Scarf-skin, and even thro' the Coats of the small Vessels, are introduced into the smallest Glands, and convey'd by the returning Veins into the Mass of the Blood, and, by the Force of the Circulation, assist in opening Obstructions through the whole Habit; and this accounts for the wonderful Efficacy of Bathing in white Swellings, Palsies, scorbutic Drynesses of the Skin, scrophulous Sores and Tumors, nervous Wastings of the Limbs, sciatic Pains of the Joints, cold Rheumatisms, and Weaknesses after the Gout. And this still will be more evident, if the Doctrine of the Attraction of Animal Bodies on the incumbent Atmosphere, lately so much improv'd by Dr. James Keil, be supposed true. It is many Years since I was informed by a Gentleman of great Ingenuity, that having a good deal of Money on a Horse, which was to run for the Plate at *New-market*, and the Rider dying not many Days before the Time appointed for the Course, he had undertaken to ride himself, and was obliged by Fasting, Watching, and Exercise, to bring down his Body to Horseman's Weight; that after the Match was over, and he exactly weighed at the Post, he had rode immediately home; and having drank up a Pint of Chicken Broth only, which might weigh about a Pound, got to Bed, and slept twelve Hours; and weighing again under the same Circumstances as before, found he had got in the Whole about three Pounds, if I remember right; whereby he concluded, that his exhausted Body had drawn in about two Pounds of the circumambient Air. This more manifestly shews, how the *Bath Waters*, being hot, and consequently more active, may be drawn in, and get thro' the Pores of the Skin into the Blood-vessels, and there concur with what is drank down towards those kindly Effects Bathing commonly produces. And 'tis impossible to account for those copious and profuse Sweats Persons (if they lie long in Bed after Bathing) run into, but that their Bodies are filled with these Waters, like a soaked Sponge. But the Weak and Low-spirited are never to be suffered to run into those; which are prevented, by either not going into, or by being only a short time in Bed.

It is somewhat uncommon, that Bathing, which for many hundred Years has wrought such Cures, as we have on Record, and singly maintain'd so long the Credit and Reputation of *Bath*, should for this last Century (in which only drinking the Water has been in Use) have fallen into such Disgrace, that it is very far from being now the chief thing People come to *Bath* for. Before drinking the *Bath Water* came to be so much used, fixed or wandering Pain, Stiffness, or Contractions on the Tendons, Lameness, or wasted Limbs, Palsies, or Rheumatisms, were the chief Distempers People came to *Bath* for. But now, since all other chronical Distempers whatsoever are relieved either by bathing or drinking, if People will bathe indifferently, without Advice, without duly preparing their Bodies, and cleansing the alimentary Passages, without any distinct Knowledge of their Case, their Strength, the proper Season of Bathing, or the Time they ought to stay in at once; there must necessarily happen (as there have happen'd) unlucky Accidents, which tend to discourage and disgrace Bathing in general. On the other hand, if those who attend on Bathing will undertake more than they can manage, or duly

tend,

send; at one time; some must necessarily be kept in longer than their Strength will suffer, or their Case requires. These have been the Sources of the late Neglect and Contempt of Bathing. But I am well satisfy'd, was Bathing managed prudently and discreetly, there are but few chronical Cases, in which it might not be useful, and in which it might not contribute with Drinking, and other proper Remedies, towards a Cure, or a Relief. If, on the one Side, we do but consider of what Use and Reputation hot Bathing was amongst the antient *Romans*, and to what extravagant Expences they ran to make their Baths convenient, or beautiful: If we consider, that most chronical Distempers are attended with want of due Perspiration, and are therefore generally of the cold and phlegmatic Kind, and are always produced by Obstructions from fizy Juices: On the other hand, if we reflect on what was hinted above, that the hot Water, in Bathing, was sucked in, and attracted through the Skin, into the returning Veins, and was thereby put in a Capacity to assist with what is drank down, to wash off Obstructions of the small Vessels, to thin and dilute the Blood, and glandular Juices, to warm, enliven, actuate, and nourish, the wasted and decayed Parts: We shall readily conclude, that Bathing, prudently managed, may be extremely beneficial in most chronical Distempers. That Bathing therefore may be performed in the best manner possible, we must first distinguish those Distempers which might suffer by it, from those which will be benefited by it. And those are chiefly of three Kinds: (1.) Those Distempers which impair the rational Faculties, or affect the Head with Pain or Giddiness. Because hot Bathing might send Fumes or Vapours upwards, and so increase these Distempers; such are hysteric Disorders, Convulsions, Epilepsies, and the like. While the Fit lasts, a Vertigo, or Head-ach, from a foul Stomach. (2.) Those which any ways affect the Lungs, because hot Bathing, increasing the Velocity of the Blood, may occasion a Pleurisy, or Peripneumonia, or a Spitting of Blood in such Cases. (3.) Those which are attended with Inflammations, moveable Tumors, or with sitting Pains, such as the Gout, or an inflammatory Rheumatism; because hot Bathing may increase the first, or translate the latter. These excepted, I know no chronical Case (but when in their last Extremities) which might not be benefited by moderate and discreet Bathing, which might scour the foul Tubes, open the obstructed ones, increase the natural Heat, and encourage a due Perspiration. I shall conclude with subjoining a general Rule, whereby to know, if, on Trial, Bathing agrees, and has not been continu'd too long in the Whole, or each single Time; that is, if it neither sink the Spirits, waste the Strength, nor weaken the Appetite, then it is certainly beneficial; for hot Bathing being of the Class of Evacuants, if it carry nothing off but faulty Humours, it can produce none of the mentioned Effects; and if it evacuate these, it must needs be beneficial; and, on the contrary, if it spend the nourishing Juices, and carry off more than the Party can well spare, it must be hurtful.

It is observable, from *Guidot's* Experiments on *Bath Waters*, That the Water, either exposed to the common and open Air, or cork'd up and seal'd in a Bottle, did, for a much longer time, retain its Virtue of tincturing a purplish Blue with Nut-gall in clear frosty Weather, than in heavy moist Weather; that is, it retain'd its chalybeate Principle much longer in frosty and clear Weather, than in warm and moist Weather. The Truth is, nobody could have been long at *Bath* but must have observed, that the Water succeeded better, quicken'd the Appetite more, made the Digestions stronger, and raised the Spirits higher, in a clear, quick, dry Season, than in moist, warm, heavy Weather; and, in Fact, in such a Season as this first is, they surpass all the Methods of producing such an Effect I have ever seen. To which two Causes concur, the greater Quantity of a subtle, active, chalybeate Principle preserved in the Water, and the greater Tightness and Firmness produced in the Fibres by the cold, clean, dry Weather: But what I would chiefly observe from the mention'd Experiments is, that the chalybeate Principle is so fine, subtle, and active, that, in a few Hours, nay Minutes, it will evaporate thro' a Cork, and seal'd Glass-bottle; and may retain, by the mere Action of the circumambient Air, its Nitre, and different Gravity, for some considerable Time: Which shews, how this so subtle and volatile a chalybeate Medicine may be convey'd from the Stomach, even to the great and complicated Distance of the most minute Nerve, the most readily and quickly; which the elementary Water, thus actuated, reaches much sooner than any artificial Preparation of Steel possibly can; and thereby becomes so admirable a Medicine in relax'd Nerves, and nervous Distempers; to which the *Bath Waters*, actuated by this subtle, penetrating, and powerful chalybeate Principle, concur inwardly in drinking them, and outwardly in Bathing, by their being drawn in thro' the Skin, into the small Vessels, as may be seen in the preceding Articles about Bathing. As to the small Quantity of Steel thus introduced, it seems generally sufficient for the real Wants of Nature; but, in chronical Diseases, may be easily supply'd by larger Doses of artificial Steel, when the other has prepared

the way: And certainly, in giving both Steel and Bitters, 'tis safest, and most prudent, to begin low, and with smaller Doses; and to rise as the Pulse and Strength rises, and as Usage has made smaller Doses less effectual. I remember to have observ'd in some of the great and sagacious Dr. *Radcliff's* Bills, four or five Drops of *Mynsicht's* Tincture of Steel, with a few Drops of Elixir Proprietatis, in a simple Water, prescribed as a chalybeate Bitter, even to grown Persons. This I freely own, in the Novitiate of my Observations, I thought very simple: I have had good Reason to condemn my rash Judgment since; and to acknowledge it prudent and judicious to begin, in some low Cases, with such small Doses.

The other Difficulty is, how the same hot Water should relax contracted Fibres, as in the Gout and Rheumatism, and yet contract and brace relax'd Fibres, as in the Palsy and wasted Limbs. That the Matter of Fact is so, is past all doubt, in these and many other Cases of Contraction and Relaxation: But to clear up this, we need only to consider what Contraction and Relaxation are. Since all the Fluids of the Body are contain'd in Vessels, Contraction can arise from nothing but from the Blood, and other Fluids, (or whatever is the Cause of muscular Motion) their being retain'd and obstructed by their Sickness; or from some external Injury in the Substance of the Muscle itself, whereby it becomes fuller and firmer, and so acts as upon its Office of Contraction. Relaxation, on the other hand, is an Obstruction of the Nerves or Vessels of the Fluids, before they arrive at the Muscles, as is seen in Palsies, and the nervous Atrophy of the Limbs; so that, in both Cases, Obstructions are the Cause both of Contraction and Relaxation. Wherefore, whatever Medicine can dissolve the Sickness of the Fluids, open the Obstructions of the small Vessels, make the Perspiration full and free, and brace the Fibres, will both contract Relaxations, and relax Contractions; and that these are some of the Effects of *Bath Waters*, has, I think, been made sufficiently appear.

If it be inquired into, what other Cases, besides the Gout, *Bath Waters* may be useful in, the Answer will be obvious from the Account now laid down; that is, That they must be beneficial in all Cases, where Steel or Sulphur is; that is, in almost all chronical Cases whatsoever. In acute and inflammatory Cases, in all Cases attended with a strong quick Pulse, no mineral Water, nor chalybeate Medicine, can be proper; but in all other Cases (excepting those only attended with a Bleeding or Hemorrhage) they are not only safe, but exceedingly beneficial: More particularly, their wonderful Efficacy has been often experienced in Cachexies, Scurvies; in the Stone, Rheumatism, and Jaundice; in Hypochondriacal and Hysterial Affections; in Vapours and Melancholy; in Palsies, Epilepsies, and other Cephalic and Nervous Distempers; in Disorders of the Stomach and Bowels; Obstructions of the Liver and Gall-bladder; in Green and Breeding Sickness; in Barrenness, and Weakness after Child-birth; in Obstructions of the monthly Purgations, and all other peculiar Diseases of the Sex. And truly, if a Person afflicted with a low, broken, or tender Constitution, suffering under the tedious Pains and Inquietudes of any of the lingering Distempers now mention'd, where the Viscera or Bowels are yet sound, would know the fittest Place in *Britain* to spend their Life-time with the greatest Ease and Pleasure; take all the Advantages of the Place together, the Agreeableness of the Waters to the Stomach, the Certainty of their procuring a good Appetite, when it fails; and the no less certain Consequence thereupon, Freedom and Cheerfulness of Spirits; the regular Way of Living; the Excellency of the Provisions; the Warmness, Cleanness, and Neatness of the Housing; the Conveniency of the free, fresh, and open Air of the neighbouring Downs for Exercise; the Easiness of the Amusements; and the Advantage of what Conversation one desires; I say, taking all these Advantages together, I can affirm, from near twenty Years Experience, without Suspicion of Flattery, or Fear of Contradiction, that *Bath* is the Place.

Some wise and frugal People think the mere Drinking of these Waters, for some Time, without taking any Medicine, either before or with them, may be sufficient to remove any of the chronical Ails they are good for; but those, if they are really ill in any other manner, except mere Loss of Appetite, are generally convinced, upon Trial, at their own Expence, that they neither ought to begin a Course of the *Bath Waters*, without a previous Cleansing of the Stomach and Bowels, lest they wash into the Blood thro' the Lacteals, by the perpetual Dilution of the *Bath Waters*, those Impurities which constantly cleave to them; nor that they ought to expect a perfect Cure of a long-breeding and lingering Distemper, without the Assistance of those other Medicines which are reckon'd specific in the Case, and to which the *Bath Waters* are so pleasant and so assistant a Vehicle: For it is but Prudence to bring all the Forces one can raise, against so potent and so formidable an Enemy as a chronical Distemper.

It is not possible to lay down a general Rule, about the Quantity of *Bath Waters* which it is convenient to drink daily, that being to be varied according to some Circumstances of the Patient,

Patient, and the Nature of the Distemper. Strong, full, and large Bodies, bear more Water than tender, thin, and lesser ones; the Younger more than the Elder; those of strong and firm, than those of weak and relax'd Nerves; those who labour under the Gravel and Rheumatism, than those who are disorder'd in the Alimentary Passages, or are subject to scorbutic or nervous Weaknesses, and the like. But, in general, it were to be wish'd, that People, who come to *Bath* for their Healths, drank less daily than they commonly do, and allow'd more Time for a chronical Distemper. I think it may be safely advanced, that any Quantity greater than an *English* Quart in a Morning, drank in two Hours time, half a Pint every half Hour, is more than what is reasonable: For, drinking in this Proportion all the rest of the Day, at Meals, that is, in the Afternoon, and going to Bed, they must take down no less than five Pounds in about sixteen Hours, viz. two Pounds in the Morning, a Pint and an half with Wine at Dinner, half a Pound in the Afternoon, and as much at Supper, and at going to Bed. This, every body must see, is fully sufficient to answer all the Intentions of drinking mineral Waters. A greater Quantity than this will serve only to distend and relax the Alimentary Passages, to force its Way thro' the largest and most patent Tubes, and to propagate the Circulation through the Branches and Inosculation of the larger Arteries and Veins, where the least Foulness, and fewest Obstructions, can happen; so that it will scarce ever reach the finest Capillary Vessels, in which alone the Danger lies. And the late ingenious and learned Dr. *James Keil* has made it evident, that the most expeditious way of altering the whole Mass of the Blood, by mineral Waters, is by small and frequent Draughts. In most Cases a Pint in a Morning is sufficient; and in low Constitutions, and Disorders in the Alimentary Passages, tending to Vomiting and Purging, half a Pint is enough; and whatever Quantity is to be drank, 'tis always best to take it in small Quantities; and at good Distances, provided it come within the Compass of the Morning. What is drank at Meals, tho' cold, yet being fresh, and not altogether drain'd of its Principles and Virtues, contributes near as much to the Cure, as that which is taken in the Morning. The Afternoon and Evening's Draughts are more arbitrary, and must depend upon the Observation of the Patient, as he finds them agreeable to his Stomach, and sit easily or not: Where too great Quantities have not been swallow'd down in a Morning, they are very proper, provided they be in proportion to the Morning's Quantity, and never taken under four or five Hours after Dinner; and that at Night, not under two or three Hours after Supper; these times being the most proper to assist the Digestion, and carry off the Remains of the Food. But the Truth is, as nothing is more necessary in a Course of these Waters than setting out right at first; so nothing requires more the Experience and Judgment of a Physician, than the accommodating the previous Preparations, the Quantities to be drank, and the Medicines to be taken with them, to the Distemper, and the Constitution of the Patient; for, these once settled, the rest generally goes on successfully.

It is equally impossible to determine the most proper Season for drinking *Bath* Waters, as it is to determine the most probable Season for falling ill of a chronical Distemper: Generally speaking, most chronical Diseases rage Spring and Fall, and Custom has made these Months Seasons for the *Bath*; but the Waters are ever the same, no real Alteration having ever been observed in them from Times or Seasons; tho' there may be some little Variation of their sensible Qualities, from the Variation of the Air and Weather. In the hottest Weather they are given off for a Month sometimes, by those that have drank them a long time before; but a great many, especially those of the tender Sort, and of cold Constitutions, feel the best Effects from them in that very Month: And with some they are best in the coldest Weather, supplying then the Inclemency of the Air by their kindly Warmth; and passing best, when the Fibres are wound up and shorten'd by the outward Cold, whereby the Circulation becomes brisker and stronger. So that Custom and Conveniency, arising from outward Circumstances, have made Seasons for the *Bath*, more than the Nature of the Waters themselves; or their Fitness to produce their benign Effects. The Length of Time People ought to drink the Waters is as little to be determin'd as the most proper Season, or as the Duration of a chronical Distemper: If they are of the Nature of an alterative Medicine, (as they most certainly are) they are to be continued till they either disagree, or the chronical Distemper ceases: And this last generally requires a Time in Proportion to the Inveteracy and Obstinacy of the Disease: Hereditary Sharpnesses require more Time than acquired ones; slighter Degrees of the same Case, less than more inveterate ones; nervous Distempers more than those confin'd to the Blood. A Lady of a low, hysteric, and weak Constitution, having ask'd the famous Dr. *Sydenham*, (as she told me) How long she might safely take Steel; his Answer was, That she might safely take it for thirty Years, and then begin again, if she continued ill. The Question might be as proper, if it

had been ask'd, How long time one might continue to eat and drink; for, in Lowness and Disorder, if Remedies be necessary, Nature will as safely admit them, as Hunger will safely admit of Food. I very well know, that Remedies, in chronical Distempers, must be changed, when they become familiar, and have no Effect; as the same kind of Food ought to be chang'd, when it becomes nauseous and disgustful. But then, this belongs not to the Question proposed, which supposes the Waters have not abated of their first Benefit and Relief, but rather increase in them, and do better; and, on this Supposition, there can be no doubt, that they may be safely continued till a perfect Cure is obtain'd, or they fail in their Relief. Some have drank them several Years with Advantage; and many cannot live, and be well, without them, as is evident from the constant Residing of several Families here for their Use. Whilst the original Disorder lasts in any Degree, and the Waters continue to relieve it, they may be used; but in all Cases, and Events, it is safest and best to let *Well* alone.

It has been alleged, that the *Bath* Waters, drank too long, dispose People to Fevers, and inflammatory Distempers, by over-enriching, heating, and exalting the Blood: But this Objection lies equally against all generous Foods, and enlivening Medicines. And, indeed, Temperance and Moderation, in every thing necessary for the Support of Life, is best and safest: And, as I just now said, it is best always to let *Well* alone; but as long as a chronical Distemper is yet unconquer'd, and unremedied, there can be no Hazard of over-enriching the Blood, the very Case supposing the quite contrary, viz. that there are remaining Sickness and Sharpness in the Blood and Juices: So that, while the original Distemper continues, this Effect is not to be fear'd; and, when it is conquer'd, the Patient is very indiscreet, that, out of mere Wantonness, would play with any Medicine whatever. But this is the Case of a very few, and, if ever I have met with any such, I have always religiously advis'd them to abstain from Waters, and every thing else, that can be call'd Medicinal; for this Reason, amongst many others, that it made a very useful Remedy become less effectual, when wanted, by being made more familiar. But the Truth is, most of the chronical Distempers, for the Cure of which *Bath* Waters are recommended, are of the colder Kind, where the Blood is sly, poor, and dispirited; and, whilst any Remains of the Distemper last, over-enriching or exalting is little to be fear'd; and when they happen, are easily remedied by Bleeding, low Diet, and a few cooling Purges. *Cheyne's Account of the Nature and Quality of Bath Waters.*

BALOIOS, *Βαλῖος*, as *Galen* writes it; or *Balæos*, as it occurs in the seventh Book of the Epidemics of *Hippocrates*, where it either signifies a *Man of Valæa*, a City of *Macedonia*, or is the Name of the Person whose Case is there related.

BALSAMATIO, Embalming.

BALSAMELÆON. The same as the *Balsamum e Mecha*. See BALSAMUM.

BALSAMELLA, according to *Blancard*, is the same as *Balsamina*.

BALSAMICA, Balsamics; that is, Balsamic Medicines, of which *Hoffman* gives the ensuing Account:

Balsamic Medicines are of a Nature somewhat hot and acrid. Under this Denomination come what we commonly call cephalic, nervous, apoplectic, and antiparalytic Medicines; as also spirituous Cordials, and other Substances of similar Natures and Qualities: But, of all the Medicines belonging to the *Balsamic* Class, these are the most noted and efficacious, Aloeswood, together with its Resin and Essence; yellow Sanders, with its Essence, reduced to a liquid Balsam; Ambergriſe; Liquid Amber; Balm of Gilead; Amber; Benzoin; Storax, with its Resin; the Ladaniferous Shrub, with its Resin; the Balsams of *Peru* and *Tolu*; Balsam of Capiui; and that call'd the red *American* Balsam; the true *Peruvian* Bark; the bitter Costus; *Indian* Bark; Cinnamon; Cloves; Cardamoms; Cubebs; Mace; Nutmegs; Savory; Thyme; Rue; Mother of Thyme; Lavender; our *Origanum*, and that of *Crete*; *Margoram*; our own and *Turkish* Baum; *Roman* Chamomile; *Syrian* Herb Mastich; Basil; Southernwood; Spikenard; Camel's-hay; Bay and Myrtle-leaves; together with the genuine, fragrant, and unadulterated Oils distill'd from them. The compound Balsamics are, the Apoplectic Balsam of *Crollius*; the Balsamum Cellense; that of *Scherzerus*; and the liquid Balsam of Life; Spirit of *Peruvian* Balsam, prepar'd in my manner; Spirit of Amber and Mastich; the Apoplectic Water of *Sennertus*; the *Aqua Anhaltina*; the true Essence of Amber; and volatile oily Spirits, impregnated with Oil of Cinnamon, Mace, and Cedar.

These Simples, and the Medicines prepared of them, by means of their fine, ethereal, subtil, and volatile Oil, which is grateful and agreeable to the Constitution, act upon the Fluids as well as the Solids of the human Body; diffuse their Virtues thro' all its Parts, supply the Blood and Humours, with a seasonable Reinforcement of sulphureous, warm, and ethereal Parts, increase their intestine Motions, and convey a genial Vigour to the vital Juices. They also abound in a subtil,

tile, acrid, balsamic Salt, by means of which they augment the Force and Elasticity of the Heart, Arteries, and muscular Fibres, in consequence of which, the Circulation of the Blood and Humours is promoted; the thick and viscid Juices attenuated, Obstructions are removed, and Perspiration is preserved entire, a Circumstance of the last Importance in curing Diseases.

In all Diseases therefore of the Head, Nerves, Spinal Marrow, Stomach, and Heart, which, according to the Antients, proceeded from a cold Cause, or, in other Words, from inspissated and condensed Juices, or from the Tone of the nervous and muscular Parts being destroy'd; such as Apoplexies, Palsies, Numbness, and Torpor of the Senses, Weakness of Memory, Difficulty of Hearing, Faintings, and excessive Weakness, these Medicines may be used both internally and externally with due Success.

They are also of singular Service in those Disorders of the Stomach and Intestines, which proceed from their Tone being too much weaken'd, an Excess of acid and viscid Crudities, or a deprav'd Digestion, such as Inflammations, Diarrheas, flatulent Colics, and Vomiting. Besides, they have this peculiar Advantage, that they are exquisitely suited and adapted to the Old and Infirm, to such as have the Misfortune of lax Habits, or phlegmatic Constitutions.

They are also of singular Service, especially as a Preservative, when, in consequence of a cold and moist Constitution of the Year, especially in the Autumn and Winter Seasons, and in the more Northerly Climates; moist Coughs, Diarrheas, pituitous Asthmas, oedematous Tumors, Coryzas, Rheumatisms, intermittent Fevers; and Disorders arising from a scorbutic Impurity, either actually rage, or are apprehended.

But they are to be used cautiously, and in moderate Doses, by young People, and Patients of choleric and delicate Constitutions, as also in Cases where the Body abounds with Blood and Humours.

I myself, for more than twenty Years, have used a liquid Balsamic, commonly called the *Balsam of Life*, prepared of the most efficacious of the above-mentioned Ingredients, especially the Oils genuine and unadulterated, which is a Medicine of so uncommon Efficacy, that the Person who knows how to use it right, both internally and externally, may rest satisfy'd without any other Corroboratives or Balsamics whatever. And, indeed, this delicious and efficacious Medicine is now universally celebrated; on account of its corroborating and restorative Qualities; but this, like all other valuable Medicines, has been counterfeited and sold to the Credulous and Unwary for my genuine *Balsam of Life*; but the supposititious is never able either to answer the Intention, or support the Character, of that Medicine. *Hoffman.*

See BALSAMUM.

See VITÆ BALSAMUM.

BALSAMINA.

There are two Plants which are called by this Name; the first of which is thus distinguished:

Momordica Balsamina, Offic. *Momordica*, Schrod. 4. 105. *Momordica Officinaria*, Volck. Flor. Nor. 293. *Momordica vulgo*, Hort. Lugd. Bat. 429. *Momordica vulgaris*, Tourn. Inst. 103. Elem. Bot. 87. Boerh. Ind. A. 2. 76. Rupp. Flor. Jen. 41. *Momordica*, *Balsamina*, *Cucumeraria*, *Pomum mirabile*, Chab. 135. *Momordica Balsamina mas*, Ger. 290. Emac. 362. Park. Theat. 714. *Momordica*, *Balsamina rotundifolia repens seu mas*, C. B. Pin. 306. Raii Hist. 1. 647. *Balsamina Cucumerina Indica*, folio integro, fructu variegato, Chom. in Not. Hort. Mal. 8. 22. Flor. Mal. 52. *Balsamina Cucumeraria*, J. B. 2. 251. *Cucumis puniceus Cordii*, Hist. Oxon. 2. 33. *Piperitis*, Tourn. Mat. Med. 357. *Balia-mucca-Piri*, Hort. Mal. 8. 21. Tab. 2. *Cucumerina Indica*, folio integro, fructu variegato, Chom. in Not. MALE BALSAM-APPLE.

It is cultivated in Gardens, and flowers in August.

The Fruit, which is the Part in Use, is of a refrigerating and somewhat drying Quality, a Vulnerary, and mitigates Pains, especially of the Hæmorrhoids. Outwardly, it is good for Wounds of the Nerves, Herniæ, and Combustion.

The Balsam which has been made for a long Time of the Fruit of this Plant dipt in Oil, and dry'd in the Sun, is of excellent Virtue in Wounds, Ulcers, especially the Hæmorrhoids, Ulcers of the Matrix, and Ruptures.

The other *Balsamina* is thus distinguished:

Periscaria siliquosa, CODDED ARSMART. Offic. Ger. 361. Emac. 446. Raii Hist. 2. 1328. Merc. Bot. 2. 28. Phyt. Brit. 90. Mer. Pin. 92. *Balsamina lutea*, seu *Noli me tangere*, C. B. Pin. 306. Tourn. Inst. 419. Elem. Bot. 332. Boerh. Ind. A. 320. Raii Synop. 3. 316. *Balsamina*, *Herba impatiens*, seu *Noli me tangere*, Floris petalo luteo, Hist. Oxon. 2. 282. *Noli me tangere*, J. B. 2. 908. Chab. 287. *Mercurialis sylvestris*, *Noli me tangere dicta*, seu *Periscaria siliquosa*, Park. Theat. 296. QUICK IN HAND, TOUCH ME NOT.

Vol. I.

It is cultivated in Gardens, and the Herb is in Use, which is so forcible a Diuretic as to induce a Diabetes, and is thought to be of a pernicious and deleterious Quality.

BALSAMITA MAS, *Costus hortorum*, Offic. *Balsamita mas*, Ger. 523. Emac. 648. *Balsamita mas*, seu *Costus hortorum major*, Park. Parad. 482. *Balsamita major*, Boerh. Ind. A. 125. Hist. Oxon. 3. 3. Act. Reg. Par. An. 1719. 280. *Costus hortorum major*, Park. 78. *Mentha hortenensis corymbifera*, C. B. 226. *Mentha corymbifera*, seu *Costus hortensis*, J. B. 3. 144. Raii Hist. 1. 363. *Mentha corymbifera Græca*, *Romana*, *Sarracenica*, seu *Costus hortensis*, Chab. 368. *Tanacetum foliis & odore Menthae*, Herm. Cat. 697. Tourn. Inst. 461. *Tanacetum hortense*, *Lepidii foliis serratis*, *Ageratum intense redolens*, Pluk. Almag. 361. *Tanacetum hortense*, foliis & odore *Menthae*, Hort. Lugd. Bat. 697. *Ageratum latifolium serratum*, Hort. Monsp. 7. *Mentha Sarracenica*, Offic. Ger. COSTMARY.

The Roots of Costmary are hard, long, and stringy; creeping in the Ground; the lower Leaves are about as big as Garden Mint, of a palish or yellow-green Colour, standing on long Foot-stalks, very neatly serrated about the Edges. The Stalks rise to be more than a Foot high, having several the like; but smaller Leaves growing on them, they are divided into Branches toward the Top, each of which is terminated by a thin Corymbus or Umbel of naked, deep, yellow Flowers, having no Petala surrounding them, but set in scaly Calyces, being lesser than the Flowers of Tansy. The whole Plant has a soft, pleasant Smell. It is planted in Gardens, and flowers in July.

The Leaves are chiefly used, being warm and drying, of Use to heat and strengthen the Stomach, and to ease the Head-ach, arising from the Disorders thereof, to expel Wind, and prevent sour Belchings. It likewise opens Obstructions of the Liver and Spleen, and is good for the Dropsy and Jaundice. Outwardly it is used in heating and warming Fomentations and Bathings, being good to comfort and strengthen the Limbs. *Miller's Bot. Off.*

BALSAMUM, Balsam. Of this there are many Sorts, both natural and artificial.

Under the Distillation of Turpentine, *Boerhaave* gives an Analysis of all the natural Balsams, as follows:

The VINEGAR, SPIRIT, two Kinds of OIL, ROSIN, and COLOPHONY, from TURPENTINE, distilled by the Retort.

1. Take a clean, new Glass Retort with a wide Neck, and cut it off short, so that the Mouth may remain large and capacious, which is a principal Requisite in this Operation; then heat pure native Turpentine in an earthen Vessel, having a Lip to pour out at, by putting the Vessel into scalding hot Water, till the Turpentine grows fluid like Water; then pour this melted Turpentine hot, in at the wide Mouth of the Retort, which is first to be strongly heated to prevent its cracking as the Turpentine is poured in. Let two Thirds of the Retort be thus filled, and leave the other Third empty; then hold the Retort, so filled, with its Neck erect, till the Turpentine shall have run quite down the Neck into the Belly, if any of it happen to stick to the Neck in pouring; otherwise this gross Turpentine would run down into the Receiver in the Distillation, and foul the Liquor that first comes over: Now place the Retort in a Sand Furnace, and lute on a clean Receiver.
2. Make a Fire that may heat the Sand to about one hundred Degrees, and carefully keep it at this Height, so long as it drives over any Liquor; by which means a thin, limpid Fluid, resembling Water, will come over, and fall to the Bottom of the Receiver, whilst another limpid, thin, and oily Liquor floats upon it. When nothing more rises with this Degree of Fire, change the Receiver; the under Liquor will be found gratefully acid, saline, aqueous, miscible with Water, refreshing to the Stomach, spirituous, and excellently diuretic. It will make an Effervescence with Chalk, deposit its Acidity therein, and afterwards distil from it in form of a pure Water: Whence we perceive, that the acid Salt and Water first come over in this Distillation. The other Liquor, which floats upon this, is a light, pure, thin, almost spirituous and inflammable Oil, thence called the *Ethereal Oil of Turpentine*, which is so penetrating as to vanish when rubbed upon the Body, pass into the Blood, and soon communicate a violet Smell to the Urine; which is an evident Sign of the Power it has to pass thro' all the Pores.
3. Let a proper Receiver be now applied, and a Heat, equal to that of boiling Water, be raised; this is done by pouring Water upon the Sand, and heating it with the Fire underneath, to two hundred and twelve Degrees, where it is to be kept, continually adding as much boiling Water as exhales away. The Matter remaining in

the Retort, after the first Operation, is left so thick as to appear consistent in the Cold; but now melts again, crackles between whiles, and again affords an acid Water, like the former, that falls to the Bottom, and an Oil also, like the former, floating at the Top, but somewhat thicker, and a little yellowish: Both of them have nearly the same Virtues as mentioned above.

4. The Receiver being again changed, and the Fire gradually increased up to a strong Degree of a Sand-heat, tho' with Caution in the raising it, there will come over an acid, ponderous, red Water, that runs separate into the Bottom of the Receiver, and a thick, red, penetrating, tho' somewhat viscous Oil floating on its Top; and it is remarkable, that this acid Water always continues to rise with the Oil, and not the Water first by itself, and the Oil afterwards. What now remains in the Bottom, after this last Distillation, proves, when cold, exceedingly red, hard, and brittle.
5. I have urged this remaining Matter with Caution, and by slow Degrees, up to the strongest Heat that Sand, and a Fire of Suppression, would afford; and have thus obtained red Oil, so thick and viscous, as to resemble Turpentine itself; but it was of a red Colour, and some red, acid, ponderous Water still continued to rise with it, leaving scarce any thing behind at the Bottom of the Retort.
6. There is the greatest Caution required in this Distillation, to prevent the Glasses bursting or cracking, whereby a dense, oily Fume would immediately escape, which readily takes Fire, and can scarce be extinguished; whilst the Fire is impetuously hurried into the Retort with a Flame that bursts the Vessels to Pieces in a dangerous manner. Turpentine is otherwise commonly distilled into an acid Water, an ethereal Oil, or Spirit of Turpentine, after this manner: Fill one third of an Alembic with pure Rain-water, and add thereto half its Weight of good Turpentine; then fix on the Head, and use the Worm and Refrigeratory. Thus distilling with Care, and a Fire that makes the Matter gently boil, there comes over an acid Water, and a pure light Oil. If the Distillation be continued so long as this Oil continues to run, there remains behind a kind of Colophony in the Still: And if the Flowers of Lavender, Roses, or other odoriferous Plants, be here put into the Still, the Oil will come over fragrant by this Operation. Therefore Turpentine is resolvable into Water, a saline, acid Spirit, a volatile Oil, and a more fixed Colophony. It is here chiefly remarkable, that the Remainder proves so much the thicker, redder, harder, and more brittle, the more Water, Acid, or volatile Oil comes over; and that even this last fixed Matter itself at length liquifies, and becomes volatile with the utmost Violence of the Fire: And this acid Water, being well separated and rectify'd from all its Oil, perhaps affords the best vegetable Acid hitherto known.

R E M A R K S.

1. Hence we learn under what Form native Oils reside in Plants; for, first, the nutrimental Juice, drawn from the Earth, seems to be a somewhat tart and aqueous Liquor, which, when received, gradually deposits its more unctuous Matter in certain Parts of the Plant; and this unctuous Matter afterwards uniting more of the same to itself, by Heat, Maturation, and the Assistance of the whole Powers of the Plant, it then appears in the Form of a fat Oil, which being driven outwards, and undergoing the same Changes in a greater Degree, at length constitutes a *Balsam*, containing a Water, a saline Acid, and unctuous Spirit, and different Kinds of Oil, all mixed together, yet separable; and after the Separation of any particular Part, the *Balsam* constantly changes to a different Form. Hence appears the great Difference of native *Balsams* in Chirurgical and other Medicinal Uses; whilst they act in their own Substance, and so by means of all their Principles together, or only by means of certain, particular, separated Parts. When used entire, and mixed with the Yolk of an Egg, Turpentine becomes somewhat more soluble, and an admirable Remedy for external Chirurgical Uses; and, internally, it proves excellent in many Distempers, where it gives Signs of its extraordinary Virtue, by its penetrating Nature, and the violet Smell it communicates to the Urine. We have many *Balsams* of this Kind, not differing so much in Virtue, as in Price and Place of Growth; as the *Asiatic*, *Egyptian*, *Hierichuntan*, *Judaic*, *Memphitic* *Balsams*, and *Balm of Gilead*; for these several Names at this Day denote the same thing; or a *white Balsam* in the Form of a liquid Turpentine, and of a citron Smell. The *American Balsams* are various, and proceed from different Trees; as the *Balsam of Capiivi*, which is of extraordinary Virtues; the *Balsam of Peru*, *Tolu*, and liquid Amber.

The true Turpentine proceeds from the Turpentine-tree of *Chio*, the Fir, the Larch, and the Pine; but all these Kinds generally resolve into the same Principles by Heat and Distillation, change alike with Time, and produce the same Effects.

2. We know, likewise, that all the Kinds we are hitherto acquainted with, contain an acid Water, or Spirit, which is volatile, preservative, esurine, and penetrating, of great Medicinal Virtue and Fragrance: This Spirit easily exhales, and leaves the *Balsam* deprived thereof, and therefore less excellent; whence these *Balsams* are not the better for keeping.
3. The Oils which first come over are light, limpid, totally inflammable, extremely penetrating, bitter, and of great Use in Surgery, as being highly anodyne, resolving, and healing, when apply'd warm to the Membranes, Nerves, or Tendons, that are lacerated, pricked or cut, and an immediate and safe Styptic, apply'd to the wounded Veins or Arteries in large Hemorrhages, as at once defending the Nerves, stopping Putrefaction, and incarning. In these Cases it should be apply'd very hot to the Part; and kept thereon by a proper Pledget and Bandage. Its *balsamic* or embalming Virtue is extraordinary; for if the Bodies or Parts of any Animals be for some time steeped in this Liquor, then taken out, and awhile suspended in the Air, and afterwards dipped afresh, they at length acquire a Case, under which they may be long preserved from Putrefaction: But the Bodies plunged into this Oil, whilst contained in Glasses, are preserved perfectly uncorrupted. It has, however, this Inconvenience, that it gradually grows opaque and thick. The Oil, being used hot externally, discusses cold, viscid, and mucous Tumors, defends the Parts against Cold, relaxes and softens them. When used internally, it also proves aperitive, heating, sudorific, and diuretic, communicating a quick Smell of Violets to the Urine: Whence it proves serviceable in the cold Fits of intermitting Fevers, and being rubbed along the Back-bone, before the cold Fit is expected, it will even cure Quartans. It must, however, be used with Caution, because, if taken too largely, it affects the Head, occasioning Heat and Pain therein, and also proves violently diuretic, and occasions an Effusion of the Liquor of the *Prostate Glands*, and the *Semen*; and therefore, if used with Moderation, it excites Venery. Hence it came to be recommended in the Cure of a Venereal Running, where it often proves mischievous, as being subject, when freely used, to inflame the Parts, and increase this Disorder.
4. The thicker Oils that come over in this Distillation are more *balsamic*, incarnative, and anodyne, more penetrating and emollient; and are therefore used as Styptics, instead of the former thinner *Balsam*, in hotter and more inflammatory Constitutions; in other respects they agree with the former. But the last thick and viscous Oil is an admirable Incarnative, that heals almost without Suppuration, and a most extraordinary Anodyne. This Oil also makes such an Effervescence with *Glauber's* strong Spirit of Nitre, as often to take Flame.
5. What remains behind upon the Distillation of pure Turpentine with Water, or after the first Oil and Spirit are drawn over, proves hard, brittle, transparent, and red in the Cold. If this be gently melted, and any Insect be dipped therein, and carefully taken out again, it will be surrounded with a transparent Case like Amber, thro' which the Subject may be commodiously view'd; and the Whole may be thus kept for a long time beautiful and unalter'd, provided the Polish be not obscured, as it easily is, on account of the great Brittleness of this resinous Crust. But the Colophony, remaining after the second Distillation, is harder and redder, and easily reducible to a fine Powder, which has little Smell or Taste. This is that extremely useful Powder, which is so advantageously apply'd to the bare Bones, Periosteum, Tendons, or Muscles, in case they are either burnt, corroded, bruised, cut, pricked, or lacerated; and affords an excellent Remedy in serous Fluxes of the Joints, and admirably procures a Cicatrix: In the same manner it takes down the fungous Excrescences of the Ulcers; whence it appears, that Turpentine serves for many Chirurgical Purposes. But nothing is here more extraordinary than the successive spontaneous Inspissation of the first exceeding thin Oil, so as to recover the Thickness of Turpentine again, and afterwards the Consistence of a thicker *Balsam*, and at length of a Rosin; tho' there is less Acid in these regenerated Rosins, than in the native.
6. Possibly, therefore, the native, acid, volatile Salt contained in this fat unctuous Substance, and in the Water, is the same Spirit, which, in other essential Oils, constitutes the aromatic Spirit; for it is so lodged in the native Fat, as, together with the Water, to lie concealed under the Form of one mixed Body: Whence natural *Balsams* are changed

changed into Oils, upon losing their Water, and their Rosin. Again, *Balsams* are changed into Rosins upon losing their Water, Acid, and Oil; whence this happens spontaneously with Time in the open Air, whilst the Action of the Sun, by dissipating the Acid, the Water, and the thin Oil; at length, through various Degrees, brings it to a Rosin. Whence Oils in the Spring are Rosins in the Winter, and in Autumn afford a proper Covering to Trees, so as to defend them from Cold, Dryness, and Frost.

7. This Experiment clearly shews, (1.) That the utmost Heat of the Sun, long continued, may gradually inspissate and change liquid Oils, through various Degrees of Thickness, up to that of Rosin or Colophony. (2.) That the Heat of boiling Water has this Effect sooner; and, by discharging the Oil, leaves a Colophony behind in four or five Hours time, whilst the exhaling Fume proves an acid Water, and a Spirit mixed among a large Quantity of Oil; the Colophony remaining hard behind. (3.) That this Colophony, being urged by an Heat of two hundred and eighty Degrees, is again resolved into an acid Water, and a red, viscous, ponderous Oil, leaving an extremely hard, transparent Colophony behind, of a Colour compounded of Red and Black, and capable of enduring unaltered for Ages. But when this itself comes again to be urged with the utmost Violence of a Fire of Suppression, so as almost to melt the Glass, its whole Quantity is, by the sole Force of the Fire, turned into an oily liquid Substance, though somewhat viscous, without leaving any hard Colophony behind. (4.) Whence we learn both the changeable Nature of vegetable Oils, and the surprising Variety of the Action of the Fire upon them, which, with a certain Degree of Heat, inspissates thin Oils, and brings them to an hard consistent Mass, that would always remain the same; though a greater Degree of Fire again reduces it to a liquid Oil, which likewise would long continue in this State; but, by a repeated Distillation with a strong Fire, it becomes totally liquid, and considerably thin; whence it is certain, that many Bodies owe their Hardness, and others their Fluidity, to the Fire. *Boerhaave's Chymistry.*

The very Word *Balsam* seems, in all Ages, to have had an Idea of Excellence and Efficacy affixed to it, above any other Branch of the *Materia Medica*; for the antient Physicians, by this Word, meant any Species of Medicine, which powerfully recommended itself by a grateful and delicious Fragrance, and whose Use, both internal and external, was of singular Efficacy in preventing Putrefaction, and resisting Corruption. *Balsams*, 'tis true, were originally used for embalming and preserving the dead Bodies of those, who, during their Lives, had signalized themselves by great and heroic Deeds, or endeared themselves to Mankind by the Practice of the several Virtues. And when the thinking and sagacious Part of Mankind observ'd, that the Bodies of the Dead, were, by means of *Balsams*, enabled to defy the Attacks of Corruption, for an immense Series of Years, they began to imagine, that their Virtues might extend to the Living, protract Life, and corroborate what they called the *Calidum Innatum* fluctuating in the Blood. But however unintelligibly they may have talked upon this Point, yet 'tis certain, the Notion itself was just and well-founded, since we are taught by Experience, that amongst the vast Variety and infinite Store of Medicines, with which the Mineral, Animal, and Vegetable Kingdoms supply Mankind, none are more powerful, none more efficacious, than those which come under the Denomination of *Balsams* and *Balsamics*. But as all *Balsams* are not alike efficacious, nor equally adapted to Medicinal Uses, I shall only consider those *Balsamics* which seem best calculated to answer the Intentions of Medicine, whether Preservative or Curative; and that I may execute the Design with the greater Accuracy, and afford the inquisitive Mind the higher Satisfaction, I shall specify the Principles by which they operate, enumerate their several Virtues, and give Directions with regard to their Uses. But, for the sake of Perspicuity, it will not be improper to inquire into the Origin of the Word *Balsam*, and ascertain the precise and determinate Idea, which I myself affix to it.

Since then the Inhabitants of *Palestine*, and the Coasts of *Phoenicia*, and perhaps their Neighbours the *Arabians* and *Egyptians*, were, according to the Accounts we have, the first who used *Balsams*, common Sense directs us to the Genius of the Oriental Languages for the Origin of the Name. Whether then it is a simple Word, which is most probable, and most consonant with the Genius of the Eastern Language, deriv'd from *בשם* *Bosem*, a Word peculiar to the *Hebrews*, for expressing the most fragrant and delicious Substances, in which other Nations have probably inserted an additional Letter, as in many other Instances they did; or whether with others we maintain, that it is compounded of *בשם* *Baal Schemen*, which signifies the Chief or Prince of Oils and Spices; yet still it amounts to the same, since by the Import of the Word, in both Cases, 'tis plain, that only

the best Spices, Oils, and Resins, and such as excell'd all others in their Virtues, the Fragrancy of their Smell, and the Sweetness of their Taste, were called *Balsams*. Neither shall I, in the Course of this Dissertation, affix any other Idea to the Word *Balsam* or *Balsamic*, than that of a Medicine possessed of a sulphureous, resinous, and oily Principle, which at the same time must be fragrant and friendly to Nature, and by means of which it operates: Two things must therefore concur to characterize and constitute a *Balsam*: The first is, that the greater Part of the Substance ought to be inflammable, that is, either of an oleous, or resinous Nature. The second Circumstance necessary to constitute a *Balsam*, is, that the Substance be of a grateful Smell, and pungent Taste, that it may give Proof of its Efficacy, and of the Smallness and Minuteness of its Parts: So that, according to this Hypothesis, all Sulphurs, and resinous Substances, as also all inflammable Oils, though of the Consistence of a *Balsam*, are yet to be excluded from the Class of genuine *Balsamics*, if they want that Fragrancy of Scent, and Deliciousness of Taste, which are requisite to constitute a *Balsam*. Thus Naphtha, or Rock Oil, *Jews Pitch*, Pitch, Resin of the Pine, the Oils of Turpentine and Fir, ought by no means to be ranked among the Class of *Balsamics*, though they are inflammable penetrating Substances, excellent for the Purposes of embalming, and promise very salutary Effects, both when used internally and externally. Yet because they abound in a too strong, acrid, and penetrating Sulphur, which is not altogether friendly and agreeable to Nature, they are therefore less fit for restoring lost Vigour, and recruiting impair'd Strength. Nor are Substances whose sole Property is Fragrance of Smell, such as Civet, Musk, and the fragrant Flowers of Jessamin, Oranges, or the Hyacinthus Tuberosus, to be properly esteemed *Balsamics*, because Fragrancy alone, which is owing to a fine and easily exhald Sulphur, is not sufficient to constitute a *Balsam*; but 'tis necessary, that this fragrant Principle be blended and incorporated with a subtile acrid Oil, and an inflammable Resin.

BALSAM of MECCHA.

'Tis therefore justly to be doubted, whether a true and genuine *Balsam* is to be found in the Animal Kingdom. Mean time the Vegetable Kingdom is richly stored with Medicines of this Class, of which the most antient, and that which first bore the Name of *Balsam*, is the *Opobalsam*, both *Arabic* and *Egyptian*. This was produced by a small Tree growing in *Judea*, *Egypt*, and *Arabia*, the Whole of which was of a fragrant Smell; and when an Incision was made into its Bark, it yielded a resinous Juice of a most grateful Odour, and of uncommon Virtues. The Antients called the Wood of this Tree *Xylobalsamum*, and its Fruit *Carpobalsamum*; but the Name *Opobalsamum* was appropriated to its Juice or Tears. Of this Tree, *Strabo* the Prince of antient Geographers gives us the following Account, *Lib. 16.* "There is a Field near *Fericho* in *Palestine*, in which there is a Nursery of *Balsam-trees*. "This Tree is a certain small, odorous, aromatic, and fruticose Tree, not unlike the *Cytifus*, or Turpentine-tree. "When an Incision is made into its Bark, it yields a Juice resembling viscid and tenacious Milk, which, when received in Shells, coagulates. It wonderfully cures Head-achs, recent Inflammations of the Eyes, and Heavinesses; and what contributes much to the Value of this Medicine is, that it is found no-where else but here." *Prosper Alpinus*, the most accurate Describer of the *Egyptian* Plants, agrees with this Account, and in *Tract. de Plant. Egypt.* writes thus: "The *Xylobalsam* is a small Tree, which grows to the Height of the *Cytifus*, bearing few Leaves, which resemble those of Rue, or those of the Mastich-tree, but which are always green. Its Branches are odorous, and so gummy, as to stick to the Fingers when handled. It bears small white Flowers resembling those of the *Egyptian* Thorn, but very fragrant, from which arise yellow Seeds, contained in Husks of a blackish red Colour, very fragrant, and containing within them a yellow Juice, which bears a near Resemblance to Honey; and which affects the Tongue with a bitter, and somewhat acrid Taste, and smells like *Opobalsamum*. Its Fruit, in Figure and Bulk, resembles that of the Turpentine-tree." 'Tis to be observ'd, that several Authors assert, that this Tree does not grow naturally in *Judea*, but was brought into it when a great many other Plants were transplanted from *Meccha*, a Town of *Arabia Felix*, into *Palestine*, whence they were convey'd into *Egypt* in the Days of *Mark Antony* and *Cleopatra*. Many are of Opinion, that there is now no such thing as the true *Opobalsam*, and that the genuine Species, of old produced in *Egypt*, is not to be met with in any Part of the World; for that which is sold for *Opobalsamum* in small Boxes made of the Shells of Nuts, is, in their Opinion, composed of *Peruvian Balsam*, *Benzoin*, and *Storax*, as *Pomet*, in his History of Drugs, informs us. But it seems pretty probable, that there is at this very Day such a thing as true *Opobal-*

Opobalsamum; for that brought from *Meccha*, which is called the *Balsam of Meccha*, and is described by a great many Authors, is of equal Efficacy with the *Opobalsamum*. It is a Liquor of an oleous Nature, as thick as Turpentine, of a penetrating and grateful Taste and Smell. It is sold at a very high Price, since half an Ounce of it cannot be purchased under two Imperials (about one Pound five Shillings). *Clisius*, in *Exoticis*, is of the same Opinion with regard to the *Opobalsamum* being still in the World; for in *Lib. 10. Sect. 9. de Balsamis*, he has these Words: "*Arabia Felix*, the Country which has in all Ages, and now does produce balsamic Plants, affords true and genuine *Opobalsamum*."

This *Balsam* was always had in so great Esteem by the Antients, that they made it an Ingredient in their most noble Antidotes, which were sold for double their Weight of Silver, according to *Theophrastus*, *Pliny*, and *Dioscorides*. This is easily accounted for, since the *Balsam-tree* being very small, and not able to afford a great Quantity of the *Opobalsamum*, its Price must of course have run high. This also was the Reason why the *Opobalsamum* of the Antients, according to *Lobelius* in *Animadversionibus*, was often vitiated with Cyprus Turpentine, or Oil of the Mastich-tree. Since then the *Balsam of Meccha*, of all others the finest, is, without Doubt, the true *Opobalsamum* of the Egyptians, and exactly resembles it in all its Qualities, its Use in Physic is for this very Reason to be highly commended; for of this, dissolved and prepared with a spirituous Menstruum, in which Amber is intimately mixed, very efficacious and elegant Medicines may be prepared for internal Use. *Hoffman*.

This precious Balsam-tree is thus distinguish'd:

BALSAMUM JUDAICUM, GILEADENSE, & MECHAVERUM, & *Opobalsamum*, seu Oleum Balsami, sive Balsamelæon, Offic. *Balsamum Judaicum*, Ind. Med. 18. *Balsamum de Meccha Judaicum*, Gileadense, *Opobalsamum*, Commel. Plant. Ufu. 85. *Balsamum de Meccha*, *Balsamum verum*, Mont. Exot. 16. *Balsamum verum*, J. B. 1. 298. Chab. 24. Raii Hist. 2. 1755. *Balsamum genuinum antiquorum*, Park. Theat. 1528. *Balsamum ab Egyptiis Balesan*, Alp. Egypt. 60. *Balsamum*, Velling. Obf. 17. *Balsamum Alpini*, Ger. 1343. Emac. 1528. *Balsamum Syriacum*, *Ruta folio*, C. B. Pin. 400. THE TRUE BALSAM-TREE.

This is the thin or liquid Rosin of a small Tree or Shrub, that grows about *Meccha* in *Arabia*, bearing ever-green pinnated Leaves, in Shape like those of the *Lentiscus* or Mastich-tree, with an odd one at the End of the Stalk. It bears small fix-leaved whitish Flowers on the Top of the Stalk, which are followed by little roundish rugged Fruit, pointed at the End. This Fruit, which is the *Carpobalsamum*, and the Wood, which is the *Xylobalsamum*, are prescribed in some old Compositions; but by reason they are not to be had in the Shops, other things are substituted in their Places.

This is a resinous Liquor, which at first is of the Consistence of sweet Almonds, but by Age becomes like Turpentine, loses much of its Smell, and grows sometimes blackish. When fresh, it is of a very agreeable aromatic Smell, and of a Taste like Citron-peel. The Plant, from which it flows, is called *Balsamum Syriacum*, folio *Ruta*, C. B. P. M. Lippi, sent by Lewis the XIVth Ambassador to the Emperor of the *Abyssines*, being in *Egypt*, was at great Pains to discover this Plant, and the ways of procuring the *Balsam* from it. The Substance of what he could find out is, that there are three ways of collecting it, and that there is some Difference in the Liquors collected each way. The first runs of itself from the Tree, the second by Incisions, and the third is got by boiling the Tops of the Trees. The *Balsam*, that rises first after a gentle Decoction, is very good, and much esteemed; but what is got afterwards, is the coarsest Sort, and of least Value. The first kind of *Balsam* is sent entirely to the Seraglio of the Grand Signior; the other Sorts are suffered to be exported. This *Balsam* is not now to be found in *Judea*, which was its ancient native Soil, and where it was very common before the Destruction of *Jerusalem*; but soon after that, the *Jews* destroyed all their Trees, lest the *Romans* should make Advantage of them. At present, it is found near *Meccha*, and *Grand Cairo* in *Egypt*, from whence it is carried to *Constantinople*, where it is in great Esteem. In *Asia* it is given in the Quantity of two Scruples, as a Diaphoretic in malignant Fevers; and it is undoubtedly an excellent Medicine for deterring Ulcers in the Lungs, Kidneys, and Bladder, and even for dissolving pulmonary Concretions. But the Use of it ought to be avoided in inflammatory Dispositions of these Parts, even tho' ulcerated. It ought likewise never to be given when there is an Erysipelas in any Part of the Body whatever. It is used with good Success in Gonorrhæas and the Fluor Albus, being given from ten to twelve Drops early in the Morning fasting, the Patient's Body having been well prepared, and the Running having continued some time. It is used externally in Wounds without Contusion, as a Detergent.

The Ladies in *Asia* use it as a Cosmetic, and especially in the Seraglio of the Grand Signior. In *France* the Ladies for-

merly prepared a kind of *Lac Virginalis* with the yellow *Balsam of Meccha*, dissolved in Spirit of Wine; but they were soon tired of this Method, because it leaves a Crust on the Face. The true Manner of preparing this Cosmetic, is as follows:

Take *Balsam of Meccha*, and Oil of sweet Almonds, of each equal Parts; mix them well together into a kind of *Nutritum*. On three Drams of this *Nutritum* in a Matrafs, pour six or seven Ounces of Spirit of Wine, and leave them in Digestion, till a sufficient Tincture is extracted. Then separate this Tincture from the Oil, and pour about an Ounce of it into eight Ounces of Bean-flower Water, or any other Water of the same kind.

This Mixture is a *Lac Virginalis*, which will answer all the Intentions of a Cosmetic, without any Inconvenience. The *Balsam of Meccha* is an Ingredient in the *Theriaca* and *Mithridate*. *Geoffroy*.

Though the *Balsam of Meccha* is by most Authors agreed to be the same as the *Opobalsamum*, yet *Pomet* seems to think them somewhat different. This Author, speaking of the *Balsam of Judea*, says, That the *Turks* have transplanted the Trees which produce this *Balsam*, from *Judea*, to Gardens in *Grand Cairo*, where they are guarded by several *Janisaries* during the Time the *Balsam* flows. A Friend of mine, who has been at *Grand Cairo*, assured me, it was impossible to get a Sight of these Shrubs, except over the Walls that inclose them, the Entrance being prohibited to the *Christians*. And as to the *Balsam*, it is almost impossible to get any upon the Place, unless it is by means of some Ambassador at the *Porte*, to whom the Grand Signior has made a Present of it, or by the *Janisaries*, who watch this precious *Balsam*; by which we may understand, that what several Cheats pretend to sell for true *Balsam*, is nothing but white *Balsam of Peru*, which they prepare with Spirit of Wine rectified, or with some Oils distilled.

But as it is met with sometimes amongst the Curiosities of People of Distinction, so in 1687. there happened to be a Quantity amongst those of *Madame de Villefavin*, amounting to about fourteen Ounces in two leaden Bottles, as it came from *Grand Cairo*, which was sold to a Person who let me see it. We found it to be very hard, of a golden-yellow Colour, and a Smell like that of a Lemon. But, since that, a Friend of mine gave me one Ounce, which he brought himself from *Grand Cairo*, and was of a solid Consistence, like that of Turpentine of *Chio*, and of the Smell abovesaid, which is the true Sign of its Goodness. *Pomet*.

I don't know, that I ever saw the true *Balsam of Judea* more than once. It answers exactly the above-mentioned Characteristics, and was brought from the East, on purpose for the Use of the late Prince George of Denmark.

Every Druggist in *London* will sell what is pretended to be *Opobalsamum*; but by what has been said it appears, how cruelly both Physician and Patient are frustrated in their Expectations, when instead of this precious *Balsam*, one of a very different Kind is substituted in its Room.

Pomet, speaking of the *Balsam of Meccha*, says, The *Turks*, who go a Pilgrimage every Year to *Meccha*, bring from thence a certain dry white *Balsam*, in Figure resembling white Copperas calcined, especially when it is stale. The Person who made me a Present of about half an Ounce, assured me, that he brought the same from *Meccha* liquid; and that, as a Cosmetic, it is equal to the *Balsam of Judea*. *Pomet*.

I cannot think this a sufficient Reason for supposing the *Balsam of Meccha* different from that of *Judea*, contrary to the Opinion of most Authors.

Dioscorides gives the following Account of the true *Balsam*.

The *Balsam-tree* grows to the Bigness of the *Lycoium*, (*Ly-cium*, according to some) or *Pyracantha*, and has Leaves like Rue, but much whiter, and far more an Evergreen. It grows in a certain Valley of *Judea* only, and in *Egypt*, differing in respect of Roughness, Tallness, and Slenderness. The fine and capillaceous Part of the Shrub is called *The Gatherings* [*θῆσεις*], perhaps, because its Slenderness renders it easy to be gathered. What they call the *Opobalsamum*, is taken in the Heat of the Dog-days, from Incisions made in the Tree by Iron Instruments, of the Figure of human Nails; but so little distils, that they collect no more than six or seven Choæ [see *CHOA*, or *CHUS*] yearly, which is sold upon the Spot, for double its Weight in Silver.

The Juice of *Balsam* which is good, is new, smells powerfully, is pure, not inclining to Sourness, is easily diluted, smooth, astringent, and moderately biting upon the Tongue. It is adulterated several ways; some mix with it Ointments, as those of Turpentine, the Cyprinum, Lentiscinum, the Sufinum, Balaninum, and Metopium, (See these in their proper Places) Honey, and Cerate of Myrtle, or very liquid Cyprian. The Fraud is easily discovered in the following manner.

The pure *Balm*, if dropped upon a woollen Garment, may be washed off without leaving the least Stain or Mark; but the adulterated

adulterated sticks to the Place. The pure also, dropp'd into Milk, coagulates it, which the adulterated will not do. Again, the pure, if pour'd into Milk or Water, is instantly mix'd with it, and turns milky; but the adulterated swims on the Top; like Oil, contracting itself into a Roundness, or diffused abroad in the Figure of a Star. Moreover, the pure *Balm* grows thick with Age, and loses its Virtue. They are mistaken who imagine, that pure *Balm*, when dropp'd into Water, first sinks to the Bottom, and afterwards rises to the Top, and freely diffuses itself.

The Wood call'd *Xylobalsamum* is known to be good by its Newness, its being in slender Branches, its red Colour, and Fragrancy, diffusing its Odours in some measure like the *Opobalsamum*. Chuse such Seed (since this also is necessary to be used) as is of a yellow Colour, plump, large, ponderous, of a hot biting Taste, and smelling, in some moderate Degree, like *Opobalsamum*. The Seed is brought from *Petra*, and resembles that of *Hypericum*, with which it is also adulterated; but you may know the *Hypericum*-seed by its Excess in Bigness, its Vacuity, Want of Virtue, and a Taste like Pepper.

The Juice is of extraordinary Virtue, as being of a very heating Quality, by which it deterges whatever darkens the Pupil of the Eye; and, used as a Pessary, with Cerate of Roses, cures Refrigerations of the Uterus, provokes the Menfes, and expels the Birth and Secundines. In Shiverings, being used as an Ointment; it causes a Solution thereof; and deterges the Filth of Ulcers. Drank inwardly, it helps Digestion, and provokes Urine; and is good for such as are troubled with a Difficulty of Breathing. Taken in Milk, it helps those who have swallow'd *Aconitum*, or been bitten by Vipers. It is an Ingredient in *Acopa*, *Malagmas*, and *Antidotes*. Universally speaking, the Juice of the *Balsam-tree* has the greatest Efficacy; next to this the Seed, and the Wood least of all. The Seed, drank, is good for the Pleurisy, Peripneumony, Coughs, Sciatica, Epilepsy, Vertigo, Orthopnea, Gripes, Difficulty of Urine, and the Bites of Vipers, and other venomous Beasts. It is also well accommodated for Suffumigations, in Disorders incident to the Female Sex; and the Decoction, used in Infections, opens the Uterus, and exhausts its Humidities. The Wood has the same Virtues as the Fruit, only in a lower Degree. Boil'd in Water, and drank, it helps Indigestion, the Gripes, the Bites of venomous Creatures, and Convulsions. It also provokes Urine, and, with dry'd Iris, is proper for Wounds of the Head, and promotes the Exfoliation of Bones. It is also mix'd with Ointments for their Inspissation. *Dioscorides*, Lib. I. Cap. 18.

BALSAM of TOLU.

The *Balsam of Tolu* justly deserves our next Consideration; since, in our own Days, 'tis by many used as a Succedaneum to the *Opobalsamum*. It is brought from the Town of *Hiobi* or *Tolu*, in a Province of *New Spain*, situated between *Carthage* and *Nombre de Dios*, and is yielded by a Tree resembling the Pine, according to *Ray* in his History of Plants. It is of the Colour of Gold, and smells like a Lemon, especially if it is rubb'd between the Palms of the Hands. It is dry, solid, and pellucid. This *Balsam*, dissolved in tartariz'd and highly rectified Spirit of Wine, affords an Essence, which is both grateful and efficacious in several internal and external Disorders.

The Tree which produces this *Balsam*, is thus distinguish'd.
BALSAMUM TOLUTANUM, Offic. *Balsamum Tolutanum*, foliis *Ceratiae similibus*, quod candidum, C. B. Pin. 401. Chom. 626. *Balsamum Tolutanum*, Mont. Ind. Exot. 12. Ind. Med. 18. *Balsamum de Tolu*, Park. Theat. 1570. J. B. 1. 296. Raii Hist. 2. 1758. De Laet. Ind. Occid. 367. *Balsamum Provinciae Tolu*, *Balsamifera*, 4. Hern. 53. *Arbor Balsamifera Tolutana*, Jonst. Dendr. 308. THE BALSAM-TREE OF TOLU.

Balsam of Tolu is brought to us in small *Callibashes* from *Tolu*, a Province in the *West-Indies*. It is of a tough resinous Consistence, growing dry and friable by Age, of a yellow-brown Colour, of a most fragrant Smell, and an aromatic Taste. It is not certain from what Tree this is produced, some saying it is a small Pine-tree, others a Tree resembling the Carob-tree.

This is an excellent pectoral *Balsam*, of great Service in Affections of the Lungs, as Coughs, Asthmas, Consumptions; and what makes it more valuable is, that it has no nauseous oleaginous Taste, as most other *Balsams* have. It makes an agreeable Emulsion, with Sugar and the Yolk of an Egg. It is very restorative, and good to strengthen the *Vesiculae seminales*, and to stop old Gleet and Strains in either Sex.

The only official Preparation of this *Balsam* is the *Syrupus Balsamicus*. *Miller's Bot. Off.*

It is good to deterge and consolidate Wounds; it resists a Gangrene, strengthens the Nerves; is good for a Rheumatism, or a Sciatica, being externally apply'd.

The Dose is from one Drop to four Drops. *Lemery des Drogues*.

Geoffroy adds, Being held in the Mouth, it has no Acrimony, in which it differs from all the rest; and for that Reason it is

prefer'd for internal Use; being given from fix to eight Grains. *Geoffroy*.

The *Balsamic Syrup* is thus made:

Take of *Balsam of Tolu*, two Ounces; and twelve Ounces of Spring-water, or any of the Pectoral Waters: Boil them together in a circulatory Vessel, well luted, in a Sand-heat, for two or three Hours. When the strain'd Liquor is cold, dissolve in it twenty Ounces of fine Sugar, so as to make it into a Syrup, without any Heat.

This hath not been received by the College till the last Emendation of their Dispensatory, but is added by *Shipton* to their former, amongst his *Addimenta*. The Manner of Boiling is very justly contrived to prevent any Loss of the finer Parts by Exhalation, which it would suffer in an open Heat: *Quincy's Dispensatory*.

BALSAMUM PERUVIANUM.

The next I shall consider, is that which is brought from *America*, and *New Spain* in *Mexico*, and is call'd *Peruvian* and *Indian Balsam*; the various Species and Differences of which are enumerated by *Pomet*, in his History of Drugs. It is, however, commonly distinguish'd into two Sorts, the White, and the Black. The former is accounted the best, and is, by way of Eminence, call'd the *Balsam of Incision*; because, according to *Monardus*, it flows spontaneously from a Tree of a large Size, upon making a slight Incision in it. It is limpid, of the Consistence of Turpentine, of a fragrant Smell, and much scarcer and dearer than the black Sort; but we are to take care, that it is not adulterated with *Venice Turpentine*, and sold for the genuine *Balsam*. The black Sort, of which great Quantities are imported to us, is, according to *Clusius* in his *Comment. in Monardum*, prepar'd and extracted by boiling the Branches, Bark, and Leaves of the Tree. The genuine Sort is of a brownish Colour, of a penetrating and fragrant Taste and Smell: It is also fluid, and the Whole of it is quickly dissolved in highly rectified Spirit of Wine. But it is to be lamented, that this very *Balsam* is, in our own Days, so commonly adulterated, in all Probability with liquid Storax, or perhaps with the Feces which remain after the Preparation of *Peruvian Balsam*, that it is scarce to be found genuine any more in the Shops. That which is adulterated, may be easily distinguish'd from the true and genuine Sort; for the former is thick and coagulated, wants the penetrating Smell and Taste, and is with the greatest Difficulty dissolv'd in Spirit of Wine, but remains like a thick and oleous Magma. But of the true Sort very elegant Medicines are compos'd; for when it is dissolved in highly rectified Spirit of Roses, it affords an Essence of excellent Qualities. When one Part of this *Balsam* is intimately mix'd, in a Mortar, with an equal Weight of Salt of Tartar, and highly rectify'd Spirit of Roses is pour'd upon it, upon being subjected to Distillation in a Sand-heat, it affords a fragrant and delicate Spirit, which is a Medicine of singular Efficacy, especially if exhibited in a Solution of Amber or Musk. This Medicine, used internally, restores lost and impair'd Strength; and, being very friendly to the nervous System, it powerfully contributes to remove those Disorders which arise from its Weakness. An extemporaneous *balsamic Syrup*, of many and great Uses, may be made, by mixing an Ounce of it with one Pound of Julap of Roses. This Syrup is conveniently mix'd with stomachic and cephalic vinous Spirits: It also gives a grateful and agreeable Taste to Potions and Mixtures. If *Peruvian Balsam* is distill'd with the Worm and Refrigeratory, it not only gives the Water a grateful Smell, like that of the *Balsam itself*, but also renders it nervous and diuretic. This Water, liberally drank, is of excellent Service in chronical Disorders, arising from the Scurvy, and a Weakness of the Nerves. 'Tis curious to observe, that on the Top of this Water swims an ethereal and very sweet Oil, which quickly incorporates with highly rectified Spirit of Wine.

The white *Peruvian Balsam* is thus distinguish'd.
Balsamum Peruvianum album, seu *Syrax alba*, Ind. Med. 18. *Huacoxet vel Balsamifera*, 11. Hern. 52. *Balsamum album*, Park. Theat. 1570. *Balsamum Peruvianum album*, Geoff. Tract. 349. WHITE PERUVIAN BALSAM.

The black *Balsam* is thus distinguish'd.
Balsamum Peruvianum, Offic. Ind. Med. 17. Mont. Exot. 12. *Balsamum Peruvianum nigrum*, Park. Theat. 1570. *Balsamum ex Peru*, J. B. 1. 294. *Hoitziloxitl seu Arbor Balsami Indici*, seu *Balsamifera*, Hern. 1. 51. *Hoitziloxitl Mexicanorum*, Jonst. Dendr. 309. *Balsamum Hutzochitl*, Laet. Ind. Occid. 224. *Caburiiba*, Marcg. 137. *Cabureiba Pisen*, (Ed. 1648.) 57. *Cabureiba seu Balsamum Peruvianum*, Ejusd. (Ed. 1657.) 119. THE NATURAL BALSAM-TREE.

This black *Balsam of Peru* is of a warming, strengthening Nature, comforting the Brain, and nervous System; is useful in Asthmas, the Colic, and Pains in the Stomach and Bowels.

Outwardly

Outwardly used, it strengthens the Nerves, helps the Cramp, and all kinds of Convulsions, and Contractions of the Sinews, old Aches and Pains; and is very serviceable in Cuts, and green Wounds. *Miller's Bot. Off.*

Pomet informs us, that the *Portuguese* make an artificial *Balsam of Peru*, which they sell to the *Dutch*.

Hoffman gives the following Processes on the *Peruvian Balsam*.

That the *Balsam* imported from *Peru* in *America* is possess'd of very singular and efficacious Qualities, is sufficiently obvious from its fragrant Smell, and aromatic Taste. It was at first only used as an external Medicine; but, in Process of Time, some Physicians and Chymists began to use it internally, sometimes mixing it with Pills, at other times dissolving it in highly rectified Spirit of Wine; and on other Occasions incorporating it with Sugar, or any other Ingredients they thought most likely to answer their Intention.

But, as far more powerful and efficacious Remedies than these may be obtain'd from it, by the Assistance of Chymistry, I shall here give an Account of the Processes I subjected it to.

First, by distilling it with common Water, with the Worm, I obtain'd a highly fragrant Oil, of a reddish Colour, and entirely free from all Empyreuma; but 'tis to be observed, that half a Pound of the *Balsam* scarce afforded half an Ounce of this Oil, which dissolves in highly rectified Spirit of Wine, of which it requires a large Quantity to procure its Solution. When dissolved in highly rectified Spirit of Roses, it is very properly mix'd with the Essences of Amber, Ambergris, and Aloeswood, since by its means their balsamic and corroborative Virtues, in Diseases arising from a Weakness of the nervous System, are considerably increased and improved.

Secondly, from *Peruvian Balsam* I prepar'd a most pure and delicate Spirit, in the following manner: I intimately mix'd two Parts of the *Balsam* with one Part of Salt of Tartar, by means of Trituration and Levigation, adding a sufficient Quantity of the best Spirit of Roses. Then I subjected the Whole to a regular Distillation from an Alembic, which was placed in moist Sand: Thus, by carefully keeping up the due Degrees of Fire, I drew off the Whole of the Liquor to Dryness. By this Process I obtain'd a Spirit of a fragrant Smell, and grateful Taste, but which was still more valuable on account of its analeptic and corroborating Qualities. I also observed, that this Spirit was very efficacious in promoting a Discharge of Urine, a Circumstance which renders it highly proper for preventing fabulous and stony Concretions in the small Tubes of the Kidneys. One Dram of this Spirit, mix'd with three Ounces of the Julap of Roses, is immediately converted into a balsamic Syrup of singular Efficacy, and which is to be justly prefer'd to all other Syrups, on account of the delicate and grateful Taste it communicates to Medicines.

Thirdly, I have, for several Years past, made very frequent Use of a volatile balsamic Spirit, prepar'd by an Affusion of highly rectified Spirit of Wine, upon a Mixture of equal Parts of the volatile Salt of Ivory, Salt of Tartar, and *Peruvian Balsam*. This Spirit, on account of its discutient and diaphoretic Virtues, and its Efficacy in restoring Strength, and a due Tone, to the Parts, is used with uncommon Success, in those Disorders incident to cold Constitutions, where 'tis proper to excite a brisker Motion in the Mass of Blood and Humours, and augment Transpiration; and I do, with good Reason, affirm, that it is far preferable either to the Spirit of *Bussius*, as 'tis call'd, or to the balsamic Spirit. *Hoffmanni Observ. Physico-chym.*

The Manner of making artificial BALSAM of PERU.

Take fine Turpentine, white Frankincense, of each one Pound; Oil of Ben, Olibanum, Labdanum, Gum Elemi, of each six Ounces; Lavender-flowers and Nutmegs, of each four Ounces; Spikenard, Wood of Aloes, and Dragon's-blood, of each one Ounce and a half; the small Valerian, Orrice, long Birthwort, Acorus verus, Gale, Benjamin, Storax, of each one Ounce; Zedoary, Malingals, Cloves, Cinnamon, Castor, and Mastich, of each six Drams: Powder all the Drugs grossly; then melt the Turpentine, Frankincense, Gum Elemi, and Oil of Ben, over the Fire; and, when they are dissolved, incorporate the Powders; and when they are made into a Paste, put them into a Glass Retort, whereof one Part is empty; and, after it is well luted and dried, set it upon a Sand-furnace; and, when the Matter begins to heat, there will flow a clear Water, then an Oil of the Colour of Gold, at last a black Balsam, tending to Red, which some would have to be what we sell by the Name of *Black Balsam of Peru*. The Water is proper to be taken inwardly, by those who have the Falling-sickness, Convulsions, Weakness of the Stomach, and to correct Wind. The Oil is good for the Palsy, Nerves that are wounded, Pains in the Joints, rubbing them with it hot. As to the *Balsam*, the same Virtues with that of *Peru* are attributed to it. *Pomet*.

Foreigners, who read the Advertisements in our News-papers, may reasonably be surpris'd at our Bills of Mortality; for there is scarcely a Distemper incident to human Nature, but, according to the Proprietors of advertised secret Remedies, may be cured easily and effectually by some or other of their Medicines, which are always taken from some Medicinal Writer. There are at least ten different People in Town, who get a very handsome Subsistence by selling a secret *Balsam*; which is the same as, in many Families, goes by the Name of the *Jesuit's Drops*, or *Frier's Balsam*. It is much celebrated in foreign Countries, by the Name of *Baume de Commandeur de Berne*; and is really an admirable Medicine.

Pomet gives the following Receipt for its Preparation, which is said to be the best known.

BALSAMUM COMMENDATORIS, or The BALSAM of the Commander of BERNE.

Take dry *Balsam of Peru*, one Ounce; Storax in Tears, two Ounces; Benjamin in Tears, three Ounces; Aloes Succotrine, the best Myrrh, Olibanum in Tears, Roots of *Bohemian Angelica*, Flowers of St. John's-wort, of each half an Ounce; Spirit of Wine, one Quart: Bear all together, and put them into a Bottle well stopp'd, which hang in the Sun during the Dog-days; at the End of which Time the Whole must be pass'd thro' a Linen Cloth, and used for the Purposes under specified:

First, all Gun-shot Wounds, and such as are made with sharp Instruments, if they are not mortal, are cured in the Space of eight Days, by the Application of this *Balsam*, either with a Feather, Cotton, or by way of Injection, provided the Wound has been first of all dress'd with it, and no other Medicines have been used; for when the Wound is at first dress'd with it, no Pus will afterwards be form'd; whereas the Generation of Pus is always the Effect of Dressing with the ordinary Medicines. There is no Occasion either for Tents or Plaisters when this *Balsam* is apply'd, especially at the first Dressings. Upon its first Application to the Wound, it creates an intolerable Pain; but that soon goes off, and is no more felt. This *Balsam* is so admirable a Remedy for the Colic, that if four or five Drops of it are intimately mix'd with a Glass of Wine, and drank, the Patient's Indisposition is soon after removed. It is also a sovereign Remedy for the Gout, when apply'd to the Part affected with a Feather or Cotton. In a Tooth-ach it is of singular Service, when Cotton, soak'd in it, is apply'd to the Tooth affected. All sorts of Ulcers, as also Cancers and Chancres, are cured by it. It is effectual against the Bites of venomous Animals, those of mad Dogs not excepted. It prevents Pitting by the Small-pox, if the Pustules are anointed with it as soon as they appear on the Face; for it dries them before Pus is form'd in them, upon which Circumstance the Pitting depends. It proves an excellent Remedy for the Hemorrhoids, if they are rubb'd with it when the Patient goes to Bed. It is excellent for Defluxions and Bruises, if the Parts affected are anointed with it. Five or six Drops of it, exhibited internally, in four or five Spoonfuls of Broth, prove an excellent Remedy for the Purple Fever. It is also good for sore Eyes, when put into them with a Feather. It is also excellent for Pains of the Stomach; in which Case, if the Patient is feverish, he must take it in Broth; and if not, in Wine. It cleanses the Stomach, and procures an Appetite. It must never be warm'd, but always be apply'd cold, and it becomes dry as soon as it is apply'd to the Part affected. Five or six Drops of it, taken in Wine or Broth, are very proper for provoking the Menfes, when defective; and giving a Check to them, when too luxuriant. When we pour out any Quantity of this *Balsam*, we must stop the Phial immediately after, to prevent its Evaporation. If any Wound has been previously dress'd with other Medicines, it must be wash'd with warm Wine before the Application of this *Balsam*, which will cure it effectually, tho' not so speedily as if the *Balsam* had been used at first. It cures Fistulas, however old, and in whatever Parts of the Body. Five or six Drops of it, exhibited in white Wine, or in three or four Spoonfuls of Broth, are an excellent Remedy for Fluxes and Hemorrhages. It is good for the Pricking of Horses, when shoed: By pouring a Drop or two into the Hole from which the Nail is drawn, it is cured immediately.

BALSAM OF CAPIVI.

I now come to take a View of the *Balsam of Capivi*, or *Copaiba*, which has universally acquired so uncommon a Reputation. It is produced in *Brazil*, and brought to us in Earthen Vessels by the Way of *Portugal* from *Rio de Janeiro*, *Fernambouc*, and *St. Vincent*. It is of a whitish-yellow Colour, and of a fluid, resinous, and balsamic Consistence, like *Venice Turpentine*. It is of an acrid and somewhat bitter Taste, and flows from a Tree of a moderate Size, upon making an Incision into its Bark. Ray calls this Tree the *Arbor balsamifera Brasiliensis fructu monospermo*. Two Sorts of this *Balsam* are brought to us, one of which is a limpid Liquor, which flows from certain Trees in a Province of *America*, called *Copaiba*, when they are perforated

perforated or pierced to the Pith; and this Sort is of a fragrant and very grateful Smell, and of a Taste somewhat acrid. The other Species is thicker, and of the Consistence of Turpentine. But this Difference depends on the different Times of gathering it; for that which flows out immediately after the Incision made in the Tree, is very clear, white, and of a resinous Smell. But that which follows it is of a Colour approaching nearer to that of Gold, and of a thicker Consistence; for which Reason it was first called a *Balsam*: And this last-mentioned Sort is what I said was brought to us in great Plenty from *Portugal* in Earthen Vessels, but the other Species is thinner and scarcer.

The Limpid is most highly esteemed, and thought best, both for internal and external Uses. When dissolved with Tincture of Tartar, it is successfully exhibited internally for a Fluor Albus, Gonorrhoea, and Disorders of the Kidneys and Bladder. Externally it is a fine Liniment, and much used for consolidating Wounds and Ulcers, and corroborating the nervous Parts, which have been weakened by the Shock of some Disease. Its Virtues principally depend upon the large Quantity of Oil it contains, as is obvious from the following Experiment:

I took one Pound of the best Sort of the *Balsam of Capivi*, and pouring four Measures of Water upon it in a Still with a Worm, and with a proper Degree of Fire, drew off six Ounces of an Oil of a pretty penetrating Taste, and pleasant Smell, of a greenish Colour, and a pretty good Consistence. As I never knew an Instance of this *Balsam's* being subjected to Distillation before, I could not help being surpris'd at the large Quantity of subtile and ethereal Oil it contained, especially since from the black Sort of the *Peruvian Balsam* a very small Quantity of Oil was obtained, when it was subjected to Distillation by the Worm; which is a pretty palpable Proof, that this *Balsam of Capivi* is of a very warming Nature. After the Distillation was at an End, there was a resinous thick Mass left in the Bottom of the Still, which, when put upon live Coals, diffused a pretty grateful Odour; and I am of Opinion, that it would be a very proper Ingredient in such Plaisters as are designed for corroborating the nervous Parts. Though the *Balsam* itself is possessed of very signal Virtues, yet I discovered still more exalted and efficacious Qualities in this distilled Oil: I mixed some of it with a double Quantity of human Fat, which, when apply'd by way of Liniment, wonderfully strengthen'd paralytic Parts, and such as were deprived of their Tone, Sensibility, and Motion.

Nor is it less beneficial and serviceable, when apply'd to Parts which are weakened, and become unfit for Motion, in Consequence of gouty Pains. From it also excellent vulnerary and pectoral *Balsams* may be prepared for internal Use, by mixing it with well-prepared Oil of St. John's-wort, Sperma Ceti, and Oil of the Yolks of Eggs, adding a few Drops of the Oil of Sassafras-wood, Mace, and Fennel. When the *Balsam* is thus prepared, it is to be exhibited either in an Emulsion, or in Asles or Goats Milk. I don't in the least doubt, but if this *Balsam* was judiciously used, Patients who labour under Impotumations of the Lungs, and Ulcerations of the Kidneys, Bladder, and Prostate, might receive very sensible Relief from it.

This Oil is very speedily dissolved in pure Spirit of Wine, but four Parts of it are required to one of the Oil, that the Solution may be the more thoroughly made. If instead of the Spirit of Wine Tincture of Tartar or acrid Antimony is used, and Spiritus Nitri dulcis added, a Medicine is produced which strongly provokes Urine, and is of singular Efficacy in Rheumatic Disorders and Cachexies. An Elæosaccharum of a balsamic Nature, and a more grateful Taste, may be prepared from it, which, when taken in Spanish or Hungarian Wine, is an excellent Remedy in Cases where the Stomach has lost its Tone, in Coughs which rend the Breast, and when the Intestines are too much relaxed or distended with Flatulencies; it is also of singular Service in paralytic Disorders.

I must not on this Occasion forget another Use of this *Balsam*. As I found that it abounded so much with a fragrant Oil, I made the following Experiment with it:

I poured half a Pound of it upon Lavender-flowers, as also upon Rosemary, by which means I obtained a large Quantity of Oil, which in Flavour and Taste differed very little from the purest Oils extracted from these Substances.

Hence 'tis sufficiently plain, that this *Balsam* may be more commodiously used than Turpentine, for increasing the Quantity of ethereal Oils in Distillation: Yet I do not advance this with a View to persuade any one to follow this Practice. *Hoffman's Observ. Chym.*

The Tree producing the *Balsam of Capivi* is thus distinguished:

Capivus, Offic. Pharmacopol. *Balsamum Copaiba*, Ind. Med. 18. *Balsamum de Copaiba*, Mont. Exot. 12. *Copaiba*, Pison. (Ed. 1648.) 56. (Ed. 1658.) 118. *Jonf. Dendr.* 309.

Rail Hist. 2. 1759. *Arbor Balsamifera Brasiliensis, fructu monospermo*, Ejuid. *Copaiba Brasiliensis*, Marcg. 130. *Balsamum album*, Park. Theat. 1570. *Balsamum certarum quarundam plantarum, quas Copaibas vocant*, J. B. 1. 306. *Balsamum Copaiba*, Geoff. Tract. 348. THE WHITE AMERICAN BALSAM-TREE. Dale:

When this *Balsam* is new; it is of the same Colour and Consistence with Oil of sweet Almonds, and smells like the *Calambour* Wood, but the Taste is a little acrid and bitter.

Fuller says, That when given in the Quantity of two Drams, it purges very well, and gives a very bitter Taste to the Urine. A Liniment may be made with two Parts of Spirit of Wine, and one Part of this *Balsam*, very proper to be used in Rheumatisms and Palsies. *Geoffroy*.

Pomet gives the following Account of Baume Nouveau, NEW BALSAM.

The *New Balsam* in Colour and Shape is very like that of *Tolu*, but of a much less agreeable Smell. This *Balsam* is made after the same manner as the Oil of Bays, from a little red Fruit, that grows in Clusters upon a kind of Tree, the Leaves whereof are very large and broad, green above, and greenish underneath, which grows in the *West-Indies*, especially in the Island of *St. Domingo*. This *Balsam* is so very scarce in *France*, that there is very rarely any of it to be seen. *Pomet*.

Among the several Simples of the balsamic Kind, we may justly reckon liquid Amber. It drops from a Tree of *Mexico*, called the *Arbor Styracifera*, upon an Incision being made into its Bark. It is an oleus, resinous, and pinguous Liquor, of the Consistence of *Venice* Turpentine, of a reddish-yellow Colour, of an acrid, aromatic, and oleous Taste, approaching pretty much to that of *Storax Calamita*. Its Essence, extracted with Tincture of Tartar, or tartarated Spirit of Wine, strengthens the Head, and nervous System. There is also distilled from it with Water, by the Worm, a thin and fragrant Oil, which is of singular Efficacy both for internal and external Uses. See AMBRA.

Having taken a View of the liquid *Balsams*, with which Nature has bountifully supply'd us, I come in the next Place to consider those which are of a more dry and solid Nature, such as the resinous fragrant Gums, impregnated with an agreeable Oil: Of these the principal are Benzoin, pure Storax Calamita, Ladanum, Myrrh, and Mastich. These are produced by making an Incision in the Bark of *Balsam-bearing* Trees, which are always green, at the hottest Season. From these Trees a tenacious Liquor drops, which becomes gradually more solid, as its humid Parts are exhaled by the Heat of the Sun; for which Reason these resinous Gums are justly called dry *Balsams*, because in all Points they agree with *Balsams*; for their whole Substance is inflammable, they have a fragrant Smell, they are of a penetrating Taste, they are dissolved, though not totally, in highly rectified Spirit of Wine, and yield an Oil, when subjected to Distillation.

And, first, as to the Benzoin, it is produced by a Tree of *Sumatra*, called the *Arbor Benzoifera*. The purest Sort of it is white, and in highly rectify'd Spirit of Wine is dissolved into an Essence, which, when poured into Rose-water, makes a very elegant cosmetic Milk. This Gum, by an easy Sublimation in a Pot, is raised in Flowers. If it is boiled in Water, and the Decoction inspissated, beautiful shining Flowers fall to the Bottom, which are not only of great Service internally for promoting Expectoration in *Asthmas*, and removing Obstructions of the Lungs by their subtile acrid Quality, but also by stimulating the Nostriils they excite Sneezing. Besides, Benzoin is the principal and most important Ingredient in the best and most efficacious Fumigations; and when duly mixed with an Extract of Benzoin, with the Addition of some odoriferous Oils, and a little Civet, it makes that Spanish Mass which is so much esteemed for the Delicacy and Fineness of its Smoke. See BENZOINUM.

Styrax, or, as 'tis more frequently written in *Latin*, *Storax*, is of the same Nature and Qualities with Benzoin. It is found in *India*, and, according to *Lobelius*, in some Parts of *France*. It flows from a Tree which has Leaves like those of the Quince-tree, and a Trunk like that of the Birch, in the Form of Icicles, from which Circumstance *Lobelius* thinks that it received the Name of *Styrax*, though his Opinion does not seem to be sufficiently authorized. The purest Resin is called the Tears of the *Styrax*. It is very odorous, and divided into Grains and Lumps. It is also called *Calamita*, the Reason of which Name *Strabo* gives in his twelfth Book, which is, because it flow'd from a Tree excavated and hollow'd like a Reed. The impure Sort is a Magma of a reddish Colour, in which there is often an Intermixture of Straws and Leaves; and this Sort of it seems to be obtained, by boiling the several Parts of the Tree, especially its Branches, Bark, and Roots. We use to obtain the Resin from this *Storax* two ways, either by Expression, after having macerated it sufficiently with a little Wine; or by means of highly rectified Spirit of Wine. See STORAX.

Mastic is a Resin of a pale-yellow Colour, pellucid, of a resinous aromatic Taste, and of a highly fragrant Smell. It flows from an Incision made in the Bark of the Berry-bearing Mastic-tree, of which there is great Plenty in the Island of *Chios*. That produced in *Chios* is the best; for that with which *France* supplies us is coarser and less pure. We have prepar'd a Spirit of singular Efficacy, by distilling rectified Spirit of Wine from two Parts of Mastic intimately mixed with one Part of Salt of Tartar. By this Process a most fragrant Spirit is obtained, which is of great Service in corroborating the Stomach and nervous System, and in exciting a Discharge of the Urine; for the Salt of Tartar proves an excellent Key, if I may so speak, to resinous Substances; since by its means their subtle volatile Oils are separated and disentangled from their viscid earthy Particles, and left at full Liberty to exert their Qualities. See MASTICHE.

Ladanum is also a resinous balsamic Concretion, wrapt up in a spiral Form, of a somewhat bitter Taste, and of a grateful fragrant Smell, especially when 'tis set on Fire. In *Spain* and *Crete* the Inhabitants gather this Gum from the Leaves of the true Ladaniferous Shrub. There are many small Grains of Sand mixed with it, because the Trees producing it grow in sandy Soils. With Spirit of Wine a most pure Resin is extracted from it, which either in a liquid or solid Form is of singular Efficacy in strengthening the Nerves; and I myself have often had Experience of its Virtues in severe and obstinate Head-achs. See LADANUM.

Gum Elemi comes next under our Consideration, which is resinous, lucid, of a whitish-yellow Colour, ductile like Wax, of an aromatic Taste, and fragrant Smell. It flows from Incisions made in the Bark of the Myrobalan-tree, produced in the Island of *Ceylon*, the Inhabitants of which Place kindle it in their Lamps, and use it by way of Lanthorn. From this Gum, with Water by the Worm, a very penetrating Oil, which is of singular Service, both internally and externally used, in Gonorrhœas, Wounds, and Ulcers, is distill'd. See ELEMI.

To the dry Balsams belongs also *Myrrh*, especially the purer Sort, which is intermixed with pale Spots, and is of an acrid aromatic Taste, and of a fragrant Smell. It drops from a Berry-bearing Tree called *Pala*, which grows in the Deserts of *Arabia*. This is best and most properly given in Substance, mix'd with Sugar-candy, for removing all Putrefaction, especially of the Lungs. It is also an Ingredient in the most valuable Compositions, such as the Elixir Proprietatis, the Pilulæ Ruffi, the Pilulæ Avicennæ, all the pompous Antidotes of the Antients, and in short in Pills almost of every Kind. It is better to use it in Substance internally, than by way of Essence; because these are of a hot Nature, and generally put the Blood into too violent Commotions; but it is more temperate in Substance, by reason of some mucilaginous and gummy Parts mixed with it. Its Essence externally used is of considerable Service in the Cure of putrid Ulcers. See MYRRHA.

Having taken a View of the balsamic Gums and Resins, it now remains, that I direct my View to those Woods which are impregnated with a balsamic Principle. Among these, the first Place has universally been assigned to Aloes-wood, otherwise called Xylaloes, the Whole of which is resinous, of an aromatic and bitter Taste, and of a fragrant grateful Smell, especially when reduced to Powder. It is the interior Substance of an Indian Tree, called *Calambach*. Its Resin is extracted with highly rectified Spirit of Wine, and formed either into cephalic Pills or Powders. And its resinous Essence, which is of the same Efficacy, when mixed with Tincture of Mars, constitutes a balsamic Tincture of Mars, whose Efficacy in removing Weakness of the Viscera in hypochondriac Disorders is highly esteemed. Besides, I formerly have prepared, by Distillation with the Worm, a Water of the Shavings of Aloes-wood, upon which a fragrant Oil floated, which, by being exposed to the Cold, was converted into a white Coagulum like Camphire. This Coagulum, dissolved in highly rectify'd Spirit of Wine, afforded an Essence of singular Virtues in strengthening the Brain, and repairing the Weakness of the Nerves. See AGALLOCHUM.

The *Lignum Rhodium* deserves to be next considered. Its Root is resinous, and of an aromatic Taste, and a fragrant rosy Smell. It grows in the *Canary-Islands*, and, when subjected to Distillation, yields a very fragrant Oil, the Use of which is highly extolled among the scented Balsams. Nor is it to be deny'd, that the Essence of the Root of the *Lignum Rhodium*, as also a Decoction of it in Water, are, by reason of their balsamic Resin, of singular Efficacy in Disorders of the Lymph, and Diseases arising from them, in a Lues Venerea itself, and a remote and deep-seated Corruption of the Humours. See RHODIUM and ASPALATHUS.

The next in Order is the yellow Sanders, which abounds with a fragrant Resin: This is plain, from the Spirit of Wine drawn off this Wood, which smells almost like Amber. And if the Extract is made with rectified Spirit of Wine, and the Essence drawn off by a gentle Heat, a most fragrant oily Liquor remains, of the Consistence of *Peruvian Balsam*. A Decoction of this

Wood is highly to be valued on account of its penetrating Resin. See SANTALUM.

Of the balsamic Barks, the principal are the Bark of the Saffras-wood, *Peruvian-bark*, *Winter's-bark*, that of *Cascarilla*, and the true *Costus*. They are endow'd with a resinous, balsamic, and subastringent Principle, which is not only discover'd from their penetrating Taste and Smell, but also from the highly penetrating Oil which these Barks yield upon being distilled with Water.

In the Northern Countries the Juniper-tree is truly of the balsamic Kind; for not only its Wood and Leaves, but especially its Berries, abound with a subtle penetrating Oil, which they yield in great Quantities, when subjected to Distillation by the Worm; and this Oil, when pure and unadulterated, is an excellent Strengtheners of the Nerves, and powerfully promotes a Discharge of the Urine, as most other Balsams do. There is also a Decoction prepared of the Wood itself, which is of singular Use in the Cure of the Scurvy. But besides the Simples already mentioned of a fragrant Smell, and penetrating Taste, with which Nature has bountifully furnished us, Oils also of the same Qualities ought to be ranked among Balsams, or Balsams: For what else are subtle ethereal Oils, than liquid Resins, or liquid Balsams? For the principal Element, which is the Source of the fragrant Smell, the penetrating Taste, and healing Quality, by which all Balsams, whether liquid or solid, act, is no other than a subtle volatile Oil, which being taken away, the Substances in which it was lodg'd become effete and useless.

For this Reason it may be asserted for Truth, that all those Aromatics which in Distillation yield a fragrant and penetrating Oil, such as Cinnamon, Cloves, Nutmegs, Mace, Cardamoms, Cubebs, Lemon and Orange-peels, are justly to be ranked among the principal of the Balsamics; for this very Reason *Valerius Cordus*, in his Dispensatory, orders Oil of Cloves to be used as a Succedaneum to the *Opobalsamum*, in all the Antidotes in which it is ordered for an Ingredient. "There are not," says he, "in our Days, *Opobalsamum*, *Carpobalsamum*, and *Xylobalsamum*, to be found, which come up to the true Descriptions given us of them. But as we are taught by Experience, that the Oil of Cinnamon and Cloves distill'd in our manner, of which the Antients were ignorant, are equal in their Virtues to the true Balsam; for this Reason we have, in our *Theriaca*, substituted the Oil of Cloves instead of the *Opobalsamum*. It would not be improper to substitute, instead of *Carpobalsamum*, Cubebs or Cloves, or Cardamoms, and Aloes-wood, instead of the *Xylobalsamum*."

These aromatic Oils, then, are subtle spirituous Balsams, of so uncommon Virtues and Efficacy, that the other oriental Balsams can scarce be expected to come up to them; for these produce their Effects only by a subtle Oil: Neither is it difficult to reduce these very penetrating and liquid Oils, either to the Consistence of a Balsam, or to the Form of a Resin, provided a concentrated acid Spirit, such as Oil of Vitriol, be duly mixed with them.

In our own Country there are also spirituous Balsams of this Kind, which, both on account of their Virtues and Fragrancy, render it a dubious Point, whether they are not of equal Value with the oriental Balsams, and aromatic Oils. And these Balsams produced in our own Country are Oils distill'd from aromatic Herbs, of a fragrant Smell, and penetrating Taste. The principal Herbs of this Kind are Rosemary, Lavender, common Spike, Marjoram, common and *Turkish* Bawm, Basil, Mother of Thyme, *Roman* Chamomile, and all the Species of Mint, Water-mint, Costmary, Field and Mountain Calamint, curl'd Mint, that *Origanum* commonly call'd the wild Marjoram. These Herbs, when duly distill'd, yield very fragrant and efficacious Oils. But as these Oils are rarely to be met with pure in the Shops, but are adulterated in their Distillation with Turpentine, it happens, that they do not discover that Efficacy of which the genuine Sort are possessed, in corroborating the Tone of the Nerves, and of the other solid Parts. They are most conveniently used when dissolved and reduced to Essences; and *Quercetan*, in the End of his *Pharmacopœia Restituta*, has these remarkable Words concerning them: "In Germany an Expedient is lately found for reducing the penetrating Oils into pure and grateful Essences, which preserve the Colours, Smells, and Tastes, of the particular Oils, without any other Mixture than the celestial Manna well purified, which extracts the Virtues of these Oils, and by its Admixture proves an excellent Corrector to them." There is no Doubt but the Menstruum, so highly commended by this Author, is highly rectify'd Spirit of Wine, prepared according to Art, for a thorough Dissolution of these Oils.

From what has been said, I think it plainly appears, that the Vegetable Kingdom supplies us with the noblest and most efficacious Balsams, which, when skilfully used, are of singular Service in curing Diseases, and preserving Life and Health. Neither is it, in the last Place, to be forgot, that the balsamic Plants and Trees, produced by the bountiful Parent of the human Race, for their Comfort and Preservation, are distinguished,

guished, as it were, by an external Mark or Characteristic, expressive of their latent and inherent Efficacy against Corruption, and consequently of their balsamic Nature; and this Characteristic is, that almost all of them flourish perpetually; and are what we call Ever-greens. We are also on this Occasion to inquire, whether Heaven, who in all her Measures consults the Interest of Mankind, has not hid Balsams for the Preservation of the human Species under the Earth, and in the Bottom of the Sea. If then we diligently inquire into the Natures of the Bodies lodged there, we shall find two dry Balsams hid under the Earth, and diffus'd thro' the Seas; which seem to vie with the other Balsams procur'd from the Vegetable Kingdom. These are *Ambergrise*, which in the Eastern Countries is very fine, and had in great Esteem; and the *Amber* produced in Northern Climates. Both of them furnish us with balsamic Medicines, which produce very instantaneous and speedy Effects. As for *Ambergrise*, it is a most fragrant, resinous Substance, the Whole of which is dissolved in a particular Menstruum, and reduced to a valuable Essence, which is free from all Precipitation or Coagulation of the *Ambergrise*. It powerfully restores lost Strength, is of a refreshing Nature, and by its grateful Exhalations mitigates Pains, and procures sound and uninterrupted Sleep. It is also wonderfully agreeable when mixed with spirituous Waters, or Waters impregnated with Sugar. But the *Amber*, which abounds with a subtle, fragrant Oil, closely sheath'd up in its viscid earthy Parts, with Difficulty yields its Oil, when distill'd with Water; but requires a strong Fire immediately apply'd to it, to which it at last yields, and affords a large Quantity of an empyreumatic Oil, which, when rectify'd, and sufficiently depurated, may nevertheless be used with great Success in Physic. But I know a Method of extracting from *Amber* a fragrant Oil, without destroying the Texture of the *Amber*. This Oil is procur'd by beating it with well-calcin'd Salt of Tartar, adding highly rectify'd Spirit of Wine, and subjecting the Whole to Distillation: Thus a very fragrant Spirit is obtain'd, which is of great Service in Weakness of the Nerves. If we again pour this Spirit upon pure *Amber*, mixed with Salt of Tartar, an Essence much more fragrant, and more penetrating, than the common Essence, rises on the Top.

These then are the natural Balsams known to us, which are certainly fine Preservatives of Life and Health; and from which a skilful Physician may, by a judicious Mixture of other Substances prepare the best and most efficacious Medicines. For this very Reason we find the best of the *Greek* and *Arabian* Physicians, mixed their most valuable Antidotes with these Oils, as we see in the Dispensatory of *Valerius Cordus*, the *Pharmacopœa Augustana*, the *Pharmacopœa Schræderi*, and in several other Books of a like Nature; and generally almost all the above-mentioned balsamic Species are made Ingredients in the *Theriaca Andromachi*, and the *Mithridate*. *Mesue* also, and *Nicolaus*, made much Use of these Species, especially as Cordials, as appears from *Mesue's* Description of Cloves. See in the Dispensary of *Val. Cordus*, the *Species Diambrae*; the *Species Cinnamomi* of *Mesue*, the *Species Diaryloaloes*; the *Aurea Alexandrina* of *Nicolaus*, and the *Species Diacastorei*, of the same Author.

Besides, these balsamic Species were with Success join'd by the Antients to laxative and purgative Medicines; for they thought, that the violent Strength of Purgatives was unfriendly to Nature, and stood in need of a Corrector, which might strengthen and corroborate her. For which Reason the *Eleaguery* of *Mesue*, (see *Cordus*) the *Diasena* of *Nicolaus*, his *Hiera Picra*, the *Hiera Simplex* of *Galen*, the *Pil. de Hiera Composita* of *Nicolaus*; the *Pil. Hiera Picrae Rhafis*; the *Pil. Aleophranginae* of *Cordus*, and the *Pil. Lucis majores*, have in their Composition a very considerable Quantity of the aromatic, balsamic Species. And, not to dissemble, these laxative and purgative Compositions of the Antients, provided they had a smaller Quantity of the purgative Ingredients, which I lay down as a general Caution, but especially of the *Aloes*, are far superior to ours in point of Efficacy. And some of the most noted Pills invented by later Authors, such as the *Pil. de Succino Cratonis*, the *Pil. Catholicae Poterii*, and the *Pil. Becherianæ*, which are now so much esteemed and corrected in various manners, would never have gain'd that Reputation they now have, unless in them a moderate Dose of the purgative Ingredients, especially of the *Aloes*, was incorporated with balsamic Gums, and Extracts of Vegetables.

The balsamic Species are also excellent Correctors to Medicines of a stupifying and narcotic Quality. For this Reason we find, that the Antients always mixed them with Opiates; because they imagined, that by their means the cold Qualities of Opium, and other Narcotics, were destroy'd; and the Spirits, when laid asleep by them, roused and render'd active; and undoubtedly the *Pil. de Cynoglossa* could not be so safely used, unless the Root of the Hounds-tongue, the Seeds of the white Henbane, and the Extract of Opium, were mixed with Myrrh, Olibanum, and Resin of Storax. Nor would the *Pil. de Syrace* be so effectual in dislodging acrid Humours in

Coughs and Catarrhs, unless they had at the same time in their Composition Olibanum, Resin of Storax, Myrrh, and Amber. The *Pil. Wildegansii* are by having in their Composition a Mixture of the Oil of Cloves, Myrrh, and Aloes; esteemed far more safe than any other Preparations of Opium. The *Ladanum* of *Sydenham*, which is much used; not only in *England*, but in other Countries of *Europe*, is not a little corrected by the Addition of these aromatic Substances, Cinnamon, Nutmegs, Cloves, and Spanish Wine. The *Elixir Propriatiss*, invented by *Paracelsus*, and the *Pil. Ruffi*, and *Pil. Avicennæ*, prepared of the same Species, have retained their Reputation for a great while; because by the Addition of Myrrh, which is of a balsamic Nature, and Saffron, the cathartic Violence of the *Aloes* is much corrected and subdued. In the mean time it were to be wished, that all these Preparations of the Antients, in which *Aloes* is an Ingredient, contained a smaller Quantity of it; since by their sulphureous and volatile Acrimony, they put the Mass of Blood and Humours into too strong Commotions; and in hot Constitutions often do more Hurt than Good. Besides, the *Womens Waters*, and *Elixirs of Life*, as they are called, the *Balsama Embryonum*, the spirituous apopleptic Waters, the apopleptic Spirits and Balsams, and the hot cephalic Waters, which are made up of the best Balsamics, Aromatics, and cephalic Herbs, which abound with a subtle, balsamic Oil, do from thence principally derive their Virtue in restoring Strength; and corroborating the Tone of the Viscera and Stomach. But, since the Antients Compositions of Medicines, on account of their Ignorance of a just Physical Theory, are, for the most part, improper and trifling, because they were not only unacquainted with the true Causes of Diseases; but also with the Manners in which Medicines operate; hence it is undoubtedly certain, that Medicine being in our Days placed in a fairer and more rational Light, better and more proper Forms of Medicines may be composed. Since then balsamic Medicines are, as it were, universal Strengtheners of Nature, and since in every Disease there is a Necessity for comforting Medicines, it will be both profitable and entertaining, on this Occasion, to give some Examples of the Use of Balsamics.

First, then, Balsamics are very properly mixed with evacuating Medicines, not only in order to correct their drastic Qualities, but that the Force of Nature may be assisted in performing the several Excretions, and that Strength, which Evacuants generally impair, may be preserved. For this Reason they are very properly mixed with Emetics. Thus I use a balsamic Emetic *Aqua Vitæ*, which Patients not only take with Pleasure, but which produces the desired Effect; for it operates quickly and easily, without doing the least Injury to the Appetite and Stomach. But the following may be used as a Succedaneum to it, which consists of spirituous Mint-water, and Cinnamon-water distill'd with Wine, of each half an Ounce; to which two Grains of emetic Tartar, and one Dram of the balsamic Syrup, are to be added. This makes a very agreeable Portion to be taken at one Dose.

If any one intends to use evacuating Pills, which shall at the same time be possessed of a corroborating and balsamic Quality, he may use the following Form.

Take of the Extracts of roasted Aloes, *Carduus Benedictus*, and Wormwood, each one Dram; of the Extracts of Rhubarb, Ladanum, and Aloes Wood; and of the Powders of Benzoin, of the best Myrrh, and of the Bark of Cascarilla; and of *Peruvian Balsam* and Nitre, each half a Dram. Let these be mixed up into a Mass for Pills, of which one Scruple is sufficient for a Dose.

If they are required more acrid; let an Addition be made; either of the *Extractum Panchymagogum* of *Crollius*, or of the Resin of Jalup, intimately mix'd with *Mercurius Dulcis*. When the Nature of the Disease calls for a purgative Infusion join'd to Balsamics, the following is a proper Form.

Take of the fibrous Roots of black Hellebore, of the best Rhubarb, and of Zedoary-root, each half an Ounce; of the Troches of Agaric, Cinnamon, Cloves, of the Barks of Sassafras and Cascarilla, of Lemon and Orange-peel, each two Drams. To these add two Ounces of Currants, and of crude Tartar, and Salt of Tartar, each three Drams. When all these are sufficiently mix'd, and beat small, let one Dram of the Spirit of Sal Ammoniac be sprinkled upon them. Then let three Pounds of Wine be poured upon the Whole.

If the Patient labours under hypochondriacal Disorders, Filings of Steel may, with great Advantage, be added in this Formula. Balsamics may also be very properly mixed with Sudorifics. For this Reason the depurated volatile Salt of Hartshorn, distill'd with such an Essence of Amber as I have above described, is of excellent Service in promoting Perspiration, and provoking Sweat; for hence a most penetrating Spirit is produced, which is still meliorated by an Addition of *Peruvian Balsam*. This is so valuable a Medicine, that scarce any Sudorific

Sudorific is equal to it: Fifty Drops may be given for a Dose; but we may venture to go farther, if Circumstances require it.

If any one intends to boil the *balsamic* resinous Woods, and procure their Virtues in a liquid Form, let him use the following Method.

Take of the Shavings of the Woods of Sanders, Rose-wood, Juniper, Sassafras, and Lignum Vitæ, and of the Root of Saraparilla, each one Ounce; of the Roots of Burnet and Angelica, of Cinnamon, Cloves, and Shavings of Aloes Wood, each two Drams; Mix these sufficiently together, and boil them in a close-stopp'd Vessel.

Many chronical Diseases require a plentiful Discharge of Urine; for answering which Intention, the following Medicine is of all others most proper.

Mix equal Quantities of the Spirit of Mastich, the Spirit of *Peruvian Balsam*, acrid Tincture of Antimony, and Spiritus Nitri Dulcis. Of this Mixture, half a Dram may be exhibited with singular Advantage.

In Disorders of the Head and Nerves, it is sometimes proper to irritate the Nostrils, in order to extract the Mucus, and excite Sneezing. This Intention is excellently answer'd by the following Form.

Take of the Powder of Marjoram, and Basil, each one Dram; of true Marum, and Shavings of Aloes Wood, each half a Dram; Flowers of Benzoin, twelve Grains; Effence of Amber, ten Drops; Oil of Cloves, four Drops. Mix all together.

It sometimes happens, that in the Cure of Diseases we are to have a regard to the Patient's Strength; because nothing is more dangerous, or inconsistent with Health, than that the Strength should be too much impair'd. For this Purpose Analeptics are to be used, of which the best may be prepared in the following manner.

Mix in equal Quantities the Spirit of *Peruvian Balsam*, and the Essences of Amber and Musk, prepared with the strongest Spirit of Roses, adding a small Quantity of the Oils of Cinnamon, of Cedar, Bergamot, Turkish Baum, or other Oils of a like Nature.

The Reputation of the *volatile oleous Salts* is very great; and their Efficacy, when judiciously used, very singular. If you desire to communicate a *balsamic* Quality to them, it may be done in the following manner.

Mix of the Tincture of Tartar, and of the vinous Spirit of Sal Ammoniac, each an Ounce; add of the Oils of Cedar, Mint, Mace, and Cloves, each ten Drops.

This Medicine is of singular Efficacy in strengthening the Stomach, and restoring the Tone of the Intestines. The stomachic Elixir, which that skilful Practitioner *Michaelis* at *Leipfic* so frequently used, was entirely composed of *balsamic* Ingredients: For the same Reason *Balsamics* enter the Composition of my *balsamic Elixir*, a Description of which is to be found in p. 186. and 882. of my Annotations on *Potterius*; since the Publication of which Book it has been received into several of the Shops of *Germany*. See ELIXIR, and VITÆ BALSAMUM.

It is sufficiently known how effectual *balsamic* Medicines are in curing the Disorders of the Glands, and removing those Disorders which arise from their too great Laxity, a Defluxion of Humours upon them, or too copious a Discharge of their Contents; for which Reason the following Medicines are of singular Service in a Gonorrhea and Fluor albus.

Take of the acrid Tincture of Antimony, of the Essences of the *Balsams* of *Meccha*, *Capivi*, *Peru*, and of the Woods, each half an Ounce. Mix all together, and add one Grain of Camphire,

But I must here give a Caution, that neither this Elixir, nor any other Medicines of a like Nature, are to be used till the Body has been sufficiently prepared by necessary Evacuations. If a Medicine is desired in a more solid Form, let Pills be prepared in the following Manner.

Take of the *Balsams* of *Capivi* and *Tolu*, of Amber, Mastich, Olibanum, Japan Earth, Terra Sigillata, Diaphoretic Antimony, and prepared Coral, each one Dram; Oil of Sassafras, ten Drops.

When these are duly mixed, let them be made into Pills with the *balsamic* Syrup. These Pills are surprisingly efficacious in Gonorrheas.

Balsamics are also excellent Pectorals, because they remove Obstructions of the Lungs, promote Expectoration, and wonderfully strengthen the pulmonary Vesicles. For answering this Intention, the following Formula may be prescribed.

Take of Benzoin, Myrrh, *Peruvian Balsam*, Saffron, Nutmegs, Tincture of Tartar, Gum Ammoniac, each two Drams; Oils of Anise, Mace, and Fennel, each ten Drops; Spirit of Sal Ammoniac may also be added at pleasure.

Nor is it improper to make up *Balsamics* in the Form of Pills, with other Ingredients, against an Asthma, for the Use of such as labour under that Disease. Let the following Formula be an Example of this Kind.

Take of Gum Ammoniac, the best Myrrh, Benzoin, Saffron, *Peruvian Balsam*, and Extract of Elecampane, each half a Dram: Add of Powder of Millepedes, and depurated Nitre, each one Scruple.

If any one intends to relieve the Pains arising from the Stone in the Kidneys or Bladder, he may expect considerable Success from *Balsamics*; and for that Purpose may exhibit one Dram of the following Powder either in Almond-milk, or in Broth.

Take of the Flower of Club-moss, and Seeds of Gromwell, of Peach-kernels, of Liquorice-powder, Crabs-eyes, Amber, and Mastich, each one Dram. Let them be sprinkled with a few Drops of the Oils of Sassafras, Mace, and Juniper.

When the Menfes are disorderly, either in point of Defect or Excess; or when frequent Abortions, or Sterility, cut off the Prospect of a hopeful Progeny, the relaxed Tone of the Uterus must in these Cases be corroborated, that Nature may be render'd sufficient for overcoming and eliminating whatever is noxious, and providing a proper Receptacle for cherishing and bringing to Perfection the Fœtus. This Intention will, in my Opinion, be excellently answer'd by the following Formula.

Take of the Herbs Baum, Costmary, Paul's Betony, Penny-royal, Yarrow, Rosemary-flowers, Lavender, and Sage, each an Handful; add of Lemon and Orange-peel, of the best Myrrh and Juniper-berries, each two Drams. Let all these be macerated in a proper Quantity of Water, or rather Wine, which seems to answer the Intention better.

The Physician is to judge whether the Patient's Case calls for the Addition of a Laxative, of which Class Rhubarb, and the Leaves of Sena, are the most proper.

It now remains, that I say something concerning the vulnerary *Balsams*, since these are of incomparable and extensive Use in Wounds of the Intestines, and when any of the external Parts are corrupted or destroy'd. But I shall communicate to my Reader one, which is of all others the most efficacious both for internal and external Purposes, and which I prefer to the celebrated English *Balsam*, which takes its Name from *Locatellus*. It is prepared thus:

Take of the Essences of Myrrh, Amber, Gum Elemi, red Sanders, *Balsam* of *Peru* and *Tolu*, each one Ounce; of the Oils of St. John's-wort, Yarrow-tops, and *Balsamina* Mas. From these intimately mix'd, we draw off the Spirit with a gentle Fire, and what remains we use for the Purposes, and in the Manner, above specified.

We also prepare a vulnerary Essence to be used externally in cleansing and incarning Wounds. It is made

Of equal Quantities of the Essences of Yarrow, St. John's-wort, Myrrh, Amber, Mastich, Gum Elemi, *Peruvian Balsam*, and Flowers of Roses, mix'd together; we sometimes also add Honey, which proves an Ingredient of considerable Efficacy.

In how great Esteem compound *Balsams* were antiently had, both for internal and external Uses, appears plainly from *Conradus Gesner's Thesaurus de Remediis Secretis*, which proposes many excellent *balsamic* Compositions, prepar'd of Aromatics, Refins, and Gums, of a fragrant Smell, which were highly esteem'd by the Antients. From that Book it plainly appears, that the Time when Chymistry began to flourish, and be diligently cultivated, those *Balsams* were principally in Use, which were procur'd by Distillation from the noblest Ingredients with which rectify'd Spirit of Wine and Turpentine were mixed. I shall only give one Example of this Kind from *Lully*; and tho' the Composition wants the Turpentine, yet the rest of the Ingredients are incomparably excellent. It is as follow-

Take

Take of Cloves, Nutmegs, Ginger, Zedoary, Galangals, Pepper, Juniper-berries, Lemon-peel, Sage, Basil, Rosemary, Marjoram, round-leaved Mint, Bay-berries, Pennyroyal, Gentian, Calamint, Elder and Rose-flowers, Bishops-weed, Spikenard, Aloes-wood, Cubebs, Cardamoms, Cinnamon, Sweet-flag, Stoechas, Germaner, Bawm, Mastich, Hepatic Aloes, Seeds and Flowers of Dill, and Seeds of Mugwort, each an Ounce; all these are to be put into three times their Weight of five or six times distill'd Spirit of Wine, and to be distill'd by a slow Heat, upon which they yield a pure and precious Water, some of the surprizing Effects of which are said to be these following.

If it is pour'd into a recent Wound, there is no Occasion for any other Medicine, since it will heal it in the Space of a natural Day and an half, at farthest, provided it is not mortal. Malignant, cold, putrid, and fungous Ulcers, if wash'd with this Water, are heal'd in a few Days. If the Eye is inflam'd, or has a Speck on it, these Disorders are cured in a few Days by dropping a little of it into the Eye affected. In Pains, without an Ulcer, arising from Blows or Falls, let the Part affected be fomented with a small Quantity of it, and the Pain will be removed in the Space of three Hours. Its internal Use was so highly esteem'd, that the following surprizing Accounts are given of it: It restores Youth to old Men; it recovers Patients when at the Point of Death; and given over by the Physicians: If a few Drops of it are drank every Day for a Year, with Borage Flower-water, the Patient shall at the Year's-end seem to have his Flesh, Blood, and, in a Word, his whole Body, renew'd. In the above-mentioned Book there are many *Balsams* excellently composed, but we are to observe, that almost all of them have Turpentine for an Ingredient, which affords an Oil somewhat ungrateful to Nature, because by its too great Heat it agitates the Blood, and puts it into preternatural Commotions; for which Reason I am of Opinion, that the Turpentine is to be left out of all the *Balsams* and spirituous Waters of the Antients.

I shall here briefly make mention of my own liquid spirituous *Balsam of Life*, which, on account of its surprizing and efficacious Qualities, has in many Places acquired an uncommon Reputation. The Efficacy of this Composition consists in a Solution of the purest Oils, and unadulterated *Balsams*, mixed in a due Proportion; and this Purity of the Ingredients is the Reason why this *Balsam* is possess'd of such uncommon Efficacy, as is scarcely to be met with in any other Medicine whatever. See VITÆ BALSAMUM.

I now come, in the last Place, to deliver my Sentiments concerning the Virtues and Efficacy of what we call *balsamic* Medicines. I affirm, then, that these are truly universal, and of extensive Use in Physic; and that their Virtues are as great as those of any other Class of Medicines whatever, since they are suited to all Constitutions, easily incorporated with all other Remedies, and exquisitely calculated for subduing and removing almost all Diseases. *Balsamics* have this peculiar to themselves, beyond other Medicines, that they are friendly to the human Constitution, and conspire, as it were, and contract an Affinity, with it. Of this we may easily be convinced, by observing, how speedily Strength, impair'd by chronical Disorders, old Age, or any other Accident, is restor'd by the timely and seasonable Use of *Balsamics*. For this Reason no Medicines are so effectual in Faintings, from whatever Cause, as *Balsamics*; and, in a Word, they wonderfully recruit, restore, and preserve that which is the original Source of Life, and imparts Strength, Pulsation, and Tone, to the Heart, Arteries, and Nerves, whether we call it Principle, Spirit, Soul, or Nature; for they seem to be transform'd into the Nature and Genius of that noble and wonderful Substance, which is the Director and Source of Motion to all our Members; for, in a Syncope, they so suddenly restore Motion to the oppress'd Heart, purely by their Smell, that we cannot enough admire their Efficacy; for such is the Nature of all Substances which abound with a penetrating and fragrant Oil, that, when used either internally or externally, they singularly cherish and preserve the Strength of our Constitutions. On the contrary, every thing that is putrid, fetid, and the Reverse of fragrant, is highly prejudicial to Strength, and the vital Motions, which it soon oppresses and destroys; for every Degree of Putrefaction is highly prejudicial to Life, and when it either begins, or is increased, in a human Body, the Strength and vital Motions forthwith fail, and are destroy'd, as we evidently see in Plagues, malignant Fevers, and Mortifications of the internal Parts. For this Reason, Remedies prepar'd of *Balsamics* are justly styl'd the *Balsams*, the Waters, and the Spirits of Life, since they have such a direct and immediate Influence upon it.

Since then *Balsamics* convey Motion, Strength, and Tone, to all the Parts of the Body, we may easily see, that these Medicines must be singularly efficacious in those Disorders and Indispositions, where the Strength and vital Motions are impair'd, or where the Viscera and other Parts are too much

relax'd and deprived of their due and proper Tone. For this Reason, they will never frustrate the Expectation of the Physician, who prudently exhibits them in Weaknesses of the Brain and Nerves, Imbecility of the Memory and Senses, a Palsy of the Members, a Privation of Voice, a Hemiplexy, Inappetencies, Loathings of the Food, Vomitings, Diarrhoeas, and Gripings of the Belly; in Cases where Flatulencies prove uneasy, in Languors of the whole Body, in Faintings, and in all cold catarrhus Defluxions; in Coughs that are too moist; a Coryza, a Fluor Albus, a Gonorrhoea, a moist Asthma; and, in a Word, in all Cases where the Parts are to be strengthen'd. Then again, as the best and most valuable *Balsamics* convey Strength and Energy to the solid Parts of our Bodies, especially to the Heart and muscular Fibres, which move and impel our Fluids; hence it follows, that they are the surest and most efficacious Preservatives against all Kinds of Diseases, as will sufficiently appear from the following Considerations. As long as the Blood and Humours are quickly and uninterruptedly carried thro' the Ducts and Vessels of the whole Body, and what is superfluous and recrementitious carried off thro' proper Strainers and Emunctories, so long the whole Body, and each particular Part of it, are in a State of Health, and duly perform their respective Functions: But as soon as this Motion is either disturb'd or interrupted, in the whole Body, or any of its Parts; or when the necessary Secretions are not duly made, a sure Foundation is, by these very Means, laid for Diseases. Now nothing is of more Efficacy for preserving the vital Circulation of the Humours, and carrying on the necessary Business of Perspiration, than those Substances which strengthen and corroborate the Heart, that principal Part of the Body, with their *balsamic* Qualities. But our noble *Balsamics* are particularly and singularly useful, as Preservatives against putrid Diseases, and such as are justly formidable, on account of their contagious and malignant Natures. For this Reason they are used, as Preservatives, with uncommon Success, when epidemical Disorders rage. They are also very properly join'd with Alexipharmics in the above-mention'd Disorders, because they resist Putrefaction, recruit the Strength, and promote a due Circulation of the Humours: And since they so powerfully guard against Putrefaction, which is so prejudicial to Life, they are, for this Reason, very properly and successfully used in the Venereal Disease, which is truly of a putrid Kind; and in those Scourvies which are the Result of an impure Air, and unwholesome Aliments; for the Decoctions, Elixirs, and Essences of the Woods, derive their Virtues and Efficacy from the *balsamic* Qualities of the Ingredients: Besides, *Balsamics*, especially of the fragrant Kind, have this singular Advantage attending them, that they becalm the exorbitant Motions of our Fluids, and allay Pain. For this Reason, in violent Head-achs, Tooth-achs, and Pains of the Ears, they often afford great Relief, even when only externally apply'd. Neither is it to be forgotten, that *Balsamics* prove excellent Correctors to all the more violent and drastic Medicines, especially Evacuants and Anodynes; for they remarkably qualify their Virtues by their corroborating Qualities. For this Reason, *Balsamics* are very happily join'd with almost all evacuant and anodyne Medicines. From all these Considerations it appears, how proper and efficacious *Balsamics* are, for the Cure of a large Number of Diseases.

But as nothing is, in every respect, perfect and complete, as there is no Medicine, however valuable in itself, but what produces bad Consequences, when imprudently exhibited, there is no doubt to be made, but this is also the Case with *Balsamics*; for when there is in the Body too large a Quantity of hot and seruid Blood, when its Motion is too much accelerated, and the Pulse quick and vehement, Nature has, in these Cases, more need of a Check than a Stimulus; for which Reason we must neither attempt to excite nor augment the Motions of the Fluids. Besides, fragrant Substances have this Disadvantage attending them, that when the Brain, in consequence of some Weakness, with Difficulty transmits the Blood, and the Vessels of the Head are become turgid with Humours, they occasion a greater Derivation of Humours to it; and sometimes increase the Pains, Torpors, Vertigoes, and Oppressions of the Senses. I must here add, that Physicians have not as yet sufficiently discover'd the Virtues and Efficacy of *Balsamics* in the Practice of Medicine; since they are far more powerful and efficacious than is commonly believed. The spirituous *Balsams*, which are commonly sold, and which ought to be made of the purest ethereal aromatic and cephalic Oils, are, for the most part, sophisticated and adulterated; so that Physicians have no Reason to be surpris'd, if they do not produce the Effects they would do, if they were pure and genuine. I must, in the last place, observe, that Physicians are very faulty in drowning, as it were, *Balsamics* in spirituous Liquors; since they almost always either mix them with Spirit of Wine, or join them with it by Distillation; by which means the Virtues of the *Balsamic* are infringed, and it assumes a violently hot Nature. The more, then, their genuine Natures are retain'd, the more efficacious and useful they are. *Hoffman*.

Besides

Besides the Balsams already mention'd, some others, which are very scarce, and rarely to be met with, are mention'd by Writers on the *Materia Medica*. Amongst these, is the

BALSAMUM IPECUEBÆ, which is drawn from the *Becuibæ Nux*; and, in *Brasil*, is much esteem'd in rheumatic and paralytic Cases. *Geoffroy*.

The *Index Medicamentorum* also takes Notice of a Balsam call'd BALSAMUM THOMÆUM; and of another call'd BALSAMUM VIRIDE, or OLEUM MARIÆ.

There has, of late, been imported from *New England* an excellent liquid Balsam, which, by its Fragrance, and whole Appearance, should not be inferior to many of those above described. I don't know, that it has yet obtain'd any particular Name. This has been frequently sold to the Apothecaries for the true *Opsbalsamum*.

A Mineral BALSAM in ALSATIA.

In the Valley call'd *Liberthal*, near *Geesbach*, (an ancient Mine-work in *Alsatia*) there runs out of a Cavern a foul, pinguous, oily Liquor, which affords an excellent Balsam, by taking a Quantity of it, and putting it in an Earthen Pot well luted, that no Steam may exhale; and then with a gentle Fire at first, but a stronger afterwards, boiling it for three Hours together, in which Space it will boil in a fourth Part, and an Earthen Matter, like Pitch, will settle itself at the Bottom; but on the Top thereof, when cold, there will swim a pinguous Substance, like Linseed-oil, limpid and somewhat yellowish, which is to be decanted from the thick Sediment, and then gently distill'd in an Alembic in a Sand-heat; by which means there will come over two differing Liquors, one phlegmatic, the other oily, which latter, swimming on the Phlegm, is to be sever'd from it. The Phlegm is used as an excellent Refister and Curer of all the Putrefactions of the Lungs and Liver; and it heals all foul Wounds and Ulcers. The oily Part, being diluted with double its Quantity of distill'd Vinegar, and brought three times over the Helm, yields a rare Balsam against all inward and outward Corruptions, stinking Ulcers, hereditary Scurs and Scabs. 'Tis also much used against Apoplexies, Palsies, Consumptions, Giddinesses, and Head-achs. Inwardly they take it, with Succory-water, against all Corruptions of the Lungs. It is a kind of *Petroleum*, and contains no other mineral Juice but that of Sulphur, which seems to be thus distill'd by Nature under Ground; the Distillation of an Oil out of Sulphur, by Art, not being so easy to perform. *Philosophical Transactions*.

A Mineral BALSAM in ITALY.

In the Territory of *Pergamo*, *Sig. M. Ant. Castagna*, upon the Confines of his Jurisdiction, lighted accidentally upon a not ordinary sweet balsamic Scent; which directed him to a rocky Hill; where he found the Stones harbour'd that Fragrance, which was so strong, and, by Trials, found so friendly to the Uterus, that, being applied, they did, in a very short time, cure it of any Evil 'tis subject to. Encouraged hereby, he made his Workmen dig into the very Bowels of the Hill, where he discover'd Holes in some Stones, as if excavated by Art, of a greenish Colour, in which he found, as distill'd by Nature, and kept in Vessels, that Liquor and Balsam which proved the Source of that Scent, which was limpid, and of a white Colour, like the White of an Egg, but somewhat oleaginous, floating upon all sorts of Liquors like Oil. Besides, he met in the same Cavities some small Grains concreted of the same Liquor, resembling that which they call white Amber, which, being chymically distill'd, had the same Odour with the Balsam. *Phil. Transf.*

BALSAMUM DE CHILI.

I have more than once, in this Work, mention'd the Balsam of *Chili*, particularly in Quotations from *Musgrave* and *Hoffman*. The Importance of these Authors renders it necessary to inquire what this Balsam is, or rather whether there is any such thing. Upon the best Information I can get, then, it appears, that there is no such thing known either in *England* or *Spain*; from whence we may reasonably conclude, that all the other Parts of *Europe* are Strangers to it. The only Author I have met with, who affirms its Existence, is *Salmon*, who, in his *Polygraphice*, recommends it as a sort of universal Panacea.

There is, says he, lately brought from *Chili*, a Province in *America*, a most excellent natural Balsam, differing (but not much) from those of *Peru* and *Toku*, but no ways inferior in Virtues and Excellency, as the several Experiments lately made of it, by several learned Physicians, in the curing of Diseases, have given evident Demonstration.

It is a Remedy that no Man under the Sun can compose, being a natural Balsam, distilling from a Tree in *Chili*, bearing a Leaf something differing from an Olive-leaf. It is, without doubt, the most precious of all natural Balsams, by reason of its great Virtues, and admirable Odour, excelling all others, even the most fragrant.

The Merchant that has brought it over, has only entrusted it to be sold with Mr. *Thomas Passenger*, at the *Three Bibles* on *London-bridge*, where it may always be had in any Quantity, ready put up in Glasses, seal'd with the Balsam-tree, Price twenty-four Shillings the Pound, or eighteen Pence the Ounce. *Salmon*.

Upon the strictest Inquiry, I have the strongest Reasons to believe all this to be utterly false; for I am well inform'd, that this Balsam is factitious, and that it was made in the Person's House who sold it, by his Cook-maid. *Salmon* therefore was deceived; or else, for particular Reasons relative to his own Interest, imposed this Falshood on the World; a thing not unusual in these Days, wherein the noble Art of Medicine is prostituted to the meanest Ends.

When we design to extract a large Quantity of Balsam of any Kind, we, for that Purpose, make Choice of the small Branches of such Trees as yield it, when they are most fill'd with Sap; for at that time they yield more than at others. Then we soak and boil them in Water, to occasion a Separation of the most fluid of the resinous Parts, which we gather off the Surface of the Water. This is the Method of preparing some liquid Balsams: And this same Course might also be taken for extracting the Resin from our Firs and Pines, if Incision was not sufficient for that Purpose. *Geoffroy, Mem. A. 1721.*

BALSAMUM ALBUM.

What the Chymists call by this Name is equal Parts of Vinegar of Lead, evaporated to the Consistence of Honey, and of Oil of Roses. This is in some Reputation, amongst the Surgeons, as a Drier.

BALSAMUM ANODYNUM BATÆI: Bates's Anodyne Balsam.

Take of Castile Soap, an Ounce; of Opium, half an Ounce; of Camphire, six Drams; of Saffron, a Dram; and of rectified Spirit of Wine, eighteen Ounces: Digest them together for ten Days; then strain off the Balsam.

This is much like a Prescription of *Horstius*, which he gives by the Name of *Balsamum Antipodagricum*. It is a most excellent Medicine, not only for procuring Ease in the most racking Extremities of Pains, but for assisting likewise in the Discharge of such Humours as occasion those Pains. In nervous Colics it is of great Service; and it cleanses all the Viscera, and glandular Parts. It is good even in the Jaundice, and such Distempers of the Urinary Passages as proceed from Obstruction of Gravel, or slimy Humours. But its greatest Excellence is in allaying the Tortures of the Gout, promoting the Transpiration of the peccant irritating Matter, and carrying off the Fit, insomuch that, with a few proper Helps, this Distemper is hardly so obstinate in any Person whatsoever, but he may meet with great Relief, if not a thorough Riddance from it. Inwardly it may be given from twenty Drops to fifty at a Dose; and being outwardly applied to the pain'd Part, it does mighty Service, a Rag being dipp'd in it, and laid thereon. *Quincy's Dispensatory*.

Bateman's Pectoral Drops are imitated from this. I take the only Difference to be, that *Bateman's Drops* have a less Proportion of the Spirit, and consequently, being not so strong, may be given in larger Doses; and that they have an Addition made to them of Aniseeds.

BALSAMUM ANODYNUM, VULGO GUIDONIS: Anodyne Balsam, commonly call'd Guido's Balsam.

Take of Hepatic Aloes, Gum Ammoniac, Bdellium, Caran-na, Castor, Galbanum, Labdanum, Myrrh, Balsam of Peru, Olibanum, Amber, Tacamahac, and solid Storax, each half an Ounce: Reduce the Ingredients, capable of it, to Powder; then add the full Weight of them all of Venice Turpentine: Put the Whole into a Retort, whereof they may fill but two Thirds, and distil it according to the Rules of Art; observing dexterously to separate the red Oil, or Balsam, from the Liquor that floats above it.

If the Distillation be perform'd in an Alembic, with the Addition of four times the whole Quantity of Spring-water, the Balsam will be obtain'd free from any empyreumatical Impression. *Edinburgh Dispensatory*.

BALSAMUM SIVE SPIRITUS EMBRYONUM.

Take three Capons without the Fat, beat and cut them small; add of Dates, one Pound; Raisins of the Sun, one Pound and an half; Baum, four Handfuls; Angelica, Marjoram, and Chervil, each three Handfuls; Basil-seeds, half an Ounce; Fennel, Angelica, and Lemon-peel, each three Ounces; Citron-peel, Piony-root, and Borrage, each four Ounces; Angelica, one Ounce and an half; Saffron, five Drams; Conserve of the Flowers of Borrage, Clove-gilly-flowers, and Marjoram, each four Ounces; Spanish Wine, thirty-two Pounds: Distil to Dryness. With this Water, together with one Pound of the

the Spirit of Clary, Black-cherry and Baum-water, each three Pounds; Borrage-water, four Pounds; blanch'd Almonds, one Pound and a half; make an Emulsion: To which add, of the Conserve of Piony-flowers, six Ounces; of Borrage, and Clove-gilly-flowers, each four Ounces; Flowers of Violets, Cowslips, *single Clove-gilly-flowers*; red Rose-flowers, and Marygold-flowers, each four Handfuls; Aloes-wood, three Drams; yellow Saunders, two Drams and an half; Cinnamon, eight Ounces; Aromaticum Rosatum, one Ounce: Distil according to Art.

This Medicine is given with great Success to Women who have suffer'd frequent Abortions; as also to Women big with Child, when they languish in consequence of a sudden Fright, or from any external Cause. In these it also cures Lipothymies, Faintings, and Inflations of the Belly; strengthens the Foetus, when weakly; corroborates the Ligaments of the Uterus; prevents the Epilepsy; and assists Sanguification. The Dose two, three, or more Spoonfuls, as the Circumstances of the Case requires. *Pharmacopœa Bateana.*

BALSAMUM GENEVIEVE, or Genevieve's internal and external Balsam.

Take three Pounds of Oil of Olives; of Rose-water, one Gallon; of new Wax, half a Pound; of *Venice Turpentine*, one Pound; and of the Powder of red Saunders, two Ounces. Boil the Whole in a new Earthen Vessel, with three Gallons of red Wine. After it has boil'd for half an Hour take the Vessel off the Fire, and allow it to cool; then separate the Balsam from the Wine, and the Powders which remain at the Bottom of the Vessel.

This Balsam is used for Wounds of all Kinds, whether they penetrate into the Cavities of the Body or not; for gangrenous Ulcers, Rheumatisms, all Pains, even those which are internal; such as the Pleurisy, the Colic, and Head-ach. The Patient is to anoint the Part affected with some of it warmed, and take two Drams of it internally. It is also used against all Kinds of malignant Fevers, and the Bites of poisonous Animals.

When Wounds happen to penetrate into the Cavities of the Body, some of this Ointment must be syringed into them; and some of it must be exhibited internally in Veal, Capon, or any other Broth; or even in vulnerary Waters or Pisans.

But what effectually proves the Efficacy of this Balsam, and what, probably, first procured it that uncommon Esteem in which it is now universally held, is a Cure related by Mr. *Duverney* the younger, in the Memoirs of the Royal Academy of Sciences in *Paris* for 1702. which, on account of the uncommon Circumstances attending it, we shall here insert.

On *St. Thomas's Eve*, in the Year 1701. a Man of forty or forty-two Years of Age, and of a good Constitution, happened to receive a Wound with a Sword in the inferior and internal Part of the Middle of his Right Arm. The Wound ran obliquely upwards into the Muscles for about four or five Fingers Breadth. The Blood flowed from the Orifice with uncommon Impetuosity, which soon brought the Patient to a very weak and feeble State. In this Condition he was carried to the first Surgeon that could possibly be found; the Artery, in the mean time, being secured with a Compress, and pretty tight Ligature, apply'd above his Elbow. But the Patient, recovering his Strength a little, was conveyed to his own House, where the Orifice of the Wound being opened, Lint drenched in astringent Liquors was conveyed to its very Bottom; then the Orifice was carefully covered up, and the Dressings secured by proper Bandage. The Patient had some Blood taken from him, and was reduced to weak Broths and Pisan. The Wound was not dressed till forty-eight Hours after, when all the Dressings were removed to the very Pledget, with a View to moisten them, and the Bandages, which were again applied with the same Care they had been in the first Dressing. This Method was, almost without any Variation, persisted in till the Eve of *Saint Genevieve*; at which time the Blood flowed in great Plenty from the Wound. For this Reason, a small Incision was made afresh, and the Wound dressed almost in the same manner as at first; though at the same time the Patient perceived, that the fore Part of his Arm had changed its Colour, but yet without any concomitant Pain; his Fever was of the continued and burning Kind; and his Inquietude and Want of Rest, very great. At last, on *Saint Genevieve's Day*, we found that not only the fore Part of the Arm was gangrened, but that the Putrefaction had spread itself to the internal Part of his Arm. The Patient, and those who were present, being struck with Terror at this Discovery, demanded a Consultation; and for that Purpose made Choice of three Surgeons, much accustomed to inspect Cases of a dangerous Nature. Upon examining the Patient, and taking a careful View of his Disorder, they found not only the fore Part of the Arm entirely cadaverous, but also its internal Part in the same Condition as far as the Arm-pit. The Bone, in the mean time, was laid

bare by the Putrefaction for about three or four Fingers Breadth from the Arm-pit. The Progress of the Mortification, the Fever accompanied with Oppression, the livid Colour of the Patient's Complexion, his small and tremulous Pulse, were Circumstances, which determined us to wait till we should see in which manner Nature herself would operate; and, in the mean time, to use both internally and externally such Medicines as could either support his Strength, or procure his Ease.

The same Day, however, a Woman of the Name of *Genevieve* presented herself, and offered to cure the Patient; upon which, the two Surgeons, who were treating him, committed him to her Care. Accordingly, *Genevieve* began her Cure by rubbing the whole Arm, and particularly the fore Arm, whether cadaverous or not, with the above-mentioned Balsam. Then she wrapt the Whole up in Cloths, which she secured with Pins till Night, when she dressed the Patient again in the same manner. In the mean time she ordered him nourishing Food, and rich Wine. Twenty-four Hours after these Measures were taken, a Suppuration began to appear. *Genevieve*, in the mean time, continued to dress the Patient in the same manner; the Wound assumed a more and more beautiful Appearance after each Dressing, and the mortified Flesh separated easily, and adhered to the Cloths, or soft coarse Paper, which she often used for Dressings. It was proposed to *Genevieve* to have the mortified Part of the fore Arm separated at the Joint, not only because of its strong and disagreeable Smell, but because it was already almost separated by the Mortification; but she refused to comply with the Proposal, and said, It was not necessary to take any Measures at all with regard to it, since her Remedy would sufficiently answer all the Intentions they could possibly propose by such a Step.

At last all the fore Part of the Arm was entirely separated at the Joint from the Arm itself, six Weeks after *Genevieve* undertook the Cure; after which, she continued to apply her Ointment to the uncovered Bone, and all the rest of the Arm, without having any manner of regard to the Filth which came from between the Bone and the Flesh, or to any other Circumstance whatever. The Consequences however of her Conduct were sufficiently happy; for about a Month after the Separation of the fore Part of the Arm, the Part of the Bone which had by that means been laid bare, exfoliated, and was entirely separated from the Remainder of the sound Bone. Before this Separation happened, we were at a Loss to conjecture what would be the Fate of this large Portion of Bone, and of the Shreds of Flesh and Skin remaining on the back Part of the Arm; we also dreaded an Hemorrhage: However, none of these Suspicions disconcerted *Genevieve* in her Measures; she continued her ordinary Dressings, the Consequence of which was, that the remaining Fibres poured forth a nourishing Juice, and lengthened themselves so as to cover the Extremity of the Bone, and form a very natural and beautiful Stump.

All this was transacted, and the Cure completed, in the Space of four Months, without the Patient's being so much as once attacked with a Fever, or any other Disorder. He was twice purged during the Course of the Cure, and at present enjoys a perfect State of Health.

REFLECTIONS.

We have Reason to believe, that the Mortification was occasioned by the manner of Dressing the Patient at first; for, besides the too tight Ligature on the Wound itself, there was also a Compress strongly applied, all along the Artery as far as the Arm-pit; so that the nutritive Juice was intercepted from the fore Arm, and the Parts were compressed by the Bandage. This Inconveniency may be shunned by tying the wounded Vessel, when 'tis possible; by using the Bandage for the Aneurysm, which is a sort of Truss, or by applying to the Orifice of the Vessel a Piece of a particular Species of Match used in *Germany*, and made of Hemp, or that Species of Mushroom called *Lycoperdon*, either boiled or not boiled; but when the two last-mentioned Remedies are used, we must take care to secure them till they adhere to the wounded Vessel, and then dress with unripp'd Match, or absorbent and balsamic Powders, remembering in both Cases to preserve the Circulation in the Part affected. The great Hemorrhage, four liberal Venesections, and a very strict Regimen, had not only exhausted, but impoverished the Mass of the Patient's Blood; so that being destitute of its unctuous and chylous Parts, it could neither recruit itself, nor supply a proper Matter for invigorating the wounded Part. These Circumstances contributed, at once, to bring on the Fever, and augment the Mortification; since the Indisposition remain'd unallay'd and uncorrected by proper Means. Accordingly, as soon as the Patient began to live upon nourishing Aliments, his State of Health became better, the Progress of the Mortification stopped, and the unmortified State of the Parts began to discover itself by a Discharge of Matter, which separated between the sound and mortified Parts. We have Reason to suspect, that the Vessels had been in a manner cauterized, and blocked up by

corrosive Juices, just as they would have been by the Application of common Caustics, or Ligatures; since the Artery did not discharge its Contents in the time of the Suppuration, though no Applications were used to prevent it; though it was so near its Trunk, and though the Patient lived upon nourishing Aliments, and rich Wine. The agreeable and insensible Manner in which the Suppuration, and consequent Separation of the mortified from the sound Parts was carried on, afforded Time for the Artery to repair and fortify itself; from which we may learn, that 'tis always improper to hasten the Separation of an Eschar, or too soon remove Ligatures from the Vessels to which they have been applied. On the contrary, we ought to use such Medicines as are capable of absorbing the Humidity of the Parts, that thus the Ligature or Eschar may remain the longer, and by that means afford an Opportunity to the Flesh and Vessels to sprout out, to unite themselves, and make a joint Resistance to the Impulse of the Blood.

We are by this Case also taught, that most of the Measures ordinarily taken to bring on the Exfoliation of Bones, either in Whole or in Part, are often useless, if not hurtful; since that is properly the Work of Nature. The great Secret in this Case consists in preserving the natural Heat of the Part, and in augmenting it when it is too faint and languid; both of which are often done with little Trouble, and in a short time, as appears by the foregoing Case, where both were easily effected notwithstanding the bad State of the Arm, and the small Quantity of Flesh, that remained on it. On this Occasion, for Instance, the Ruginé, the Trepan, and the Application of Caustics, had been entirely useless; and even though the Bone had been sawed off upon the Separation of the mortified Flesh, the Patient would not have been the sooner cured by that Step; on the contrary, the Exfoliation would have been evidently retarded, and the Elongation and Sprouting out of the Fibres entirely prevented. I have seen some Surgeons wait in vain for the Exfoliation of some Part of a Bone, for seven or eight Months, and even for a whole Year, notwithstanding the Use of dry Lint, Spirits of Wine, Caustics, and the Ruginé; whilst others, who followed a different Course, happily produced the desired Effect in a much shorter Time.

BALSAMUM LUCATELLI: *Lucatellus's Balsam.*

Take of the best yellow Wax, one Pound; melt it over a moderate Heat, in a like Quantity of *Canary*: Then add of the best Oil of Olives, and *Venice Turpentine*, wash'd to a Whiteness in Rose-water, each one Pound and a half. Boil them by a gentle Fire, till the Wine is evaporated; then removing it off, sift in of red Saunders in fine Powder, two Ounces; stirring the Whole about continually, till it is quite cold, that it may become a *Balsam*.

This is but a modern Prescription, so that the College had it not at first. It is used however very much in the present Practice, both for internal and external Uses. *Quincy's London Dispensat.*

This was very unskillfully directed; for the melting the Wax in *Canary* can answer no End, unless to such whose Opinions of a Medicine are in proportion to the Trouble of making it; nor does the Washing the Turpentine with Rose-water avail any thing. If therefore the Materials are all good in their Kind, as soon as the Wax and Turpentine are melted, let the Saunders be stirred in without any boiling at all. But even this way, which the Shops are obliged to comply with, because the Physician would not else know what he prescribes, the Saunders is a very injudicious Ingredient; for it cannot answer any End as a *Balsamic*, neither in internal nor external Use; and if it be put in for the Colour-sake only, this might much better be done by boiling Dragon's-blood for some time in the Oil, with a sufficient Quantity of Water to keep it from burning; for with that it might be brought up to any Degree of Colour, and to a much more elegant Red than the Saunders will give. And when the Oil is tinged, strain it off, mix the Wax and Turpentine with it, and all is finished; and this way it is made in some of our Hospitals. By this means the Medicine is not clogged with Dust to give it a Colour, and is therefore much better for all the Purposes it seems originally designed for. This Composition stands recommended for an internal Vulnerary, and is prescribed in such Coughs as give Suspicion of Tubercles and Ulcerations in the Lungs; and also in all internal Decays from the like Causes, whether the Seat be in the Breast, or any other Part. It is given likewise upon accidental Bruises, and inward Bleeding. Externally it is used to deterge and incarnate green Wounds and Ulcers, that are not of too long Standing; but in the latter Intentions, the Saunders is a vast Prejudice to it, and helps to foul a Wound more than to cleanse and heal it. Inwardly it is given from one Dram to two Drams at a time, either mixed with a little Sugar, or pleasant Conserve. *Quincy's Dispensat.*

The Edinburgh Dispensatory gives this Preparation different from that of the College.

Take of the best Oil of Olives, a Pint and an half; of *Canary Wine*, a Pint; of Dragon's-blood reduced to Powder, an Ounce; boil them together over a gentle Fire, till the Wine is consumed; then add of yellow Wax, 2 Pound; of *Venice Turpentine*, a Pound and an half; and of Balsam of *Peru*, two Ounces: Mix them together, by boiling them a little; but add not the Balsam of *Peru* before the Vessel is removed from the Fire.

The substituting Dragon's-blood for red Saunders alters this Medicine considerably for the better, as it improves its Colour, and adds to its *balsamic* Virtues; both which Ends are very indifferently answered by the Saunders. But if the Colour were to be primarily regarded, nothing gives a more beautiful Red to Oil than Alkanet-roots, infused warm therein.

BALSAMUM POLYCHRESTUM: *A Balsam of many Virtues.*

Take two Pints and an half of Spirit of Wine, infuse in it with a gentle Heat, and after stirring it, twelve Ounces of Gum Guaiacum; and lastly, add one Spoonful of *Peruvian Balsam*; so that the Whole may mix together into a Balsam.

This is but a very modern Prescription, and lately receiv'd by the College; but here it differs from their former Edition, in rejecting the Sarsaparilla, and increasing the Gum Guaiacum; which is certainly much to the Advantage of the Medicine, because its Virtue wholly consists in the two Ingredients here retained, the Sarsaparilla affording nothing to the main Intention, which is greatly to warm the Nerves, and refresh the Spirits.

This is an efficacious Remedy for many good Purposes; but particularly to warm and defend the Nerves from those Defluxions which prejudice their Motions; and when they prove of a saline tartarous kind, make the Gout in the Joints. To preserve against this last-named Distemper, there is not a better Medicine, considering the Conveniences of making and taking it. It will likewise answer all the Ends that are aimed at by the Wood Diet-drinks; it dries up, or dissipates by insensible Transpiration, all superfluous Moistures, is good in all Venereal and scrophulous Cases, and very certainly wears off an old Gleet, where the Virulence has been previously removed. It will change an aqueous Vehicle milky, but may conveniently enough be given in any Liquor, and it is usually taken from ten to thirty Drops, two or three times a Day. It is somewhat strange, that this Medicine is almost neglected in a regular Practice, and yet made a great deal of, both as to Profit and Reputation, by Empirics, with some of whom it has been pretended a Family Secret, as the *Elixir Salutis*, that is, *Daffy's Elixir*, and some others, which are first stolen from some Physical Writers. *Quincy's Dispensat.*

BALSAMUM CONTRA RHEUMATISMUM: Or, *Balsam against the Rheumatism.*

Take of Rosin, and of *Burgundy Pitch*, each half a Pound; Shoe-makers Wax, two Ounces; yellow Wax, four Ounces; *Venice Turpentine*, two Ounces; new Hogs Lard without Salt, and fresh Butter, each a Pound; Essence of Rosemary, three or four Spoonfuls: Mix, and make a Balsam according to Art.

This Balsam was communicated to Mr. *Duverney* the younger, as a great Secret, under the Title of *A Balsam for Rheumatisms, Gun-shot Wounds, Ulcers with Caries*, and others.

Before using it, the Wound, or Ulcer, must be washed with warm Wine; then the Balsam must be warmed in a Plate, and some of it must be poured into the Wound or Ulcer as hot as the Patient can bear it; then put coarse soft Paper over it, and wrap it up with a linen Cloth. *Memoire de l'Academie, 1702.*

BALSAMUM SAMARITANUM: *The Samaritan Balsam.*

Take equal Parts of Wine and Oil, and boil them till the Wine is consumed. This takes its Name from the good Samaritan of the Scriptures, and is esteemed for cleaning and healing Wounds.

BALSAMUM SULPHURIS ANISATUM: *Balsam of Sulphur with Oil of Aniseed.*

This is prepared in the same manner, with Oil of Aniseed, as the Balsamum Sulphuris Terebinthinatum is with Oil of Turpentine.

BAL

BALSAMUM SULPHURIS CRASSUM: *Thick Balsam of Sulphur.*

Take of Linseed Oil, or Oil of Olives, a Pound; of Flowers of Sulphur, four Ounces; and boil them together over a soft Fire to the Consistence of a Balsam; keeping the Matter continually stirring. *Edinburgh Dispensatory.*

BALSAMUM TEREBINTHINÆ: *Balsam of Turpentine.*

Take of the best Refin, and Sand, each equal Quantities; mix them together, so that they may be distilled in a slow Sand-heat; first the Phlegm, then the Oil, and lastly, upon raising the Fire, and changing the Receiver, the Balsam will come over.

The Sand is of no other Effect than to divide the Refin, and facilitate its Rising in the Retort. *Quincy's London Dispensatory.*

BALSAMUM VIRIDE: *The Green Balsam.*

Take of Linseed Oil, half a Pint; of Gum Elemi, two Ounces; of Verdegrise in Powder, two Drams; mix and boil them together over a gentle Heat, so as to make them into an Ointment, *S. A.*

This is a very modern Contrivance, and is much used by our Surgeons in some particular Dressings. *Quincy's London Dispensatory.*

The *Edinburgh Dispensatory* directs this somewhat different, as follows:

Take of Linseed Oil, and Oil of Turpentine, each a Pound; Of Verdegrise reduced to Powder, three Drams; and boil them together, keeping the Mixture stirring, so as to dissolve the Verdegrise.

BALSAMUM VIRIDE DETERSIVUM: *The Green detergent Balsam.*

Take of Linseed Oil, and Oil of Turpentine, each one Pound; of Gum Elemi, Oil of Bays, and the best Turpentine, each four Ounces; Powder of Verdegrise, one Ounce; mix and melt all together over a gentle Heat, continually stirring all the while, so as to make them into a Balsam, *S. A.*

This is said to be greatly valued in the present Practice amongst our Surgeons as a Detergent. *Quincy's London Disp.*

BALSAMUM VIRIDE METENSIVM: *SEU DOMINÆ FOEUILLET.*

Take of the expressed Oils of Linseed, and Olives of each one Pound; Oil of Bays, one Ounce; of *Venice* Turpentine, two Ounces; melt them upon a very gentle Fire, and when they are cold, mix with them distilled Oil of Juniper-berries, half an Ounce; Verdegrise, three Drams; Succotrine Aloes, two Drams; white Vitriol, a Dram and an half; Oil of Cloves, one Dram; make a Balsam, *S. A.*

REMARKS.

The Vitriol, the Aloes, and Verdegrise, must be powder'd separately very fine; and the Turpentine, Oil of Olives, of Linseed, and Bays, must be mix'd together over a gentle Fire; when the Mixture is half cold, incorporate exactly the Powders, stirring the Matter some time with a Spatula; afterwards add the distilled Oils of Juniper-berries and Cloves, making them all into a Balsam, which must be kept in a Vessel well stopp'd.

It is proper to cleanse Wounds and Ulcers, to incarn and cicatrize them; for the Bites of venomous Animals, they heat it, and put it into Wounds with the Feather of a Quill, or a Pledget of Lint, and apply upon it the *Styptic Plaster of Crollius*.

This Balsam was first invented by Monsieur *Duclos*, a Physician at *Metz*; Madame *Fœuillet* used it at *Paris*, and had it called by her Name. *Lemery's Phar. Univers.*

BALSAMUM VIRIDE VULNERARIUM: *The Green Vulnerary Balsam.*

Take of Linseed Oil, one Pound and an half; Turpentine, twelve Ounces; of the Leaves of Adders-tongue, gathered in the Month of *May*, six Handfuls; mix, and infuse these warm together; then boil them till the Leaves are crisp. Press out the Oil, and add to it of Gum Elemi, four Ounces; of Oil of Bays newly extracted, two Ounces; of the best Turpentine, one Ounce; of the Flowers of Verdegrise, two Drams. Let them all melt over a gentle Fire, continually stirring them about to facilitate their Mixture; then strain again, and let the Whole cool into a Balsam. *Quincy's London Dispensat.*

BAL

There are many Sorts of artificial Balsams of Sulphur, which have acquired great Reputation in Medicine. The Methods of preparing them are as follows:

BALSAM of SULPHUR with expressed OILS.

To a Quantity of any expressed vegetable Oil, contained in a glazed Vessel, set over the Fire, add a fourth Part of the Flowers of Sulphur, as soon as the Oil is sufficiently hot to dissolve the Sulphur, which will now fall to the Bottom of the Oil, like a highly red shining Liquor, and they will remain with this Degree of Heat, for a long time, unmixed; but the Fire being gradually increased, though with Care, to prevent the Matter from taking Flame, at length, when the Oil begins to fume; it will intimately mix with the Sulphur, and the Whole become opaque, and form a new and entire Body of the two. If more Sulphur be added, this also may be easily dissolved, by bringing the Oil to fume; and almost to boil; and thus, at length, a considerable Quantity of Sulphur may be dissolved in a small Proportion of Oil, so as perfectly to lose its former Nature of Sulphur.

REMARKS.

This is the famous Balsam of Sulphur of *Helmont*, *Rulandus*, and *Boyle*, who very highly commend it for heating, mollifying, and resolving, when used externally; and internally against Putrefactions, and Suppurations of the Kidneys and Lungs especially, declaring they have thus found a secret; but effectual Remedy for Consumptions of the Lungs; but I judge, that by its acrimonious, indigestible, and hot unctuous Part, it offends the weak Lungs, the Stomach and Viscera, of languid Persons, spoils the Appetite, increases Thirst, and parches the Body, already too much dried by the Distemper. And this I speak not rashly, but upon Experience and Consideration; and therefore advise it to be sparingly and cautiously used, with a careful Observance of the Effect: Certainly it is not without a burning Rancidness, as being found, when externally used, successfully to cure pale, cold, watery, mucous, sanious, running Ulcers. Perhaps it was hence somewhat too hastily concluded to have the same Effects when used internally; for thus it raises and continues a Fever. The Chymical Use of the Experiment shews, that Sulphur, which remains untouched in *Alcohol*, the most subtle of Oils, expeditiously, and almost totally, dissolves in a very thick and sluggish Oil, strongly heated by the Fire; which evidently shews, with regard to the History of Menstruums, that an extreme Degree of Subtlety and Penetrability does not here perform what may speedily be effected by a sluggish and viscous Matter. But this is not all: Chymists often wonder that many Fossils, which remain untouched by the sharpest acid Liquors, should yet be successfully resolved by a mild and indolent Oil. Sulphur does not yield to any acid Menstruum; for there is no known Acid stronger than that already contained in the Sulphur, whence others cannot act upon it; but Sulphur is dissolved by Oil: As often, therefore, as a fossil Glebe, when boiled in Oil, affords such a sulphureous Balsam, the Oil must act upon the sulphureous Part of the Matter, unless we except Lead, whose metallic Part dissolves into a Balsam with Oil.

BALSAM of SULPHUR with TURPENTINE.

Put an Ounce of the Flowers of Sulphur into a tall Bolt-head; pour thereon six times the Weight of the ethereal Oil of Turpentine; let them boil for an Hour; the Sulphur will first melt at the Bottom, and part of it will be dissolved in the Oil that floats above it, with a crackling Noise, till at length the whole Sulphur will appear dissolved in the Oil. Let all cool, and a large Proportion of the Sulphur will appear concreted into yellow Spiculæ at the Bottom, the Balsam remaining at the Top; so that the Sulphur seems precipitated by a true Crystallization in this Balsam. Pour off the clear Liquor entirely, from the golden sulphureous Crystals, into a clean Vessel apart; add fresh Oil of Turpentine to the Remainder; boil as before, and all the Sulphur will be dissolved into a Balsam; but when suffered to cool, it again shoots into sulphureous Crystals. Again, pour on more Oil, and continue thus, till all the Sulphur is perfectly dissolved; whereby it will appear, that one Part of Sulphur requires about sixteen of this Oil to dissolve it entirely. Keep all the Balsams, thus prepared, under the Title of Balsam of Sulphur with Turpentine. This Operation requires the utmost Care, as being attended with Danger; for if the Mouth of the Vessel was stopp'd, the boiling Matter would burst the Glass with greater Violence than has been hitherto observed in any other Experiment.

R E.

R E M A R K S.

Hence we see, that a thin, penetrating, sharp, distil'd Oil, cannot easily dissolve the Sulphur, though a mild, gross, and indolent Oil so easily does it, as we saw in the preceding Process; whence it should seem, that the more subtle the Oils are, the more unfit to dissolve Sulphur, as appears remarkably in *Alcohol*. It appears also, that Sulphur dissolves in distil'd Oils, as Salt dissolves in Water, till the Water is saturated; but afterwards is thrown off into Crystals. The explosive Force of this *Balsam* of Sulphur is the most violent of any that is known. This *Balsam* consists of the Oil of Sulphur, the Oil of Turpentine, the perfect Acid of Sulphur, like that made by the Bell, and a fixed Earth. This *Balsam* is an extemporaneous anodyne Remedy in Pains of the Nerves, and an excellent Medicine in sanious, sinuous, weeping, watery, and fistulous Ulcers. Internally taken, it is heating, diuretic, and sudorific. It is recommended for cleansing and healing internal Ulcers; it is hence too highly commended for a Consumption, Ulcers of the Kidneys, and for expelling and dissolving the Stone; but the cautious Physician will recommend only the gentle Medicines, and be afraid of those that operate violently. It is certain, that the Urine is soon impregnated with a violet Smell, upon taking a little of this *Balsam*; and hence also the Tinctures of Fossils, extracted by Art, with distil'd Oils, are safely received for the Tinctures of Metals. This is call'd the *terebinthinated Balsam* of Sulphur; and as other distil'd Oils may be thus mixed with Sulphur, the *Balsams*, so prepared, receive their Names from the distil'd Oil employed, which gives them their prevailing Odour. Hence the *Balsamum Sulphuris anisatum, succinatum, and juniperinum*.

The Balsam of Sulphur with Turpentine is generally directed to be made with common Oil of Turpentine, and not with the æthereal Oil, in the manner following:

Take Flowers of Sulphur, four Ounces; and Oil of Turpentine, one Pound: Place the Mixture in a Sand-furnace; stop the Matrafs loosely with another Glas; apply a small Fire for one Hour; then increase it till the Oil boils gently, in which Degree keep it three or four Hours; then let it cool, and pour off the impregnated Oil from that which is not dissolved.

This is an excellent Medicine for all Diseases of the Breast, and likewise for Ulcerations and Obstructions of the Urinary Passages; but 'tis nauseous to take at first, because of an Emphysema, which wears off with long keeping. Its Dose is from six to fifteen or twenty Drops, upon fine powder'd Sugar, which is the best way to take it, because it will not well mix with any Liquor. After the same manner is a Balsam made with any other Oils, as Aniseeds, which is much used in the same Dose, or any other the Physician may direct; but Care must always be taken, lest it boil over, because it immediately takes and burns so fiercely, as to endanger a House. The Vessel ought therefore to be large enough to be two Thirds at least empty, to give it room to rise without running over. *Quincy's Dispensatory*.

The following extraordinary Case, related by *Hoffman*, may serve as a Caution to those who make Balsam of Sulphur with Turpentine.

Considering how universally Chymistry is cultivated, few I believe are ignorant of the surprising Effects produced by Gunpowder, and the *Pulvis fulminans*; as it is call'd, which is made up of three Parts of Nitre, two Parts of the Salt of Tartar, and one Part of common Sulphur; and also by the *Aurum fulminans*. But it may possibly appear somewhat strange and uncommon, that a distil'd Oil, especially Oil of Turpentine, and in which common Sulphur has been dissolv'd, should, when shut up in a Glas, and exposed to a strong Fire, exert itself with a Degree of Explosion, at least equal, if not superior, to that of Gunpowder. However, in Confirmation of the Truth of this, I shall here give an Account of a memorable Accident which happened on the 7th of November 1698. at *Zellerfeldt* in *Germany*, to the great Surprise and Astonishment of the Inhabitants.

A certain Apothecary putting some *Balsam* of Sulphur, with Oil of Turpentine, into a pretty strong Glas Retort, committed it to a Sand-heat; and the Mouth of the Receiver being strongly shut up, he apply'd a very brisk and intense Fire. Soon after such a violent Noise was heard, as made the People who were in the House imagine, that a Hurricane had arisen of so boisterous and dangerous a Nature, as to threaten the immediate Ruin and Downfall of the House. A certain Apothecary's Apprentice standing by the Mortar in the Area not far from the Laboratory, was suddenly dash'd against the Wall; and another, who was standing within the Gate of the Area, being, as it were, thunderstruck, dropp'd down upon the Ground. But, upon his Recovery, he perceiv'd a very fetid and strongly

sulphureous Smell; and suspecting from this Circumstance, that the Havock and Confusion produced was owing to an incautious and injudicious Management of Sulphur, he ran with all the Haste he could, along with a Neighbour who came to discover the Cause of so uncommon a Noise, into the Laboratory, where they found one half of the Retort remaining in the Sand, and the other half, together with the Neck, forcibly driven a great Way into the Area, through the Kitchen-windows, which it had broken and shatter'd very terribly.

Nor were these the only Effects produced by this impetuous Explosion; for it broke the Door of a Cellar, and forcibly drove it, and some Pots and Dishes, out of the Kitchen into the Area. It also broke another Door which communicated between the above-mentioned Cellar and the Laboratory, and tore a very strong Lock off it; and as from the same Cellar there was an Ascent by a winding Stair-case, built in a manner resembling a spiral Shell, to another Apartment, it also broke open the Door of that, and threw a Chest of Drawers, in which there were some *Dutch* Vessels for holding Confections, upon the Floor. In the same Apartment it also lifted some Vessels of the same Kind from amidst others, and dash'd them on the Floor, and drove both the Windows into the Area. Besides, it shattered the Windows by the Door which opened to the Street; and in a smaller Apartment it broke the Flooring, and threw down the Door, together with the Door-case, Lock, and Hinges; the Windows of this Apartment were also shatter'd. It also threw open the Door of the Apartment where the distil'd Waters were kept; and another Door which communicated with the Laboratory, with great Force and Violence. In the Laboratory itself it only broke the Glasses of the Windows, and loosen'd their Cases, without carrying them along with it.

The People in the Neighbourhood affirm'd, that at the very Instant the Noise was heard, a large Quantity of thick Smoak ascended from the Chimney; that the Noise was equal to that produced by the Discharge of Cannons; and that the explosive Force reach'd all the several Quarters of the Town, and shaked almost every House in the same manner an Earthquake used to do.

This surprising Accident, the incredible Effects of which I saw with my own Eyes, clearly discovers the Genius, Nature, and irresistible Force of Lightning and Thunder; and convinces us, that their piercing and violently concussive Force depends upon the strong Percussion of the Air, whilst it is impetuously agitated and thrust from its Place by means of an igneous, expansive, and highly elastic Principle; so that a whole Column of Air of a considerable Weight produces various and wonderful Effects on Objects that are exposed to it, especially if they are of a hard and resisting Nature, by bruising, breaking, and agitating them; for in reality the surprising explosive Force of Gunpowder, when kindled, is not to be ascribed to Nitre or Sulphur, as the material Cause, but rather to the Column of Air impetuously driven from its Place by the violent rarefactive and expansive Motion of the Air: Hence we see, that Effects of the same Kind with those produced by Thunder and Lightning may, without the Concurrence of Nitre, be produced by a sulphureous Substance close shut up and inflam'd.

Nor is it to be doubted, but the tremulous and concussive Motions of the Earth, commonly called *Earthquakes*, frequently draw their Origins from such a sulphureous Substance being resolved and kindled in subterranean Caverns, where 'tis sometimes found in great Plenty; for 'tis most certain, that no nitrous Salt, which is produced only by the Air, can be ingender'd and form'd in the Bowels of the Earth.

Besides, this Experiment furnishes us with some very useful Cautions; and in a particular manner teaches us, that all inflammable Substances, Oils and Spirits not excepted, especially when close shut up in Vessels, ought to be managed cautiously, and with a due Degree of Fire, lest by the Violence of their explosive Force they should destroy People, or throw down Houses; for we know, that a few Years ago some Chymists in *Leipsic* were convinc'd of this to their Loss, whilst in distilling rectified Spirit of Wine, in a Copper Still, by the Application of too strong a Fire, the Vessels were burst, and the Spirit broke out in a Flame.

For the Illustration of this Experiment we may also bring a memorable Observation publish'd by *Mauchardus* in the *German Ephemerides*. A Cooper put some Measures of dephlegmated Spirit of Wine into a Cask, which held thirteen Firkins, in order to take away the Taste of the new Wood; and, burning Sulphur upon it, he ignorantly shut up all the Holes of the Vessel; upon which such an Explosion was made, that the People of the Neighbourhood imagined an Earthquake had happen'd. By means of this Explosion the whole posterior End of the Cask, though three Inches thick, was not only broken in two Parts, in the transverse Direction of the Boards, but also driven to a Wall at the Distance of four Feet from it with such Violence, that its Fragments were bruised and dash'd in Pieces,

but its exterior End remained entire in the Groove; and at the same time the Bar which was designed to render it the firmer, was driven away with such Violence, that the Iron Nails which fixed it were driven as forcibly into some Boards lying near it, as if a large Hammer had been used for that Purpose. *Hoffmanni Observ. Physico-chymic.*

BALSAMUM SULPHURIS MARTIS, or Balsam of Sulphur with Iron.

Take clean Filings of Iron, or broken Needles, one Pound: Put them into a Cucurbit, with five Pounds of Spirit of Salt. Let it stand in a digestive Heat five or six Days, in which time the Iron will be almost dissolved. Filtre, and remove it into a Glass Retort. Place it in the Furnace, with a great deal of Sand about it. Apply Fire of the first Degree for one Hour, augment it to the second, which continue till no more Drops fall; then change the Receiver, and increase the Fire to the third Degree for one Hour, and so pass on to the Extremity of the fourth, and there keep it four or five Hours, in which Time red Flowers will ascend into the Neck of the Retort, and some yellow Spirit come into the Receiver. Let all cool, and remove the Vessel. In the Receiver there will be about four Ounces of a yellow Spirit; and if the Process be regular, about the same Quantity of foliated red Flowers in the Neck of the Retort. Take of the Flowers, three Ounces; of the yellow Spirit, one Ounce: Put them into a Matrafs, and pour eight Ounces of Oil of Turpentine upon them. Let them digest upon warm Sand for twenty-four Hours; then augment the Fire, so as to make the Matter simmer for two Hours. Let all cool, and separate it carefully from the Fæces, for Use.

This Medicine is by some affirmed to be one of the best Vulneraries in the World, both internally and externally. It is good in all Distempers of the Breast and Lungs, against Gravel, and Ulcers of the Reins. It also cicatrizes and heals Ulcers, outwardly apply'd; but the Shops are too great Strangers to this Remedy, and it is hardly ever prescribed, but very well deserves a Place in Practice. Its Dose is from ten to fifty or sixty Drops. *Quincy's Dispensatory.*

ODORIFEROUS BALSAMS artificially prepared from distilled Oils, Wax, and Pomatum.

Take an Ounce of perfectly pure Pomatum; melt it in a China-vessel over a gentle Fire; then gradually add a Dram of white Wax, fine shaved; and after the two are well mixed, remove the Vessel; and when they begin to thicken, drop in a Dram of essential Oil, keeping the Whole constantly stirring; that it may perfectly mix; after which set the containing Vessel in cold Water, where growing immediately cold, it may keep in the Oil and Spirit. When the Balsam is thoroughly cold, directly put it up into Boxes of Lead or Pewter; which being close stopp'd, it may thus be preserved perfect for Years. Instead of Pomatum and Wax, the express'd Oil of Nutmeg may be here used, after it has been wash'd so long in Water as to become white, tasteless, inodorous, and pure; for this is the common way of preparing these Balsams. If they are desired of a grateful Colour, this may be easily given them by the Addition of a little Pigment. Thus, for Instance, a Scruple of Cochineal, reduced to fine Powder, will tinge an Ounce of the Balsam of an agreeable Purple; or the same Quantity of the inspissated Juice of Buckthorn of a Green; a little native Cinnabar, ground fine, will turn it of a Scarlet; fine Turmeric, of a Yellow; or a little Smalt, of a Blue. Any of these Pigments, therefore, may be used at Pleasure; provided they have no ungrateful Odour, or pernicious Property.

R E M A R K S.

As these Balsams are prepared in the way of rich Perfumes, and in order to raise the languid Spirits, the noblest Oils, either separate, or artificially mix'd, should be used therein; and the principal of this Kind, are those of Baum, Calamus Aromaticus, Cinnamon, Cedar, Citron, Cloves, Jessamin, Lavender, white Lilies, Marjoram, Mace, Nutmegs, Origanum, Oranges, both those of *China* and *Seville*, Roses, Rhodium, yellow Saunders: To which we add Balsam of Peru, and Balm of Gilead, these two being spontaneously fragrant, without Distillation. *Boerhaave's Chymistry.*

BALSAMUM PHILOSOPHORUM is the *Aurum Potabile* of the Chymists.

It would be almost endless to specify all the artificial Balsams which have been contrived by Dispensatory Writers. *Lemery*, in his *Pharmacopée Universelle*, has seventy-three different Sorts, some of these above-specified included; besides

VOL. I.

many others in foreign Dispensatories. *Lemery's* are as follows:

Balsamum Album, Leon. Fioraventi. This is very different from the *Balsamum Album* taken Notice of above.
Balsamum Absinthiacum, seu Stomachicum, Mynsichti.
Balsamum ad Nervorum puncturas, de La Framboisiere.
Balsamum Angelicæ, Sennerti.
Balsamum Angelicæ reformatum.
Balsamum Anodynum vel Podagricum, Batei.
Balsamum Antipodagricum, Philip. Mulleri.
Balsamum Apoplecticum.
Balsamum Apoplecticum reformatum.
Balsamum Apoplecticum, Etmulleri.
Balsamum Arcæi.
Balsamum Aromaticum, Mynsichti.
Balsamum aut Unguentum Sympatheticum, Batei.
Balsamum Balsaminæ.
Balsamum Bezoardicum.
Balsamum Cephalicum, Angeli Salæ.
Balsamum Cephalicum Italicum.
Balsamum Christi Paracelsi.
Balsamum Christi Paracelsi reformatum.
Balsamum Cordiale, Angeli Salæ.
Balsamum Cordiale, Sennerti.
Balsamum Dolorem levans.
Balsamum Equitis Sancti Victoris.
Balsamum Galbanetum, uterinum, Sennerti.
Balsamum Guidonis.
Balsamum Heurnii.
Balsamum Hispanicum.
Balsamum Hollerii.
Balsamum Hypnoticum, Mynsichti.
Balsamum Hystericum, Lud. Penicher.
Balsamum Jacomo de Pinto.
Balsamum Italicum.
Balsamum Josephi Balsame, Equitis Sanctæ Crucis.
Balsamum Loimicum Hemisfanum.
Balsamum Lucatelli.
Balsamum Magistrale, Batei.
Balsamum Medicorum Florentiæ.
Balsamum Mirabile, Fulleri.
Balsamum Mirabile, Renodei.
Balsamum Mumie, Laz. Riverii.
Balsamum Nephriticum, Fulleri.
Balsamum Nervale.
Balsamum Palmeum.
Balsamum Paralyticum, Mynsichti.
Balsamum Paralyticum, Batei.
Balsamum Polychrestum.
Balsamum Polychrestum, Jacobi Le Mort.
Balsamum Puerorum Dentientium.
Balsamum Samaritanum.
Balsamum Sanguinem sistens.
Balsamum Sarcoticum.
Balsamum Saturni.
Balsamum seu Oleum Benedictum, Apparitii.
Balsamum seu Oleum tranquillum, Abbatis Rousseau.
Balsamum Solimani.
Balsamum Spasmodicum, Mynsichti.
Balsamum Spinale, Batei.
Balsamum Stypticum, Mynsichti.
Balsamum Sulphuris Anisatum.
Balsamum Sulphuris Antimonii.
Balsamum Sulphuris Compositum.
Balsamum Sulphuris Rulandi.
Balsamum Sulphuris Rulandi, reformatum.
Balsamum Sulphuris simplex seu terebinthinatum.
Balsamum vel Butyrum succini, Batei.
Balsamum Venereum, Mynsichti.
Balsamum Uterinum aliud.
Balsamum Vulgare.
Balsamum Vulnerarium, Fallopii.
Balsamum Vulnerarium, Mindereri.
Balsamum Zibethæ, Mynsichti.

BALUX. A Name for the Sand of some Rivers, which is mix'd with Gold.

BAMBALIO. A Man that stammers, or lisps.

BAMBAX, or BOMBAX. Cotton.

BAMBU. The ARUNDO TABAXIFERA, which see.

BAMIA. The same as ALCEA INDICA, which see.

BAMMA. The same as Embamma.

BAN. The Name of an Egyptian Plant, call'd also CALAF, which see.

BANANA, Offic. Raii Hist. 2. 1375. *Musa caudice maculato, fructu recto rotundo breviori odorato, Cat. Jam. 192. Sloan. Hist. 2. 147. Ficoides, seu ficus Indica, longissimo latissimoque folio, caule maculato, fructu minore, H. Beaum. 21. Boerh. Ind. A. 2. 171. Musa fructu cucumerino breviori, Plum. Nov. Gen. 24. Senoria, Jons. D. 143. Pacoira, Pif. (Ed. 1658.) 154.*

Pacoba, Ejusd. (Ed. 1648.) 76. *Pacoeira Lusitanis*, Marcg. 137. THE BANANA-TREE.

The Virtues ascribed to the Fruit of this Tree, are, to nourish much, to excite Urine, and provoke to Venery. It grows in America.

BANANIERA. A Name for the *Ficus Indica*.

BANAUSIA, *Βαναυσία*. An illiberal or mechanical Art. *Hippocrates*, in his Treatise *περὶ διαγνῶσεως*, uses this Word, where it seems to mean dishonourable Artifice, or low Craft, inconsistent with the Character of a Physician, or a Gentleman; and only practised by Quacks and Pretenders, with a View of concealing their Ignorance.

BANDURA *Congalensium Gentianæ Indica species*, P. Amman. *Planta mirabilis destillatoria*, Grimmii.

It is like Gentian in Seeds and Seed-vessels; but is, besides, remarkably conspicuous for a foliaceous Sheath, or Follicle, representing a Penis, which is sometimes much above a Foot in Length, and much thicker than a Man's Arm: It hangs by a Leaf, and is half full of a sweet potable Liquor.

To this Description *Grimmii* adds, in the *German Ephemerides*, that the Root attracts the Moisture of the Earth, which, by the Benefit of the Sun's Rays ascending into the Plant, flows down, by the Stalks and Fibres of the Leaves, into this natural Vessel, as into a Reservoir, till it is exhausted for Man's necessary Use. These Receptacles, till they come to full Maturity, are closed up at the Top with a fine Cover, which sometimes falls abroad at the Pressure of the Fingers, and yields the Possession of this sweet, limpid, lovely, cool, and comfortable Liquor; and about six or eight of these Receptacles are sufficient to quench a Man's Thirst, with all the Pleasure imaginable.

The Medicinal Virtues are as follows: The Root is of an astringent Quality; the Herb is cooling and moistening; and the express'd Juice may be of Service, with some proper distill'd Liquor, internally, in burning Fevers; and externally in Inflammations, Erysipelas, and the like.

It grows not far from Columbo, in moist and shady Woods. *Raii Hist. Plant.*

BANGUE, Offic. Park. 1624. Garz. ab Hort. 233. C. à Costa, 290. *Raii Hist.* 1. 159. *Bangue Cannabi simile*, J. B. 3. 440. *Cannabis Indica trifoliata*, frve *Bangue Indorum*, Pluk. Almag. 80. Mal. 68. *Althæa alia species, foliis Cannabinis*, à *Garzia ab Horto Bangue dicta*, Herm. Hort. L. Bat. 26. *Kalengi Cansjava*, H. M. Tom. 10. 119. Tab. 60. *Tjjeru-Cansjava*, Ejusd. 121. Tab. 61. BANGUE. *Dale*.

Acosta, who has describ'd it, says, it is almost like Hemp, has a square Stalk five Palms high, of a watry green Colour, hard to break, but not so hollow as the hempen Stalk; but the Rind of it is as easy to be drawn into Threads as that of the other. The Leaves are like those of Hemp, green above, and cover'd with a Down underneath, and have an earthy and insipid Taste.

The *Indians*, says *Acosta*, eat the Seed and Leaves, to increase their Vigour in Love-affairs, and to excite an Appetite to their Food. The Nobles, and chief military Officers, when they are disposed to forget their Toil, and to sleep in perfect Ease and Security, take of the Powder of the Seed and Leaves as much as they think sufficient, and thereto add an Areca, or green Indian Hazel-nut, and as much Opium as they think fit, and eat them all together with Sugar. If they desire to be entertain'd with Variety of Scenes, and Images of Things, in their Sleep, they add some of the choicest Camphire, Cloves, Nutmegs, and Mace. If they have a mind to be merry, witty, and to indulge their Amours, they add Ambergris and Musk, and make them all into an Eleatuary with Sugar. It is by many affirm'd, that the Seed and Leaves are very effectual in promoting Lust; whence, says *J. Baubine*, it appears, that this Herb has no Affinity with Hemp, tho' it be very much like it; since Hemp, according to *Dioscorides*, is of an hot and dry Nature, and extinguishes amorous Desires and Motives.

Ray, from whom this Account is taken, says, he learned from Sir *Hans Sloane*, that it is a different Plant from Hemp.

It grows in *Indostan*, and other Parts of the *East-Indies*, where it is principally in Use.

BANILIA. The same as VANILIA, which see.

BANISTERA, *Houft*.

This was so call'd from a famous Botanist, who lost his Life in the Search of Plants in *Virginia*. We have no English Name for this Plant.

The Characters are;

It hath a papilionaceous Flower, which is succeeded by one naked Seed, whose outer Membrane is extended into a winged Leaf, after the manner of the Maple-seed.

Miller mentions five Species of this Plant.

These Plants are all of them Natives in the warmest Parts of America, where they grow in the Woods, and twist themselves round the Trunks of other Trees or Plants which grow near them; some of them grow four or five Feet high, and

others will rise to the Height of ten, twelve, or fourteen Feet; but must be supported by other Plants, for they do not grow erect.

The first, second, and third Sorts grow plentifully in the Woods in *Jamaica*; but the other two Sorts were collected by the late Dr. *William Houstoun* at *Carthage*, in the *Spanish West-Indies*. These Plants were call'd Maples, by Sir *Hans Sloane* and Father *Plumier*, from the Resemblance which their Seeds have to those of the Maple; but the Flower differing so remarkably from that of the Maple, the late Dr. *Houstoun*, with good Reason, separated it from that Genus, and gave the Name of *Banistera* to them. *Miller's Dictionary*, Vol. 2.

BAOBAB, or rather BAHOBAB. An African Fruit, of which *Prosper Alpinus* gives the following Account: *Bahobab*, says he, is a Fruit as large as a Lemon; it resembles a Gourd, and contains black hard Seeds, whose Extremities incline, as it were, to the Form of a Demi-arch. Its Substance also resembles that of the Gourd, which, when newly pull'd, is moist, red, and of a pretty grateful acid Taste. This Fruit, when newly taken from the Tree, is very grateful to the Taste; and in those Parts of *Ethiopia* which are scorched with insupportable Heat, the richer Sort of the Inhabitants correct it acid Taste with Sugar. It is a great Cooler, and a very efficacious Quencher of Thirst. I am also inform'd, that in *Ethiopia* 'tis used against all hot Disorders, and against all putrid Fevers; but more especially those of the pestilential Kind. They have various Ways of using it in these Intentions; for they either eat its Pulp with Sugar, or drink its express'd Juice with Sugar, or take a proper Dose of a Syrup prepar'd from it. At *Grand Cairo* also, where the Fruit cannot be had fresh, they use its Pulp, reduced to a Powder, which is like an Earth of a reddish Colour, and has an astringent acid Taste, not unlike that of *Lemnian Earth*. This Powder is also very much used by many against pestilential Fevers, Spittings of Blood, Lienteries, Dysenteries, and the Hepatic Flux; as also for stopping immoderate Fluxes of the Menfes. Some for these Disorders prescribe a Drain of this Earth, reduced to a fine Powder, and dissolved in Plantain-water. Others exhibit it in Decoctions, and others in Infusions. I myself saw one of the Trees, which bears this Fruit, in a certain Nursery; and it very much resembled an Orange-tree, both with regard to its Leaves, its Bulk and Shape. *Prosper Alpinus de Plantis Egypti*.

There is a sort of Stone also, which, from its Resemblance to this Fruit, is call'd BAOBAB LAPIDEUM.

BAPTISECULA. A Name for the CYANUS MINOR.

BAPTISTERIUM. A Font, or Bath, to wash in.

BAPTUS. A bituminous soft Fossil, of an agreeable Smell, mention'd by *Agricola*.

BARA. *Josephus*, in the third Chapter of his seventh Book concerning the Wars of the Jews with the Romans, gives us a very fabulous and romantic Account of this Plant, in the following Words: "On the North Side, says he, of that Valley which encompasses *Macheron*, at the Place call'd *Bara*, there is a Plant bearing the same Name, which resembles a Flame. Towards the Evening it emits resplendent Rays, and retires when any Attempts are made to lay hold on it. The only Means of preventing its Escape, is, to throw the Urine, or the menstrual Blood, of Women upon it. One cannot touch it without dying, unless he has some of the Root of the same Plant in his Hand. But there is still another Method discover'd of gathering it without Danger: They dig all around it, till only a small Part of its Root remains fix'd in the Earth; to this they tie a Dog, which, upon making an Effort to follow the Person who tied him to it, tears up the Plant, and dies immediately; and thus, by losing his own Life, saves, as it were, that of his Master. After this the Plant may be safely handled; and has a particular Virtue of removing from People all Dread of the Dangers they may be afterwards exposed to in gathering it: For Demons, which are nothing else but the Souls of the Wicked, which enter into living Men, and which would undoubtedly kill them, if proper Remedies were not used, are dispossest and thrown out, as soon as this Plant is applied to the miserable Patients."

BARACH PANIS. *Rulandus* explains this by *Nitrum Salis*.

BARAS. In *M. A. Severinus*, signifies the same as ALPHUS, or LENCE.

BARATHRA, *Βαράθρα*. The Memphitical Caves, or *Charonæan Pits*, as they are call'd by *Strabo*, go by this Name.

BARBA. The Beard, a Part so well known, that it requires no Description.

BARBA HIRCI. See TRAGOPOGON.

BARBA JOVIS.

The *Barba Jovis* of *Caspar Baubine*, the *Jovis Barba pulchre lucens* of *John Baubine*, the *Jovis Barba frutex* of *Parkinson*, is the Silver Bush. *Raii Hist. Plant.*

I don't find any Medicinal Virtues attributed to it.

The *Barba Jovis Plinii forte Gesneri*, is the *Coggygia*, a Species of Sumach. *Parkinson*.

The *Barba Jovis Plinii* some take to be the *Oleaster Germanicus*. *Parkinson*.

The *Sempervivum majus* is also call'd by this Name. *Raii Hist. Plant.*

BARBAREA, Offic. Ger. 188. Emac. 243. *Raii Hist.* 1. 809. J. B. 2. 868. Mer. Pin. 14. *Barbarea*, *Pseudo-bunias*, Merc. Bot. 1. 23. Phyt. Brit. 14. *Barbarea*, *Carperitaria*, Chab. 278. *Barbarea flore simplici*, Park. Theat. 819. *Eruca lutea latifolia*, five *Barbarea*, C. B. Pin. 98. *Raii Synop.* 3. 297. *Eruca latifolia lutea*, seu *Barbarea major & minor*, *Hist. Oxon.* 2. 230. *Nasturtium Hybernium*, Thal. 80. *Sisymbrium Erucae folio*, flore luteo, Elem. Bot. 192. Tourn. Inst. 226. Boerh. Ind. A. 2. 15. Dill. Cat. Giff. 64. Rupp. Flor. Jen. 63. Buxb. 305. WINTER-CRESSES. *Dale*.

It is a Species of *Sisymbrium*, which sends forth many Leaves to the Height of a Foot and a half, spreading, hollow, bearing Leaves less than those of Radish, and having some Resemblance to those of Cresses, of a blackish-green Colour, and shining: The Flowers are little, yellow, each consisting of four Leaves, disposed in the Form of a Cross; they are succeeded by little Pods, which are long, round, and tender, containing reddish Seed: The Root is oblong, moderately large, of a sharp Taste; it grows in the Fields, and is cultivated in the Kitchen-gardens for Sallad. It contains a great deal of essential Salt and Oil.

It is deterfive and vulnerary; it excites Urine; it is very good for the Scurvy, for the Diseases of the Spleen, and for the nephritic Colic. It is used externally and internally. *Lemery des Drogues*.

This Herb grows spontaneously in moist and sandy Places, upon old Walls, in Cross-ways, Meadows, and on the Banks of Rivulets. It has the same Virtues and Qualities with the Cresses. It is good for the Spleen, and cures the Scurvy, and Wounds. It is sometimes used all alone, and sometimes mix'd with other Herbs. Its Leaves, bruised, and infused with Wine and Sugar, are excellent for the Scurvy. The express'd Juice of the Herb cures a Defluxion of fetid and scorbutic Humours in the Mouth, Bleedings and Loosenes of the Teeth, and Excrecences of the Mouth, if the Gums are rubb'd with it. It is of a drying Quality, and cures impure and fetid Wounds, when mix'd with other vulnerary Ointments. The Herb, boil'd in Wine or Milk, cures Sciatic Pains, if Lint is soak'd in it, and apply'd hot to the Part affected. Of it, together with tepid Water of unripe Oranges, an excellent Medicine is prepar'd, against the Gout of the Feet and Knees, or Sciatic Pains. *Chabr.*

The Seed provokes Urine, and expels the Stone; and may also be used in Sinapisms and Veficatories. *Barthol. Zorn, Botanolog.*

BARBARUM. An Epithet for a Plaster for green Wounds, in *Scribonius Largus*.

BARBOTA, the Barbut. A small River-fish, with a very large Head. It is generally about six Inches long, or more.

In the Choice of this Fish, take that which is well-fed, tender, delicious, and agreeable to the Taste. It yields pretty good Nourishment, and is easy enough of Digestion.

This Fish is a little too soft and viscous. The Row, as well as that of the Eel-powt, is not to be eaten; for it will work both upwards and downwards.

It contains much Oil, Phlegm, and volatile Salt.

It agrees, at all times, with young People of a hot and bilious Constitution.

R E M A R K S.

This is a small River-fish, well known to Fishermen, that lives upon Mud and Slime: Several nice Palates there are, who do not much esteem it, because, they allege, it tastes of the Ordure with which 'tis fed.

Its Liver is well-tasted, and very large, in Comparison to the Bigness of the rest of its Body. Some Authors assure us, there is no other but this Part of the Fish, that is good to be eaten. *Lemery on Foods*.

This Fish is very rare in England; but is sometimes found in the River which runs by *Tamworth* in *Warwickshire*.

BARBUS, Offic. Aldrov. de Pisc. 597. Charlt. de Pisc. 37. Schonf. Ichth. 29. Gesn. de Aquat. 123. *Raii Ichth.* 259. Ejsid. Synop. Pisc. 121. Rondel. de Pisc. 2. 194. Salv. de Aquat. 86. *Barba & Barbus*, Mer. Pin. 189. *Barbo*, Schrod. 5. 325. *Myxus fluviatilis*, *Barbus*, Bellon. de Aquat. 301. THE BARBEL. *Dale*.

The small Barbels are to be preferr'd before the large, because they are easier of Digestion. They should be also taken in pure running Waters. There are two Sorts of them, one of which is bearded, and the other not.

This Fish is very nourishing, and even proves solid and durable Food enough. It is also look'd upon to be good for the Colic, Piles, and Stinging of venomous Creatures. They also pretend, that it allays Venereal Inclinations: But I am not certain, that all these Virtues, which are attributed to it, are grounded upon solid Experiments.

This Fish is a little hard, and not easily digested; and a certain Author says, that the Wine wherein it hath been steep'd and boil'd, makes Men and Women barren.

It contains much Phlegm, Oil, and Salt, that is almost all volatile.

It agrees, at all times, with young bilious People, those who have a good Stomach, and are used to much Exercise of Body.

R E M A R K S.

Barbel is a Fish of an oblong Form, and middle-sized, and beset with large and tender Scales. It was antiently consecrated to *Diana*. It breeds three times a Year. It is by some call'd *Trigla*, according to this Verse:

Accipiunt Trigla terno cognomina partu.

This Fish is a little hard to be digested, by reason of some gross Juices contain'd therein: In the mean time, these same Juices make it very nourishing, and good durable Food. It has a good Taste; and the old *Romans* esteem'd it very much, which made them put it amongst those that went at an excessive Price, as several faithful and true Historians have assured us. The Liver is that Part of the Fish that is most esteem'd for the Goodness of its Taste, and the Head next. But *Galen* speaks slightly both of the one and the other, not only upon the account of the Taste, but also Health. *Lemery on Foods*.

The Spawn of the Barbel, at some Seasons of the Year, is a most violent Vomit and Purge.

BARDADIA. A Pound, *Libra*. *Rulandus*.

BARDANA MAJOR, *Lappa*, Offic. *Bardana major*, Ger. 665. Emac. 809. *Raii Hist.* 1. 332. Synop. 88. Schw. 27. *Bardana vulgaris major*, Park. 1222. *Lappa major*, *Arcium Dioscorides*, C. B. 198. *Hist. Oxon.* 3. 146. Tourn. Inst. 450. Boerh. Ind. A. 146. Dill. Cat. 168. Buxb. 179. *Personata five Lappa major aut Bardana*, J. B. 3. 570. *Personata*, *Lappa major*, *Bardana*, Chab. 514. BURDOCK. *Dale*.

The Root of the great Burdock runs down deep into the Earth, pretty large and thick, of a blackish Colour on the Outside, and white within, from which spring many large Leaves cover'd with a hoary Whiteness underneath, and green above; of a roundish Shape, yet pointed at the End, and hollow'd in, next the Foot-stalk, indented about the Edges, and many times so large as to cover the Head and Face from the Sun. The Stalks are large and thick, full of a whitish Pith, somewhat downy, and often of a purplish Colour; they are divided into many Branches, on which grow smaller Leaves, and on their Tops a great Number of scaly Heads or Burs, the End of every Scale terminating in a hooked Point, by which it sticks very tenaciously to Garments: From the Middle of these Heads arise hollow fistular Flowers of a purple Colour, and they are succeeded by oblong, flattish, and angular brown Seed. This Plant grows every-where by the Way-sides; and flowers in June and July. The Roots, Leaves, and Seeds, are used.

The Roots are sudorific and alexipharmic, and good in malignant Fevers, and are therefore put in Quantity into the *Aqua Theriacalis*. They are likewise useful against the Gout, and Pains in the Limbs. The Leaves, boil'd in Milk, and apply'd as a Cataplasm, are good for the same Distemper. They are likewise good for Burns and Inflammations, and are one of the Ingredients of the *Unguentum Populneum*. The common People frequently apply them to the Feet and Wrists in Fevers. The Seed, powder'd, and given in white Wine, is good to provoke Urine, and help Fits of the Stone. *Miller's Bot. Off.*

BARDANA ARCTIUM, Offic. *Lappa major montana*, capitulis tomentosis, seu *Arctium*, C. B. 198. Tourn. Inst. 450. Boerh. Ind. A. 146. Dill. Cat. 162. Buxb. 174. *Hist. Oxon.* 3. 147. *Bardana major altera*, Ger. Emac. 810. *Raii Hist.* 1. 332. *Bardana major*, lanuginosis capitulis, Park. 1222. *Bardana montana*, Schw. 28. *Personata seu Lappa altera*, cum capitulis villosis, Chab. 514. *Personata altera*, cum capitulis villosis, J. B. 3. 571. *Personata montana*, capitulis magis tomentosis, *Raii Synop.* 88. WOOLLY-HEADED BURDOCK.

It grows in ruinous Places, and by the Sides of Paths; and flowers in July.

The Root and Seed are used in Medicine, and agree in Virtues with the former. The Root, with the Seed, boil'd in Wine, mitigates the Tooth-ach, if the Decoction be held in the Mouth; and the same is used to foment Burns and Chilblains. It is drank in Wine for the Sciatica and Strangury. *Dale*.

BARDANA, Offic. *Bardana minor*, Ger. 664. Emac. 809. Schrod. 4. 25. Schw. 28. *Lappa minor*, *Xanthium Dioscoridis*, C. B. 198. *Xanthium*, Elem. Bot. 348. Tourn. Inst. 439. Boerh. Ind. A. 2. 103. *Xanthium*, seu *Lappa minor*, J. B. 3. 572. *Raii Hist.* 165. Synop. 55. Chab.

514. Hist. Oxon. 3. 604. Park. 1223. Buxb. 342. *Marrullumetæ Malab. Aët. Philosoph. Lond. No. 224. p. 318.*
LOUSE-BUR. Dale.

This is a much smaller and lower Plant than the common Burdock, having usually but one Stalk, and that not very much branched, growing somewhat more than a Foot high, a little downy, round, and full of black Specks; having its Leaves growing on long Foot-stalks, which are in Shape like those of Marshmallows, but broader, and not so long, waved about the Edges of a yellow-green Colour, somewhat rough on both Sides. The Flowers grow towards the Top, of a greenish Colour, and staminous. The Seeds do not succeed the Flowers, but come forth among the Leaves; being long and roundish, full of large hooked Spines, divided into two Parts, each holding one long Seed. The Root is small, fibrous, and perishing, after it has ripened the Seed. It grows but in few Places in England; and that only in a rich and fat Soil; particularly, it is found on the small Common near Dulwich, and gives its ripe Seed in September.

It is but very seldom that this Plant is used, tho' some commend it against scrophulous Tumors, the Juice being taken inwardly, and the Leaves apply'd to the Swellings. *Matthiolus* extols it much, as an Herb of great Service against the Leprosy. *Miller Bot. Off.*

BARLERIA.

This Name was given to this Genus of Plants, by Father Plumier, in Honour of *Jacobus Barlier* of Paris, who was a famous Botanist. We have no English Name for it; but the Inhabitants of the Island of Jamaica call it *Snag-dragon*.

The Characters are;

It hath a personated Flower, consisting of one Leaf, whose upper Lip or Crest is erect, but the under is divided into three Parts; from whose Empalement rises the Pointal in the hinder Part of the Flower, which afterwards becomes a quadrangular, oblong, membranaceous Fruit, with one Capsule, in which are lodged flat roundish Seeds.

Miller enumerates two Species of this Plant.

I don't know, that any Medicinal Virtues are attributed to it.

BARNA. *Johnson* explains this by *Vas Vitreatum*. I suppose he means a glaz'd Vessel.

BARNABUS. *Rulandus* explains this, if it may be call'd explaining, by *Barnaas. Sal Petre Urinarium; Urina Salis Petre; Acetum acerrimum.*

BARNACLES. These are Birds very common in the North of England and Scotland, remarkable for being the Subject of an extravagant Fable, gravely related by *Gerard*, which is, that they are produced from the Shell of a Fruit, which, falling into the Sea, opens and lets out the young Barnacle.

The Barnacle is a very rank, and highly alcalescent Food, and esteem'd by some as a great Dainty.

I don't know whether it is the same as the *Vulpanser*, or different. See VULPANSER.

BAROMETRUM, a Barometer. An Instrument for measuring the Gravity of the Air.

BARONES. Small Worms, called also *Nepones* by *Johannes Anglicus*.

BAROS, βαρος. Properly, Gravity. *Hippocrates* frequently uses this Word, to express an uneasy Sensation of Weight or Gravity in any particular Part.

Baros signifies vehement, violent, acute, or heavy, in Medicinal Writers.

BARURAC, Glas. *Rulandus*.

BARYECOA, βαρυκοία, from βαρύς, dull, heavy, and αἶσα, hear. Dulness of Hearing.

BARYOCOCCALON. A Name for the *Stramonium*, Thorn-apple, which see. *Blancard*.

BARYPHONIA, from βαρύς, dull, heavy, and φωνή, the Voice. Difficulty of Speaking. *Blancard*.

BARYPICRON. A Name for the *Absinthium Latifolium*. *Blancard*.

BASAAL. The Name of an Indian Tree, which grows in sandy Places, especially near *Cochin*. It flowers, and produces Fruit, once a Year, from the first Year of its Bearing to the fifteenth.

A Decoction of the tender Leaves in Water, with an Addition of Ginger, is used as a Gargarism in Affections of the Fauces. The Berries fry'd in Butter are made into an Ointment, with which they anoint the Forehead and Temples of those who are affected with a Phrensy, and with very good Effect, as they say. The Kernels of the same kill Worms. *Ray, Hist. Plant. 1570.*

BASALTES. A rough Stone, of the Colour, and almost the Hardness, of Iron, which renders it difficult to be cut.

BASANISMOS, βασανισμός, from βασανίζω, a Touchstone. It signifies the Investigation, Examination, or Trial of a thing.

BASCANON, βασκανον, Fascination.

BASELLA. Climbing Nightshade, from *Malabar*.

The Characters are;

It hath an annual Root: The Stalks are climbing, and of a purple Colour: The Leaves are round, thick, succulent, and of a dark-green Colour. From the Foot-stalk of the Leaves are produced Spikes of Flowers, which are Male and Female; in different Parts of the Spike: The Female Flowers are succeeded by flat Berries, in each of which is contained one hard Seed.

Miller enumerates three Species of this Plant. There is no Medicinal Virtue attributed to this Plant, that I know of.

BASIATIO. The same as AMPLEXATIO, which see.

BASILAREOS. A Name for the *Os Cuneiforme*.

BASILEION; βασίλειον. An Epithet for a Collyrium, described by *Ætius*.

BASILICA VENA. The Basilic Vein in the Arm. See VENA.

BASILICON. An Epithet for an Ointment, or Cerate, described in *Ætius Tetrabiblos, 4. Serm. 3. Cap. 21.* very little different from that of the College. *Quincy* is therefore mistaken, when he attributes the Invention of it to *Mesue*. It is thus prepared as directed by the College:

Take of yellow Wax; fat Refin, and Pitch, of each one Pound and a half; of Oil, nine-Ounces. Mix them together into an Ointment by melting; *S. A.*

It hath been continued the same thro' all the officinal Dispensatories, especially those of our College, and is much used to incarn Wounds; tho' of late our Surgeons begin to substitute, for such Intentions, Dressings that are not so liable to produce Fungosities; one of which is the following.

UNGUENTUM BASILICON FLAVUM; The Yellow Royal Ointment.

Take of yellow Wax, and Refin of the Pine-tree; of each three Pounds; of *Strasburg* Turpentine, twelve Ounces; of Linseed Oil, three Pounds six Ounces. Melt them over a slow Fire, and then put in three Pounds of *Burgundy* Pitch, and let them all melt together into an Ointment, *S. A.*

This was never before in any officinal Dispensatory; and it hath the Reputation of a very eminent Person for its Author. It seems, if any Regard was had in its Contrivance to Example, to have chiefly followed the *Unguentum Aureum* of *Mesue*; but this is a much neater Composition than that; tho' both pretty nearly agree in Intention. *Nicolaus* hath, indeed, a Prescription under the Title of *Unguentum Basilicon Citrinum*, which the *Augustan* Dispensatory hath transcribed; but that is a very injudicious Medley of Ingredients of different Virtues, notwithstanding *Zwelfer* takes a mighty deal of Pains, in his Animadversions, to direct the manner of compounding it. All the *London* Dispensatories, before the last, have likewise retained from *Mesue* an *Unguentum Basilicon majus*; but it is a most perplexed Mixture, and never used, and therefore very justly omitted here. *Quincy's Dispensatory*.

Basilicon is also an Epithet for a great many Compositions, to be found in the antient Medicinal Writers. It signifies Royal.

BASILICUM.

Ocimum Basilicum, Offic. *Ocimum medium citratum*, Ger. 547. Emac. 673. *Ocimum vulgatius*, C. B. Pin. 226. *Rajj Hist. 1. 547.* Tourn. Inst. 204. Boerh. Ind. A. 170. Rupp. Flor. Jen. 178. *Ocimum medium vulgatius & nigrum*, J. B. 3. 247. Chab. 419. *Ocimum vulgare majus*, Park. Theat. 18. *Basilicum, seu Ocimum, medium vulgatius*, Hist. Ox. 3. 406. COMMON BASIL.

The Basilicon of *Hippocrates* is, by most Interpreters, thought to be the *Ammi*, Bishops-weed. But what now goes by this Name, is a different Plant.

This is a tender Plant, growing about a Foot high, branched from the Bottom, having two succulent, roundish-pointed Leaves, set opposite at a Joint on pretty long Foot-stalks, in Shape like those of Pellitory of the Wall, but larger; little or nothing indented about the Edges; the Stalks are four-square, somewhat heavy, not very full of Leaves, having on their Tops thin verticillated Spikes of white galeated and labiated Flowers, having two small, round, green Leaves set under each Whorle of Flowers. The Calyx is large and open, containing four, small, round, black Seeds. The Root is small, fibrous, and perishing with the first Frosts. The Leaves and Tops have a pleasant fragrant Smell, especially when gently rubbed. It is sown in Gardens, and flowers in July and August.

Basil, tho' it has a fragrant, and to most a pleasant Smell, is but little used in Physic. The Antients condemned the inward Use of it, as hurtful to the Sight. *Schroder* says, it cleanses the Lungs of Phlegm, and provokes the Menfes. It is an Ingredient in the *Aqua Bryonia Composita*, or hysteric Water. *Miller's Bot. Off.*

Hoffman says, that the Chymical Oil of Basil is extremely fragrant, and friendly to the Head and Nerves.

BASILIDION. The Name of a Cerate describ'd by *Galen*, and recommended for the Itch.

BASILIS. The Name of a liquid Collyrium mention'd by *Galen*.

BASILISCUS, the Basilisk. A very poisonous Serpent, which is the Subject of many extravagant Fables. A Bird also is fabled to be produced from the Egg of a Cock, which is the most poisonous thing in Nature.

In Chymistry, the Philosophical Sublimate Mercury is call'd *Basiliscus*. And a Stone goes by this Name, which some Chymists have boasted would kill Mercury, and congeal it into Silver, without Fire. The Philosopher's Stone is also called by this Name. *Paracelsus* names the Venereal Disease *Basiliscus*.

BASIOGLOSSUS. One of the Heads of that Muscle of the Tongue call'd *CERATOGLÖSSUS*, which see.

BASIS, *βᾱσις*, from *βαίω*, to go. The Support of any thing, upon which it stands, or rather goes, according to the original Import. Thus *Hippocrates* calls the Sole, or Bottom of the Foot, the *Basis of the Foot*, in his Treatise de Articulis. The superior Part of the Heart is, however, call'd its *Basis*; to distinguish it from the Apex, or small Point.

The *Basis* of a Compound Medicine, is that Ingredient which enters it in the largest Quantity; or sometimes, which is of the greatest Importance.

BASIUM, a Kiss. I don't know, that this Word belongs more properly to Medicine, than to any other Science; but it is sometimes mentioned as a ready way of taking Infection in all contagious Distempers; especially in Venereal Disorders, when an Ulcer resides in or near the Lips, of which there are some Instances.

Figuratively it signifies an extemporaneous Tincture of *Mars* and *Venus*, that, is of Steel and Copper, invented by *Cloffeus Castellus*.

BATEMAN'S PECTORAL DROPS. See *BALSAMUM ANODYNUM*.

BASSI COLICA. The Name of a Medicine in *Scriverius Largus*, compounded of Aromatics and Honey. *Marcellus Empiricus* mentions it. It is taken notice of also by *Aetius* and *Aetnarius*.

BASURA. *Rulandus* explains this by *Seeten*.

BATHMIS, *βάθμις*, a Seat. Basis, or Foundation. It is used by *Hippocrates* and *Galen* to express a Sinus or Cavity of a Bone, which receives the Protuberance of another at the Joints; particularly those at the Articulation of the Humerus and Ulna.

BATHRON, *βάθρον*, or *βάθρων*, as it is written in *Hippocrates's* Treatise de Flatibus. The Seat, or Support. Thus, in the Treatise just quoted, it is said, that the Air is the Support of the Moon.

Bathron also signifies the *Scammum Hippocratis*, an Instrument invented for the Extension of fractur'd Limbs. The Surgeons have laid it aside at present, and make use of more commodious Instruments. The Curious may see a Description of it in *Oribasius de Machinamentis*, Cap. 29. *Scultetus* also describes it.

BATHYPICRON. A Name for the *Absinthium latifolium*. *Blancard*.

BATHYS. A Sort of Cheese which People of Distinction in *Rome* used to eat. *Galen* says it is the best Sort of Cheese; that is, that, of all Sorts of Cheese, it is the best Aliment. *De Aliment. Facultat. Lib. 3. Cap. 17.*

BATIA. A Retort.

BATINON MORON. The Raspberry. *Blancard*.

BATIS, *βατίς*. The *Critimum* is thus called, and also *Baticula*.

Batis is also the *Thornback*. See *RAIA*.

Hippocrates makes mention of this Fish; and directs the Tongue as a Pessary to be used in a Redundance of the Menes.

BATITURA. The same as *BATTIPURA*, which see.

BATOS, *βάτος*, a Bramble, or Briar.

BATRACHIOIDES. This is, according to *Blancard*, a Species of *Geranium*, resembling the *Ranunculus*.

BATRACHITES. A Sort of Stone, which takes its Name from *βάτραχ*, a Frog, as the *Busonites* does from the Toad. It is of no Use, that I know of.

BATRACHIUM. A Name for the *RANUNCULUS*, which see.

BATRACHUS, *βάτραχος*, is an inflammatory Tumor, which rises under the Tongue, especially in Children. *P. Eginet. Lib. 3. Cap. 26.*

It is a Tumor of the Parts under the Tongue, especially of the Veins. *Aetius, Tetrab. 2. Serm. 4. Cap. 37.* See *RANULA*.

BATTATAS HISPANICA.

Batatas, Offic. C. B. Pin. 91. J. B. 2. 790. *Batatas planta peregrina*, *Indica-Camotes*, *Amotes*, & *Alis etiam dicta*.
VOL. I

Clusii, Chab. 259. *Battatas occidentalis India*, Park. Theat. 1383. *Battatas Hispanorum*, Parad. 517. *Convolvulus Indicus Batatas dictus*, Raii Hist. 1. 728. Pluk. Almag. 114. *Convolvulus Indicus, radice tuberosa eduli, cortice rubro, Batatas dictus*, Parad. Bat. Prod. 325. *Indicus Orientalis Inhamæ, seu Batatas, Sifarum Peruvianorum, seu Battata Hispanorum*, Hist. Oxon. 2. 11. *Battata radice tuberosa esculenta, Spinachie folio, flore albo, fundo purpureo, semine post singulos flores singulo*, Cat. Jamaic. 53. Hist. 1. 150. *Sifarum Peruvianum, seu Battatas Hispanorum*, Ger. Emac. 925. *Jetica, vulgo Batata*, Pif. 93. *Jetica Brasiliensibus*, Marca. 16. *Kappa-kelengu*, Hort. Mal. 7. 95. **SPANISH POTATOES.**

They are used either boil'd or roasted under the Ashes. They are of a fine Taste, and by some preferred to our Turneps. If they are taken new, and bruised, and macerated with a little Water, they ferment of their own Accord, and produce a Drink used by the Inhabitants of *Brasil*.

They grow spontaneously in *Newfoundland*, and the neighbouring Islands; whence they were first brought into *Spain*, and thence into other Countries of *Europe*, Raii Hist. Plant.

BATTATA VIRGINIANA, Offic. Park. Theat. 1383. *Battata Virginiana, seu Virginianorum, & Pappus*, Ger. 781. Emac. 927. *Papas Americanum*, J. B. 3. 621. *Papas Americanum Pycnocomum*, *Opanank Insulae Virginiae radix Chumbo*, Chab. 523. *Papas seu Battatas Virginianum*, Park. Parad. 517. *Solanum tuberosum esculentum*, C. B. Pin. 167. Prod. 89. Raii Hist. 1. 675. Synop. 3. 265. Hist. Oxon. 3. 522. Tourn. Inst. 149. Elem. Bot. 124. Boerh. Ind. A. 2. 67. Rupp. Flor. Jen. 37. Buxb. 306. **VIRGINIA, COMMONLY CALLED IRISH POTATOES**, Dale.

In *Virginia* it grows spontaneously, but with us is cultivated in Gardens. It flowers in the Months of *June* and *July*. Its Root is only in Use; and that too in the Kitchen; but never in the Shops. It seems to agree, as to its Qualities, with the *Spanish Potatoes*, but is somewhat narcotic. Dale.

You are to chuse those which are large, plump, tender, reddish without, and white within, and of a good Taste, like that of an Artichoke.

They nourish the Body, moisten much, and allay the sharp Humours of the Breast; but yet produce gross Humours, and cause Wind.

They contain a little Salt, but much Oil and Phlegm.

They agree at all times with young bilious People, and those in general, whose Humours are very sharp, and much agitated.

REMARKS.

Potatoes are by some called *Earth Pears*; because they grow in the Earth to the Branches of the Root that bears them. They were brought originally from the Country of *Tapi-nambour*, in *India*, and they are now much used for Food. They are nourishing enough, and allay the sharp Humours of the Breast by their oily and balsamic Principles, which are apt to unite to those Parts that want recruiting, and to embarras the sharp, Salts that vellicate the Breast. They produce gross Humours, and Wind, because they contain a viscous and thick Juice. *Lemery on Foods*.

Potatoes are extremely emollient, and consequently good to prevent and cure Disorders proceeding from, or attended with, a Rigidity or Stricture of the Fibres. Hence it is a very proper Food for those who use much Exercise.

BATTATA CANADENSIS, Offic. *Battatas de Canada*, Park. 1383. Parad. 516. *Flos solis pyramidalis, parva flore, tuberosa radice, Heliotropium Indicum quorundam*, Ger. Emac. 753. Raii Hist. 1. 335. *Flos solis tuberosus Indicus, seu Adenes Canadensis*, Griseb. Virid. Lusitan. *Corona solis, parva flore, tuberosa radice*, Elem. Bot. 391. Tourn. Inst. 489. Boerh. Ind. A. 102. *Helianthemum Indicum tuberosum*, C. B. 277. *Helianthemum Indicum tuberosum*, H. R. P. 85. *Chrysanthemum Indicum, radice tuberosa*, Herm. Hort. Lugd. Bat. 142. Pluk. Almag. 99. *Chrysanthemum perenne majus, foliis integris, Americanum tuberosum*, Hist. Oxon. 3. 23. *Chrysanthemum Canadense strumosum*, Florent. Schw. Cat. Leyd. 22. *Flos solis Farnesianus, seu Aster Peruanus tuberosus*, Col. Ecyh. 2. 11. *Flos solis tuberosus, seu Flos Farnesianus*, Aldin. 91. **JERUSALEM ARTICHOKE**, Dale.

It is cultivated in Gardens, and only applied to culinary Uses.

BATTITURA. The Squamæ or Scales of Metals, which fly off, whilst under the Hammer.

BATCIA. According to *Blancard*, a Name for the *Pastinaca Sylvestris*.

BAUDA. A Vessel for Distillation. *Rulandus*.

BAUHINIA. Mountain Ebony. *Vulgò*.

This Plant was so named by Father *Plumier*, in Honour of the two famous Botanists, *John* and *Caspar Bauhine*.

The Characters are;

It hath a polypetalous anomalous Flower, consisting of five or more Leaves, which are disposed on one Side; from the Flower-

Flower-cup arises the incurved Pointal, accompanied with several Stamina of the same Form, which afterward becomes a Pod inclosing Kidney-shap'd Seeds.

Miller enumerates seven Species of this Plant.

BAUL, Urine. *Rulandus*.

BAURAC. The Arabic Word for Nitre; or for any Salt. *Rulandus*. Hence Borax took its Name.

BAXANA. An Indian Plant thus distinguish'd.

Baxana Arbor venenata; J. B. *Arbor fructu venenato*, *Radice venenorum antidoto*, C. B.

Near Ormuz in *Queionne*, a desert Island, there is a Tree call'd *Baxana*; the smallest Quantity of whose Fruit suffocates the Person who tastes it. The same Effect is also produced by remaining a Quarter of an Hour under its Shade. But, since the Root, Leaves, and Fruit of this Tree, which is call'd *Rabuxit*, are, in other Countries, Antidotes against all kinds of Poisons, these Circumstances to me appear improbable. *Raii Hist. Plant.*

BDALSIS, βδάλσις, from βδάλω, to suck, or milk. Suction, or Milking.

BDELLA, βδέλλα. A Horse leech. *Hippocrates*, in his second Book of *Prorrhethics*, seems to mention the βδέλλα, as a Cause of Bleeding at the Fauces. As it is not very easy to conceive how this Animal should get to that Part; some have thought that βδέλλα, in this Place, signifies a varicose Vein, as it does in *Dioscorides*. But *Galen* contradicts this, and says it really means a Horse-leech, which may accidentally get thither.

Leeches, when swallow'd, are esteem'd of bad Consequence: Therefore *Celsus* advises to drink, by way of Antidote, Vinegar with Salt, L. 5. C. 27.

We know that a Leech has been swallow'd, when the Mouth of the Stomach has a Sensation of being suck'd and bitten. Sometimes also, when the Leech fixes on the Throat, the Patient, in Spitting, brings up a florid Blood. Brine, the Succus Cyrenicus, the Leaves of Silphium or Beets, with Vinegar, or Snow dissolved in *Posca*, (a Mixture of Water and Vinegar) are proper for dislodging and bringing them away. The Patient must also use Gargarisms of Water and Nitre, or Vinegar and Vitriol. Leeches, which fix on the inner Side of the Throat, may be dislodged by ordering the Patient to sit up to the Neck in warm Water, and hold cold Water in his Mouth; for they will come out forthwith in Quest of a cold Liquor, to which they have been accusom'd. Some prescribe Bugs (*χόρες*) for those who have swallow'd Leeches; but, says *Galen*, I never had Occasion for prescribing them, since I found Garlic effectual in these Cases. *Paul. Aegineta*, L. 5. C. 36.

I don't know, whether *Paulus* means, by *χόρες*, Bugs, Cimices, as *Cornarius* has translated it; or a sort of *Hypericum*, call'd by *Dioscorides rheus*. See *HIRUDO*.

BDELLERUM, according to *Johnson*, also signifies a Horse-leech.

BDELLIUM, Offic. Park.-Theat. 1571. C. B. Pin. 503. J. B. 1. 317. Chab. 73. Mont. Exot. 11. *Bdellium omnium auctorum*, *Raii Hist.* 2. 1844. *Bdellium gummi*, Ind. Med. 18. GUM BDELLIUM. *Dale*.

Bdellium is by some call'd *Madelcon*, by others *Bolchus*. It is the Tear of a *Saracenian* Tree.

The Marks of its Goodness are, a bitter Taste, Transparency, a Resemblance of Bull's-glue, a Fatness of the innermost Parts, and an easiness to be soften'd; its being free from Chips and Dirt; with a Fragrancy in Suffumigations, like the *Unguis odoratus*.

There is another kind of *Bdellium*, which is of a black Colour, and dirty, in large Grains, made up into Masses: This is imported from *India*. There is also a dry, resinous, leaden-colour'd Sort, which comes from *Petra*, and is next to the best in Efficacy.

It is adulterated with a Mixture of Gum; but what is thus vitiated has not that Bitterness of Taste, nor Fragrancy in Suffumigations, which belongs to the pure and genuine.

It is of a heating, mollifying Virtue, dissolves Hardnesses, Tumors about the Throat, and an Hydrocele, if it be diluted with fasting Spittle. Used in a Pessary, or by way of Suffumigation, it relaxes the Vessels of the Uterus, and brings away the Birth, and all manner of Humidities. Being drank, it breaks the Stone, and provokes Urine: It is given with Success in a Cough, and to those who are bitten by venomous Creatures. It is good also in Ruptures, Convulsions, Pleurifies, and erratic Flatulencies; and is an Ingredient in Malagmas that are composed against Hardnesses, and Nodosities of the Nerves. They bruise it, and work it up with Wine, or warm Water. *Dioscorides*, Lib. 1. Cap. 80.

The *Arabians* call *Bdellium Mokel*, not *Molechil*, as the Translator of *Serapion*, whom all follow, reads it. Every one knows, that it is a sweet-scented Gum of an *Arabian* or *Indian* Tree. The *Arabians* had another *Mokel*, which was the Fruit of a kind of Palm-tree. *Serapio* treats of both Sorts in two distinct Chapters. *Avicenna* comprehends them both in one Chapter, tho' they agree in nothing but the Name; but for

Distinction-sake they call'd one the *Mokel of Mecca*, and the other the *Mokel of Judea*.

Brassavolus, whom almost all follow, is mistaken when he writes, that the *Bdellium* of the Antients was divided by *Avicenna* into the *Judean* and *Arabian*; for *Avicenna* distinguishes the *Judean Bdellium*, which is a Gum, from the *Meccan*, which is the Fruit of a Tree; but he makes two Kinds of the *Judean Bdellium*, the *Sclavian* and the *Arabian*; therefore the Epithet of *Judean* was common to both sorts of Gums, in order to distinguish them from the Fruit of that Name. Thus many *Indian* and *Arabian* Simples were, by the Antients, call'd *Syrian*; because they were exported out of *Arabia* and *India* into *Syria*. *Marcellus Empiricus* says, of the exotic and aromatic Simples used in Medicine,

*Addes Aromaticas Species quas mittit Eous,
Vel quae Judaicis fragrant bene condita Capsis.*

“Add aromatic Simples sent from the East, or such as preserve their Fragrancy in *Judean* Boxes:” *Judean*, that is, *Syrian*, for in the Greek Geographers also. *Συρία Παλαιστήν* (*Syria Palaestina*) means *Judea*. The same Species were call'd *Indian*, from the Place where they grow; and *Syrian* or *Judean* from the Markets or Shops where they were sold; so that the *Judean Bdellium* was the same with the *Syrian*, of which there were two Kinds, the *Indian* and *Arabian*. However, *Avicenna* seems to be of Opinion, that the *Judean Bdellium* was different from the *Arabian* and *Sclavian*; for he writes, that there was the *Sclavian Bdellium*; and the *Arabian*, besides the *Judean*. By a like Mistake, *Dioscorides* made the *Syrian Nard*, which is the same with the *Indian*, a different Thing. He seems also to make three Kinds of *Bdellium*, and his Account of them is pretty confused. He says it is the Tear of a *Saracenian* Tree, that is, an *Arabian* Tree, pellucid, and like the Colour of Bull's-glue. He then adds, that there was a dirty and black Kind, made up in Lumps, which was brought from *India*. Lastly, he subjoins, that there was a dry, resinous, blackish [*ὑποπόλιον*] Sort brought from *Petra*. Perhaps, by the *Judean*, *Avicenna* meant the *Petræan*, as *Pliny* sometimes renders *Πετρεῖον* by *Judeum*, and mentions *Petræa Judea*; and *Stephanus* makes *Petra*, which gave Name to *Arabia Petraea*, a City of the *Third Palaestina*, which, it is certain, was *Judea*. *Avicenna*, in another Place, mentions a *Bdellium* of an *Ath-colour*, which may probably be the same with the *Petræan* of *Dioscorides*, which he calls *ὑποπόλιον*, *hypopelium*; for the *Indian* is black, but the *Arabian* of the Colour of a Man's Nail, or like transparent Wax.

All the Greek Authors, since *Dioscorides*, knew no more than two Kinds of *Bdellium*, which are, as they call them, the *Σκυθικὸν* & *Ἀραβικόν*; “the *Scythian* and *Arabian*”; so says *Galen*; *Aetius*, *P. Aegineta*, and others. As to the *Scythian*, they give the very same Account of it, which *Dioscorides* does of the *Indian*; so that it is plain, that their *Σκυθικόν* was the same with *Dioscorides*' *Ἰνδικόν*. By *Σκυθικόν*, must be understood what is brought out of *Indo-scythia*, or *Southern Scythia*, at the Mouth of the *Indus*. The Author of the *Periplus* writes, that *Bdellium* is brought from those Parts.

Since *Avicenna* and *Serapio* make a Difference between the *Bdellium Judaicum* (of which one Sort is the *Arabian*) and the *Bdellium Meccense*, which they will have to be the Fruit of a Tree; and as every one knows, that *Mecca* is in *Arabia*; it appears, that there are two Kinds of *Arabian Bdellium*; one a Gum, and the other the Fruit of a Tree. And *Avicenna* himself, in the same Chapter, takes Notice also of a *Bdellium Meccense*, which was the same with the *Judaicum*, and was not the Fruit of a Tree; and this probably was the same as that which *Dioscorides* says was brought from *Petra*; for it is the general Opinion, that the modern *Mecca* was the *Petra* of the Antients. It was formerly a very noted Emporium for *Indian* and *Arabian* Commodities, which were brought thither from *Albus-Vicus*, a Port of the *Arabian* Gulph. And perhaps the *Indian Bdellium* was the same as that which *Dioscorides* says came from *Petra*; at least, it is certain, that the *Greeks*, who follow'd *Dioscorides*, understood him in that Sense, making only two Kinds of *Bdellium*, the *Arabian*, and the *Indian*; which they call the *Scythian*. The first, then, in Goodness, was the *Arabian*; and of an inferior Sort was the *Indian*, which was brought from *Petra*, an Emporium of *Arabia*. However, I cannot deny but the Words of *Dioscorides* may be understood of three Kinds of *Bdellium*. *Pliny* reckons more, as the *Babylonian*, the *Median*, and the *Bactrian*.

As to the Word βδέλλον, *Bdellium*, it comes from the Hebrew בְּדֹלַח *Bedolach*; for βδέλλον is the Diminutive, but βδέλλα the Primitive. *Damocrates*, in the Author of the *Periplus*, calls it βδέλλον. *Marcellus Empiricus*,

— Crocon atque Bedellam.

I am not ignorant, that most of the Jewish Interpreters expound the *Arabian Bedolach* by a Pearl; but some of the Antients understood by it a Spice, and the Matter itself plainly speaks it. For of this *Bedolach* the *Greeks* coin'd their *μυδαλλός*, or *μαδαλλός*, to signify *Bdellium*; for *μ* and *β* are often chang'd for one another.

another. Nor is it to be wonder'd, that two Words of different Sounds, but signifying the same Thing, should have the same Original, as that *βδέλλα* and *μεδαλχος* should both come from *Bedelach*. For, after the same manner, out of one Hebrew Word *אבולח* *Ahaloth*, some made *ἀγέλλαχον* (*Agalochum*); others from the same Word, contracted into *Aloth*, made *ἄλον* (*Aloe*). The Country of *Havilah* *חבילה*, or *Chavila*, *Genesis* 2. 11. where the *Bedelach* grows, may as well be taken for *India* as *Arabia*. All the Characters there given belong also to *India*; for *India* too exports Gold and the Onyx-stone. There is frequent Mention made of the *ὄνυχιν λίθια* in the Author of the *Periplus*, which Stone is brought out of *India*. The *Ευιλαῖοι* (*Eulæi*), a People of *India*, are not far distant from this Country of *Havila*; they are so call'd by *Epiphanius*. The ancient *Periegesis*, or *Itinerary*, of the World, takes Notice of *Ευιλίται* (*Eulitæ*). *India* then produces *Bdellium*; that is, *Bedelach*. But the Characters belong to *Arabia* in a more eminent Degree; there are the People *Χαυλοῖται* (*Chaulotæ*), or the *Χαυλοῖται* (*Chaulotæ*), of *Eratosthenes*; there is also the purest Gold. The finest *Bdellium* is that of *Arabia*, which is transparent, and of the Colour of Wax. "Bedella" is a Tree in *India* and *Arabia*, the Tear of which is best in *Arabia*; being light, fat, and like Wax throughout; but the *Indian* is dirty, black, and in bigger Lumps." *Isidorus*. *Avicenna* says the *Arabian Bdellium* is red, of which the Antients say nothing; but perhaps he only means a Wax-colour. *Βδέλλιον τὸ Ἀραβικὸν διαγύρεται καὶ εἰς χυλόν* "The Arabian *Bdellium* is transparent and yellow." *Aetius*, Lib. 3.

From what has been said, it appears, that the *Bdellium* of the Antients was that sort of Gum which the *Portuguese* now call *Gum Anime*. It is the Tear of a Tree, whitish, resinous, transparent, inclining to the Colour of Frankincense, which, broken, appears of a Wax-colour, in Grains like Frankincense, but bigger: The Oriental, or *Indian*, is *ἡδερβόλον* (*Haderbolum*) in great Lumps. *Salmasius de Homonym. Hyl. Iatric. Cap. 109.*

This is a Gum of a reddish-brown Colour, deeper than Myrrh, and of a tougher and more tenacious Consistence; and is difficultly dissolved in any Liquor, coming nearest to Myrrh in Scent, but not so pleasant; of a bitterish hot Taste. What comes from *Turkey* and *India*, is by much the best. There is another Sort, which comes from *Guiney*, that is whiter, in large round Drops, of little Scent; but this is less esteem'd. We are quite Strangers to the Tree which produces this Gum. The best Accounts which we have, is, that it is a thorny Tree, with Leaves like those of the Oak.

This Gum is of an heating and drying Nature, helpful against Coughs and Impostumations of the Lungs, provokes Urine and the Catamenia, expels the Birth and After-birth. Outwardly it is used in dissolving and discussing Plaisters. *Miller's Bot. Off.*

Geoffroy says, that both Sorts undoubtedly come from *Abyssinia*.

Some esteem the *Bdellium* of the Antients to be the *Gum Anime* of the Moderns.

Pliny, *H. N. L. 12. c. 9.* says, that this Tree is prickly, black, and as high as the Olive-tree; and that it bears Leaves which are evergreen, and very like those of the Oak. The best Sort of this Gum is pure, yellowish, of a bitter Taste, and very agreeable Smell; it is transparent when broken. It is fat, combustible; soon catches Fire, and is easily melted. That which is black and impure is good for nothing. See *Joh. Jac. Wecker. Antid. Spec. L. 1. Sect. 17.* *Galen* gives it the Epithets *Arabian* and *Scythian*; *Pliny* that of *Bactrian*, *L. 6. C. 16. & L. C. Celsus* also, *L. 7. C. 4.* gives it the Epithet *Bactrian*, either from the Country of *Bactria*, or from the River *Bactrium*, not far from *Judea*. Some are of Opinion, that *Bdellium* and *Myrrh* are produced by one and the same Tree, and that there is no Difference between these two Drugs. *Monardes* is of Opinion, that it is the true *Anime*. See *Matthioli Comment. in L. 1. Dioscor. C. 70. Ruel. L. 1. C. 57. Ol. Worm. Museum, L. 2. C. 15. & 23. Joh. Dan. Mylii Antidotar. Med. Chymic. reform. L. 2. C. 9. Georg. à Turre de Hist. Plant. L. 1. C. 81. Paul. Amman. Manuduct. ad Mater. Med. p. 128.* *Bdellium* is of a hot, comforting, sweetening, abstergent, discussing, and opening Nature. When used internally, it cleanses the Breast of acrid Matter, allays Coughs, purges the Kidneys, and cleanses Ulcers of the Lungs, provokes Urine, and expels the Stone and Gravel, *Galen. S. 6. de Simpl. Med. fac.* stops the immoderate Flux of the Menes and the Hemorrhoids, tho' tis very rarely used internally. Externally, it softens, discusses, and maturates all Kinds of Swellings and Apostems, cures recent Wounds, and injured Arteries. In the Shops it is made an Ingredient in many softening and discussing Plaisters and Ointments: It is also in the *Mithridate*, the *Emplast. de Melilot. Mes. Empl. Apostolicon, Nicol. Alexandrin. Emplast. Cera-neum, Nicol. Empl. Stictic Croll. Emplast. Diaphoret. Myns. the Ceratum Ammoniacum Forest. the Ceratum Matricale, or De Galbano August. the Unguent. Apostolorum Avicenn. Barthol. Zorn Botanolog.*

BDELLOS, *βέλλος*. The Smell of a Lamp just extinguish'd. It signifies also a Discharge of Wind by the Anus. Hence,

BDELYGMIA, *βδελυγμία*, or *βδελυγμία*, or *βδελυγμία*. A horrid, disagreeable, and fetid Smell, sufficient to induce a Nausea; or, as it is usually express'd, to turn the Stomach; such as that of some Ulcers, or Excrement.

BECABUNGA. A Name for the *ANAGALLIS AQUATICA*, Brook-lime, which see.

BECHICA, *βήχικα*, from *βήξ*, a Cough. All Medicines which are design'd to relieve Coughs, are call'd by this Name. It is particularly appropriated to several sorts of Troches, to be found in the Compilers of Dispensatories, and signifies the same as *Pectoral*.

TROCHISCI BECHICI ALBI: The white Pectoral Lozenges.

From the College.

Take of fine Sugar, one Pound; of white Sugar-candy, half a Pound; of *Florentine* Orrice-root, half an Ounce; of *Liquorice*-root, six Drams; of Starch, one Ounce and an half; and make them into small Lozenges, with a sufficient Quantity of the Mucilage of Gum Tragacanth, made in Rose-water. On Occasion may be added Ambergriſe and Musk, four Grains of the first, and three of the latter.

These are in all the old *Dispensatories* in the same manner, without Alteration. They are pretty much used for Coughs, and Defluxions of Rheum. Some add to them Ambergriſe and Musk, which makes them serviceable to sweeten the Breath. But they are of no great Efficacy to any Purpose, and may be taken at Pleasure.

This is directed very little different in the *Edinburgh Dispensatory*.

White PECTORAL LOZENGES.

From Quincy.

Take of the Four greater cold Seeds, husk'd, of each one Ounce and an half; white Poppy-seeds, and Pine-nuts, of each one Dram; Orrice and Starch, in fine Powder, of each three Ounces; fine Sugar, seventeen Ounces: Beat the Seeds into a Paste; then put to it the Powders, and make all into a due Consistence, with a Mucilage of Gum Tragacanth and Rose-water, to cut out into Lozenges.

This is a much better Composition than that under the same Name in the *College Dispensatory*; and if sweet Almonds were in the room of the Pine-nuts, it would be yet more grateful. This is from the *Pharmacopœa Regia* of *Zwelfer*, who likewise makes a red Lozenge, by adding to this two Ounces of Bole; which, with the Whole, is very good against the Heart-burn, and is the same, if not a better Remedy, in that Case, than some which are frequently advertised in public Places with great Encomiums.

TROCHISCI BECHICI NIGRI: The black Pectoral Lozenges.

From the College.

Take of the Juice of *Liquorice*, and of white Sugar, of each ten Drams; of Gum Tragacanth, and sweet Almonds, blanch'd, of each six Drams; and make them into Lozenges, with a sufficient Quantity of the Mucilage of Quince-seeds, made with Rose-water, *S. A.*

In the *Augustan Dispensatory* this is clogg'd with many other Ingredients; but the first of the College hath it exactly as here, and there ascribes it to *Rhazes* for its Author. The *Augustan Collection* hath also many other Compositions of the same Form and Intention; but they have not Reputation enough to continue them down to the present Practice. These are much more effectual than the former, to stop Coughs from tickling Rheums, but not quite so grateful to take. Some powder the Tragacanth, but that is very tiresome, and will not make up so smooth, as if it be gradually open'd with Rose-water, enough to beat up with the Almonds into a Paste, and afterwards with the other Ingredients.

The *Edinburgh Dispensatory* directs this different from the preceding.

Take of the Juice of *Liquorice*, two Ounces; Balsam of *Tolu*, and Storax Calamita, each a Dram; white Sugar, half a Pound; Mucilage of Gum Dragon, made with Hyssop-water, such a Proportion as will, with the requisite Art, make the Whole into Lozenges.

Quincy directs a Troche with the same Title, the Preparation of which is as follows:

Take of the Four greater cold Seeds, husk'd, of each two Ounces; white Poppy-seeds, one Ounce; pour upon these, in

in a Marble Mortar, a sufficient Quantity of Juice of Liquorice, diluted to the Consistence of a Syrup with Rose-water; to make them into a soft Pulp; which drive thro' a Sieve with more Pulp of Liquorice, four or five Ounces; and to them put strain'd Storax, one Ounce; Powder of Orrice, three Ounces; of Anise and Fennel-seeds, of each one Ounce; fine Loaf-sugar; two Pounds and an half; and make all into a Paste.

This is likewise from *Zwelfer*, and greatly exceeds that of our College. It is an excellent good Pectoral Lozenge, and useful in all Coughs whatsoever, to be taken at Discretion.

BECHION, a Name for the *Tussilago*, Coltsfoot; because it has the Reputation of being good for Coughs.

BECIOIS, βηκίσις, or βηκισίς, is explain'd by *Galen* πρεβηλίου, Sheep.

BECUIBA NUX.

This Nut is as large as a Nutmeg, and of a brown Colour. It consists of an oily Kernel, inclosed in a woody brittle Husk. A Balsam is drawn from it, very much esteemed in Rheumatic and Paralytic Cases. It is brought from *Brasil*. *Geoffroy*.

BEDEGUA. Amongst the *Arabians*, this was the Name for a Species of Thistle. *Raii Hist. Plant.* *Blancard* says it was the *SPINA ALBA*.

BEDEGUAR. The spongy Excrecences of the *Rosa Sylvestris* are thus called by some Writers on the *Materia Medica*. The Ashes of these, burnt, are said to be effectual in the Gravel and Dysury; and to incline the Person, who lies upon them, to sleep. *Raii Hist. Plant. Dale*.

BEENEL, an evergreen Shrub, which grows in *Malabar*.

A Liniment is prepared of the Root of this, boiled in Oil of *Sesamum*, which is said to be good for Head-achs, and effectual in removing inveterate Pains in the Limbs.

BEESHA, a Species of the *Bambu*, which grows in *Malabar*. A Decoction of this is used in Obstructions of the Menfes; as also in Erosions of the Gums, and Tooth-ach, by way of Gargarism.

BEGMA, βήγμα, from βῆξ, a Cough, in *Hippocrates* signifies both a Cough, and the Spit brought up by it.

BEGUILL, a Fruit about the Size of an Apple, with a rough and knotty Rind, inclosing a Pulp like the Strawberry. *Raii Hist. Plant.*

BEHEM.

The Root *Behem*, as it is delivered to us by the *Arabians*, has been the Occasion of no small Mistake on account of its Homonymy, or passing under the same Appellation with the *Hermodactyl*. *Been* and *Ben* are erroneously made to be homonymous with the *Balanus Myrsifca*. The Name of this Root in *Arabic* is *Behem*, and *Albehem*. The *Greeks* pronounce it βήχημ (*Bechem*), because they express the *Arabic*, *he*, by χή, as *ταμαρχήνδ* for *Tamarhend*. Hence, in *Charito*, and other Physicians of later Ages, we read of the βήχημ λευκόν and ἐρυθρόν, "the white and the red *Bechem*," which must be understood of this *Arabian Behem*, which is of two Kinds, white and red. Therefore *Avicenna*, where he treats of them, expresses the Name, in the Title, in the Dual Number, *Behemen*, and comprises them both under the following Description; that they are ligneous Pieces of dry'd Roots, shrunk and shrivell'd up, and are of two Kinds, the white and the red. The later *Greeks* make also two Kinds of *Hermodactyls*, the white and the red; and, for the most part, they use the Term *Hermodactyl* for the *Arabian Behem*, tho' what the *Arabians* call *Hermodactyl* be quite another Thing. *Myrsifus*, in his *Antidote* δὲ μαργαρίτης *Galen*, has it thus in the *Greek Copy*, as *Fuchs* assures us: Μπερὶ ἀλβὲ βήχημ τὰ ἐπικλεόμενα βήμα *Hermodactylus* μαργ. In the King's Manuscript we found written, on that Place, Ἀρμόδ' αὐτὸν λευκὸν καὶ ἐρυθρόν. That antient Copy always reads Ἀρμόδ' αὐτὸν for Ἑρμόδ' αὐτὸν. In an antient *Græco-Arabic* Lexicon, we read Μπερὶ αὐτὸν καὶ μαργὰ τὸ Ἑρμόδ' αὐτὸν, where μπερὶ αὐτὸν is written for βουαίδαν, which is the *Arabic Buzidan*, or *Buzaidan*; and, as we are inform'd by *Avicenna*, a ligneous *Indian* Drug, endued with the same Virtues as both the Kinds of the *Behem*. This Wood, he says, uses to be adulterated with another Kind call'd *Alhaha Barbarie*. This is a Root brought out of *Africa*, which Country was call'd by the *Arabians* *Barbaria*, and is so named at this Day. *Avicenna*, in the Chapter where he treats particularly of this *Chabe Alberberi*, that is, the *Barbarian* or *African Chabe*, says, it was something which was like *Hermodactyl*, brought from *Africa*, and by which *Hermodactyls* are adulterated. So that the *Buzidan* and the *Hermodactyls* were both adulterated by this *African* Root *Chabe*, and the *Buzidan* had the same Virtues as the *Behem*. There was no great Difference, then, between the *Hermodactyl* and the Roots of *Behem*, since one and the same Thing adulterates *Hermodactyl* and *Buzidan*, which is like *Behem*. It is no Wonder then, that the later *Greeks* used the Name of *Hermodactyl*, instead of *Behem*.

The *Arabic* Word for *Hermodactyls* is *Alsurengian*, the Meaning of which we are to inquire into. *Surengian* is not properly the same as the *Greek* Ἑρμόδ' αὐτὸν but this latter is the

Flower of that Plant which the *Arabians* call *Surengian*. For this we have the Authority of *Avicenna*, who calls it *Asaba Hermes*, that is, the Fingers of *Mercury*, which plainly answers to the *Greek* Word Ἑρμόδ' αὐτὸν. He says it is the Flower of the *Surengian*, and has the same Virtues; therefore the *Hermodactyl* is the Flower, and the *Surengian* the Plant. The same Author says, that the *Surengian* is the Root of a Plant, which bears white and citron-colour'd Flowers.

P. Aegineta is the first of the *Greeks*, as far as I know, who mentions Ἑρμόδ' αὐτὸν, and only says of it, that it was of peculiar Efficacy in Pains of the Joints, while the Humour is afloat. By Ἑρμόδ' αὐτὸν, he means that Kind of *Ephemerum* which is not poisonous, of which *Dioscorides* also writes, that it dissolves Swellings; and the *Arabians* say, that it mitigates the Pains of the Gout, if the Parts be anointed with it. This is their white *Hermodactyl*, which they also call *Surengian*; but they bestow'd this Name on two Plants; and were deceived by the Homonymy. One of them was a deadly Herb of *Colchis*, of the bulbous Kind; call'd by the *Greeks* ἐφμερόν, because it was so quickly mortal as to kill within a Day's Space. But there was another Herb of that Name, which was also call'd the *Iris Sylvestris*, which was not at all hurtful: This, perhaps, is what the *Greeks* also call'd Ἑρμόδ' αὐτὸν, for it had one long Root of the Thickness of a Finger; for which Reason they seem to have call'd it Ἑρμὸς δ' αὐτὸν, "the Finger of *Mercury*," which Name agrees better with the Root than the Flower. So *Asaba Safra*, another Root, from its Colour and Shape resembling a Finger, is by the *Arabians* call'd *Yellow Fingers*. It is certain, that the same Effects are ascrib'd by *Paulus* to the *Hermodactyl*; as are attributed by *Avicenna* to the *Surengian* which is not poisonous, which are; that it is useful in Pains of the Joints, when the Humour is afloat.

The *Greeks* then knew but one Kind of *Hermodactyl*, which was the harmless *Ephemerum*, call'd *Iris alycia*, "the wild Iris;" and had a long Root of the Thickness and Likeness of a Finger, and on that Account deserved its Name; but the other round and bulbous-rooted *Ephemerum* had nothing to merit that Appellation; yet the *Arabians* call'd both these *Ephemera* by the Name of *Surengian*. An antient *Arabian* Herbalist renders the τὸ Κορχήν of *Dioscorides*, which is the deadly *Ephemerum*, by *Surengian*: The other *Ephemerum*, which immediately follows in *Dioscorides*, he makes to be another Species of *Surengian*. So they divided this Kind into two Species, the white and the red; the red was the *Colchian*, or noxious *Ephemerum*, which had the Bark of its Root of a red Colour. *Avicenna* calls it the black and red *Surengian*, and says it was poisonous; he so calls it, because its Fruit was black, inclining to red. *Dioscorides*, speaking of the *Colchian*, μαργὰν ἐχούσα πυρρὴν ἐν τῷ μέλει, ἔχουσα φλοὶν ἐχούσαν ἐρυθρόν, "having its Fruit black, inclining to red, and the Bark of its Root of a red Colour." Thus it is read in a very good and antient Copy; and it is further confirm'd by *Neophytus*. In the common Editions these Epithets are apply'd to the Root, not the Fruit; φλοὶν ἐχούσαν ἐρυθρόν ἐν τῷ μέλει, "having a black Bark, inclining to red." Wherefore this is not properly the red *Hermodactyl*; for that Name only belongs to the *Ephemerum* with a long Root of the Thickness of a Finger. This is commonly call'd the white *Hermodactyl*, and is the only Plant on which *P. Aegineta* bestows the Name of *Hermodactyl*. *Avicenna*, who says that the *Digitus Mercurii* was the Flower of the *Surengian*, is to be understood of both Species; and hence the Inhabitants of *Barbary* or *Africa* call'd the Root of both *Ephemera* *Hermodactyl*. There is another Error in *Avicenna*, in making the *Surengian* the Root of a Plant, that bears a white and citron-colour'd Flower; for both *Ephemera* have a white Flower. He misunderstood the Words of *Dioscorides*, where, speaking of the *Colchian* Species, he says, ἀνίστην ἀνθος λευκόν, ὁμοίον ῥόδου ἀνθεῖ, "it produces a white Flower, resembling that of Saffron." He took them in a Sense as if they had run thus, ἀνθος λευκόν, καὶ ὁμοίον ῥόδου ἀνθεῖ, "a white Flower, and like that of Saffron," or of a Saffron-colour; but the Author intends it of a Likeness in Shape, not in Colour. The Flower of the *Colchian Ephemerum* is shap'd like that of Saffron, but white. *Pliny* makes the Flower of the other *Ephemerum* to be blue instead of white; nor must you think, that he had any Authority for what he says. The good Man was imposed upon by his own Ears, which represented to him ὑάκινθον ἀνθος for χιτρών, "blue Flower," for "Snow-white," as he hearken'd to his *Amanuensis*, who usually read to him. He has been mistaken in Hundreds of other Places from the like Occasion.

The Herb *Pentaptyllum* was also call'd Ἑρμόδ' αὐτὸν. The Author of the Synonyma of *Dioscorides*, Περὶ ἰσχυρῶν ὀνύχων, αἱ δὲ ἄλσεν ἰσχυρῶν, αἱ δὲ Ἑρμόδ' αὐτὸν, "the Prophets call it the Claw of the Ibis, others the Wing of the Ibis, others the *Hermodactyl*." The spurious *Apuleius*, in his Herbal, under the Chapter of *Pentaptyllum*, has the same Expressions in Latin; *Propheeta*, &c. They also call'd it ἀνθος χιτρών, "Man's-hand," and Ἑρμὸς βέλων, "the Herb of *Mercury*," as I found it in the Lexicon of *Harpocration*. This also is good for Pains in the Joints, and for the *Sciatica*. And perhaps *Paulus* is to be understood

stood as speaking of this Hermodactyl: That he did not mean the *Ephemeron* is probable, because he reckons it separately, and also the *Colchian* Species. *Serapion*, however, takes the *ἑρμωδάκτυλον* of *Paulus* for the other *Ephemeron*, which is not the deadly Sort. To this they attribute a Virtue of curing Pains in the Joints, which must be understood of the harmless *Ephemeron*, not of the poisonous. For *Abix*, in this Author, gives his Opinion, that the best of the two Hermodactyls was that which had the Outside, as well as Inside, of its Root of a white Colour; for the black and red were pernicious. He means the *Colchian*, of which he seems to make two Sorts, the black and the red, tho' there be but one, which is of a black inclining to red. *Abix*, in *Serapion*, adds, that they are mistaken who think the *Lagias agrestis* is brought from *Africa*; so the Translator renders it; but for *Lagia* we are certainly to read *Labia*, which is the *Caaba* or *Chabe* of *Avicenna*; which, he says, is like the Hermodactyl, and is used to adulterate it. The *Arabian* Interpreters observe, that this *Chabe* is like a small Radish, and is by some placed among the Species of Hermodactyls, and is also call'd by the *Arabians* *Buzeidan*. But these Plants differ only as to their native Soil; this latter is from *India*, the other from *Barbaria*, that is, *Africa*. The *Arabian* *Labia*, and the Hermodactyl, or black *Ephemeron*, are so near akin in Shape and Effects, that some have taken them for the same Plant; some also adulterated one Species with the other, that is, the Hermodactyl with the *Labia*.

The *Arabians* attribute to this *Caaba* a Virtue of augmenting the Body in Bulk; and the Women use it for that Purpose, and to give themselves a portly Figure. The *Behem* has the same Property, as *Avicenna* assures us: This is call'd by the later *Greeks* *ἑρμωδάκτυλον*. Whenever we meet with Hermodactyl in these Authors simply mention'd, we are to understand it of the *Pentaphyllum*, or of one of the two Species of *Ephemeron*; but whenever we find in *Myrepsus* and others *ἑρμωδάκτυλον λευκὸν καὶ ῥυθρὸν*, "the white and red Hermodactyl," we are to take them for the white and red *Behem*. *Myrepsus* commonly mixes them with *Cardiacs*, for comforting the Heart, and strengthening a weak Body, and for curing the Palpitation of the Heart; for which Purpose both Sorts of the *Ben* are endued with a singular Virtue, according to *Avicenna*, and other *Arabian* Authors.

Since the red and white Hermodactyls are both Ingredients in the same compound Medicine, that they cannot be the same with the red and white Hermodactyl of the *Arabians*, may very well be inferred from these last being accounted of different Properties, so as to be unqualify'd for entering the same Composition; and the red Hermodactyl, which is the *Κολχικόν*, is accounted rank Poison both by *Greeks* and *Latins*, and has no Place in Medicine, except it be in the way of killing; upon which Account therefore it can have no Place at all in Medicine, which rather provides a Remedy against noxious things, than uses them as a Remedy. It is said, that a Decoction of the Leaves of Hermodactyls in Water, being drank, mitigates Pains in the Joints, which must be understood of the white Hermodactyl or *Ephemeron*, which has no deleterious Quality. In *Myrepsus* there is an *ἁγία δόσις δι' ἑρμωδάκτυλου* for the Gout in the Feet and Joints, which can be understood of no other than of the Hermodactyl with the long Root. Therefore *Brassavolus* is in an Error, when, following *Mesue*, he says, that the round Hermodactyl is of more Efficacy towards these Intentions, for which he would have them understood to be effectual, that is, for Affections of the Joints; for the round Hermodactyl, which is the *Colchian*, does not agree with the Joints, and cannot be taken inwardly for the Joints, without being pernicious. By the round Hermodactyl we are certainly to understand the *Colchian* with the round and bulbous Root; for the other with the long Root may be called the *ἑρμωδάκτυλον μακρὸν*, "the long Hermodactyl."

Upon the Whole, the Hermodactyls of the *Greeks* are different from those of the *Arabians*. These call the Flower of the Herb *Surengian*, the Fingers of Mercury, by which Name they call both Species of *Ephemeron*. And the *Greeks* bestow the Name of *ἑρμωδάκτυλον λευκὸν καὶ ῥυθρὸν*, "the white and red Hermodactyl," on what the *Arabians* call the white and red *Behem*. They also call the *Buzidan* of the *Arabians*, which is like the white *Behem*, by the Name of Hermodactyl. They will have it to be a Species of *Satyrium*, and so *Serapion* expounds it. The vulgar Appellation for it is *Satyrium Basilicum*, but the Shops call it *Palma Christi*. Very learned Physicians maintain, that the *Buzidan* of the *Arabians* is the same as *Avicenna's* Citron-fingers. *Brassavolus*, who is followed by *Puchsius*, says, that *Avicenna* treated of the *Buzidan*, which he corruptly call'd *Bucheidan*, under the Title of Citron-fingers. But there are two Chapters in *Avicenna* of the *Buzidan*, and the Citron-fingers, and they are quite different things. This Author indeed uses to give the different Appellation of the same thing in distinct Chapters, but then he always gives Notice of it. The Citron-fingers, or *Asaba safra*, are shaped, as he says himself, like the Palm of the Hand. He calls it *alcas*, which is the same as the Hebrew *קץ*, *Chaph*, and properly signifies the Palm, or hollow

Part of the Hand, from the Verb *קצץ*, which is to bend or incurvate. Hence *Cochleare* also comes to signify both a concave Instrument, and the Sole of the Foot. An old *Latino-Arabie* Lexicon interprets it by *Pugillum*, and *Alapa*, because it is given with the flat Hand; whence comes *depalmare*, *καταπίπτειν*, "to strike with the flat Hand." This Root is commonly called *Palma Christi*, from the same Likeness. *Avicenna* speaks of the Citron-finger as a common Root; but the *Buzidan*, he says, is brought from *India*. The Citron-fingers shew this Colour by their Name; but the *Buzidan* is white. *Serapion* says it is like the white *Behem*, that it was also white itself, and an *Indian* Drug. Therefore the *Buzidan* can never seem to be the same with the Citron-fingers. Nor is *Julius Scaliger* nearer the Truth in saying, that it is the same with what the *French* Painters call *Terramenta*, which is the *Cureuma* (*Turmeric*) of the Shops, and therefore different from the Citron-fingers. *Salmas. de Homonym. Hyl. Iatrices, Cap. 116.*

The Sorts of *Behen* commonly known are the following:

Behen album, Geoff. Tractat. 286. *Behen album Rauwolfii*, J. B. 3. 37. *Behen album Rauwolfii, folio lapathi, flore luteo, & radice longa flexili*, Chab. 448. *Behmen aliud*, Park. Theat. 1572. *Jacea Syriaca spinosa, folio laciniato, flore luteo*, Rauwolf. Itin. Ed. Angl. 231. *Jacea Orientalis patula, carthami facie, flore luteo magno*, Tourn. Cor. 32. Raii Hist. 3. App. 104. *Serratula affinis capitulo squamoso luteo, ut & flore*, C. B. Pin. 235. *Raphanticoides lutea, foliis inferioribus dissectis, cæteris carthami*, Vaill. Mem. Acad. Scienc. Anno 1718. 1. 229. WHITE BEAN OF THE ANTIENTS.

Authors distinguish two Sorts of *Been*, white and red, but both are different from the *Arabian* *Ben*, which is the *Glans Unguentaria*, Offic.

White *Been* is a Root, which *Rauwolfius* found at the Foot of Mount *Libanus*, and which *Tournefort* brought from the *Lesser Asia*. The Plant to which it belongs is named *Jacea Orientalis, carthami facie*, J. R. H. according to *Vaillant*. It is cordial, antispasmodic, and good to kill Worms. Geoff.

Behen album, Offic. Ger. 550. Emac. 679. Mer. Pin. 14. *Behen album Monspelianum & Officinatum*, Merc. Bot. 1. 23. Phyt. Brit. 14. *Behen album Officinatum*, J. B. 3. 356. *Lychnis sylvestris, quæ Behen album vulgo*, C. B. Pin. 205. Raii Hist. 2. 998. Synop. 3. 337. Tourn. Inst. 335. Elem. Bot. 281. Buxb. 201. Dill. Cat. Giff. 110. Boerh. Ind. A. 211. *Lychnis sylvestris perennis, quæ Behen album vulgo*, Hist. Oxon. 2. 535. *Papaver spumeum vulg.* Herm. Cat. Hort. Lugd. Bat. 387. *Papaver spumeum, sive Ben album vulgo*, Park. Theat. 263. *Muscipula pratensis vesicaria*, P. pp. Flor. Jen. 100. SPATLING-POPPY, or WHITE BEN.

This Plant has a long, thick, whitish, woody Root, not much branched, from which spring several smooth, weak Stalks, about two Feet high, with pretty large Joints, at each of which grow two Leaves opposite to each other, without Foot-stalks, two or three Inches long, and about an Inch broad, sharp-pointed at the End, of a glaucous or bluish-green Colour, smooth, and without any Indentures about the Edges. The Flowers grow on the Tops of long Foot-stalks, several together, of five small white Leaves apiece, standing in a loose, swell'd, round Husk or Bladder, of a greenish-white Colour, with several fine darker Veins: This incloses the roundish Calyx, in which are contained small brown Seeds. This is an Herb, which is frequently to be met with in Meadows and Corn-fields, and flowers in Summer.

The Roots only are used; and, as to their Qualities, they are accounted Cordial, Cephalic, Alexipharmic, and a Provocative to Venery. It is but seldom used. *Miller's Bot. Off.*

Behen rubrum limonium & Behen rubrum, Offic. *Limonium*, Ger. 332. Emac. 411. Raii Hist. 1. 395. Synop. 3. 201. Chab. 508. *Limonium majus vulgatius*, Park. 1234. *Limonium maritimum majus*, C. B. 192. Hist. Oxon. 3. 600. Boerh. Ind. A. 76. Tourn. Inst. 342. *Limonium majus multis, aliis Behen rubrum*, J. B. 3. 876. SEA-LAVENDER, Dale.

Red *Been* is imported in round Slices. Some believe it belongs to a Species of *Limonium*, or Sea-lavender; but its Origin is not certainly known. It is supposed to have the same Virtues as the white *Been* of the Antients, and moreover to be astringent. Geoff.

The Root of the red *Behen*, or Sea-lavender, is pretty thick and long, and runs deep into the Earth, mostly single, with several Fibres at the End, of a brownish Colour on the Outside, and reddish within, from which arise many large, firm, thick, green Leaves, growing on long, broadish Foot-stalks, roundish at the End, and something resembling the Leaves of the Lemon-tree, whence it takes its Name. The Stalks arise to be about a Foot high, bare of Leaves, divided towards the Top into several Branches, on which grow long Spikes of small, purplish, red Flowers, of five Leaves each, growing somewhat like *Lavender*, in greenish Husks, each including one long Seed.

It grows every-where in the Salt-marshes, as below *Greenbith*, and about *Gravesend*, in great Plenty; and flowers in July and August.

B E L

The Root and Seed is refringent, binding, and of Service in a Diarrhoea, Dysentery, against the too great Abundance of the Menfes, and the Fluor Albus.

Though neither this nor the Spatling Poppy can be certainly proved to be the true Behens of the *Arabians*, the Descriptions they give of them being so lame and imperfect; yet they are allowed by the best Authors to come near them in Virtue, and to be proper Succedanea for them. What the Druggists sell for the white *Behen* are whitish slender Roots, less than those of wild Parsnip. What they call the Red, are round transverse Slices of a Root of a reddish-brown Colour, in Shape like Jalap; but what either of them are, is hard to determine. They are of very little Use now-a-days, being not put into any Composition of the Dispensatory. *Miller's Bot. Off.*

BEID-EL-OSSAR, or BEID-EL-SSAR, an Egyptian Plant described by *Prosper Alpinus* and *Veslingius*, which grows near *Alexandria* at a Place called *Mattharia*, upon a Branch of the Nile called *Calig*. This Plant abounds with a milky Juice, which flows from the Leaves when cut, and is used in preparing Skins for Leather, in order to make the Hair strip off; for which Purpose the Skins are macerated in it. If taken internally, this Milk causes a violent, and sometimes fatal Dysentery; it is, however, used externally with very good Effect in the Itch, and cutaneous Foulnesses. The Leaves bruised, both raw, or boiled in Water, are apply'd successfully to cold Tumors, and Parts in Pain.

The Fruit is inclosed in a Down or sort of Cotton, softer than Silk, which is used for making Beds, or Cushions; and for Tinder.

Bees delight much in this Plant, and get from it excellent Honey.

BELEMNITES, *Lapis Lyncis*. *Belemnites*, Offic. Geoff. *Prælect.* 70. *Lapis Lyncis*, Schrod. 353. *Gefn. de Lap.* 92. *Belemnites*, Worm. 70. *Charlt. Foss.* 29. *Mer. Pin.* 211. *Aldrov. Mus. Metall.* 618. *Schw.* 369. *Belemnites Lapis, seu Daitylus Idæus*, Boet. 476. *De Laet.* 150. *Belemnites parvus*, Kentm. 34. THUNDER-BOLTS.

It is sometimes written Belenites.

The *Belemnites* is a round oblong Stone, ending in an obtuse Point, sometimes of a white, sometimes of a gold, and sometimes of a dark Colour. Some of these Stones are solid, others hollow, and it is distinguished by Lines drawn from the Axis to the Circumference. It is commonly about an Inch in Length and Thickness, though some have been found as large as a Man's Arm, and in every one of them there is a Fissure or Slit running through its whole Length. The Name *Belemnites* comes from a Greek Word, which signifies the Point of an Arrow; *Daitylus Idæus*, from its resembling a Finger in Shape, and its being found in Mount *Ida*, in the Island of *Crete*; but it is dug up likewise in the *Alps*, and many other Places of *France* and *Germany*. It is without Ground taken for the *Lapis Lyncuricus* of the Antients, since it is evident, that by that Word *Dioscorides* understood Amber, which he tells us was by some taken to be the concreted and indurated Urine of the *Lynx*. The *Germans* say, that this Stone is good against the Night-mare, and the Stone in the Kidneys. It is given in Powder, from half a Dram to a Dram, in any convenient Liquor. *Geoffroy*.

BELEMNOIDES, BELENOIDES, or BELOIDES PROCESSUS. A Name for the Processus Styloides. The Process also, at the lower Part of the Ulna, from which some Ligaments arise, which connect this Bone to the Wrist, is called by these Names.

BELESON. Balsam. *Rulandus*.

BELI *seu Serifole Bengalenfium*. The Name by which *J. Baubine* calls the COVALAM, which see. It is a tall Fruit-tree not unlike the Quince.

BELILLA, *five Frutex Indicus baccifer, fructu oblongo polyspermo*. An Indian Berry-bearing Shrub. A Decoction of the Root is successfully given for refrigerating the Liver, and purging off pituitous Humours. The same bruised with Water, make a good Embrocation for Pains in any Part of the Body; and apply'd to the Eyes, remove Redness and Inflammations. The Root also digested and boil'd in Oil is successfully drank by Children for Pustules in their Mouths; and a Decoction of the Bark in Oil serves for the same good Purpose. The Vapour of the Decoction of the Leaves eases external Pains. The Juices of the Leaves and Fruit put together into the Eyes, remove Specks and Films. *Raii Hist. Plant.*

BELLADONNA. A Plant thus distinguished.

Solanum lethale, Offic. Ger. 269. *Emac.* 340. *Raii Hist.* 1. 679. *Park. Theat.* 346. *Mer. Pin.* 114. *Solanum melanocephalus*, C. B. Bin. 166. *Solanum maniacum*, Chab. 523. *Solanum maniacum multitis, seu Belladonna*, J. B. 3. 611. *Solanum furiosum, luride purpureo flore calathoides, Melanocerasus*, Pluk. *Almag.* 352. *Solanum somniferum*, Merc. Bot. 1. 70. *Phyt. Brit.* 115. *Solano congener flore campanulato vulgatus, latioribus foliis*, Hist. Oxon. 3. 532. *Belladonna*, Clus. Pan. 504. *Elem. Bot.* 68. *Raii Synop.* 3. 265. *Dill.*

B E L

Cat. Giff. 143. *Belladonna majoribus foliis & floribus*, Tourn. Inst. 77. Boerh. Ind. A. 2. 69. Rupp. Flor. Jen. 204. DEADLY NIGHTSHADE. Dale.

This is the largest of all the Nightshades, having many thick, long, spreading Roots, that shoot forth many tall, angular Stalks, to a Man's Height, or more, beset with dull green Leaves, in Shape like common Nightshade, but much larger. The Flowers are set on among the Leaves, growing singly on long Foot-stalks, and are large, hollow, and Bell-fashion'd, divided into six Segments at the Ends, of a dusky-brown greenish Colour on the Outside, and purplish within, which are succeeded by large, round, shining, black Berries as big as Cherries, set on a brownish Calyx, and containing a purplish juicy Pulp of a nauseous sweet Taste, full of small flat Seeds. It grows in several Parts of *England*, but not very frequently.

It is to be found in a Ditch at the End of *Goswell-street*, in the Road to *Islington*; in *Cuckstone*, near *Rocheſter* in *Kent*, all the Yards and Backsides are over-run with it. *Miller's Bot. Off.*

The Fruits of this Plant taken internally are very dangerous, as appears by several Histories which occur among Botanic Writers. The Painters in Miniature macerate it, and obtain a fine Green from it. The Leaves of *Belladonna* are great Sweeteners and Resolvents; they are applied to the Piles and Cancers. Some boil them with Whey, or make use of their Juice. Mr. Ray confirms these Uses of it, especially in carcinomatous Ulcers and Indurations of the Breasts. *Mariyn's Tournesfort*.

In the Month of *August* some Children of *Grandvaux*, a Village four Leagues from *Paris*, having got into an uncultivated Garden, they eat of the Fruit of deadly Nightshade, or *Melanocerasus*. Some time after they had a violent Fever, with Convulsions, and terrible Palpitations at the Heart, they knew nobody about them, and intirely lost their Understanding. A little Boy of four Years of Age died the Day after. They found three Wounds in his Stomach, with the Berries of the Nightshade bruised, and the Seeds sticking in the Wounds; the Heart livid, and no Water in the Pericardium. Mr. *Boulduc* communicated this to the Academy. *Hist. de l'Acad. Roy. de Scienc. A.* 1703.

Our own Country will furnish us with many Instances of the same Kind from eating by Mistake the Berries or Leaves of this Plant. I know a Gentleman, who had a Tenant, and his Wife, his Father-in-law, and Children, driven out of their Senses for some time, by eating Herbs boiled with Bacon in the Spring, amongst which were the young Shoots of the *Belladonna*. A Hound also who eat the Broth had the same Fate, but they all recovered in a few Days.

The Plant takes the Name of *Belladonna* from the Use which the Italian Ladies apply it to; for of the Juice, or distill'd Water, they make a sort of Cosmetic, with which they wash their Faces, in order to take away a too florid Colour.

Notwithstanding the deleterious Effects of this Plant, some have ventured to give an Infusion of it in Wine, as a Remedy for a Dysentery. And others have given a very small Quantity of the Juice boiled up with Sugar to a Syrup, as a Narcotic. But this Practice is rather empirical than rational, and, at best, very hazardous.

As to the Cure of Disorder from taking this Plant, *Gerard* relates a Story of three Children at *Wibich*, in the Isle of *Ely*, who eat of the Berries; two of these dy'd, and the third was vomited plentifully, by drinking copiously of Honey and Water, and recovered.

Ray, from *Hæchstetterus*, relates a History of a Mendicant Friar at *Rome*, who drank an Infusion of this Nightshade in Wine; the Consequence of which was, that he lost his Senses, but was brought to himself by drinking a Glass of Vinegar.

BELLARIA. Sweet Cakes, Tarts, or any sort of Confectionary Ware used for Desserts.

BELLERICÆ. An Epithet for a particular Species of Myrobalani. See MYROBALANI.

BELVEDERE. The Italian Name for the *Scoparia*, Bushy, or Besom-toadflax.

BELLICULUS, or BELLIRICUS MARINUS. A Species of Shell-fish like the Periwinkle.

BELLIS MAJOR, Offic. J. B. 3. 114. Chab. 362. Ger. 509. *Emac.* 634. *Schw.* 28. *Raii Hist.* 1. 350. *Synop.* 91. *Bellis major vulgaris seu sylvestris*, Park. 528. *Bellis sylvestris caule folioso major*, C. B. 261. *Bellis polyclonos sylvestris major, caule folioso*, Hist. Oxon. 3. 28. *Leucanthemum vulgare*, Elem. Bot. 393. Tourn. Inst. 492. Boerh. Ind. A. 107. *Dill.* Cat. 82. *Bellidioides vulgaris*, A& Reg. Par. An. 1720. 281. OX-EYE DAISY. Dale.

The Leaves of this Daisy are long and round at the End, serrated about the Edges, growing narrower towards the Root, and ending in long broad Foot-stalks: The Stalks use to be a Foot or more in Height, striated and clothed with smaller and narrower Leaves, having large Flowers growing on their Top, composed of several broad white Petals, set about a broad yellow Thrum, made up of a Number of hollow Flowers thrust close together. The Root is small, slender, and creeping. It grows

grows in Pasture-grounds, and in the Borders of Fields; and flowers in June.

The Flowers of this Daisy are chiefly used, and commonly go under the Name of Ox-eye; they are of a balsamic Nature, and are accounted good for all Disorders of the Breast and Lungs, as Coughs, Shortness of Breath, Pleurisy, Consumption, and Wasting of the Flesh. They are helpful against inward Bruises, and Wounds, and Ruptures, and are often put in Apozems and Decoctions for the aforesaid Purposes. *Miller's Bot. Off.*

BELLIS MINOR, *Symphytum minimum*, *Consolida minima*, *Offic.* *Bellis sylvestris minor*, C. B. 261. A& Reg. Par. An. 1720. 278. *Raii Hist. 1.* 349. *Synop. 91.* *Tourn. Inst. 491.* *Elem. Bot. 392.* *Dill. Cat. 46.* *Boerh. Ind. A. 108.* *Bellis minor sylvestris simplex*, Park 531. *Bellis minor sylvestris*, Ger. 510. *Emac. 636.* *Bellis minor sylvestris spontanea*, J. B. 3. 111. *Chab. 361.* *Bellis minor pratensis seu vulgaris*, *Hist. Oxon. 3. 31.* **COMMON DAISY.** *Dale.*

The Root of the common Daisy is a thick Bunch of Fibres; the Leaves grow in a Circle close to the Ground, being thick and fleshy, and are long and narrow at the Bottom, ending broad and round, not much bigger than a Silver Penny, with very few Indentings about the Edges: The Flowers spring immediately from the Roots, upon slender Stalks three or four Inches high, bearing one small single Flower at the End, made of a Border of white Petals, or Leaves, set about a yellow Thrum; sometimes the Border is edged with a reddish Colour, and red underneath. The Seed is whitish, slender, and flat. Daisies grow every-where in the Fields and Meadows, and flower in April and May.

The Leaves, and sometimes the Roots, are used, and are reckoned among the traumatic and vulnerary Plants, being used in Wound-drinks, and are accounted good to dissolve congealed and coagulated Blood, to help the Pleurisy and Peripneumony. In the King's-evil, the Decoction given inwardly, and a Cataplasm of the Leaves applied outwardly, are esteemed by some extraordinary Remedies. *Miller's Bot. Off.*

Its Leaves are acrid, glutinous, and give hardly any Tincture of red to the blue Paper, which shews that its Salt is not very different from that which is natural in the Earth; that is, composed of Sal Ammoniac, Nitre, and marine Salt, involved in a great deal of Sulphur and Earth, which thicken the Sap of the Daisies, and render it viscous. This Plant, taken in a Puffan or Extract, dissolves the Blood which is thickened by too cold an Air, as it often happens in Inflammations of the Lungs; it takes away Obstructions, facilitates the Circulation of the Blood, and restores the Fibres to their natural Elasticity; for which Reason it is thought to be very vulnerary. *Ruellius* affirms, that a Cataplasm, made with Daisies and Mugwort, dissolves scrophulous Tumors, and those wherein there is an Inflammation, and gives Ease to those who are troubled with the Gout or Palsy. *Martyn's Tournesort.*

There are several other Plants which go by the Name of *Bellis*. Thus the *Aphyllantes Anguillareæ*, or *Globularia*, is called *Bellis cærulea Monspelica*. See **GLOBULARIA**.

BELLOCULUS. A Sort of precious Stone resembling an Eye, and from hence superstitiously said to be good in Disorders thereof.

BELLON. A Distemper very common in *Derbyshire*, and other Countries where they smelt Lead-ore, to which Beasts, and even Poultry, as well as Men, are subject; and, for this Reason, a certain Space round the Smelting-houses is called *Bellon-ground*, where it is dangerous for any Animal to feed.

This Disorder is attended with Languors, Weakness, intolerable Pains, and Sensation of Gripings in the Belly, and generally Costiveness; and very frequently proves fatal.

The Method of Cure which has been found most successful on this Distemper, is, to give Cremor, or Crystals of Tartar, in small Doses, and to repeat them frequently, for Example, two or three times a Day.

I must not omit remarking, that I have twice met with Disorders much resembling this, from the taking *Saccharum Saturni*, as a Remedy for the Fluor Albus; for which Reason I look upon it as a very dangerous Medicine. See **PLUMBUM**.

BELLONIA. This Plant was so named by Father *Plumier*, in Honour of the famous *Petrus Bellonius*, who has left many valuable Tracts on Natural History.

The Characters are;

It hath a wheel-shap'd Flower, consisting of one Leaf, and divided at the Top into several Parts; from whose Cup arises the Pointal, fix'd in the Middle of the Flower like a Nail: The Flower-cup afterward becomes a hard oval pointed Fruit, in which are contained many small Seeds.

We have but one Species of this Plant; that is, the *Bellonia frutescens, folio melissæ aspero*. *Plum. Nov. Gen.* **SHRUBBY BELLONIA, WITH A ROUGH BALM-LEAF.**

There is no Medicinal Virtue attributed to this Plant, that I know of. *Miller's Dictionary.*

BELMUSCUS. See **ABELMUSCUS**.

BELONE, *Βελώνη*. A Needle. See **ACUS**.

BELONOIDES. See **BELEMNOIDES**.

BELOERE. An Indian evergreen Plant. The Leaves powder'd purge with too much Violence. The Seeds bruised, and taken warm, purge more moderately. *Raii Hist. Plant.*

BELOS. *Βέλος*. An Arrow, or Dart. This Word only belongs to Medicine, as it is a Cause of Wounds.

BELULCUM. From *Βέλος*, an Arrow, and *ελκεω*, to draw. An Instrument for the Extraction of Darts of Arrows, of which many are describ'd by chirurgical Writers.

BELUTTA TSJAMPACAM. The Name of a very large Tree, which grows in *Malabar*.

The Root bruised with fresh Ginger, and taken internally, powerfully excites Sweat. The Bark also taken, or powder'd, and sprinkled on a Wound made by the Bite of a Serpent, cures it. Cataplasms are made of the Leaves, boil'd in new Milk, with an Addition of Palm-oil, which, applied to the Top of the Head, are said to discuss viscid and pituitous Humours collected in the Brain, to attenuate them, and to discharge them by the Nose. A Decoction of the Leaves, drank, attenuates viscid Phlegm, and, by this means, cures a Cough. The Fruit, when fresh, boil'd in Honey, loosen the Belly; but, when dry, are astringent. From these also an Oil is express'd, which agreeably removes Pains of the Limbs, if they are anointed with it. *Raii Hist. Plant.*

BELZOINUM, the same as **BENZOINUM**, which see.

BEN. The *BALANUS MYREPSICA*, which see. See also **BEHEM**.

BENATH. The Arabic Name for small Pustules, which rise in the Night after sweating.

BENEDICTUS, Blessed. A pompous Epithet given to some Plants; as the *Carduus Benedictus*, and the *Herba Benedicta*, which is the same as the *Caryophyllata*, *Avens*.

It is also given to many Compositions. Thus the emetic Infusion of *Crocus Metallorum* is call'd sometimes *Aqua Benedicta*; and, amongst the Alchymists, the Philosophers-stone goes by the same Name, as well as by that of *Lapis Benedictus*. But *Mynsicht* gives the Name of *Aqua Benedicta* to a Water distilled from the *Serpyllum*. *Bates* gives two Waters, each under the Name of *Aqua Benedicta*, the first of which only differs from the *Aqua Calcis*, in the Proportion of the Water to the Lime. As thus:

AQUA BENEDICTA BATEI.

Take Quick-lime, one Pound; and pour upon it eight Pounds of boiling Water; after some time settling, pour it off by Inclination, and filtre for Use.

This stands commended for an extraordinary Medicine in many Cases of Obstinacy; and, if it be drank, three or four Ounces, three or four times a Day, is said to cure red pimpled Faces, Struams, Dysenteries, the Fluor Albus, rheumatic Pains, and the Diabetes. It is certainly a powerful Drier, and very proper to use in Decoctions of the Woods, and all Ingredients of that Intention; but tho' the making of it is easy enough, yet, here in *London*, it may be had at any time from the Sugar-baker's, by the Name of Lime-water, as it happens to be wanted, because they use it much in refining their Sugars. This is also much prais'd for cleansing and drying up old foul Ulcers, both by its internal Use, and washing them frequently with it.

AQUA BENEDICTA COMPOSITA BATEI.

Take of fresh Liquorice, an Ounce; Sassafras-bark, half an Ounce; stoned Raisins, six Ounces; Nutmegs, six Drams; of the preceding *Aqua Benedicta*, six Pints. Infuse cold for two Days, and strain off the Liquor.

The Virtues are the same as those of the *Aqua Benedicta* preceding, but of more Efficacy in some Cases.

BENEDICTA LAXATIVA: The Blessed Laxative, from the College.

Take of choice Turpeth, ten Drams; of Diagrydium, the Bark of Spurge-root prepar'd, and Hermodactyls, of each five Drams; the Seeds of Anise and Fennel, of each half an Ounce; of Sal Gem, one Ounce; of clarify'd Honey, three times the Quantity of the rest, so as to make into an Electuary.

This is originally taken from *Nicolaus*, both by the College, into their first Dispensatory, and by the Augustan, with very little Variation; and it hath so continu'd down to the present Reformation of our College, who have now rejected many needless Spices and Carminatives, which were crowded into it under the Notion of Correctors, here being a Sufficiency retain'd for such Purposes. *Zwelfer* says, that some have order'd double the Quantity of the Spurge-root; but thinks, that, as it stands here, it is enough; and that even that requires a due Preparation, which is, by infusing it three Days in very sharp Vine-

B E N

gar, and then drying it. It is, however, so wholly neglected by the present Practice, that it is never made in the Shops.

Quincy's Dispensatory.

BENEOLENTIA. Sweets, or sweet-smelling Medicines.

BENGI-EIRI. A Species of evergreen Indian Ricinus is thus call'd, which grows in Malabar.

The Leaves powder'd, and sprinkled upon Ulcers, destroy luxuriant and fungous Flesh; of the Leaves also, bruised, and mix'd with Cows Dung, and sew'd together in a Bag, a very good Topic is made for any Parts affected with Convulsions. *Raii Hist. Plant.*

BENIGNUS. Mild, gentle. It is apply'd to Diseases which are not virulent, and to Medicines which operate gently.

BENINGANIO. A Fruit which grows in the Bay of St. Augustine, of the Size of a Lemon, red without, and which is very grateful to the Stomach. *Raii Hist. Plant.*

BENZOINUM.

Benzoin, Benzoinum, Offic. Benzoin, Comm. Plant. Usual. 87. Park. Theat. 1572. Boerh. Ind. A. 2. 259. *Benzoin, Asa dulcis, Mont. Exot. II. Benzoinum Officinatum, Jonsl. Dendr. 355. C. B. Pin. 503. Raii Hist. 2. 1845. Benjoinum, Chab. 74. Benjoinum, cujus arbor folio citri, J. B. I. 328. Arbor Benzoini Grimm, Ephem. Germ. A. II. 376. f. 31. Arbor Benzoinifera, Breyn. Prod. 2. 16. Arbor Virginiana pisaminis folio baccata, Benzoinum redolens, Pluk. Almag. 42. Phytog. Tab. 139. f. 3. & 4. Arbor Virginiana, citria vel limonia folio, Benzoinum fundens, Hortus Amstel. I. 187. f. 97. Benjui Garzia, Clus. Exot. 155. THE BENJAMIN-TREE. Dale.*

This is called *Asa dulcis, Asa odorata, Belzoë, Benzoë, Gummi Benzoë, Benzoinum, and Benzoinum*. It is a Gum of an agreeable and fragrant Smell, produced in the East Indies by a large and high Tree, which bears long Leaves, like those of the Citron and Lemon-tree, though somewhat smaller, and not so green; they are also whitish on one Side. This Tree is called by *Herm. Nic. Grim. in Ephem. N. C. Dec. 2. An. 1. Obs. 152. Arbor Benzoini*. By *Jac. Breynio in Prodrom. Benzoinifera*. By *Garzia, Benivifera*; and by *Chabreus, Benivi Arbor*. Some take it for the *Cyrenaic Laserpitium*, or ferulaceous Juice, formerly found very good in the Country of the Cyrenians; hence 'tis called *Liquor Sirenaicus, or Cyrenaicus*. *Jac. Bontius* says, it is produced in great Plenty in *Zeilon, Sumatra, Siam, Cambodia, Java, and Malacca*; but the best Sort comes from *Boninas and Bairos*. It is imported to us quite dry. Some write, that it is composed of several Pieces of different Colours. The best is hard, solid, shining and transparent, has white Spots in it, and is of an agreeable Flavour. It is by some called *Amygdaloides*, on account of its white Spots, which resemble a blanch'd Almond. See *Ol. Worm. Mus. C. 34. Job. Dan. Horst. Pharmac. Part. I. L. 6. C. 260. Erasmi. Franciscus*. The Brown and Black, though of an agreeable Smell, are yet far from being so good as the other Sort, on account of some Impurities, with which they are mixed. It is of a warming, drying, dissolving, and purifying Nature; resists Putrefaction, is good against Disorders of the Breast and Lungs, and cures Oppression of the Thorax. It is very rarely used internally; but yet the Flowers, the Magistery and Tincture prepared from it in the Apothecaries Shops, are of singular Service in Coughs, Oppressions of the Breast, Ulcers of the Lungs. In Obstructions of the Menfes, the Flowers taken in a poach'd Egg are of singular Service. *Amarus Lusitanus*, with these Flowers, and Flowers of Sulphur, happily cured an inveterate Cough, *Cent. 6. Cur. 90. Jo. Beguinus*, in his *Tyrocin. Chym. L. 2. C. 28*, asserts, that they are good for Asthmas, and all Disorders of the Lungs. The Commentator on the same Chapter commends them in inveterate Phthyses and Asthmas. *Fabr. Bartolet. L. 5. de Dyspn. C. 1*, says a great deal concerning it in Disorders of the Breast, and Defects in Respiration, and calls it the Balsam of the Lungs. But *Marcus Banzer* endeavours to demonstrate the contrary, *Controvers. Medico-miscellan. Dec. 4. Thes. 7*, and asserts, that its Flowers are hurtful in a Phthisis, and other Disorders of the Lungs. The Flowers have a more disagreeable Taste than the Gum itself. Externally it is used in all fragrant Compositions; for it proves cordial by its agreeable Smell, fortifies the Senses; by its Steam, dries up the cold Humours of the Cerebellum, dissipates Defluxions, and cures Tooth-achs. However, in burning the Benzoin, we ought to take particular Care not to swallow a great deal of the Smoke, because it not only affects very quickly the Cerebellum, but also acts with such Force upon the Breast and Lungs, that 'tis ready to destroy Respiration. There is also a Cosmetic Tincture made of Benzoin, in this manner:

Take of Benzoin, and Storax Calamita, each an Ounce: After reducing them to a Powder, and putting them into a Phial, pour upon them four or six Ounces of rectified Spirit of Wine; put it in a warm Place, and let it remain in it, shaking it now-and-then till the Tincture is extracted; then filtrate it through Paper; put some of it into Rose-

B E N

water, Water of the Flowers of Beans, or any such Water

It suddenly turns the Water into which it is put to a milky Colour; for which Reason 'tis called *Lac Virginis*, or Virgin-milk. With this the Face is to be washed. It carries off all Spots, and renders the Skin white, clear and pure. It carries off Blotches contracted by the *Lues Venerea*, *P. Amman. Manuduct. ad Mater. Med. p. 122*. It also removes Tooth-achs, if applied on a little Cotton. See also *Collect. Chym. Leydens. C. 94. and 95. and Chem. Rational. P. T. C. 1. Artic. 10*. As also the *Dispensat. Brandenburg. p. 170*. Its odoriferous Oil also purifies and heals the Skin, if diluted in Spirit of Wine, or the White of an Egg. *Barth. Zorn Botanolog.*

Benzoin is a resinous, inflammable Substance, sometimes of a reddish, sometimes of a pale Colour, and generally very foul. When it is cover'd with white Spots, it is call'd *Benzoinum Amygdaloides*. It is of an agreeable Taste, a little acrid, and is much used in Perfumes. It is not certain, that this Juice was known to the Antients. It is brought from the *Philippine Islands*, from *Siam* and *Sumatra*. *M. Grimm* has describ'd the Tree which produces it, and the Manner of preparing it, in the *Ephemerides Naturæ Curiosorum, An. i. Dec. 2*. It is very proper in Asthmas, to attenuate the Phlegm which oppresses the Lungs, and in Ulcers of that Part; but the Flowers of Benjamin are prefer'd for internal Use. *Geoffroy*.

It is the resinous Gum of a Tree which grows in the East-Indies; the best in *Siam*, taken from young Trees of five or six Years Growth, whose Bark they cut right down in several Places in the upper Part of the Tree, from whence this Gum flows out; which, at first, is soft and glutinous, hardening in time. The Tree bears large Citron-like Leaves, but of a paler Green, and whitish underneath: The Fruit is about the Bigness of a Nutmeg, somewhat flattish, cover'd with a Bark like the outer Shell of a Walnut, but somewhat downy on the Outside. *Miller's Bot. Off.*

The Druggists generally keep two Kinds of Benzoin, that in Tears, as 'tis call'd, and another Sort. The true Benzoin, which was imported into France by the People in the Embassy of *Siam's* Retinue, was, externally, of a yellowish-gold Colour; but white internally, with small, clear, white and red Veins distributed thro' it: It was friable, and without any Taste, but of a very agreeable and highly aromatic Smell. It differ'd very much from that Benzoin in Tears which is commonly sold, which is a clear and transparent Mass, of a reddish Colour, and mix'd with whitish Tears, resembling Almonds, for which Reason 'tis call'd *Amygdaloide Benzoin*.

This last-mention'd Species ought to be chosen with Qualities as much approaching to the former as possible; and it ought, above all things, to be pure, and free from Dregs, a Property with which 'tis very rarely to be found.

The other Sort of Benzoin is the most common of all, and very often counterfeited by a Fusion of several Gums together. The best of this Kind is pure, of an agreeable Smell, very resinous, and intermix'd with a great many whitish Tears: That which is black, and without any Smell, is absolutely to be rejected. *Savary*.

Preparations of BENZOIN, or BENJAMIN.

TINCTURE of BENJAMIN.

Let Benjamin, which spontaneously flows from its Tree in Plenty, be ground to Powder, and boil'd in a Glass Vessel, with Spirit of Wine once rectified, without any farther Preparation; and thus it resolves into a red and sweet-scented Liquor, which, being decanted clear, and more Spirit pour'd to the Remainder, and boil'd therewith, nearly the whole Body of the Benjamin is thus dissolved, except a little shaggy Matter. But if the Alcohol were perfect, and boil'd in this manner with the Benjamin, the Tincture becomes the richer. They are both of them odoriferous, and of a warm, bitterish, and balsamic Taste.

R E M A R K S.

Hence it appears, that an unctuous Resin may be perfectly and totally dissolved in Alcohol, so as therewith to appear in the Form of a considerably homogeneous and thin Liquor; a little whereof being pour'd to a large Proportion of Oil, the Mixture immediately turns white, opaque, and milky, thence call'd *Virgin's Milk*; because, if the Face be wash'd therewith, it becomes rosy and soft, and cover'd with a thin shining Skin, if suffer'd to dry spontaneously. This Mixture, therefore, is esteem'd an innocent Cosmetic; and, when mix'd with Wash-balls, renders them of an agreeable Odour. This Resin of Benjamin is wonderfully volatile, with a small Degree of Heat, and spontaneously dissolves in Alcohol without Alkali. *Boerhaave's Chymistry*.

This is somewhat different from that quoted from *Zorn*.

TINCTURA

TINCTURE of BENJAMIN. *From Quincy.*

Powder four Ounces of select Benjamin; put it into a Matrafs, and add to it tartariz'd Spirit of Wine, one Pound. Fit the Matrafs to a Cucurbit; lute the Joint, and set it in a warm Sand for three or four Days, now-and-then shaking it about. In that time there will be made a fine Tincture, which decant, and keep for Use.

This is good in Asthmas, and other Distempers of the Lungs, given from twenty to sixty or seventy Drops, in any convenient Vehicle. But it is most used externally, to smooth the Skin, and take Spots off the Face: One Dram of it, put into four Ounces of clean Water, turns it white, and is call'd *Virgin's Milk*. To this Tincture may be added, of Storax, one Ounce; and Balsam of Peru, one Dram; which will render not only the Scent more grateful, and make a deeper Tinge in the Spirit, but be also better for inward Use.

These three Tinctures only differ as to the Ingredients added to the Spirit, with the Benjamin.

FLORES BENZOINI: *Flowers of Benjamin.*

Put into a subliming Pot two or three Ounces of Benjamin, in gross Powder; set on its Cover, without luting; keep it in the second Degree of Fire in Sand, or immediately over a small Fire of Charcoal. The Flowers will presently begin to rise into the Cover, which, once in an Hour, or an Hour and an half, must be taken off, and wiped out, upon a clean Sheet of Paper, with a Feather. There ought to be two Covers to one Bottom in Readiness, that one may be clapp'd on as soon as the other is off. When the Flowers begin to rise yellow, take the melted Benjamin out of the Pot with a Spoon, and put into it more powder'd Benjamin, as at the first; and so proceed until there are as many Flowers as desired.

In this Operation Care must be taken, that the Fire be not too strong, because it will throw up some Oil, and discolour the Flowers. These are a wonderful Pectoral, and particularly in Asthmas; for they greatly attenuate, and open viscous Obstructions, and cleanse the Bronchia. They are convenient almost in any Form, and give a very grateful Scent to any Composition. Their Dose is from three to ten or twelve Grains.

OLEUM & SPIRITUS BENZOINI: *Oil and Spirit of Benjamin.*

Take of the black melted Benjamin, which remains after the Sublimation of the Flowers, one Pound; put it into a Retort, which place in a Sand-furnace; cover it well with Sand, lute on its Receiver, and make a Fire of the first Degree for one Hour; then increase to the second, and there will come over some Oil and Spirit, with some discolour'd Flowers: Augment the Fire to the third Degree, and at last to the fourth, till no Fumes appear, and there will be a blackish Oil, with an acid Spirit; and the Neck of the Retort will be fill'd with the discolour'd Flowers, which may be taken out, and put upon a clean brown Paper, to suck up the Oil.

These Flowers, tho' not so beautiful, are as good for Use as the former; and tho' the Oil, Spirit, and Flowers, acquire for the present an empyreumatical Scent, in six or eight Months that will wear off, and they become very fragrant.

After the same manner may be made the Oil, Spirit, and Flowers, or volatile Salt, of any Balsams; as that of *Tolu*, *Peru*, and the like. The Spirit is diuretic, but not very pleasant, by reason of its Empyreuma. The Oil is accounted a good Vulnerary, both in external and internal Application; and for inward Use, if two or three Ounces of it be put into a Cucurbit, which is capable of holding a Gallon of Liquor, and to it five or six Pounds of Water are added, and the Whole is set in a Sand-furnace, luting on its Head and Receiver, with a gradual Fire, till the Water is ready to boil, the spirituous Part of the Oil will come over with the Water, of a fine Amber-colour, and a fragrant Scent; which is an admirable internal Medicine, a powerful Diuretic, and by some reckon'd a Specific against the Stone and Gravel in the Kidneys and Bladder. Its Dose is from five to fifteen Drops, in a little refin'd Sugar. *Quincy's Dispensatory.*

BER. The Name of a Tree which grows in many Parts of the *East-Indies*. It bears a Fruit like the *Jujeb*.

BERBELICE. A Name in *Nicolaus Myrepsus* for the *Tussilago*, Coltsfoot.

BERBERI, *βερβερι*, according to *Athenæus*, the Name of the Shell in which Pearls are found.

BERBERIS, *Oxyacantha* *Galen*. Offic. *Barbaris*, Park. *Theat.* 561. *Mer.* Pin. 15. *Chab.* 50. *Berberis*, vel *Oxyacantha*, *Ind. Med.* 20. *Berberis Crespinus*, *Mont.* *Ind.* 38. *Berberis*, *Vol. I.*

beris dumetorum, C. P. Pin. 454. *Raii Hist.* 2. 1605. *Synop.* 3. 465. *Tourn.* *Inst.* 614. *Elem. Bot.* 487. *Boerh. Ind.* A. 2. 233. *Jenf. Dendr.* 219. *Dill. Cat. Giff.* 66. *Buxb.* 36. *Berberis vulgo*, quæ & *Oxyacantha putata*, J. B. 1. 52. *Spina acida*, sive *Oxyacantha*, *Ger.* 1144. *Emac.* 1325. *Oxyacantha Galeni*, *Merc. Bot.* 1. 56. *Phyt. Brit.* 86. THE BAR-BERRY, or PIPPERIDGE-BUSH.

The Barberry Tree, or rather Bush, for it never grows to any great Bigness, has the outward Bark of a whitish or ash Colour, and under that another of a deep Yellow. The Branches are long and brittle, full of sharp Thorns at the Setting-on of the Leaves, which are of a roundish or oval Form, neatly denticulated or notched about the Edges, of a fourish Taste. The Flowers grow among the Leaves, in long Bunches of six Leaves apiece, of a yellow Colour, which are follow'd by round cylindrical Berries of a red Colour, and full of a four Pulp, each having two long hard Seeds included. They grow wild in several Places, and are frequently planted in Gardens. They flower in April and May, and the Berries are ripe in September. The inner Bark and the Berries, with the Seed, are used.

The inner Bark is opening and attenuating, and is accounted a Specific against the Yellow-jaundice, taken either in an Infusion or Decoction. The Fruit is very cooling and restraining, and good to moisten the Mouth, and quench Thirst, in burning Fevers. The Conserve is serviceable against all kind of Looseness and Fluxes, and likewise of Use in the Jaundice.

The Seed is likewise binding and restraining, tho' it is but seldom used.

The only Official Preparation from this Tree is the Conserve of the Fruit. *Miller's Bot. Off.*

Its Root is yellow, very bitter, and gives but a faint red Colour to the blue Paper: The Juice gives it as lively a Red as Alum. This Plant, being analysed, yields a great deal of acid Liquor, a little urinous Spirit, and a good deal of Oil and Earth. The Fruit is chiefly in Use; it allwages too great a Fermentation of the Humours, especially when caused by Bile. *Tragus* affirms, that a Wine made of the Juice of its Berries will stop a Diarrhoea, Dysentery, and the Whites. The Infusion of them is given to drink. There is a Confection, a Syrup, a Jelly, and a Rob, made of them, which are used in cooling Julaps; *Simon Paulli* shews the Manner of making the essential Salt, which he calls the *Tartar of Barberries*:

Take, says he, two Pounds of the Juice of *Barberries*, and two Ounces of Lemon-juice; evaporate them very gently over the Fire, strain them, and set them to crystallize in a Cellar: These Crystals are very cooling.

In the Heat of Urine, and internal Inflammations, they dissolve Nitre in the Juice of *Barberries*, to make it crystallize. The Bark of the Root is astringent and deterfive. *Martyn's Tournefort.*

BERDIRAMON. A Name in *Nicolaus Myrepsus* for the *Jarus*, *Dracontium majus*, *Bistorta major*, or *Serpentaria major*, which are all the same Plant.

BEREAS. *Rulandus* explains this by *Rotundum*.

BEREDRIAS. The Name of an Ointment described by *Aetius*, *Tetrabib.* 4. *Serm.* 4. C. 113.

BERENI SECUM, signifies *Artemisia*, Mugwort. *Castellus*.

BERENICIUM. A Species of Nitre in *Galen* and *Actuarius*.

BERETINUS FRUCTUS. A Fruit found in the *Malacca Islands* by the Sailors, in *Sir Francis Drake's Expedition* round the World.

BERGAMOTE. A certain fragrant and cordial Essence is call'd by this Name, as also *Essentia de Cedra*. It is extracted from a kind of Lemon in *Italy*, call'd *Bergamote*; which, they say, owes its Original to an *Italian*, who took a Fancy to graft a Branch of a Lemon-tree upon the Stock of a *Bergamote* Pear-tree, whence the Lemons produced from this Union participate of both the Nature of the Citron-tree and the Pear-tree. The Inventor kept this Discovery secret for a long time, and enrich'd himself by it.

To extract the *Essentia de Cedra*, they cut the yellow or external Rind of the Lemon into small Bits, and immediately break them, one after another, by squeezing them into a Glass Vessel, in the same manner as you squeeze Orange-peel, when you have a mind to perfume a Glass of Wine: But this Vessel must have a narrow Mouth, so as not to admit more than the Ends of the two Fingers which squeeze the Rind; and even this Opening must be closed, as much as possible, after the Ends of the Fingers are enter'd within it, with some wet Parchment, in order to prevent what we labour to obtain from evaporating. It is proper, that the Vessel should be belly'd, and that its Capacity below should be far more extensive than its Neck, that the essential Part of the Rind, which was express'd by the Fingers, may have Space enough to disperse itself, and to circulate as it comes off, and to resolve itself into a Liquor. This Liquor is an ethereal Oil, very subtil, and of a charming Smell; but there

there must be a vast Number of these little Bits of *Bergamote* Lemon-peel cut up, in order to obtain a small Quantity of Essence.

The *Essentia de Cedra*, being prepar'd without the Help of Fire, in manner aforesaid, has a much more agreeable Smell, and participates of the Quality in a much greater Degree, than the Essence which might be extracted from the Rind of the *Bergamote* Lemon by a Separation, after the manner of other Essences.

It is a Cardiac, Stomachic, Cephalic, and is qualify'd to resist the Malignity of the Humours. The Dose is from one Drop to six. *Lemery des Drogues*.

BERIBERII. A kind of Palsy, common in some Parts of the *East-Indies*. The Name, in the Language of the Country, signifies a Sheep, and was given by the Natives to this Distemper, as *Bontius* thinks, because the Patients, in throwing out their Knees, and lifting up their Legs, seem to imitate Sheep in their Walk. It is, says he, a kind of Palsy, or rather Trembling, in which there is a Depravation of the Motion and Sensation of the Hands, Feet, and sometimes of the Body, accompanied with a Trembling.

The principal Cause of this Disorder is a gross and viscous pituitous Humour, which, in the Night-season, especially in rainy Weather, which holds without Intermission from the Beginning of *November* to the Beginning of *May*, falls upon the Nerves; while Persons, being fatigued with the Heat of the Day, throw aside their Cloaths, and lie without any Covering; by which means the phlegmatic Humour, which was before generated principally in the Brain, very easily seizes upon the Nerves; for the Nights in these Countries, compar'd with the hot Days, may be said to be cold. In this Case, the Joints are lengthen'd, the pituitous Matter insinuating itself between the Junctures, so as to relax the Nerves and Ligaments. Tho' this Disease, for the most part, comes on gradually, and by slow Advances; yet sometimes it seizes a Person on a sudden; as when, after being fatigued with Heat, he immediately takes a very plentiful Draught of the Liquor of the *Indian Palm-tree*. Thus we have sometimes seen, in our own Country, in the Season of the Dog-days, when Persons have been heated with Running, or any other vehement Motion, that a Draught of Beer, or Whey and Curds, greedily swallow'd, has thrown them into the utmost Danger of their Lives, and even proved fatal.

To proceed, the Symptoms of this Disorder are manifest to Sight; for there is a spontaneous Lassitude of the whole Body; the Motion and Sensation, especially of the Hands and Feet, are depraved; and the same Kind of throbbing Trillation is felt in them, as is felt in the Fingers and Toes in a cold Country, and in the Winter-season, only the Pain is not so great. Sometimes the Voice is so obstructed, that the Sick can hardly speak articulately. This happen'd to myself under this Disorder; for my Voice was so low for a whole Month, that those who sat close to me could scarcely understand what I said. Besides these Symptoms, there sometimes happen many others, all which, however, seem to owe their Rise to a cold and tenacious Humour; but let it suffice, that I have mention'd the principal.

Let us now betake ourselves to the Cure, which is usually very tedious, because the cold and viscid Humour is not easily and quickly dissolved: However, it is not mortal in its own Nature, except it falls upon the Muscles of the Breast and Thorax, and so stops the Passage of the Breath and Voice. Above all things, you must avoid, if by any Means possible, Confinement to your Bed; but bestir yourself, as much as Strength will allow, either in Walking or Riding, or any other Kind of vigorous Exercise: Running, indeed, is more than you can perform. Strong and smarting Frictions are also highly necessary, at which your *Bengal* Men-servants, and *Malacca* Women, are very dexterous; for our *European* Servants are as much unaccustomed to this Exercise as to Bathing, which is frequently used here. They prepare Fomentations and Infusions of a noble Herb called *Lagundi*, which has a Leaf like the *Periscaria*, and is of a sweet and aromatic Smell. This Plant, I am well assured, not only does the Service of Chamomile and Melilot, but excels them, at least, in my Opinion, in its dissolutive and resolving Virtues. The Hands and Feet are also to be anointed with the Oils of Cloves and Mace, but mix'd with Oil of Roses; for they are too caustic, and very easily corrode the Skin, if used alone. Besides these Medicines, we have a noble kind of *Naphtha*, brought from *Sumatra*, which lies over-against the Kingdom of *Java*, and in Sight of the same. This Drug the *Indians* call *Minjac Tannab*, which signifies the Oil of the Earth; because it breaks out of the Earth in the same manner as the *Naphtha*, which we know, and call *Petroleum*; or bursts out of the Rock, and runs into the adjacent Rivers. This Oil is so highly valued by the Barbarians, that the King of *Achin*, who is the most powerful of Death; so that the Inhabitants bring it off by Stealth from the Land, in the Dead of the Night, to ours, and the *English*

Ships that happen to be near their Shores. This Oil, rubbed on the Parts affected, relieves the Patient in a miraculous manner. It is also of a strong, but not a nauseous Smell.

But since this Disease belongs to the chronic Kind, no Medicines are so effectual against it as Decoctions of the Root of *China*, *Sarsaparilla*, and *Lignum Guaiacum*, which, by their gentle and friendly Heat, discuss those cold and thick Humours, and evacuate them by Sweat and Urine. We must, however, now-and-then interpose some gentle Cathartic. The best of this Kind is what we here prepare of an Extract of Aloes, and what is commonly called *Gutta Cambodia*, corruptly named by us *Gutta Gamba*.

Phlebotomy, is not allowed in this Case; for it is not a Plethora, but a *Kachochymia*, that is in Fault; and who is so ignorant as not to know, that the Blood is the Fountain of Heat, and the Treasure of Life?

The Reliques of this Disease are conveniently discussed by Venice Treacle, Mithridate, &c. and by Sudorifics, Diuretics, and such Medicines as strengthen the Nerves. Seasonable Exercise will assist Nature to overcome the other troublesome Attendants on this Disorder: *Bontius de Medicina Indorum*.

BERILLISTICA. A kind of pretended Magic Art, employed in observing preternatural Visions in Glass Mirrors, which are called *BERILLI*. *Rulandus*.

BERMUDIANA. This Plant takes its Name from the *Bermudas* Islands; from whence the Seeds of the first Species were brought.

The Characters are;

It hath lily Flowers, composed of six Petals, whose Em-palement becomes a triangular Fruit, which opens in three Parts, and is divided into three Cells, which are filled with round Seeds.

There are two Species of this Plant. *Miller's Dict.*

BERNA, or **BIRMINA**. These *Rulandus* explains by *Vac Vitreum*, a glazed Vessel.

BERNARDIA. This was so named by the late Dr. *William Houstoun*, in Honour of Dr. *Bernard de Jussieu*, Demonstrator of Plants in the Royal Garden at *Paris*.

The Characters are;

It is Male and Female in different Plants; the Male Plants produce small Karkins, which, when ripe, fall off; the Female Plants have a coccous petalous Flowers, which are succeeded by trilocous Fruits, resembling those of the *Ricinus*.

There are four Species of this Plant.

I know of no medicinal Virtues attributed to this Plant. *Miller's Dictionary*.

BERRIONIS. Colophony, Gum Juniper, or Vernice. *Rulandus*.

BERS. A sort of Electuary which the *Egyptians* make use of out of Gaiety, in order to raise a temporary Delirium; in which they probably take the same monstrous Satisfaction as the *Europeans* do in getting drunk. The Composition is thus:

Take of white Pepper, and of the Seeds of white Henbane, each twenty Drams; Opium, ten Drams; Indian Nard, Euphorbium, and Pellitory of Spain, each one Dram; and Saffron, five Drams. Reduce all these Ingredients to a fine Powder in a Marble Mortar, and make into an Electuary, with three Parts of pure Honey.

This Electuary is not to be used till it has stood six Months. It seems to differ very little from the *Philonium Romanum*, of which *Avicenna* has given us the Receipt; and the *Egyptians* find it from Experience to be possessed of the same Virtues and Efficacy, *Prosop. Alpin*.

BERULA, Offic. Chom. 539. *Sium*, Rivin. Irr. Pent. Dill. Cat. Giff. 142. *Sium erectum umbellatum, fructu Pastinaca aquatica*, Raii Hist. 1. 444. Merc. Bot. 1. 69. Rhyt. Brit. 114. *Sium fructu Apium palustre, foliis oblongis*, C. B. Pin. 154. Raii Synop. 3. 211. Rupp. Flor. Jen. 230. Tourn. Inst. 308. Elem. Bot. 258. Boerh. Ind. A. 55. Buxb. 305. *Sium fructu Apium palustre, foliis oblongis*, Bot. Monsp. 243. *Sium umbelliferum*, J. B. 3. 172. Chab. 173. *Sium medium*, Ejusd. 174. & J. B. 173. *Sium minus alterum*, Park. Theat. 1241. *Sium majus angustifolium*, Ger. Emac. 256. *Sium erectum, foliis serratis*, D. Doody. *Nasturtium aquaticum*, Ger. Icon. 200. UPRIGHT WATER PARSNIP.

It grows for the most part in moist and wet Places, and flowers in the Month of *June*. Its Leaves are only now in Use. It is esteemed an Antiscorbutic, and like the *Sium*, or Water-Parsnip, dissolves and evacuates the Stone, provokes Urine, and the Menstrues, expels the Foetus, and, if mixed with Food, is of Service in the Cure of Dysenteries. *Dale*.

BERYLLUS, Offic. Boet. 214. Calc. Mus. 221. Mont. Exot. 14. De Laet. 44. Aldrov. Mus. Metal. 952. Kenm. 47. *Berillus fructu Beryllus*, Charlt. Foss. 40. THE BERYLL. *Dale*.

This is a precious shining and transparent Stone, the Colour of which is commonly a Sea-green; but there are some of the Colour of Oil, or of Garlick, or Pale, or Yellow, or of the Colour

four of Gold: They call this last *Chrysoberillus*; that is to say, gilded Beryl. This Stone is found in the Mines in the Indies, in the Island of Zeylon.

It is good to stop Fluxes and Hemorrhages, being bruised and given inwardly; but it is seldom used in Medicine. *Lemery des Drogues*.

BERYTION, *Βερυτιον*. The Name of a Collyrium described by *Galen*, and recommended by him for Inflammations of the Eyes. It is also the Name of a Paffil, taken Notice of by the same Author, as good in Dysenteries.

BES. A Weight. It is Two Thirds of an Integer; generally of a Pound. Eight Ounces.

BESACHAR. A Fungus, or Sponge. *Rulandus*.

BESASA. *Βεσασα*. The *Ruta Sylvestris*, wild Rue.

BESLERIA. This Plant was named after *Basilus Besler*, an Apothecary at *Nuremberg*, who was the Author of a Book, intitled, *Hortus Eystetensis*.

The Characters are;

It hath a flower consisting of one Leaf, which is tubulous, and of an anomalous or perforated Figure, having two Lips; from whose Cup arises the Pointal, which is fixed like a Nail in the hinder Part of the Flower, which afterward becomes a soft, fleshy, oval-shap'd Fruit, in which are many small Seeds.

There are four Species of this Plant.

I know of no medicinal Virtues attributed to this Plant. *Miller's Dictionary*.

BESONNA. *Rulandus* explains this by *Muscarum Fungus*, I suppose he means a Sponge, which is the Nidus of some Sort of Flies.

BESSANEM. This, in *Avicenna*, signifies a Redness of the external Parts, resembling that which precedes the Leprosy. It occupies the Face and Extremities. This should seem to be what we call Chilblains.

BESTIA. Any sort of Beast.

BESTO. A Name, in *Oribasius*, for the *Saxifraga*, *Saxifraga*.

BETA. Beet. A well-known Plant.

There are two Species of Beets, of which the black Beet, and especially its Root, boiled with Lentils, is a powerful Binder; but the white Sort keeps the Belly in a right Temper; but both of them are of bad Juice, on account of their Nitrosity; by which Quality, however, their Juice, with Honey, infused into the Nostrils, purges the Head, and helps Pains in the Ears. The Decoction of the Roots and Leaves detergeth Scurf and Nits, and mitigates Chilblains, which are fomented therewith. The crude Leaves are applied by way of Cataplasm to the Alphi, which ought first to be rubb'd with Nitre; they also serve as a Cataplasm for an Alopecia, after the Place has been scrap'd, and for spreading Ulcers. Being boil'd, they cure Eruptions of Pimples, (*εξανθήματα*) Burns, and Erysipelas. *Dioscorides*, Lib. 2. Cap. 149.

There is another Sort of Beet call'd *Beta Sylvestris*, or the wild Beet; of which *Dioscorides* treats under the Appellation of *Limonium*.

BETA ALBA, Offic. Ger. Emac. 318. Raii Hist. 1. 204. *Beta*, Chab. 302. *Beta alba vel pallefcens, quæ Sicula & Cicla Officinarum*, Hist. Oxon. 2. 596. Boerh. Ind. A. 2. 94. *Beta communis alba*, Park. Parad. 489. Ger. 251. *Beta candida*, J. B. 2. 961. *Beta alba vel pallefcens, quæ Cicla Officinarum*, C. B. 118. Tourn. Inst. 502. **WHITE BEET**. Dale.

The Root of this Plant is large and thick, growing deep in the Ground, shooting out pretty large Leaves standing on long Foot-stalks, pretty broad, and roundish pointed, and somewhat crumpled, of a fleshy and insipid Taste. The Stalks are pretty thick and angular, growing to be two Foot high or more, branch'd and beset with the like Leaves, but smaller. The Flowers grow in Clusters, of a green Colour, small and chaffy. The Seed is hard and prickly. This is usually planted in Gardens; though we have a Species of Beet which grows wild in several Places by the Sea-side.

Beets are more used as a Pot-herb, and to eat with Salt-meat, than phyically. They loosen the Belly, and temperate hot cholerick Humours. The Juice of the Roots is sometimes used as an Errhine, being snuff'd up the Nose to clear the Head of Phlegm and mucous Humours, and by that means to help old Head-achs.

The Beet is one of the Five emollient Herbs. *Miller's Bot. Off.*

BETA RUBRA, Offic. Ger. 251. Emac. 318. Raii Hist. 1. 204. Chab. 302. J. B. 2. 961. *Beta rubra vulgaris*, C. B. 118. Hist. Oxon. 2. 596. Tourn. Inst. 502. *Beta communis rubra*, Park. Parad. 489. **RED BEET**. Dale.

This grows in all respects like the former, except that it is somewhat less, and the Leaves strait; and the whole Plant, Stalk, Leaves, and especially the Root, is of a deep-red or purple Colour. It grows with the former. Its Virtues and Uses the same.

The Root is more frequently employ'd to garnish Dishes, than to any medicinal Uses. *Miller's Bot. Off.*

BETLE, Offic. *Beile frue Betre*, Ger. 1357. Emac. 1541. *Betre*, *Beile*, *Betele*, *frue Bethle*, Park. Theat. 1615. *Betre frue Tembul*, C. B. Pin. 410. Jonst. Dendr. 172. C. Com. Flo. Mal. 60. *Beile frue Betelle*, J. B. 1. 437. Chab. 33. *Betele*, Bont. 91. *Beetla*, Codi, Hort. Mal. 7. 29. Tab. 15. *Piper longum, foliorum nervis decurrentibus tenuioribus & mollioribus*, *Beile dictum*, Hist. Oxon. 3. 603. *Bulatwala*, Herm. Mus. Zeyl. 34. **BETLE**.

This is a Plant of the scandent Kind, much celebrated in the *East-Indies*. The Leaves are principally in Use, which are esteemed best when fully ripe, and of a yellowish Colour; they are spoiled by being much handled when they are newly pulled from the Plant.

In the *Malacca* Islands, the *Beile* bears a kind of Fruit wreathed in the Form of a Lizard's Tail, which the Inhabitants of these Islands eat on account of its agreeable and grateful Taste. *Bontius* informs us, that it bears a Fruit resembling the white oblong Pepper, or rather the Tail of a Dormouse. This Fruit is, by the Inhabitants of the *Malacca* Islands, called *Sirii Boa*, and is had in much higher Esteem than the Leaves of the *Beile*. It is planted like Vines, and Props and Supports are erected for it to creep along. Some, for the sake of greater Profit, make it cling to the Trees which bear the Arcea, or *Indian Nut*, and thus form a beautiful Shade. It grows in all the Provinces of the *Indies* on the Sea Coasts, but not in midland Places, or such as lie remote from the Sea, unless it has been transplanted to them.

Most of the ancient Botanists confound the *Beile* with the *Malabathrum*, or *Indian Leaf*; but they are quite different Plants, since, according to *Garcias*, the latter is a strait Tree, whereas the former is of the scandent Kind, and stands in need of Supporters.

In the Morning, the Afternoon, the Evening, and the Night-time, the *Indians* chew the *Beile*, and carry it continually about in their Hands; but they do not use it alone upon account of its Bitterness, but wrap up the *Indian Nut*, and a little Lime, in the Leaf of the *Beile*, which they affirm to be a Mixture of a very grateful Taste. Others mix *Lycium* with the *Beile*. The Rich and Opulent use it with Camphire of *Borneo*, and some others with Aloes-wood, Musk, and Ambergrise. When thus prepar'd, it has so agreeable a Taste, and renders the Breath so sweet and fragrant, that the more wealthy of the Inhabitants chew it almost continually; and also others according to their Circumstances; tho' some chew the Arcea with Cinnamon or Cloves. These are the Circumstances, of which *Garcias* gives us an Account; but other Authors, who have travell'd themselves thro' the *Indies*, inform us, that both the rich and poor *Indians* constantly chew the Arcea alone, broken and wrapp'd up, with a little Lime, in the Leaves of the *Beile*, which sends forth so fragrant a Smell, as to fill the whole Room. Upon spitting out the first Juice, which some retain, it appears bloody, which Colour it receives from the Arcea, and not from the *Beile*. Then they take successively more Leaves, prepar'd in the same manner. Unless the *Indians* us'd this Practice, their Breaths would have a disagreeable Smell. *Bontius* asserts, that the Leaves of the *Beile*, us'd without the above-mentioned Substances, which is frequently done, corrode the Teeth, and sometimes make them drop out. In the *Indies* I myself have known young Men, not exceeding twenty-five Years of Age, entirely deprived of their Teeth, by a frequent Use of the Leaves of the *Beile*.

When they take their Leave of any one, 'tis customary to make him a Present of a filken Purse full of those Leaves thus prepar'd; and no one allows his Friend to part from him without a *Beile*, which, with them, is the Sign of taking Leave.

When they make their Addresses to the Great and Opulent, they use to chew the *Beile*, in order to give them an agreeable Breath; for, with them, not to have a perfum'd Breath, is an unpardonable Transgression of the Laws of Decorum and good Manners; and when People of a low Condition are oblig'd to converse with the Great and Opulent, they put their Hands on their Mouths, lest, perhaps, a Gust of their disagreeable Breath should prove offensive to the Nostrils of their Betters. When their Women have Business of a certain kind to transact with Men, they chew the *Beile* previously, imagining that it is an Incitement to Wantonness: Hence, when they pay their Visits, and mutual Compliments, they always have the *Beile* in their Hands; and it is every-where presented with the greatest Demonstrations of Benevolence, along with Arcea and Lime, in a wooden Vessel kept on purpose. They chew it principally after Dinner, in order to prevent Uneasiness at their Stomachs.

They sometimes use to abstain from it, when performing the funeral Rites of their near Relations, and on certain Days set apart for fasting.

It strengthens the Gums, corroborates the Heart and Stomach, dissolves Flatulences, and purges the Stomach and Brain; if chew'd in the Morning, immediately after Breakfast, it renders the Breath agreeable, but blackens the Teeth, and, according to *Bontius*, not only corrodes, but makes them fall out.

The

B E T

The Portuguese Women imitate the Indians in this Particular, and are so excessively fond of chewing the *Betle*, that they think they cannot live without it. *Raii Histor. Plantar.*

BETONICA. Offic. Ger. 557. Emac. 714. Raii Hist. 1. 550. Synop. 3. 238. Mer. Pin. 15. Rivin. Irr. Mon. Dill. Cat. Giff. 126. *Betonica vulgaris*, Merc. Bot. 1. 23. Phyt. Brit. 15. *Betonica purpurea*, C. B. Pin. 235. Tourn. Inst. 202. Elem. Bot. 172. Boerh. Ind. A. 154. Rupp. Flor. Jen. 136. Buxb. 37. *Betonica vulgaris purpurea*, J. B. 3. 301. *Betonica vulgarior, flore purpureo*, Park. Theat. 614. *Betonica sive Vetonica*, Chab. 431. **WOOD BETONY.** Dale.

The Root of *Betony* is pretty thick at the Head; whence it sends out a great Number of small Fibres, of an unpleasant nauseous Taste. The Leaves grow on pretty long Foot-stalks, somewhat wrinkled, rough and hairy; full of Veins; broader at Bottom than at the End, which is blunt-pointed; they are roundly indented about the Edges. The Stalk is four-square; about a Foot or more high, with very few Joints; at each of which stand two Leaves, one opposite to the other, on short Foot-stalks. The Flowers grow in Spikes on the Tops of the Stalks, *verticillatim*, or whorle-fashion, two small Leaves being placed under each Whorle: they are of a red purplish Colour, of one single Flower, having a round Galea, and a *Labella* divided into three Parts, each growing in a rough five-pointed Calyx, in which, after the Flowers are past, grow four small Seeds.

Betony grows in Woods and Thickets, and by Hedge-sides, and flowers in May and June. The Leaves and Flowers are used.

Betony is a good cephalic, hepatic, and vulnerary Plant, of so great Esteem among the Antients, that *Antonius Musa*, Physician to *Augustus Caesar*, wrote a whole Treatise concerning it. It is very good in Pains of the Head, Convulsions, and nervine Affections. The dried Leaves, cut and mix'd with Tobacco, are frequently smok'd for the Head-ach, Vertigo, and sore Eyes. Mix'd with Wood-sage and Ground-pine, it makes a good Diet-drink for the Gout and rheumatic Pains. The fresh Leaves, bruise'd, are good for green Wounds, and to draw out Splinters.

The only official Preparation from this Herb is the *Emplastrum de Betonica*. *Miller's Bot. Off.*

The Leaves of this Plant have an herby Taste, are a little saltish and aromatic, and give no Tincture of red to the blue Paper. The Flowers and Roots, which are very bitter, stain it very little. The *Betony* is full of Sulphur, mix'd with a little oily, volatile Salt and Earth.

By the chymical Analysis it affords a great deal of Oil, a little Earth, and fix'd Salt; no concreted volatile Salt, but a little urinous Spirit.

The *Betony* is vulnerary, aperitive, diuretic, sweetening, good for the Diseases of the Brain and lower Belly; a Tea of the Leaves is good for the Vapours, Sciatica, Gout, Pains in the Head, Jaundice, and Palsy: The Tisane of its Leaves, a cold Infusion of them in Water, the Conserve of its Flowers, the Syrup of the Flowers and Leaves, and the Juice and Extract of these Parts, have the same Virtues: They promote Expectoration, and bring away purulent Matter; they consolidate internal Ulcers, and remove Obstructions in the Bowels: A Sneezing Powder is made of the Leaves, and a vulnerary and cephalic Plaster is prepar'd with the Juice: The Roots have not the same Effect, but they purge both upwards and downwards. *Martyn's-Tournefort.*

A Decoction of *Herniaria* and *Betony* is commended for the Stone in the Kidneys and Bladder. Others advise a Decoction of *Betony* to stop a Flux of the Lochia after the Birth. The Surgeons mix it in their cephalic Cataplasms. They make a Plaster of the Leaves for Wounds, especially those of the Head. *Boerhaave.*

In the old Dispensatory of the College, a Conserve of the Flowers of *Betony* was directed, which is omitted in the present. Some Authors, however, have a very great Opinion of it.

EMPLASTRUM DE BETONICA: *Betony Plaster.*

Take of green *Betony*, Pimpinell, Agrimony, Sage, Pennyroyal, Yarrow, the lesser Centaury, and Clary, each six Ounces; of Frankincense and Mastich, each two Drains; of Orrice and round Birthwort, each six Drains; of Wax and Turpentine, each eight Ounces; of Resin of the Pine-tree, six Ounces; of Gum-elemi, and Oil of Firr, each two Ounces; of White-wine, three Pounds. Let the Herbs be well bruise'd in a Mortar, and stand in Maceration for a Week with the White-wine, and then stirred about and boil'd: When the Wine is press'd out, strain'd, and boil'd to the Consumption of a third Part, put to it the Oil of Firr, then the melted Wax, afterwards the Resin and Gums, and last of all the Turpentine. When these have had a gentle Boil, and been taken from the Fire, and near cooled, sift in it the Orrice and Birthwort in fine

B E Z

Powder, and stir them briskly together, so as to make into a Plaster, *S. A.*

This hath pass'd thro' all the Revises of our College with little or no Alteration, but is not in any other official Dispensatory that I have met with. It requires a good deal of Care and Trouble in the Composition; yet, as it is sometimes met with in Prescription, most of the Shops are at the Pains to keep it by them.

BETONICA AQUATICA. See SCROPHULARIA.

BETONICA PAULI. See VERONICA MAS.

Betula, Offic. C. B. Pin. 427. J. B. 1. 148. Raii Hist. 2. 1410. Synop. 3. 443. Chab. 60. Ger. 1205. Emac. 1478. Park. Theat. 1408. Tourn. Inst. 588. Elem. Bot. 460. Boerh. Ind. A. 2. 182. Dill. Cat. Giff. 42. Rupp. Flor. Jen. 265. Buxb. 38. Merc. Bot. 1. 23. Phyt. Brit. 15. Mer. Pin. 15. Jonsf. Dendr. 33. **THE BIRCH-TREE.** Dale.

BETULA.

This Tree grows to be tall and large, cover'd on the Outside with a whitish Bark, which it sheds yearly. It has a great Number of slender, tough, red Twigs, or small Branches, clothed with small, roundish, green Leaves, indented about the Edges; these are preceded by little scaly round Cones, which contain the Seed. It grows in Woods in divers Parts of the Land.

The Leaves of the Birch-tree are accounted good for the Dropsy, as also for the Itch, used both inwardly and outwardly. The Liquor that flows out of this Tree, bored with an Augre in the Spring, is accounted to be very good for the Stone and Gravel, and against bloody Urine, and the Strangury. The Wood makes good Fire-wood, and; next to Juniper, is prefer'd to burn in Times of Pestilence, and contagious Distempers. *Miller's Bot. Off.*

The Bark of the Birch-tree is very fine. *Tragus* says, that he has seen, in a Library at *Coire in Switzerland*, Verses written upon it; they use it to this Day to make Ropes for Wells: They affirm, that the Liquor which comes out of the Trunk of this Tree, after it has been pierced with an Augre in the Spring, is very aperitive, deterfive, and cosmetic; they ascribe the same Virtues to its depurated Juice, and distill'd Water. *Martyn's-Tournefort.*

BETULUS. A Tree; call'd also *OSTREYS*, which see.

BEX. B \acute{e} x, a Cough, is nothing else but a vehement Effluvia, in which a great Quantity of Breath, being hurry'd forth with vast Swiftnefs, attracts and pushes forward, by its Impetuosity, whatever obstructs its Passage; and, if it be too weak to expel the offensive Matter at the first Discharge, it fails not to renew its Effort even once and again. For the most part, it obtains its End; that is, whenever the Breath passes with a strong Current, and the obstructing Matter is dispos'd for Expulsion, as when it is neither of a watery nor viscous Substance. *Galen De Symp. Causis, Lib. 2. Cap. 4.*

The End of a Cough is to cleanse the Passage of the Breath. *Idem, in 6. Hipp. de Morb. vulg. Com. 5.* See TUSSES.

BEXUGO. This is the Root of the *Clematis Peruviana* of *Casp. Baubine*. It is purgative, taken in the Quantity of a Dram. The Indians prefer it to *Mecboacan*.

BEYA, in the alchymistical Jargon, is the *Aqua Mercurialis*, Mercurial Water, which is Wife to the *Gabriel*, or *Sulphur Philosophorum*, Sulphur of the Philosophers.

BEZOAR. *Avenzoar* is the first who mentions *Bezoar* as us'd by way of Medicine, or gives its History. He says, that is best which is found in the East, near the Eyes of Stags. But that which has gone under that Name in these latter Centuries, is, according to the best Accounts, always found in the Stomach, or rather Omasum, of the Cervicapra.

This is originally a *Persian* Word, namely, *Badzcher*, or *Bazcher*, which, in that Language, signifies no more than any Substance intended to prevent the fatal Effects of Poison; and the *Persians* us'd the Word in the same Sense in which the *Greeks* us'd the Word *Antidote*; whether that Antidote was a simple or a compound Medicine. But the Word came afterwards to be peculiarly appropriated to that Species of Stone, which, by a Corruption of the *Persian* Word, we now call *Bezoar*. Some *Arabian* Authors have asserted, that this Stone was only to be found in Mines; and others, that it was to be met with in the Heads of certain Serpents: But the most judicious Authors of that Nation have given an Account, which has since been confirm'd by the Relations of several Travellers, which is, that this Stone is found in the Corners of the Eyes of such Stags as have eat Serpents; where, growing gradually bigger, by the Formation of one Crust above another, it at last acquires such a Weight, as to drop off of its own accord, and is found in the sandy Grounds of *China* and *Tibet*. If applied to Wounds, occasion'd by the Bites of venomous Animals, it extracts the Poison lodg'd in them; for, as soon as it comes into Contact with a Wound of this kind, it adheres to it of its own accord; and, after having absorb'd as much of the Poison as it can contain, it discharges its venomous Contents in the Water in which it is immersed. After which it is to be apply'd

apply'd afresh to the Wound, to which it adheres 'till it has produc'd its design'd Effect, and brought about a thorough Cure. *Herbelot Bibliothéque Orientale.*

Mr. *Herbelot* seems to give too much Credit to this Oriental Account of the Production and Virtues of *Bezoar*, which is fabulous.

Bezoar is nothing else but a Stone form'd by the Gall of several Species of Animals, found in the *East* and *West-Indies*, such as Goats, Hogs, Apes, &c. The Virtues of the *Bezoar* consist in the volatile alkaline Salts of which 'tis compos'd, since 'tis, in reality, nothing but the Bile of these Animals. 'Tis by means of these volatile alkaline Salts that it destroys Acids, and promotes Transpiration. We have no Occasion to go far in quest of *Bezoar* Stones, since all Stones, form'd by the Gall of any Animal whatever, are such, tho' their Activity and Virtues differ according to the different Animals from which they are taken, and the different Climates in which these Animals live. The *Bezoar* Stone is also sometimes found in other Parts of these Animals besides the Gall-bladder. *Hist. de l'Acad. A. 1703.*

There are several Medicines us'd in the Practice of Physic, with regard to the Origin and true Account of which, we *Europeans* are still pretty much in the Dark: They sometimes pass thro' so many different Hands before they arrive at ours, that 'tis no easy Task to form a true Judgment of their Natures and Compositions.

Merchants, who deal in Commodities of this kind, very often know no more than the Name of the Medicines, and are more intent upon making Profit by their Sale, than enriching their Minds with a Knowledge of their Origin and Qualities. Travellers, on the other hand, have not always an Opportunity of procuring the Evidence of their Senses, in Cases of this Nature; they often rely on the Relations of others, with regard to Things they themselves have not seen. In Matters therefore of this kind, an accurate and minute Examination of any Substance is sometimes of more Use and Importance, than a great many Accounts and Relations concerning it. This Consideration induc'd me to undertake a very careful Examination of the several Substances call'd *Bezoar*, a Name given to a particular Species of Stones found in the Bodies of certain Animals. Some affirm, that the Name *Bezoar* comes originally from the *Persian* Word *Bazar* or *Pazan*, which signifies Dung or Dirt; others maintain, that it is deriv'd from the *Hebrew* or *Chaldean* Word *Belu-zaar*, which means a Medicine against Poisons.

The first Stones known under the Name of *Bezoar* were imported from the Eastern Nations; but, since the Discovery of *America*, we have had some brought to us, which resembling the former both in the Conformation of their Parts, and their medicinal Virtues, have been also call'd *Bezoars*, only with this Difference, that what comes from the *Levant* is call'd *Oriental Bezoar*, and what is imported from *America* receives the Name of *Occidental Bezoar*. There are also other stony Concretions taken from Animals, which are dispos'd in *Strata*, and have been call'd *Bezoars*; but these have been distinguish'd by the Names of the particular Animals from which they happen to be taken; such, for Instance, are the *Bezoar* of the Ape, and that of the *Cayman*. Some, taking the Word *Bezoar* for a general Name, signifying any Medicine against Poison, have applied it, without Distinction, to every Substance of that Nature: So that the Name *Bezoar* has been affix'd to chymical Preparations, such as the *Mineral* and *Jovial Bezoars*: With others, a Powder of the Heart and Liver of Vipers has been styl'd *Bezoar*. The Name *Bezoar*, or rather the Epithet *Bezoardic*, has also been bestowed upon some Powders, or artificial Stones, in which the *Bezoar* is an Ingredient; such as the *Countess of Kent's Powder*, and the *Goa Stone*.

Some People, observing that *Bezoar* was dispos'd in *Strata*, have given the same Name, and ascrib'd the same medicinal Qualities, to a Stone resembling it in the Conformation of its Parts, and which is found in several Parts of the Earth in *America*. *Bezoars* of this kind are to be found in *Italy*, in *Sicily*, and even in several Parts of *France*, but especially in *Languedoc*.

These are, in general, the several Substances known under the Name of *Bezoar*; but, strictly speaking, *Bezoar* is a Substance of a stony Nature, extracted from some Animal, compos'd of several *Strata* or Layers, like those of Onions, and which possesses a certain Quality, by means of which it resists Poisons. The two principal Species of this Medicine are, as we have already said, the *Oriental* and the *Occidental Bezoars*. We have not, as yet, arriv'd at an absolute Certainty what particular Animals produce these two different Species, because, 'tis possible, People may have said concerning both, what was only true of one of the Species: Only this much we know in general, that this Stone is form'd in the Stomach of a certain wild Goat, which brouses upon aromatic Plants. If we may give Credit to *Tavernier*, there are several of these Stones to be found in one and the same Animal, the Truth of which, he says, we discover by the Touch. These Stones are of different Shapes and Sizes: Some of them are of the Form of a Kidney, or *French Bean*; others are round, oblong, and of an irregular

Vol. I.

Figure. Each Stone of this kind is compos'd of several Laminæ, form'd of a greenish or olive-colour'd Substance, diversify'd with white Streaks, which run thro' the whole Body of the Stone. These Laminæ adhere so closely to one another, that, upon breaking the Stone, we may observe several Layers of different Thicknesses, and even sometimes of different Colours. There are also found Laminæ, which, upon breaking these Stones, disengage, and separate themselves very regularly from each other; which they also do when a considerable Degree of Heat is apply'd to them. The Substance which possesses the Middle or Centre of these *Bezoars*, is usually hard, gravelly, and pretty smooth. The *Bezoardic* Layers, which cover this Substance, are easily broken between the Teeth, to which they adhere like a gently glutinous Substance, and tinge the Saliva a little.

Upon burning some of these Layers, I found that they were easily inflammable, and contain'd a volatile Salt and an Oil. The Matter which remain'd after their being burn'd, resembled the *Caput Mortuum* which remains in the Retort after the Distillation of animal Substances. These Stones are smooth on their Surfaces, but sometimes, on certain Parts, are rough and unpolish'd, like Shagreen. They are pretty tender, and, if apply'd with a considerable Degree of Force to Paper, rubb'd over with Chalk, White-lead, or Lime, they wear away, and tinge the Paper, thus prepared, with a yellow, greenish, or olive Colour, leaving some Part of their Substance upon the Chalk, White-lead, or Lime. I steep'd two of these Stones in cold Liquor, the one in Water, the other in Spirit of Wine, for twelve Hours, without any apparent Change or Alteration being produced in them. I left the same Stone in the Water for some Days, during which Time there was so very small a Quantity of Matter separated from it, as only render'd the Water gently turbid; the Water and Spirit of Wine had nevertheless penetrated both the Stones.

Among the great Number of *Bezoar* Stones I have broken for the sake of Examination, I have found many, in the Middles of which, agreeably to the Accounts of some Authors, there were Straws, Hairs, Marcassites, Flints, and gravelly Concretions, as much compacted, and as hard, as the Stones themselves. In some of them I have also found Talc, Wood, Stones almost resembling those of Cherries, Stones of Myrabalan, and Fragments of the Stones of other Fruits. In some I have also found a Sort of Cassia-nuts and Kidney-beans, included in a Coat or Membrane, the external Surface of which was indurated by the Matter of which the *Bezoar* is form'd, and in which the proper Membrane was shrivell'd up, and become dry. In others I have found the first Covering waisted; and the entire Stones, upon being struck, founded like Eagle-stones. I have endeavour'd to prick one of these Stones with a red-hot Needle, in order to discover whether it was genuine or not; but the Needle did not prick them, and only left a brownish Mark where it touch'd them; which Method some Authors have proposed as the most effectual for distinguishing the good from the counterfeit, assuring us at the same time, that those in which the Kidney-beans were found, are counterfeited by the Inhabitants of the several Countries from which this Commodity is imported.

These Authors, therefore, advise us to make Choice of the *Bezoar* Stones which are of a moderate Bulk, of a brownish Colour, and which communicate a yellow Colour to Quicklime, a greenish one to Chalk, and which cannot be dissolv'd in Water. If prick'd with a hot Iron, no Bubbles ought to arise round the Iron, which is a Proof, that it is not adulterated with any Rosins. The Laminæ also must be fine, and dispos'd in *Strata*. The best Species of these Stones are taken from Animals that feed on large Mountains, such as those of *Persia*. After all, it appears to me a hard Task to counterfeit *Bezoar*; and any one who has been in the least conversant in this Commodity, may by his Sight only, as well as by the other Marks I have laid down, discover the Imposture; for, if it was counterfeited with Plaster, or any other Substance of a similar Nature, it would neither undergo a Change by means of Fire nor Water, nor convey its Colour to Lime; nor, in a word, would it be able to stand all the several Methods of Proof for distinguishing the genuine from the counterfeit.

Nor is it credible, that, in order to counterfeit it, People should be at the Pains to seek for all those different Materials, which serve as a Ground-work for the Laminæ; or Beds of which 'tis compos'd; since, without so much Ceremony, they have only Occasion to begin it upon a small Ball of the same Matter, which, in all Probability, is not very scarce.

I am of Opinion, that the Substances included in the *Bezoar* Stones discover to us the precise Manner in which they are form'd, as *Tavernier* observes, who says, that these Stones are form'd around the small Buds or Tops of the Branches of a certain Plant. Those Buds of *Tavernier* may possibly be the same with the Kidney-beans mention'd by *Morand*, and which I myself have observed. These solid and indigestible Bodies, remaining in the Stomachs of these Animals, irritate their Glands; and the thick Lymph which these Glands discharge, together

with the Menstruum of the Stomach, which is impregnated with the Juice of the aromatic Plants, upon which they feed, form those regular, smooth, and beautiful Layers, which Art would in vain attempt to imitate; and I have even observ'd, that whatever Substance was lodg'd in the Centre of these Stones, the Strata were so fine, and so well dispos'd, that the external Figures of the Stones bear a Resemblance to that of the Substance lodged within them.

If, for Example, a Piece of Straw be the Ground-work, the Stone form'd upon it will be long; if it is a Piece of Flint, the Stone will preserve the same Figure; and, if a Kidney-bean, we may observe externally the Radicle, and the Line which separates the two Lobes of the Bean. In short, from the Form and Weight of these Stones, we are enabled to judge effectually of the particular Substances on which they are form'd. Thus, as in a Commodity so precious as *Bezoar*, we are not allowed to break each Stone, we must therefore trust to the Touch and Sight, after having try'd our Experiments upon some of the most suspicious ones. By the Sight we are enabled at once to form a Judgment of the Colour, which ought to be neither too pale nor too deep. Secondly, we are to judge of it from the Fineness of the Grain, and the Texture being so smooth and close, that the several Laminæ are not easily separated from each other. We must also take care to choose those which are of a regular Figure; that, for Instance, of a Kidney, a Bird's-egg, or some other similar Form. By the Touch we may also judge of the Substance included in the *Bezoar*, since the Weight or Lightness will determine that Point very well. If, for Instance, the Stone is heavy, the Ground-work, or Substance on which it is form'd, will be a Portion of Flint, possessing the greater Part of the Stone. If, on the other hand, the Stone is light, it will either be hollow internally, or include only some light Substance, such as a Collection of Hairs, or some of the vegetable Substances I have already mentioned. The Stones which found upon being struck, probably have, for their Groundwork, some Fruit, which, either becoming dry, shrinks up into a smaller Bulk than it at first had, or else is putrefied, and reduc'd to a Powder which some Authors esteem very much.

I have observ'd also, that when the *Bezoar* Stones are of the Shape and Form of a Kidney, feel light, and yield a Sound, a Kidney-bean is ordinarily the Substance on which they are form'd. There are others of these Stones which are also light, of a round and somewhat flat Figure. These, upon Trial, I found contain'd a round and flat Fruit, almost of the Figure of a Cassia-nut. Besides, tho' these *Bezoars* should include hard Stones of Fruit, (Instances of which have been met with) or even Portions of Wood, yet still their Lightness renders them preferable, provided the *Bezoardic* Matter bears the other Proofs, to those form'd upon Flints, and which are much more heavy.

For answering its common Intentions in Physic, the Method of preparing *Bezoar* is, to reduce it to a fine Powder, whether with a View to be taken in Substance, or to serve as an Ingredient in some other Compositions; provided we remember to pulverize only the *Bezoardic* Part, and to separate all adventitious Substances, especially Flints, and other Things which have none of the Qualities of *Bezoar*, and which are lodg'd in them.

The Sentiments of People are strangely divided with regard to the Animals which produce the *Oriental* and *Occidental Bezoars*: But it appears, that the *Oriental Bezoar*, which is brought to us from *Egypt* and *Persia*, the *East-Indies* and *China*, is produc'd by a Species of wild Goat, which the *Persians* call *Pazan*, and which is larger than ordinary, swift as a Deer, and has Horns reclining on its Back; for which Reason *Clusius* calls it *Capricerva*, and which is thus distinguish'd:

Capra sive Gazella Bezoardica Orientalis, Offic. *Gazella Indica*, cornibus rectis, longissimis nigris, prope Caput tantum annulatis, Raii Synop. A. 79. *Capricerva Orientalis*, à qua *Lapis Bezoar Orientalis*, Schrod. 5. 277. *Capra sive Hircus Bezoarticus*, Aldrov. de Quad. Bisul. 755. *Capra sive Hircus Bezoarticus vel potius Pazaharticus*, Jons. de Quad. 56. *Hircus Bezoarticus*, Charlt. Exer. 11. THE BEZOAR GOAT.

That Species of *Bezoar* which is imported from *America*, is produc'd by a Goat, which differs little or none at all from the former, except with regard to its Horns. It is thus distinguish'd:

Cervus minor Americanus Bezoarticus, Offic. *Capricerva Occidentalis*, Schrod. 5. 278. *Maxama seu Cervus*, Hern. 324. *Caguacu-ete*, Marcg. 235. *Caguacu-apara*, Ejsid. *Sive mas & femina*, Raii Synop. A. 90. Pis. (edit 1658) 98, THE LESSER AMERICAN DEER.

Pomet describes the *Oriental Bezoar* Goat thus, from *M. du Renou*: It is a very active Animal, says he, that skips from Rock to Rock, at his Ease, and is very fierce, so that when he is closely pursued, he sometimes kills the *Indian* Hunters. The Hoof, or Claws of his Feet, are divided neither more or less than the Goat's; the Legs are pretty thick, the Tail short and turn'd up; the Body hairy, as that of the He-goat, but shorter, and of an Ash-colour, inclining to Red, or rather of

the Colour of the Hind's Belly; the Head is shap'd like the Goat, and arm'd with two black Horns, jagged at the lower Part, and turn'd backwards.

The great Variety of Opinions advanc'd by different Authors, with regard to the Name and Shape of this Animal, induce me to believe, that there are several Species of Animals in which these Stones are found, and that each Author has describ'd the particular Species which he has had an Opportunity of seeing. This Reason may also account for the different Colours of *Bezoar*.

The *Occidental Bezoar* is easily known from its being of a paler Colour: It is sometimes of a Greyish-white, and is form'd on Substances of the same kind with the *Oriental*. Its Laminæ are also sometimes thicker and striated according to their Thickness.

The fossil *Bezoars* are Species of Stones, form'd by Strata or Beds, and in Figure resemble the animal *Bezoar*. They are ordinarily of a grey-whitish Colour: Their Strata are pretty minute; they have no Smell; and are used in the same Disorders for which the other *Bezoars* are thought proper. *America* supplies us with large Quantities of these *Bezoars*, and they are also to be found in *Italy*, and several Parts of *France*. Mineral *Bezoar* is thus distinguish'd:

BEZOAR MINERALE, Terra Sicula; *Bezoardicum Minerale*, Mont. Ind. Exot. 14. *Bezoar Minerale*, Aldrov. Mus. Metall. 805. *Lapis Bezoar Minerale Siculus*, Bocc. Obs. Ed. Ital. 379. *Lapis Bezoar Siculus albus*, *Orientali fragilior*, Cup. Hort. Cath. Supp. 1. 246. *Lapis Bezoar fossilis*, Geoff. Prælect. 69. De Laet. de Lap. 114. *Belzuar Mineralis Siciliana*, Bocc. Mus. di Fisica 55. MINERAL BEZOAR, or SICILIAN EARTH.

There are some other Substances, which, from the Manner of their Production, are called *Bezoar*. Thus there are the BEZOAR GERMANICUM. German *Bezoar*. See EGAGROPILA.

BEZOAR HYSTRICINUM. See HYSTRIX.

BEZOAR MICROCOSMI, is the human Calculus.

BEZOAR SIMIÆ. See SIMIA.

Those who have written upon *Bezoars*, and amongst others *Caspar Bauhin*, have comprehended under that Name a great many Substances which have not the least Affinity to *Bezoar*, which must undoubtedly introduce Disorder and Confusion into natural History. If then we were to range into a proper Order all the Substances which can come properly under the Denomination of *Bezoar*, I think we might very properly reduce them to five Classes.

The first of which should contain the true *Bezoars*, which are the *Oriental* and *Occidental*.

The second should comprehend all Stones extracted from Animals, which approach to the *Bezoar* in the Conformation of their Parts, or their Qualities; such as the *Bezoar* of the *Apé*, that of the *Cayman*, and even the various Species of Pearls and Crabs-eyes.

In the third Class should be ranked the several Species of fossil *Bezoars*.

In the fourth should be placed those Substances which are shaped like *Bezoar*, without having its Virtues; such as the Stones found in the human Bladder, Kidneys, and Gall-bladder; as also those that are found in the Gall-bladders of Oxen, or other Animals.

In the fifth and last Class should be ranged the *Egagropila*, which are a Species of Balls of different Figures, and very light, formed by a Collection of Hairs and Fibres of Plants, which the Animals, in whose Stomachs they were lodg'd could not digest. These Fibres and Hairs are at last so interwoven with one another, as to form one Body, which resembles a Ball of Felt like that employed in making coarse Hats. Some of these are found covered with a very fine Crust of *Bezoar*. They are ordinarily found in the first Ventricle of all ruminating Animals, or in the Stomach of such as do not ruminate; such are the Stones found in the wild Porcupine, and other Balls of Hair found in Goats, Oxen, Cows, and other Animals. *Mem. de l'Acad. R.* 1710.

In a subsequent Memoir Mr. *Gouffroy*, continuing the Subject of *Bezoar*, proceeds thus:

I have already observ'd, that there was almost always some kind of Substance, round which the *bezoardic* Strata are form'd and dispos'd; and this Circumstance has to me appear'd a Mark, that these Stones were not counterfeit'd, since any one that would attempt to counterfeit them, would not, in all Probability, be at the Pains of collecting so great a Variety of Materials as are generally found in these Substances, which are the Bases or Ground-works of different *Bezoar*-stones.

The fossil *Bezoar* is also form'd in the same manner. *Boccone* has in them observ'd Fruit stones of various Sorts; Flints, Gravel-stones, Wood, Metal, Coal, and other Substances. I examined some of these commonly called *Priapalites*, which are found in *Languedoc*; and I had one of this Kind given me by Mr. *Ben*, in the Heart of which there was a Piece of Rock-crystal.

Among

Among the several Substances found in the animal Bezoar-stones, I have observed one, which, to me, appeared very like the Cassia-nut, or a Tamarind-stone, though smaller. However, I have since found, that it might possibly be the Seed of a certain Pod, which I had not then seen, and which resembles the Seed of the Pod produced by the true *Egyptian Acacia*, which grows in *Egypt*, in *Arabia*, and in several other Places. This Pod is imported to us from *Senegal*, and is three Inches or three Inches and an half long, and nine or ten Lines in Circumference. It is composed of two Membranes, one external, and another internal. The external Membrane is very tender, of a brownish Colour, and adheres to the internal one, which is cartilaginous, and very slender. The Substance which unites them is of a gummy Nature, of a yellowish transparent Colour, melts in the Mouth, and is of a very bitter Taste. In the longest of these Pods I have found eight Seeds, separated from each other by a sort of Coat, which unites the two Sides of the internal Membrane. Every Cavity of these Pods contains a flat Seed, resembling that of a Lupin, sometimes exactly circular, and sometimes a little compressed by the Coats joining the two Membranes of the Pods, which are more contracted in the Middle than towards the Extremities; so that the Seeds in the Middle of the Pod are a little compressed; and those at its Extremities perfectly round.

What made me suspect, that these Seeds were the same I had observed in the Hearts of the Bezoar, which are round, and a little flat, is, that in both I have found the same Marks, and among others a whitish circular Line drawn on every Surface of each Seed, resembling that found on the Substance included in the Bezoar. I put some of these Seeds into Water, where they swell'd almost in the same manner they were found to do in the Stomach of the Animal, when they were beginning to have the bezoardic Matter form'd upon them. The Tincture I extracted from these Seeds was of a red Colour, a very bitter Taste, and, upon the Addition of a little Vitriol, became black. In the Countries where these Pods and Seeds are produced, the Inhabitants use them for tanning Leather. From a Decoction of them in Water, there is a Juice extracted, which, when inspissated, is imported to us under the Name of the Juice of *Acacia*. Some also assert, that what we call the Gum Arabic, or Gum *Senegal*, flows from this Tree. Is there then any Probability, that the Persons who are said to counterfeit the Bezoar, should be at the Pains, among other things, to seek for the Fruit of the *Acacia* as the Stamina or Ground-works of their Compositions? Or is it not more probable, that this Fruit, and some others used for the Pasturage of Cattle, by their astringent Qualities, produce an Inspissation of the Juices in the Stomachs of those Animals, which feed most commonly on them, and that in Consequence of this Inspissation the Bezoar-stones are form'd?

This then is the Manner in which these Stones are form'd in the Stomachs of the several Animals which produce them. Several of them may be found in the Stomach of one and the same Animal; and *Tavernier* tells us expressly, that six of these Goats, which he received as a Present, had among them all seventeen Bezoars, which might have been felt and number'd by touching their Stomachs externally; and that this Circumstance augmented the Price of the Animals, in proportion to the Number of Stones discover'd. This Account agrees entirely with that given by *Clusius* of the Animal which produces the Occidental Bezoar. He says, that a Friend of his at *Peru*, who first discover'd the Occidental Bezoar, having a Mind to know how these Stones were formed in the Bodies of those Animals, dissected one of them, in whose Stomach he found a kind of Cyflis, in which these Stones were ranged and disposed in the same manner with the Buttons of a Coat.

This Account given by these two Authors is directly opposite to that given by *Pomet*, who asserts, that there is only one Bezoar found in the Stomach of each Animal. He assures us, at the same time, that he would not dare to contradict the Authors who have written on this Subject, if he had not had in his Custody a Piece sufficient to justify his Opinion. It will not be improper to inquire a little more minutely into this Fact, since nobody, so far as I know, has as yet animadverted publicly on this Error of *Pomet's*, with regard to his pretended Coat of the animal Bezoar, which he asserts to be one of the greatest Curiosities the Virtuosi of *France* have seen for a long time.

In that Part of his Treatise of Drugs, which relates to Animals, he gives the following Account of it.

"This Coat," says he, "is as large as a Goose's Egg, covered over externally with a rough, short, and yellowish-coloured Hair. Upon cutting it, the first thing that occurs, is a thin brown Shell, which serves as a Cover to another white one, as hard as a Bone, in which the Stone called Bezoar is contained."

Now this extraordinary Coat in which the Bezoar is wrapt up, and which he pretends to have discover'd, is by no means any Part of the Animal which produces the Bezoar, but an exotic Fruit, in which either *Pomet* himself, or some wanton Impostor, by whom he has allowed himself to be deceiv'd, has dexterously fitted the Bezoar. 'Tis only a Year since I detected

this Piece of Fraud; for when I was examining this Curiosity of the late Mr. *Pomet's*, along with Mr. *Vaillant*, and Mr. *De Jussieu*, we perceived that this pretended Coat could not possibly be a Part of any Animal, but rather some little known Fruit; which Conjecture was afterwards confirmed by Mr. *Vaillant*, who, happening to have some Fruit of the same Kind, found no Difficulty to make of their Coats Bezoars exactly like that so much valued by *Pomet*. This Fruit is produced by a sort of Palm-tree, described by *John Baubine* under the Name of *Palma Cuciofera*. This Fruit is also described by *Theophrastus*, and the Tree itself grows in *Egypt*, *Nubia*, and *Ethiopia*. *Cordus* calls it the *Nux Indica minor*, and has given the same Description of it which *Pomet* has given of the Coat of the Bezoar. *Pomet* has omitted only one Particularity of this Description, which is the Skin which covers the Whole of the Fruit, and is of a yellow tawny Colour. The Fruit itself has a Pedicle divided into six Parts; three of which are large, and three small. These Circumstances were sufficient to deceive Mr. *Pomet*, and others with him; but a careful Detection of Frauds of this Kind must contribute considerably to the Perfection of natural History. *Memoires de l'Acad. Royale de Sciences*, A. 1712.

Mr. *Geoffroy* the younger exhibited to the Academy a Bezoar of a very singular Kind. It is a Stone irregularly round, three Inches and three Lines in its greatest Length, and two Inches and an half where it is shortest. It weighs only five Ounces, and is of a greenish-yellow Colour. It was found in the Gall-bladder of a Land-tortoise in the Island of *Bourbon*. Mr. *De Jussieu* has one of the same Sort, but more flat, an Inch thick, and as large as the Palm of a Person's Hand. They are both disposed in Strata like all other Bezoars. From this we see, that stony Concretions may be formed in all the Cavities of the Bodies of every Species of Animals. *Hist. de l'Acad. Roy. de Scienc.*

Schroder says, that Bezoars are alexipharmic, and Promoters of Sweat; that they are good in Epilepsies, Palpitations of the Heart, Jaundice, Dysenteries, Stone, and Obstructions of the Menes; as also that they cure Melancholy, and forward Delivery; and in these important Intentions he assigns the Dose from three Grains to twelve. But we have no Instances from Experience to support any such Practice. They have neither Smell nor Taste; and upon taking into the Stomach, give no Sensation, nor produce the least perceivable Effect, which is Ground enough to suspect them good for nothing; although our Physicians prescribe them in much larger Doses than what *Schroder* mentions; and others have ventur'd half a Dram or a Dram at a time. The Shops use it only in the *Pulvis à Chelis compositus*, commonly called Gascoign's Powder, which, tho' it is a dear Medicine, seems to be of no Virtue as an Alexipharmic; yet as it has often been join'd in Prescription with some Alexipharmics of Efficacy, it has the Credit, amongst the Ignorant, of doing what it never had any Share in. *Quincy*.

Many Circumstances contribute to render the medicinal Virtues of Bezoar precarious, and not easy to be determin'd; as the Uncertainty of procuring that which is genuine, it being much adulterated; as is said, even in the *Indies*, not to mention the large Quantities that are made in *Europe* in Imitation of the true. Again, the excessive Price it generally bears, makes it inconvenient to exhibit it in a great Number of Cases, and that in sufficient Quantities, and those long enough continu'd, to determine, whether the Virtues attributed to it are real or imaginary; and, without this Test, it is not possible to reason accurately and conclusively with respect to the Efficacy of any one Simple, tho' the Manner of its Production, and the Analysis, are both taken into Consideration; neither does the Taste give us any surer Information, notwithstanding the above-quoted Remark of *Quincy*.

As to my own private Opinion, it is of no great Importance in the Case before us, because I have very seldom directed it, and consequently am not a Judge of its real Effects: But I am informed, from Physicians who have industriously attempted to make the proper Experiments, that it has no sort of medicinal Virtues, that they could perceive, which might give it the Preference to the Testaceous Powders. I cannot, however, forbear thinking, that if we had the genuine Bezoar Stone, we should find it endow'd with greater medicinal Virtues, than at present we have any Reason to believe it possessed of.

That Species of Bezoar call'd by the *Dutch Pedro de Porco*, and by the *Portuguese*, who first imported it into *Europe*, *Pedro de Vassar*, is found in the Gall-bladders of certain wild Boars in the *Indies*. It is not much larger than a Filbert of a moderate Size, which it resembles pretty much in Shape, tho' 'tis more irregular. It is not always of one and the same Colour, tho' generally it approaches to that of *Toulon Soap*, which is a Greenish-white. Its Surface is as it were polish'd, and smooth to the Touch.

When any of these Bezoars are imported to *Amsterdam*, (the Number of which brought home in the richest loaded *East-India Ships* rarely exceeds five or six) they are purchased at three or four hundred *Livres* each, and sometimes more; not by the Merchants, with a View to profit, but by the more opulent

Burgbers,

B E Z

Burghers, either for Presents to Persons of Distinction, or in order to be preserv'd as a Treasure in their Families, and handed down by way of an Entail to their Posterity.

'Tis incredible what surprising Virtues the *Indians* ascribe to this *Bezoar*, which is by them called *Mastica de Soho*. The Inhabitants of the Kingdom of *Malaca*, where 'tis most commonly found, also esteem it more than the Oriental *Bezoar*, not so much because they believe it the best Preservative in the World against all sorts of Poisons, as because it is a sovereign Cure for the *Mordoxi*, a Species of Disease to which they are subject, and which in that Part of *Asia* is no less dangerous and fatal than the Plague is in *Egypt*.

The *Indians* also affirm, that this Species of *Bezoar* is an excellent Remedy in all malignant Fevers, the Small-pox, and most Disorders under which Women not with Child may happen to labour. Experience has also convinc'd them, that it causes Abortion when used by Women with Child.

The Method of using this *Bezoar* is to infuse it in a Glass of Water or Wine, till it has communicated a slight, though not a disagreeable Bitterness to the Liquor, which is to be drank in a Morning fasting, and on all other Occasions, when pressing Circumstances call for it.

In order to facilitate the Infusion, and preserve so precious a Stone, most People who have it, set it in a round Box of Gold perforated in several Parts, to which a small Chain of the same Metal is fix'd, in order to suspend it in the Liquor when they use it.

The *Bezoars* taken from the Porcupines and Apes do not differ from those taken from the wild Boar, except in this Circumstance, that they come from different Animals; unless with Mr. *Tavernier* we assert, that these two Stones, which he calls *Malaca Stones*, are not found in the Gall-bladder of the Porcupine and Ape, but in the Heads of both these Animals; and that they are *Bezoars* so much esteemed by the Inhabitants of *Malaca*, that they never allow any of them to be carried out of their Territories, except such as they intend for Presents to Ambassadors, or some of the more potent *Indian Kings*.

Some assure us, that the *Bezoar of Siam*, so much esteemed for its excellent Qualities, is a Stone taken from the Ape; and that it is found in *Siam* as well as in *Malaca*, in which last Country alone Travellers affirm'd it to be found, till Mr. *Chau-mont* went to *Siam* in 1686. in Quality of Ambassador from the Court of *France*.

There are several compound Substances, which are call'd *Bezoars*, or *Bezoartics*, the principal of which are the following.

BEZOAR ANIMALE is thus prepared.

Take of Harthorn calcin'd to its greatest Whiteness, and reduced to Powder, four Ounces: Levigate it on a Marble till it become very fine, pouring to it, Drop by Drop, a Quantity of the Spirit of Vitriol, sufficient to form a Paste, out of which form small Balls, which are to be dry'd immediately.

The Liver and Heart of Vipers pulveris'd is called also ANIMAL BEZOAR.

This Medicine is an Alexipharmic, a Sudorific, and a Destroyer of Worms. It stops Fluxes, quenches Thirst, and is an excellent Medicine for Children.

BEZOARTICUM JOVIALE is thus prepared.

Take of the Regulus of Antimony fus'd in a Crucible, three Ounces; to which add two Ounces of *English Tin* fus'd in the same manner, that a Regulus may again be produced; then levigate the Whole, and mix with it six Ounces of sublimate Mercury, and distil with a Retort. Fix the Butter distil'd from it, with Spirit of Nitre, by three Distillations. Then calcine; and when ignited, extinguish it in Spirit of Wine, and dry it. Thus a greyish Powder is produced.

This Medicine is a strong Diaphoretic, and is of singular Efficacy in Disorders of the Womb, and a great many other Distempers incident to Women; as also in Fevers, the Plague, and Scurvy. Its Dose is from three to five Grains.

BEZOARTICUM LUNARE

Is prepared of Silver dissolved in Spirit of Nitre, and Butter of Antimony, by proceeding in the same manner as in the Preparation of the *Bezoar Joviale*.

This Medicine is a Specific in Epilepsies, Convulsions, Mergims, and Apoplexies. It is Anodyne, Sudorific, and of singular Efficacy in curing the Erysipelas. Its Dose is from six to twelve Grains.

BEZOARTICUM MARTIALE

Is prepared of the Crocus of *Mars* dissolved with Butter of Antimony, fixing it as above directed in the *Bezoar Joviale*: Or,

B E Z

It is made by dissolving one Ounce of the Filings of Steel in a sufficient Quantity of *Aqua Regia*, pouring to it, by little and little, eight Ounces of Butter of Antimony, and proceeding with Spirit of Nitre.

This Medicine powerfully stops hepatic and other Fluxes, and strengthens the Viscera. Its Dose is half a Scruple.

BEZOARTICUM MINERALE: *Bezoar Mineral.*

Take of the Butter of Antimony, three Ounces; drop upon it slowly as much Spirit of Nitre; draw that off again in a Sand-heat; which pour back again, with the Addition of another Ounce of the same; which draw again, and repeat that Operation three or four times. Let the remaining Matter be powdered, and calcined for an Hour in a Crucible; then edulcorate by washing, and burn upon it three or four times Spirit of Wine.

This seems to have been originally the Contrivance of *Crolius*; tho' *Quercetan*, *Sennertus*, *Hartman*, and many other practical Writers, give several Processes for its Preparation; as doth also *Schröder* give one not much different from this. It hath been much controverted by some, whether this is a mercurial or an antimonial Medicine; but it is not of Consequence enough to require any Notice of the several Opinions thereupon. This Medicine is however of Efficacy and Use enough to tempte some Chymists, and such-like Artificers, who keep Medicine Warehouses, to sophisticate it; for to make it genuine will cost double (besides the Trouble and Danger of noxious Steams) of what those Impostors frequently sell it for. Their common Adulteration is with half or two Thirds of the *Flores Salis Ammoniaci*.

The Fumes of the first mixing are very noxious, and therefore to be carefully avoided. Its Operation is by Sweat, though it will also sometimes purge. It is much more efficacious than the Antimonium Diaphoreticum, and it will eradicate even Leprosies, and the most obstinate Cases of that Kind, if rightly managed. Some account it a Resister of Poisons, and commend it in pestilential Distempers. Its Dose is from ten Grains to half a Dram. Some calcine it in a Crucible, after it is taken out of the Retort. Others think it better to let that Part of the Spirit of Nitre it holds, remain with it; but its Operation is certainly milder for such Management.

Lute not on the Receiver, till the Violence of the Fumes are over, lest when the Fire augments its Motion, it break the Retort and Receiver. Do not exceed the third Degree of Fire, nor let it stand long after the Spirit of Nitre is drawn off, to prevent discolouring the Medicine. The Spirit of Nitre being now impregnated with common Salt which was in the Butyrum, is become an *Aqua Regia*, and will dissolve Gold, and is called *Spiritus Nitri Bezoarticus*. *Quincy*.

BEZOARTICUM MERCURIALE.

This is made by extracting a Tincture from the Glass made with *Mercurius Vita*, with Butter of Antimony, and fixing it with Spirit of Nitre.

It is said to be an excellent Medicine in Venereal Disorders.

BEZOARTICUM SATURNI.

This is prepared by extracting a Tincture from the Glass of Lead, (which may be obtained from Red-lead and Flints) with unrectify'd Butter of Antimony, and fixing it according to Art with Spirit of Nitre.

This Medicine is Anti-hysteric, and of great Service in Disorders of the Spleen. Its Dose is six Grains.

BEZOARTICUM SOLARE

Is prepar'd of Plates of Gold dissolv'd in *Spiritus Nitri Bezoarticus*, by pouring this Solution by little and little upon Butter of Antimony, and proceeding as above.

This Medicine is an excellent Sudorific; and of Use in the *Lues Venerea*, the Plague, the Gout, the Dropsy, Fevers, and Obstructions of the Spleen. Its Dose is from three to eight Grains.

BEZOARTICUM VENERIS

Is prepar'd, by extracting the Tincture from the Filings of Copper, with rectified Butter of Antimony, and fixing it according to Art, with Spirit of Nitre.

This Medicine is, by some, exhibited in Leprosies and Diseases of the Head and Brain. Its Dose is six Grains. Externally it is of Use in old Ulcers, Fistulas, and Impetigos, if mix'd with some proper Ointment. *Pharmacop. Batan.*

SPIRI-

SPIRITUS NITRI BEZOARTICUS is made by distilling Spirit of Nitre and Butter of Antimony together, in a Retort. See **BEZOARDICUM MINERALE**.

BEZOARTICUM. Bezoartic, that is, possessed of the Virtues of Bezoar. *Alexipharmic*.

BHACTA. *Johnson* explains this, *Terra Rubra*.

BIA, bia. Force, Violence. Hence *biae*, violently, forcibly. *μὲν βίαι* sometimes imports, scarcely; not without Difficulty. *Galen*.

BIARGHETNUSIM. *Cerufs. Rulandus*.

BIBINELLA, or **BIPENULLA**. The same as *Pimpernella*, which see. *Blancard*. *Ray* says, it is the *Plantago angustifolia serrata* of *Clusius* and *Parkinson*.

BIBITORIUS MUSCULUS. The Adductor Oculi is sometimes called by this Name.

BICAUDALIS MUSCULUS. The *Triceps Atris* has sometimes been thus called; and also *Tricaudalis*, and *Intricatus Castellus*.

BICEPS. The Name of several Muscles, one of which is called,

Biceps internus Humeri, to distinguish it from the *Biceps externus*, otherwise called *Gemellus*. See **GEMELLUS**. It is more frequently called simply *Biceps Humeri*, without the Epithet of *internus*.

The *Biceps Humeri* hath two Heads or Beginnings: The first or outmost arises with a long round Tendon, from the upper Part of the Brink of the Acetabulum Scapulæ, and runs under the Ligament of the Articulation, in a Sulcus or Channel, on the Head of the Shoulder Bone, wherein it is inclosed by a proper Ligament. In its Descent it begins to grow fleshy, as it marches under the Termination of the Pectoral Muscle, where dilating itself into a large fleshy Body, it joins with its other Head or Beginning. The latter arises with a somewhat broad, flat, and long Tendon, at the Extremity of the Processus Caracoides Scapulæ; in its Descent it strictly adheres to the Coracobrachialis (wherefore some Authors, not rightly describing that Muscle amongst those of the Arm, have mistaken it for a fleshy Beginning of this). But then parting from it, both these Heads compose a large fleshy Belly, which becoming tendinous, near the Cubit, is commonly said to be inserted by a strong, round Tendon, to the Tubercle at the upper Head of the Radius. But we have observed this Tendon to be double, the external of which, being thin, passes obliquely over the *Musculus Pronator Radii Teres*, and, Membrane-like, expanding itself, joins with the *Membrana Communis Musculorum*, which embraces all the external Muscles of the Carpus and Fingers.

When this Muscle acts, the Cubit is bended.

The double tendinous Termination of this Muscle (tho' not taken Notice of by any Author that we know) is very evident, and was observed first by us, some few Years since, in dissecting these Muscles, in Company with our very good Friend, that most indefatigable and curious Botanist Mr. Samuel Doody. It appears immediately under the Skin, and *Membrana Adiposa* of the Cubit.

As for the Use of this external Tendon, which we call *Fascia Tendinosa*, it seems designed, not only for the more advantageous Elevation, or Bending of the Cubit, which it more easily moves, by how much the more it recedes from the Centre of its Motion or Fulcrum, at the lower Part of the Arm-bone, and approaching to its other Extreme; but likewise strictly including all the external Muscles, whether belonging to the Radius, Carpus, or Fingers, it thereby corroborates them in performing those strenuous Actions they are necessarily employed in. This latter use was first suggested to us, by observing those artificial Bandages made of Leather, which some laborious Mechanics make use of, by adapting them to the belly'd Part of the Muscles of the Cubit, amongst which Turners, and especially those that use the Rasp in making Frames for Cane Chairs, (as they are commonly called) like a double Screw, are frequently obliged to this Artifice.

In Phlebotomy, the Ductus of these external tendinous Fibres ought to be respected, by directing the Lancet according to their Length, to avoid too great a Division of them, which is frequently the Occasion of those ill Symptoms that remain after that so commonly practised Operation by bold Blood-letters.

An extraordinary Case relating to this Muscle once happen'd in our Practice. A Woman, three Days before she consulted us, had (as she suspected) dislocated her Shoulder Bone, by wringing of Linen Cloths after Washing, (which is commonly done to express the Water) adding, that in straining her Arm in the Action, she sensibly felt something (as she thought) slip out of its Place on her Shoulder. After examining the Part, we were well satisfied, that there was no Dislocation: But observing a Depressure on the external Part of the *Deltoide* Muscle, and finding the two inferior Tendons of this Biceps rigid, and the Cubit thereby denied its due Extension, we suspected that the external tendinous Beginning (before taken Notice of) was split out of its Channel in the

Os Humeri; but finding the Part at that time somewhat inflamed, she having not long before made use of it, we advised her to an emollient Application, and to give it Rest till the next Morning; at which time we found our Conjecture true, and, by turning the whole Arm to and fro, it readily slipped into its Place, she recovering the Use of the Part immediately.

BICEPS FEMORIS.

The *Biceps Femoris* has two Heads, the superior and the longest of which arises with a round Tendon from the Protuberance of the Ischium, in its Descent becomes large and fleshy, and, in above half its Progress, lessens itself again, where it is joined with its other Head, having a broad, partly tendinous, and partly fleshy Beginning from the *Linea Aspera* of the *Os Femoris*, immediately below the Termination of the *Gluteus Maximus*; it being thus united, grows tendinous, as it marches in a Channel on the external Appendix of the *Os Femoris*, becoming perfectly tendinous at its Implantation into the superior Epiphysis of the Fibula.

Besides the Office commonly assigned to this Muscle in bending the Tibia, together with the *Sartorius* and *Membranosus*, it is likewise employed in turning the Leg together with the Foot and Toes outwards, when we sit with the Knees bended. *Cowper's Myotomia Reformata*.

BICHICHLÆ. An Epithet of certain Pectoral, or rather Troches, describ'd by *Rhazes*, consisting of the Juice of Liquorice, Sugar, Starch, Gum Tragacanth, and blanch'd Almonds. *Castellus*.

BICONGIUS. Two Gallons. It contains twelve *Sextarii*. *Castellus*.

BICORNE OS. A Name for the *Os Hyoides*. See **HYOIDES**.

BICORNIS MUSCULUS. A Name for the *Extensor Carpi Radialis*.

BICUCULLATA *Canadense radice tuberosa squamata*. This is a Name given by Mr. *Marchant* to the *Fumaria tuberosa insipida Cornuti*, of which *Marchant* makes a new Genus of Plants, because it differs from the other *Fumaria*; principally with respect to the Structure of the Flower. *Mém. de l'Acad. Roy.* 1733.

BIDENS, *Offic.* *Bidens*; *Verbascina*, *Mont.* 38. *Bidens, foliis tripartito divisis*, *Tourn. Inst.* 462. *Elem. Bot.* 367. *Herb. Par.* 60. *Boerh. Ind. A.* 122. *Buxb.* 39. *Verbescina*, *Dill.* Cat. 166. *Verbescina sive Cannabina aquatica, flore minus pulchro, elatior ac magis frequens*, *J. B.* 2. 1073. *Cannabina aquatica, folio tripartito diviso*, *C. B.* 321. *Eupatorium aquaticum fœmina*, *Ger. Emac.* 711. *Raii Hist.* 1. 360. *Synop.* 93. *Eupatorium aquaticum alterum*, *Park.* 596. *Chrysanthemum Cannabinum Bidens, folio quinquepartito, sive vulgare*, *Hist. AGRIMONY. It grows in watery Places, and flowers in August. The Herb is in Use. It is hepatic and vulnerary. *Dale*.

BIFIDUS. Forked. *Spina Bifida* is a Name apply'd in the *Acta Eruditorum*, to certain Tumors at the Spinal Processes of the Vertebrae of the Back, in new-born Children. *Castellus*.

BIFOLIUM, *Offic.* *Bifolium sylvestre vulgare*. **ORDINARY WOOD BIFOIL**, or **TWAYBLADE**. *Park.* *Theat.* 504. *Bifolium majus vulgare*, *Hist. Oxon.* 3. 489. *Bifolium majus, seu Ophris major quibusdam*, *J. B.* 3. 533. *Raii Hist.* 2. 1232. *Synop.* 3. 385. *Bifolium vulgare sylvestre, sive Ophris*, *Met. Bat.* 461. **TWAYBLADE**.

This Herb has a slender Root, with many Fibres; from which springs a round Stalk a Foot high, or somewhat more, single, and not branched; about the middle of which grow two large oval Leaves, full of Nerves, somewhat pointed, and in Shape like the broad Plantain, on very short Foot-stalks. The Flowers grow in Spikes at the Top, like an Orchis, of a dull-green Colour, having no Spurs or Heels, and of a roundish Figure. It grows in Woods and Thickets, and in moist Meadows, particularly in *Battersea Meadow*, near the *Thames*, and flowers in June.

Twayblade is astringent and agglutinating, good to consolidate Ruptures, and heal Wounds, tho' it is but seldom used. *Miller's Bot. Offic.*

BIFURCATUS. The same as *Bifidus*, forked.

BIGNONIA.

Mr. *Tournefort* called this Plant *Bignonia*, in Memory of the Abbé *Bignon*, Librarian to *Lewis XIV.* King of France, he being a great Encourager of Learning. *The Trumpet Flower*, or *Scarlet Jessamine*.

The Characters are;

It hath a tubulous Flower, consisting of one Leaf, which opens at the Top like two Lips: These Flowers are succeeded by Pods, which are divided into two Cells, and contain several wing'd Seeds.

There are eleven Species of this Plant.

I don't know of any Medicinal Virtues attributed to it. *Miller's Dictionary.*

BIHAL.

This is the *American* Name of a Plant.

The Characters are;

It hath a tubulous Flower, consisting of one Leaf, shaped almost like a Lily, and cut into two Parts; the Pointal and Stamina are included in two Leaves. The Pointal afterwards becomes a fleshy three corner'd Fruit, containing three hard rough Seeds. To these Notes should be added, many Flowers contained in a common Covering.

There are two Species of this Plant.

I don't know of any Medicinal Virtues attributed to it. *Miller's Dictionary.*

BILADEN. Steel, or rather Iron; for Steel in Medicine signifies Iron. *Rulandus.*

BILIMBI. The Name of a small Tree about eight or ten Foot high, call'd by *Bontius* *Billing-bing*, and by *European* Botanists *Malus Indica*, *fructu pentagono*.

It is commonly cultivated in Gardens in *Malabar*, and bears Flowers and Fruit all the Year round, being fruitful from the first Year of its planting to the fifteenth, and longer.

The Juice of the Root, drank, allays a feverish Heat. A Cataplasm is made of the bruised Leaves, with an Infusion of Rice, which powerfully mollifies and resolves all Sorts of Tumors. The Leaves, boiled or macerated in an Infusion of Rice, make an excellent vulnerary Decoction. The Juice expressed from the Fruit cures Itchings, Impetigo, Pfora, and other like cutaneous Affections, if Linen Cloths be wetted therein, and now-and-then applied. The same drank with burnt Arrack cures the Gripes, and stops a Diarrhoea. Of the bruised Leaves, with the Juice of the Flowers of the Palm-tree, is prepared a Cataplasm, which cures all Kinds of Inflammations. Of the dry'd Fruits, and the bruised Leaves of Betel, they make a Powder, which drank in burnt Arrack promotes Delivery, and expels the dead Fœtus and Secundines.

The ripe Fruits are eaten for their Deliciousness, but the unripe are preserved with Sugar, or in Pickle and Vinegar.

Bontius also tells us, that he used to make a Syrup of the Juice thereof, which he prescrib'd in a hot Distemperature of the Liver, and an inflammatory State of the Blood: We make use of the same, he says, in a Decoction with Rice undecorticated, which we call *Pada*, as an excellent Medicine in burning and continual Fevers; for it very much contributes to the quenching of Thirst, and checks the Effervescence of the Bile.

There is another Species of this Tree, which is called *Nebipouli*, or *Bilimbi altera minor*, H. M.

Of this there are two Kinds, or rather Sexes, one of which, tho' it flowers, never bears any Fruit, and is called by the peculiar Name of *Ala-pouli*.

It grows every-where in *Malabar*, and in many other Parts.

The Root of this Tree bruised with the Seeds of Mustard and Cumin, and taken, excites Vomiting, and loosens the Belly; but if it be used with the Fruit *Tomara-tonga*, it restrains an immoderate Flux of the Belly, and cures a Dyspnoea. A Decoction of the Leaves in common Water excites Sweat, and expels the Small-pox. The same with *Malabar*ian Saffron, which the Natives call *Manja Cava*, makes a Bath, which is of great Efficacy in all Pains of the Limbs. The Fruit is highly refrigerant, and therefore extremely proper to allay a violent Thirst in a continual Fever. *Raii Hist. Plant.*

BILIS. The Bile or Gall.

Few Subjects have been more copiously treated of than the Bile, both by the Antient and Modern Writers in Medicine; and it must be confessed, that very few so much deserve it, or are of equal Importance. I shall therefore endeavour to give a general Idea of the Notions entertain'd by the Antients, concerning the different Species of Bile; more with a View of rendering their Writings easily intelligible, than of explaining the true Nature of this Fluid, the Generation and Uses of which must be learned from the Moderns, who have with greater Accuracy, and more intelligibly, treated this Subject.

Bilis, *χολή*, in *Hippocrates*, when put absolutely, and without an Epithet, signifies pale or yellow Bile, as *Galen* in many Places assures us; as in his *Com. 3.* on the Book *De Rat. Viâ. in Morb. acut.* *ἐπιβαίνει γὰρ τοῖς ἰατρῶν χολὴν μὲν ἀπλῶς ὀνομάζει τὴν ὀφθαλμὸν τε καὶ ξανθὴν, τὴν μέλαιναν δὲ χολὴν ὅλον τὸ λεγὲν ἢ ἀπλῶς χολὴν.* "Physicians usually call pale or yellow Bile, simply Bile; but black Bile they express in so many Words, not simply, or by the Name of Bile only." And *Com. 4.* *ἐν δὲ ὅλῳ, &c.* "We said before, that Bile sim-

ply said, signifies *bitter Bile*." And in his Comment on the thirty-second Aphorism of the Seventh Book, *τὸ δὲ χολῶδες, &c.* "Bile is always the Cause of acute Diseases; for, as we said, by this Name the antient Physicians usually called a bitter bilious Humour, and they never express the melancholy Humour without an Epithet, not calling it simply Bile, as they do yellow Bile, but black Bile." Again in his first Comment on the Book *de Natura Humana*, *καὶ μέλαιναν χολήν, &c.* "It is customary not only for Physicians, but with all the Greeks, to say Bile, without any Addition, when they intend to signify pale, or yellow Bile, for both these Epithets are apply'd to one kind of Humour, differing in respect of Moisture and Dryness; but all the other Biles are expressed with some Addition, as by *ærginous*, *black*, *red*, *porraceous*." And in another Passage of the same Comment, he says, it was usual for the Greeks to call yellow Bile, simply Bile, but never intended black Bile without mentioning its Epithet. The same Author, in his Book of preternatural Tumors, says, "A Custom has obtained, I know not how, among us Physicians, when we say Bile simply, or the bilious Humour, we are understood to mean the pale or bitter Bile, not the acid and black Sort, which we never mention without an Addition, connecting it with its Colour." Once more; and very fully, in his fifth Comment on the sixth of the Epidemics, where he enumerates the various Species of Bile, *χολῶδες δὲν γὰρ ὅτι ἐκ γενέσεως, &c.* "He (*Hippocrates*) says *pale Tongues*, according to the vulgar Way of speaking, as when we say, that we saw some look pale, whose Colour has been alter'd to a more bilious Hue, or to that of pale Bile. For this we express simply by the Term Bile, not as we do the other Kinds, with an Addition of Epithets, as *black*, *ærginous*, *red*, *yellow*, or *vitelline*. Now the yellow Bile is next to the pale, and almost of the same Kind; and the pale Bile we commonly express without its Epithet, as when we say, the Man vomited Bile; but the yellow Bile is but seldom expressed absolutely, for we immediately subjoin its Epithet, saying, the Man vomited yellow Bile, or pure Bile. But neither Physician, nor any of the Vulgar, did ever express ærginous or black Bile without an Addition; nor yet the glaffine, (bluish) porraceous, or vitelline. These Names are given by some Physicians to the different sorts of Bile, and are taken from their Colours; so also they call by the Name of red Bile, the Serum of the Blood; but the vitelline is the yellow Bile incrassated, as the pale Bile is the same diluted with a watry Substance." This pale Bile, *Hippocrates* in the Place above refer'd to, which is *Aph. 13. Sect. 5. lib. 6. Epid.* says, "Is generated of Fat," *τὸ δὲ χολῶδες ἐκ πύου.*

The Terms *χολῶδες*, and *χολῶδη* also, in *Hippocrates*, simply used imply pale or yellow Bile, as *Galen* writes in his fourth Comment on the sixth Book of the Epidemics, *λέγουσιν δ' ἡδὴ πολλὰν, &c.* "We have often observed, that when he (*Hippocrates*) says simply *bilious* (*χολῶδη*), he intends pale or yellow Bile, since to other kinds of Bile he attributes their several Colours; thus we find in him, that ærginous, and reddish, and black, and dark-colour'd Bile are vomited." Again, *Com. 2. in lib. 3. Epid.* "Tis probable, says he, that she voided pure bilious Matter (*χολῶδη*), that is, either yellow or red; for it is usual with him, as well as other Physicians, to express the black and ærginous, with an Addition of their proper Colour. We also commonly say, such a one voided bilious Matter, meaning yellow Bile; for we do not call ærginous, or black Excrements, or those of any other Colour simply *bilious*, but with an Addition of their proper Colour. And this Custom has universally prevailed, because pale and yellow Bile are every Day voided both by Stool and Vomit, not only by sick Persons, but by those in Health, but seldom any other sorts of Bile, and never but by such as labour under some morbus Affections." So also *χολὴ ξανθὴ* is called by *Hippocrates*, *Lib. περὶ ἀρχ. καὶ πύου πύου*, that is, Bitterness, or a bitter sort of Humour; and all Fevers are said to arise from Bile, *Lib. 4. de Morb.* and *Lib. 2. de Nat. Humana*, and in *Aph. 42. lib. 7.* in which he comprehends all putrid Fevers.

Χολή is also pretty often simply used by *Hippocrates*, to signify a Flux of Bile; and, in *Lib. de Loc. in Hom.* for any Defluxion in general, which arises from a thin Humour lodged in any Part, and by its Nature easily disturb'd, and put in Motion; and he often uses the Word in this Sense throughout the Book, as, for Instance: *ὅς τὰ πολλὰ ἐμπύου γίνονται ὅταν βούμα ἐς τὸ αὐτὸ ὅσπερ ἐν τῇ χολῇ γίνονται, ἀλλὰ τῇ μὲν χολῇ πολὺ ἀπορρέει.* "An Empyema, for the most part, happens when a Rheum falls upon the Part, as is the Case in bilious Defluxions, which carry with them Plenty of Matter."

BILIS ATRA, *χολὴ μέλαινα*. Black Bile, or Melancholy, is almost constantly mention'd with its Epithet, and has a two-fold Origin; one from the thicker, and, as it were, muddy Part of the Blood, and this is properly call'd the melancholy Humour; Its other Origin is from yellow Bile, too much con-

cocted

cocted and heated. This appears to be *Galen's* Opinion, in many Places of his Works; as in his sixth Comment on the sixth Book of the *Epidemics*, and on *Aphorism* the twenty-first of the third Book; and his Comment on the Book *de Rat. Vict. in Merb. acut.* And in his Comment on the fifty-third *Aphorism* of the sixth Book, he says, *μεμυδιασθαι καὶ πρὸς τοῖς μέλαις καὶ τοῖς λευκοῖς διακρίσθαι, &c.* "The Reader ought to call to mind my Definitions concerning black Bile in other Places of my Works, how that one Sort proceeds from yellow Bile, too much torrefy'd [*ὑπερπυρρῶς*]; and this is the worst of all. Another Sort arises from the Mud, if I may so say, and Dregs of the Blood: This, indeed, is of a thicker Substance than the former, but is far less malignant in Quality. We told you also, that the Bile, which is a sort of Lees of the Blood, ought not, as yet, in Accuracy of Speech, to be call'd black Bile, but a melancholy Humour; but, by an Abuse of Names, we sometimes call it black Bile, because, if it be not evacuated in a little time, it will be really such." *Boerhaave*.

Χολὴ μέλαινα, black Bile, in the common Acceptation, signifies any thick and black Humour, whether it be the muddy Part of the Blood, or Blood adust, or Bile torrefy'd beyond measure, or however generated. But this Appellation properly belongs to a Humour render'd, by Adustion, preternaturally mordacious, acid, harsh, splendid, corroding, and malignant, which, pour'd on the Ground, bubbles up, and raises the Earth, after the manner of Ferment or Vinegar; is the Cause of incurable Ulcers; and is so nauseous, that neither Fly, nor Mouse, nor any other Animal, will taste it. It is generated two Ways; first, and principally, from a black and feculent Humour, which is beyond measure putrid and adust; the other Kind is from yellow Bile, vehemently adust, and is by far the more malignant Sort, as yellow Bile itself is more malignant than the melancholy Humour or Dregs of the Blood. Sometimes it proceeds, by Adustion, from vitelline Bile: Such an Alteration in the Bile is produced by a preternatural Heat and Putrefaction, by which it acquires an Acrimony, and is render'd like Ashes; just as the Lees of Wine, which are cold and dry, before they are burnt, but afterwards become so hot as to burn the Flesh, and produce a Colliquation and Putrefaction therein. *Galen* has told us, that he never observed an Excretion of this kind of Bile without pernicious Consequences. Such *μέλαινα χολή*, strictly speaking, is manifestly distinct, *ἀπὸ τῆς μέλας χολῆς καὶ τοῦ χυμοῦ τῆς μέλανος*, "from the melancholy or black Humour." For this latter is reckon'd among the Elements of the Body, and contributes, together with the Blood with which it is mix'd, to the Generation and Nutrition of the Animal, having nothing of an acrimonious or corroding Quality; but being, as I may say, the Mud or Sediment of the Blood, answers to the Lees of thick Wines. This Humour the Spleen attracts to itself, purging it from the Liver and Blood, and appropriates it, when alter'd, to its own Nourishment, expelling the Reliques, with other excrementitious Juices, into the Stomach, in order for Evacuation. The Excretion of this black Humour, whether by Stool or Vomit, is often healthful, signifying, that the Body is in a right Temperament, and that vigorous Nature, being oppress'd with too great a Plenty, finds a Way to ease itself of its Burden: But if it be retain'd too long in the Body, without being evacuated by some sensible or occult Passage, it oppresses and debilitates the Liver, undergoes Alteration and Putrefaction, is render'd adust by some febrile Inflammation, and perfectly becomes that black Bile before spoken of.

Χολὴ μέλαινα also, in *Athenæus*, passes under the Appellation of *χυμὸς ξυστικός*, "the corroding Humour;" so it is call'd there by one *Trapezobothor*; and *Galen* assures us, that some gave it that Name, where, speaking of black Bile, he says, *νομα δὲ τὸν ἰδίον τῷ τοῦτο χυμῷ, πλὴν ἔτι τι τινὲς ἢ ξυστικὸν ἢ ὀξωδὸν κεκληκασιν αὐτὸν* "This kind of Humour has no peculiar Name, except that there are some who have call'd it the corroding or vinegar-like Humour."

Χολή also signifies τὸ *χοληδόχον ἄγγειον*, "the Vessel containing the Bile," *Pollux*, Lib. 2. and is sometimes used for the black Liquor of the Cuttle-fish.

Bilis, *Fel*, *χολή*, is that Humour in the human Body, which is distinguished by its Heat and Dryness. This is two-fold; one natural, which is call'd simply *Bile*, *χολή*, the other transgressing the Bounds of Nature. The natural Bile, which is mix'd with the Blood, contributes towards nourishing the Body: It is of a yellow or palish Colour, of a bitter Taste, thin Consistence, like the Flower of Wine, and of a heating and drying Virtue. The Substance of this Humour is contain'd, at first, in the Meat and Drink; which being concocted, the well-disposed Part of the Bile is converted, together with the Blood, into Nourishment for the Body; but what is excrementitious finds a Receptacle in the Gall-bladder. For as from new Wine, while under Fermentation and Changing, two Kinds of excrementitious Substances are separated by virtue of its Heat during that Alteration, one lighter and more airy, which they call the Flower; the other heavier, and of a more earthy Quality,

which they call the Lees; so from the Food are produced yellow Bile, of a thin Consistence; and black Bile, which is of a more dense and gross Contexture. But all the natural Bile, that is in us, does not proceed from the Aliments; for the Heat of the Liver and Veins, if a little exalted above the common Standard, sometimes converts the thinner Part of the pure Blood into yellow Bile. For as Choler proceeds from a weak Heat, Blood from a moderate Heat, so, from an immoderate Degree of the same, is Bile generated, which is endued with the Qualities above-mention'd, and so familiar to our Nature, as to be accounted among the Elements of our Body. But the Bile, which is above or below the natural Standard, is no longer call'd simply Bile, but has an Epithet denoting its bad Quality; and there are a Multitude of these vicious Biles, as the Excess of Heat, and other Qualities, will admit of a great Latitude; but almost all the Differences, taken Notice of by Physicians, borrow their Name from their Colour or Consistence. Thus,

Ερυθρά, the Red. This is either an acrimonious and mordacious Serum of the Blood, or comes very near, in Consistence, to a thin Blood; but because it does not concrete, like Blood, after Effusion, it is call'd *Bile*.

Ισάδης, the Glaſtine; or what, by its Colour, resembles that of *Glaſtum*, *Wood*; but is indeed darker, and nearest the Colour of Cabbage. This Bile is extremely acrimonious, hot, and pungent, and next to black Bile in Consistence, Colour, and Efficacy. It is the most malignant among all the kinds of Bile, and is generated in the Stomach, or adjacent Parts, by a very vehement and burning Heat.

Ιώδης, the Æruginous, or what is of the Colour of Verde-grise, that is, green. It is acrimonious, hot, and pungent to a great Degree, and next to the *Ισάδης*, but not yet arrived to that Height of Malignity. It is generated in the Stomach, or in the Liver affected with a Phlegmen.

Κυανὴ ἢ κυανίσα, the Azure or Sky-colour'd. This seems to be the same with the *Ισάδης*; for the *Ισάδης*, or *Glaſtum*, is of this Colour.

Λευκώδης, the Vitelline; that is, in Colour and Consistence, resembling the Yolk of a raw Egg. This Kind is of a gross Substance, and of a high yellow Colour. It comes of yellow Bile, too much concocted, and dried by an immoderate Heat, and, for that Reason, afterwards condensing. It nearly holds the middle Place between the natural Bile, and what is arrived at the highest Degree of Malignity. It is generated in the Vessels, as *Galen* writes in his Book *de atra Bile*, tho' it is often voided both by Stool and Vomit.

Ξανθή, the Yellow. This comes nearest to the natural Bile, which ought to be a Medium between the pale Bile and the yellow.

Ορεώδης, the Dark, or Obscure. This Epithet is used by *Galen*, in his fourth Comment on the sixth Book of the *Epidemics*. He seems to mean by it τὴν *κυανὴν* καὶ τὴν *ισάδην*.

Πορρεώδης ἢ πορρώδης, the Porraceous. This is often generated in the Stomach, from indigested Food; and sometimes from a Disease, or preternatural Heat, in the Veins, whence it is convey'd into the Stomach and Intestines. But it is not produced by a vehement Heat, like the *Ιώδης*; for tho' both Sorts are green, the *Ιώδης*, on account of a more vehement Heat, is more acrimonious, mordacious, and of a thicker Consistence; which Qualities belong to the *πορρώδης*, but in a much inferior Degree. *Galen*, in his third Book *de Aliment. Facult.* writes, that, in severe Distempers, all sorts of Bile are voided, except the porraceous; but that the yellow, and the pale, and the porraceous also, are often voided, both upward and downward, by Persons in Health; which is a Proof, that the porraceous differs from the æruginous, as to Excess of Heat.

Πυρρὰ, which proceeds from a less intense Degree of Heat than the yellow. This Colour is a Medium between a pale and a yellow; therefore this and the yellow Bile have their Names often confounded, on account of the Nearness of their Colours, as *Galen* tells us, *Lib. 1. de Crisibus*, C. 12.

Υγρὰ, the Liquid; that is, diluted with Serum, or some other Humour.

Τδαλώδης, the Watery. This is the same as the *Υγρὰ*.

Τριεσθής, Reddish, consisting of the Serum of Blood, or the thinner Part of it, mix'd with another Substance of a different Colour from Blood.

Φαύα, Brown. The same with the *ορεώδης* and *κυανή*.

Χλωρὰ, Green or Pale; for τὸ *χλωρὸν* signifies both, as *Galen*, in many Places, has observed; but what is properly green, has a Tincture of the Pale and Yellow.

Ὀχρὰ, the Pale. This is the most moderate of all the Kinds, and least hot. It is bitter and pungent, and generated within the Veins of a Body in its natural State. It is of a humid Quality, and but little inclining to the Yellow, because it is mix'd with some thin pituitous or aqueous excrementitious Humour. This Sort is more frequently understood by the simple Name of Bile, than the Yellow, as implying a less Excess of Heat, which is always contrary to Nature. *Gorraeus*.

The natural Heat is diffused thro' all Parts of the Body for the sake of Concoction; and there is, in all Parts, a Generation and Separation of Humours, but by different Ways, and such

such as are proper to each-Part. Thus the Flesh creates and separates Sweat; the Eye, Tears; the Joints and Nostrils, Mucus; the Ears, Ear-wax. Therefore, if the natural Heat be incapacitated to perform its several Functions, it becomes acrimonious and fiery, and all the Humidities are changed into Bile; for Things become bitter, and infected with Bile, by means of the Heat. If this Indigestion happens in the Blood, it turns bilious, and disperses the Infection, with its Nutrient, into all Parts; for which Reason its Effects are universal, and Bile is every-where visible.

One Species of Bile is of a yellow Colour, subtle, transparent, and of a finer Sort than what inclines to livid or black: What is of a deeper Colour, like that of Saffron, or the Yolk of an Egg, is accounted of the same Kind.

A second Species of Bile is of a darker Colour, resembling that of a Leek or Woad, black.

Between these are an infinite Variety of Colours, which depend upon the Heat and Humours. The Viscera also are a Cause of this Diversity, as the Liver, if the Bile be yellow; the Spleen, if it be livid. *Arctaus, πει δὲ ὁ ὀνυ. χερ. παθ. Lib. 1. Cap. 15.*

If an Inflammation proceeds from an Influx of Bile, the Intention is commonly directed to the Evacuation of the peccant Matter, both by Vomit and Stool. For this End, some Cholagogues are to be prescribed which work both Ways, such as the Thlaspi; for an Acetabulum of this Plant, which is the greatest Dose, evacuates Bile both upwards and downwards. Also Medicines prepared with Scammony work upon and purge yellow Bile. We must, therefore, not make the least Scruple to administer a Purge, and repeat the same, if need be; for the Disease immediately submits to Evacuants. If the Patient, for some Reason or other, be either unwilling or unable to take a Purge, it will be proper to apply such Things to the Navel as will work upon and evacuate the Belly; or, to produce the same Effect by means of Suppositories, let a Clyster also be given, and Cataplasms apply'd, consisting of the Meal of Barley and Beans, with recent and unsalted Swine's Fat, and the fine Flour of Chamomile, and Water. But these Things are to be applied last of all; for, in the Beginning to the Height of the Distemper, we are to make use of Remedies composed of Houseleek, fresh Roses, Perdicium, Alkanet, Sanguinaria, Pellitory of the Wall, Siderius, Purslain, sharp-pointed Dock, Attriplex, Nighthade, Plantain, Henbane, Water-lentils, and Seagreen; Blites, Lettuce, Succory, Garden-mallow, Raspings of Gourds, Navelwort, Violets, and Rinds of Pomgranates. Every one of these, applied with Bread of the Meal of Polenta, removes the Pain; but especially the Seed of Fleawort, macerated in boiling-hot Water, and, after it is reduced to a Mucilage, applied by way of Cataplasma. An Ointment of Litharge is also very proper to repress the Influx of Blood; so also are Apples, applied with Crums of Bread, and such-like Things. Cerates composed of Wax, Chamomile, and Oil of Roses, with the Juice of one or other of the before-mention'd Refrigerants, and the White of an Egg, and Water, with a little Vinegar, are of Service. Cerate of Oil of Roses, with a sufficient Quantity of the Juice of Beet, is an excellent Medicine. I have seen a Person labouring under this Disorder, who found wonderful Relief by putting his Feet into cold Water, and keeping them there awhile. Another I have seen, who made use of the Flesh of Oysters, with Litharge, Leaves of Henbane, and old Oil, carefully pounded together; and by Anointings, and Applications, made of the same, was very well restor'd. In want of Oysters, we may use River Shell-fish. These Remedies are sufficient, if the Inflammation and Heat are but moderate; but if they are excessive, we must manage the Cure as for an Erysipelas; that is, with the Leaves of Hemlock, Poppy, Mandrake, and Henbane, and Narcotics composed of Opium, and such-like Things. But, in the Use of these Medicines, our Intention is only to allay the immoderate Heat, which is often accomplish'd in an Hour; after which the stupefactive Medicine must be removed, and a Cataplasma of Bean-meal, Fat, and Water, be applied. For if those vehement Refrigerants continue longer on the Part, they induce a Stupor, and a Deadness or Dulness of Sensation: Wherefore when we are obliged, under acute Pains, to have recourse to Narcotics, we take care afterwards to revive and cherish the Parts by heating Medicines. *Actius, Tetrab. 3. Serm. 4. Cap. 28.*

The Bile is the hottest of all the Humours of an Animal, but differs in Degrees of Heat, according to its Colour; for the yellow Bile is hotter than the pale, and the æruginous than the yellow. It varies also in different Animals; so the Bile, or Gall, of a Swine is the weakest of all, and even cures Ulcers in the Ears, without shewing any pungent Quality. The Bile of a Sheep is more acrimonious than the Swine's; and the Goat's, than that of the Sheep. The Bile of a Bull is stronger than the foregoing, but weaker than that of the Hyena, which is yet surpass'd by those of the Callionymus and Scorpion Fish, which help Cataracts, Dimness of Sight, and an Albugo. The same Virtue belongs to the Bile of the Sea-tortoise; and the Bile of the wild Goat is said to be good in a Nyctalops.

The Bile of volatile Animals is more acrimonious and drying than that of Quadrupeds; and among them the Bile of Cocks and Partridges is accounted the best: Those of the Hawk and Eagle have more of a kind of Acrimony, and are corrosive; their Colour is æruginous, and sometimes black. *P. Ægineta, Lib. 7. Cap. 3.*

Yellow Bile is a bitter and yellow Excrement; porraceous Bile is acrimonious and greenish; æruginous, or rather violet-colour'd (*isidus*) Bile is highly pure and unmix'd; black Bile is the thick Sediment of Blood: Some call black Blood by the Appellation of black Bile. *Ruffus Ephesus, Lib. 1. Cap. 36.*

I now proceed to the modern Accounts of the Bile.

It is a just Observation made by Hippocrates, *That we are disorder'd and render'd sick, by means of those very Things which are immediately necessary to Life and Health.* What we call the Non-naturals, afford a palpable, but melancholy Proof of the Truth of this Assertion; for as Air, Meat and Drink, Motion, Sleep and Rest, are absolutely necessary for the Purposes of Life, so 'tis no less certain, that any Fault or Imperfection in these Things produce Disorders in themselves the most terrible, and to the human Constitution the most fatal. This holds true, not only with regard to Things extraneous to the Constitution, but also with respect to those internal Substances which are immediately conducive to the Support of Life, and the Preservation of Health, such as the Blood, the Lymph, and the Animal Spirits; for, as the Perfection of the vital Functions depends upon the due State and Temperament, the just Commixture, and Degree of Motion of these Substances; so the more immediate and direct Causes of Diseases must be derived from the Defects they labour under, and their several Degrees of Recess from a natural State. There are also other Fluids in the Body, which, tho' not so immediately, are yet so absolutely necessary to Health, that their becoming faulty or peccant must considerably destroy it, and lay an unavoidable Foundation for Diseases. Instead of all other Instances of this Kind, I shall, at present, confine myself to the Bile; the Usefulness and Necessity of which Liquor, for the Preservation of Life and Health, are sufficiently known to every one who is acquainted with the rational and solid Principles of Physic. Its being found in every the most minute Animal is a sufficient Proof of this; for there is not a Possibility of finding, in the whole Extent of Nature, a single Insect destitute of a bilious Humour. And, indeed, when we come to explain our Sentiments on this Subject, we must acknowledge, that the Bile lodged in the Bodies of Animals is a real and genuine Medicine, wisely elaborated by unerring Nature, for preventing Diseases, destroying their Causes, and correcting the Faults and Disorders of the Constitution; and that, by means of its incomparable Virtue and Energy, Animals are kept alive, and preserved in an easy and comfortable State of Health, as I shall, in the Sequel, shew more fully. Since, then, the Bile is so highly useful and efficacious in maintaining a State of Health in the Body, by proving, as it were, a natural and universal Medicine, it must of course follow, that when this Liquor is either faulty, with regard to its Quantity, or depraved by a Recess from its due Temperament and Crasis, a sure and unavoidable Foundation for Diseases must be laid: Since then many, and these, too, formidable Disorders draw their Origins from some Fault of the Bile, the principal Virtue and Energy of the Medicines, employ'd in curing them, ought to consist in correcting this Liquor when peccant in Quality, generating it when defective, or evacuating it when too abundant in Quantity; for as the Bile, when in its due State, is justly to be accounted a true and genuine Medicine to the Body, so we must readily grant, that the most important of all other Medicines are such as are calculated for reducing this Liquor to a natural and temperate State; and that the principal Business of a Physician consists in inventing and applying such Remedies with Judgment. I shall therefore make it my Business, at present, to consider the Bile, not only in its natural State as an universal Medicine to the Body, but also in its preternatural and depraved State, as the Cause and Origin of many Disorders.

'Tis well known to Anatomists and Physicians, that the principal, if not the only, Office of the Liver is, by the Laws of a certain beautiful Mechanism, to filtrate and strain that active, saline, and sulphureous Humour, call'd the Bile, from the Blood, thro' the Trunk of the *Vena Porta*, the Hepatic Artery, and its glandulous Kernels.

It must be own'd, Anatomists are not agreed among themselves whence the Gall-bladder, adhering to the Liver, is supply'd with the Bile it receives; for some of them are of Opinion, that the *Tunica Glandulosa* separates it from the Blood convey'd thither by the Cystic Arteries; others again maintain, that there are some very minute Ducts inserted in the Bottom of the Gall-bladder, by means of which the Bile is convey'd to it; and another Class of Anatomists venture to affirm, that there are certain Cysti-hepatic Ducts, by means of which the Bile is immediately convey'd to this Receptacle. But, what Judgment we ought to form concerning these different Opinions, we may learn

learn from the following Experiment, made by *Bohnius* and some others. Upon opening a Dog, the whole Bile was express'd from the Gall-bladder, and the Cystic Duct tied; but the Subject remaining alive for some time after, they expected to find some more Bile in the Gall-bladder, notwithstanding the Ligation on the Cystic Duct, and tho' all Communication was cut off between the Gall-bladder and the *Porus Hepaticus*. But they were disappointed; for, instead of Bile, they found only a little grumous Blood. Hence the more accurate Anatomists justly maintain, that the Bile lodged in the Gall-bladder is convey'd to it from the common Hepatic Duct itself: For the Communication between these Ducts is highly obvious, since, by blowing into the *Ductus Cholodochus*, both the Gall-bladder and *Ductus Hepaticus* are inflated. On the other hand, by introducing a Pipe, and blowing into the Hepatic Biliary Duct, the Hepatic Duct itself, the Cystis, and the *Ductus Cholodochus*, are distended. In Man also, and in other Animals, the Hepatic and Cystic Ducts, uniting, form together one common Canal. Now if we consider the Situation of the Gall-bladder, its Bottom is placed in a low declining Part; but its Neck, and the Biliary Ducts, are situated higher: Hence 'tis probable, that when the Bile descends slowly thro' the *Porus Cholodochus*, by reason of its oblique Insertion among the Coats of the *Duodenum*, especially if that Intestine happens to be empty, it falls back into the Gall-bladder, which is placed below, especially if it is not very full; where it remains, till, either by the Compression of the Intestines, or the proper Contraction of the Gall-bladder itself, it is again express'd. In an Ox this appears very plainly, since the Hepatic Duct so opens into the Neck of the Gall-bladder, which is pretty tendinous and nervous, that the Bile can as easily descend into the Gall-bladder, as it can be sent off to the *Duodenum*, thro' the common Duct. In the same Subject a pretty surprising Circumstance occurs; for a certain small Papilla is observable, almost in the Middle of the interior Membrane of the Gall-bladder, and is prominent almost in the same manner as the Extremity of the *Ductus Communis* appears to be in the *Intestinum Duodenum*. This small Papilla seems to be the Orifice of the Duct, which passes between the Membranes of the Gall-bladder; and the Protuberance performs the Office of a Valve, by preventing the discharged Bile from returning the same Way it went out.

But the Bile in the Gall-bladder differs very considerably from that in the Liver; for the former is thicker, more acrid, more bitter, and of a deeper Colour, than the latter, which is more fluid, more diluted, and less bitter. But by what Means, and for what Purposes, the Bile contain'd in the Gall-bladder undergoes such a Change, seems to be a Matter of such Importance, as to deserve an accurate and careful Disquisition; and that our Inquiry into this Particular may be the more distinct, I shall premise a few Things concerning the Structure of the Gall-bladder. We observe, then, that the Gall-bladder is made up of several Membranes, the innermost of which, almost in every respect, resembles the *Tunica Villosa* of the *Duodenum*: In this Membrane there are also various Furrows and Ducts, with Valves appropriated to them; but no Glands are to be discover'd. The Membrane which lies next to this is of a spongy vascular Contexture, made up, as it were, of various Pellicules, in which small Bubbles of Air are lodged. 'Tis not to be doubted, but this Membrane affords an Origin to a large Number of Lymphatic Vessels; tho', at the same time, very many of those, found in the Cystis, are distributed in it immediately from the Liver. The third Coat is muscular or fibrous; but we neither observe a nervous nor a tendinous Coat, either at the Bottom of the Gall-bladder, or in its Cavity; however, not only its Neck, but also the Hepatic and Cystic Ducts, are made up of a pretty strong tendinous and nervous Coat. The external Coat is furnish'd from the *Peritonæum*; and between this and the muscular Coat, arterial and venous Ducts are seen distributed. The Neck of the Bladder is very narrow; and this Circumstance is very conspicuous in the Gall-bladder of an Ox, but no Valve can be observed in it; however, *Bauhine* and *Spigelius* have, in human Subjects, discover'd a semilunar Valve, extended in the Form of a spiral Shell, and render'd rough with many Furrows. I must own, I could never find such a Valve in human Bodies; but I have evidently discover'd the Narrowness of the Passage, which is not rectilinear, but runs along in so oblique and winding a manner, as to resist a Probe, when introduced into it: And this Narrowness seems to be of no other Use, than to prevent the Return of the thicker Bile, when once discharged from it into the Gall-bladder; but the thinner and more diluted Hepatic Bile finds a commodious Passage thro' it.

The interior Coat of the Bladder being villous, like that of the *Duodenum*, performs the Office of a Strainer, by fecerning the thin and watery Part of the Bile, and pouring it into the Lymphatic Vessels; for it is not to be deny'd, that the Vessels not only in the Gall-bladder itself, but also those distributed around it, contain a Lymph of a bitterish Taste. Besides, 'tis confirm'd by many Observations, that, in a preternatural State, a large Quantity of thin Bile has cused thro' the Pores of the

Coats of the Gall-bladder: But because this interior Coat separates the thinner Part of the Bile, what remains of course acquires a thicker Consistence, and a more bitter Taste. Besides, the Bladder, by reason of its carnosie Tunicle, and considerable Nerves, is possess'd both of a Power of Sensation and Motion; but more especially its Biliary Ducts, which are furnish'd with a pretty strong and nervous Coat; for which Reason very terrible Pains and Spasms may sometimes happen in them. As *Vieussens* has justly observed, from the semilunar Hepatic Plexus of the Right Intercostal Nerve, there arise six Fibres; the three inferior and smaller of which are distributed to the *Vasa Cholodocha* of the Gall-bladder, to the *Pylorus*, the *Duodenum*, and the *Pancreas*; in order to give them a due Tone and Constriction. Hence also the great Consent between these Parts is to be accounted for; and it is not to be doubted, but that the Bile descends into the Intestines by means of its Weight, and is also assist'd in so doing by the proper Motion of the Ducts. Besides, we ought carefully to advert to the Insertion of the *Ductus Cholodochus*, which creeps along, almost for an Inch, between the exterior and interior Coats of the *Duodenum*, and at last opens with a round Orifice into its Cavity.

But before I treat of the remarkable Use, and absolute Necessity, of the Bile, or consider the several Faults and Imperfections to which it is subject, I judge it highly expedient to premise such Things concerning its Nature and Qualities, as we learn from Experiments made upon it, that we may be the better able to form a Judgment of the various Phenomena and Disorders produced by it. First of all, then, let us have recourse to the Evidence of our Senses; since, from the Taste and Smell of any Substance, we are in some measure enabled to judge concerning the Nature of those Principles, of which it is made up and compos'd. It holds, then, universally true, that the Bile of every Animal is so intensely bitter, that a very small Drop of it communicates its Bitterness to half an Ounce of Water, when put into it. Now 'tis universally acknowledged, by the more knowing and skilful Part of the Chymists, that Bitterness of Taste proceeds from an intimate Commixture of a somewhat earthy Sulphur with a Salt; but what the Nature and Genius of this Salt may be, I shall now inquire. According to our Conceptions, and indeed according to the Result of Experiments, an Acid, intimately joined with an earthy, alkaline, and sulphureous Substance, forms a bitter Mixture. Thus the sulphureous and acid Spirit of Vitriol, coagulated with Salt of Tartar, or fix'd Nitre, produces a neutral Salt of a bitterish Taste, as in vitriolated Tartar, and the Arcanum Duplicatum; tho' very sulphureous Wine-vinegar, pour'd upon prepar'd Coral and Crabs-eyes, afford a neutral Salt, which is still somewhat more bitter. Besides, 'tis confirm'd by Chymical Experiments, that the bitterest Substances, such as Aloes, bitter Gourd, and Wormwood, lose much of their Pungency of Taste by an Admixture of alkaline Salts; which is no weak Proof, that an Acid contributes not a little to the Production of that Bitterness of Taste which is found in the Bile of Animals; since, when that Acid is destroy'd, the Bile becomes insipid and tasteless. It is also confirm'd by Experience, that bitter Vegetables, by Incineration, yield a larger Quantity of Salt than any others; but 'tis certain, that a fix'd alkaline Salt is generated or produced by an intimate Combination of an acid Sulphur with Earth.

Besides, the penetrating and permanent Taste of the Bile, when applied to the Tongue, is a Circumstance which sufficiently proves its remarkably active Nature; for every Substance which penetrates, and diffuses itself upon, the Organs of Taste, is of a subtile Quality. Among other Circumstances, which prove its highly penetrating Force, it is none of the least considerable, that when a few Drops of it are pour'd upon the Coat of the Stomach, or any of the Intestines, a deep-yellow Colour, not to be obliterated or wash'd off by any Art, is forthwith induced on the Part to which it is applied. Its penetrating Qualities are sufficiently known to Hatters, who, in order to give a deeper and more lasting Colour to their Hats, mix it with Substances of a black and inky Colour. Its Saffron-colour may also be easily accounted for, from the highly subtile and active Sulphur it contains, if the Chymical Axiom is right, that real yellow or red Colours are produced by Sulphur. But Chymical Distillations, and Mixtures of Bile with other Substances, discover its Elements, or component Parts, far more effectually than any thing else. Thus twelve Ounces of the Gall of an Ox yield eleven Ounces of Phlegm, intirely void of all Taste: From the remaining Ounce there was afterwards drawn a Spirit of an ungrateful and empyreumatic Smell, which speedily produced an Effervescence with Spirit of Nitre, and tinged Syrup of Violets green, as a Proof of its alkaline Nature: It also yielded something like an Oil, partaking of the Nature and Effects of the above-mention'd Spirit. The earthy *Caput Mortuum*, which remain'd in the Retort, and weigh'd two Drams and an half, by Incineration, yielded one Dram of a manifestly fix'd alkaline Salt: From this Experiment 'tis obvious, that there is a very great Quantity of Water in the Bile; which is also plain from this, that it may be reduced to an Extract; for two Ounces of

Ox's Gall, inspissated in a gentle Heat, yield not more than one Dram of thick Extract. Besides, by the Assistance of a proper statical Instrument, four Ounces of *Bile* are found to weigh scarce two Drams more than an equal Quantity of pure distill'd Water. If the Extract of Ox's *Bile* is mix'd with an equal Portion of Salt of Tartar, and again distill'd in a Glass Retort by means of a Sand-heat, then an urinous and manifestly alkaline Spirit is yielded, which raises a violent Ebullition, with any Acid; it also turns the Solution of Sublimate to a milky, and the Syrup of Clove-gillyflowers to a greenish Colour, which all volatile urinous Salts generally do. But the Reason why an Addition of the Salt of Tartar produces a more alkaline, volatile, and urinous Spirit, seems to be this: Calcin'd alkaline Salts make a very close and strong Attack on the Texture of oleous Substances, and, by destroying their acid Parts, volatilize and alcalize their Sulphur more highly. Something of a like Nature is observed to happen in distilling Soot, Amber, and Tartar, which, when distill'd alone, yield an oleous acid Spirit; but if, before Distillation, they are mix'd with a fixed Salt, the Spirit obtain'd is highly urinous and oily.

I now come to consider the Mixtures of *Bile* with other Substances, the Use of which, in discovering the Virtues and component Parts of Bodies, is very great. It is, therefore, confirm'd by Experience and Observation, that *Bile* produces an Effervescence with no Acid, except our fuming Spirit of Nitre. This Phenomenon seems to run counter to common Experience; since the *Bile* is thought to be of an alkaline Nature: Nor does the Gall of an Ox produce an Ebullition, with highly concentrated Oil of Vitriol, nor immediately assume a greenish Colour, as many imagine; but Perturbation, Coagulation, and Precipitation, are rather the Results of their being mix'd. But it is remarkable, that Spirit of Salt renders *Bile* thicker than Spirit of Nitre and Vitriol; and that it is not at all coagulated by Spirit of Nitre. When concentrated Spirit of Sal Ammoniac, prepar'd with quick Lime, is mix'd with *Bile*, its Colour is exalted, it becomes more saturated, and the Mixture remains diaphanous. The same Phenomena are produced, when the Experiment is made with Oil of Tartar per Deliquium. But we must here observe, that an Admixture of Alcalis very much impairs and diminishes the Bitterness of its Taste. When *Bile* is mix'd with the Syrup of Clove-gillyflowers or Violets, the Mixture does not become green, but assumes such a Colour as is usually produced by a Mixture of a yellow and a red Substance. Highly rectified Spirit of Wine also renders *Bile* turbid, and it loses its Transparency when mix'd with it; but a very small Quantity of the *Bile* is precipitated in it, and the Spirit becomes highly bitter. On the contrary, a very small Quantity of *Saccharum Saturni*, sprinkled in *Bile*, produces a very thick Coagulum in it. But inspissated *Bile*, upon pouring Oil of Vitriol into it, did not produce an Effervescence, but lost its blackish Colour, and became gradually livid; the Mixture, in the mean time, was of a highly disagreeable Smell. Our fuming Spirit of Nitre, mix'd with Extract of *Bile*, produced a very strong Effervescence, accompanied with a great deal of Froth, Heat, and a reddish Smoke; but the Extract was dissolved into a Mucus, which, by means of Oil of Vitriol, was reduced to a Coagulum of a more pitchy Colour: Almost the whole Extract was dissolved in Spirit of Wine; as also in Water. The Extract of *Bile* dried, and exposed to a Flame, melted; nor did it immediately take Fire, for it did not burn till its humid Parts were evaporated: It diffused the Smell of a fetid volatile Salt; and the Ashes left were impregnated with a large Quantity of alkaline Salt, as was obvious from their Taste.

To the Experiments already mention'd, I shall add the following Observations. The *Bile* newly taken from the Gall-bladder of an Ox, is diaphanous, and pretty fluid; but when it is exposed to the open Air for some Hours, its Transparency is diminish'd, it becomes thicker, changes its Smell, and in Process of Time grows fetid; for 'tis scarce credible how easily, and how soon, the *Bile* contracts an abominable Fætor, even much sooner than the Blood itself; which is a Proof, that as all the other Fluids of Animals, so the *Bile* consists of Parts, whose Union and Commixture the Heat of the Air alone is sufficient to disjoin and separate. It must also be observed, that the Serum of Blood or Lymph, held over a gentle Heat in a Spoon, is converted to a gelatinous Mass; which Experiment is in vain tried upon *Bile*, which is less coagulated by Heat, because the nutritive Lymph is none of its component Parts. As for the Uses made of *Bile* by Trades-people, it is most generally employ'd by Scourers, for taking greasy Stains out of Cloaths; and by Painters, for heightening their Colours, and cleaning Pictures; for which last Purpose it is very good. Besides, Ox's Gall proves an excellent stimulating Ingredient in a Clyster; and, by some, the Galls of other Animals are prescrib'd with Success, in Epilepsies, Quartan Fevers, hard Labours, and Hysteric Fits.

These, then, are the Experiments which I made with the *Bile* of an Ox. However, I do not deny but the *Biles* of other Animals are, in some measure, different from it; and that even

the *Bile* of one and the same Animal is not, at all times, of the same Nature and Qualities. I could not subject any considerable Quantity of human *Bile* to Distillation, because I had it not; but I am of Opinion, that its Difference from the *Bile* of an Ox consists in this, that it is somewhat thicker; by which means it happens, that by pouring Aqua-fortis into it, or Spirit of Vitriol, and applying a brisk Heat, an Effervescence is produced, and the Mixture becomes green: Hence also it happens, that it is quickly coagulated by rectified Spirit of Wine. Hence it is not to be doubted, but that the human *Bile* is of a far more active Nature, and more richly saturated with a saline and sulphureous Principle, than the *Bile* of other Animals: I must here observe in general, that the hotter Animals are, their *Bile* is proportionably of a more active Nature, and *vice versa*.

The above-enumerated Experiments sufficiently prove to us, that the *Bile* is not of a pure alkaline Nature; hence it does not produce an Effervescence, but with the strongest Acids: Now every pure Alkali, whether earthy or saline, speedily causes an Ebullition with every the most weak and gentle Acid. Hence we learn, that the *Bile* is of an oleous and sulphureous Nature, for which Reason it burns; but it is not purely sulphureous, otherwise, when mix'd with Spirit of Nitre, or our fuming Spirit of Nitre, it would excite a tumultuous Effervescence; for such is the Nature of subtle Oils, that, when mix'd with these Spirits, they produce an Ebullition; so that the *Bile* seems rather to be a very temperate Liquor, made up of oleous, earthy, aqueous, saline, and volatile Particles. And, to explain myself in a few Words, the bitter *bilious* Juice in all Animals; in its Commixture and Crasis, almost resembles the Juices of bitter Herbs, especially that of the lesser Centaury, the Extract of which is not much different from inspissated *Bile*; for the Juices of all these bitter Plants are made up of Sulphur, and an earthy alkaline Salt. As to these Plants, we ought also to consider, that their Juices, when depurated, and distill'd in the same manner with the *Bile*, when mix'd with acid, alkaline, and spirituous Menstruums, cause Phenomena so much like those produced by the *Bile*, that we have all the Reason in the World to believe, that the constituent Parts of these Simples, as to their Mixture, Crasis, and Virtues, are the same with those of the *Bile*: Hence the Reason is obvious, why the Extracts and Essences of bitter Plants are so singularly and surprisngly efficacious in augmenting the Quantity of the *Bile*, when it is defective; and in correcting it, when its Quality is depraved; two Circumstances which contribute not a little both to the Prevention and Cure of Diseases.

Having thus taken a View of the Nature and Qualities of the *Bile*, it now remains, that we inquire into the particular Manner in which it is generated and elaborated in the Body. First of all, then, I must observe, that the *Bile* does not exist in the Blood, under the same Form, and in the same State, in which it appears in its Receptacles, which are the *Porus Hepaticus* and *Gall-bladder*; for neither the Blood nor Serum are bitter, nor, in a natural State, are they yellow; but the Serum becomes so by an Admixture of *Bile*. For which Reason it is plain, that the Materials, of which it is composed, are only lodged in the Blood; which does not at all appear improbable, when we consider, that large Quantities of Sulphur, Earth, Salt, Phlegm, and Mucus, of all which the *Bile* is composed, are found in the Blood. Now 'tis known from Chymico-mechanical Experiments, that the Qualities, Properties, Tastes, and Smells of Bodies, depend entirely upon the Mixture, Union, Position, Crasis, and Texture of their various Parts; which when chang'd or destroy'd, a proportionable Change is induced on the Taste, Smell, Consistence, and Virtues of the Body. For this Reason a peculiar Mixture of the pinguious, saline, earthy, and aqueous Parts of the Blood, separated from the Blood and Serum by means of their intestine Motion, constitutes and makes up the *Bile*. But to me it seems somewhat improbable, that the *Bile* should consist immediately of the chylous Parts of the Blood, or those which are most slightly united with it; but I am of Opinion, that all these Parts being resolv'd and separated from the Blood, by means of its intestine Motion are afterwards united, and form the *Bile*. Hence we plainly see, that a large Quantity of *Bile* must necessarily be generated in People whose Blood is agitated with a strong and violent intestine Motion: Hence it happens, that young Men of choleric Habits, who enure themselves to Exercise, and live upon hot Foods, abound with *Bile*; whereas old Men, Children, the Phlegmatic, the Idle, and the Lazy, have an aqueous, thin, and unactive *Bile*. Burnings, continued, and tertian Fevers, afford us a signal Proof of this; since, in them, too great a Quantity of *Bile* is produced by the violent intestine Motion, which dissolves the Contexture of the Blood; for it is surprisng to observe, what large Quantities of *Bile* are daily discharged, in the above-mentioned Fevers, by Urine, Stool, and Vomit; for which Reason the Antients imagin'd, that the *Bile* thus discharged was the productive Cause of the Fever, whereas it is rather its Effect. For Instance, we observe, that the more violent and lasting a tertian Fever is, the Excrements are proportionably more bilious: Nor does Nature cease to generate new *Bile*, even during the

the Paroxysm of the Fever; but this Fever is removed, or rather stopp'd and suppress'd for a while, by the Use of that celebrated Medicine the *Peruvian Bark*; for by using it a short time the fiery Colour of the Urine is removed, it becomes thin and aqueous, and the Excrements assume their natural Colour; but, as soon as the Fever returns, all these Symptoms return with it. From what has been said it is sufficiently plain, that the Blood itself may, by a too hot intestine Motion, be resolv'd into *Bile*, and other excrementitious Liquors. The Truth of this is also confirm'd to us by hectic and latent Fevers, where the Blood itself is, by a continual and excessively violent intestine Motion, at last consumed, and converted into *Bile* and Excrements. Among the few who have adverted to this Circumstance, none have been more explicit than *Hildanus*, who (in *Select. Medic.*) has these Words:

“Tis something wonderful and surprising, that, on some Occasions, large Quantities of *Bile* should be evacuated, and yet the Gall-bladder not be found empty after the Death of the Patients; 'tis not, in consequence of this, to be doubted; but that the Blood is, by an inflammatory Heat, parch'd and converted into *Bile*.” We farther observe, that the more we abstain from Food, and the more Exercise we use, a proportionably larger Quantity of *Bile* is generated; whereas an inactive Life, and high Feeding, prevent and hinder its Generation.

Having taken a View of the Origin of the *Bile*, and its generating Cause, I shall now inquire in what manner the Particles, forcibly separated from the Blood by its intestine Motion, are united into *Bile*; which Phenomenon I deduce from the slow and languid Progress of the Blood thro' the Liver: But, for the better Illustration of this Point, I shall assume the following mechanical Axioms.

1st. Substances capable of being mix'd, the more they are agitated, and the more quickly they are moved, the more their Particles are divided and broken.

2d. The more minute the Parts are render'd by Motion, the more closely are they united; and the more difficultly are they separated from the rest; because large Bodies, by being divided, have the Sum of their Surfaces increas'd, and, in proportion to the Smallness of the Parts into which they are resolv'd, that Force, with which one Fluid endeavours to recede from another, is diminish'd. Hence it follows, that the homogeneous Particles must unite, come together, and more easily separate themselves from a Mixture of heterogeneous Parts, when their Motion is diminish'd, or destroy'd, as we evidently see in extravasated Blood, in which, upon a Cessation of its Motion, the Serum is separated from the Crassamentum. Since, then, we know from Anatomical Observations, that the Circulation of the Blood is slowest in the Liver, because it is convey'd to it by the Vena Portæ, which has no Pulsation, and is introduc'd into the smallest Ramifications dispers'd thro' the Parenchyma of the Liver, in which it does the Office of Arteries; and since an Impetus of Motion is wanting, the Blood must move slowly not only in this Organ, but also proportionably so in all the Viscera, which have Vessels distributed to them from the Vena Portæ. Hence the Reason is obvious, why the Liver, the Spleen, the Pancreas, the Mesentery, and Intestines, are, for the most part, the Seats of the most violent chronical Disorders; since, in these Parts, Obstructions, Indurations, Stagnations of Blood, Inflammations, and Corruptions, may very readily happen. For which Reason, since in this Vein the Blood is deprived of its sweet and chylous Parts; its gross, sulphureous, and saline Particles, as it were, parched with Heat, together with its mucilaginous and lymphatic Parts, moving slowly, unite, are collected and secreted; by which new Union and Mixture, a new State, Crasis, Taste, and Colour, result. But 'tis not to be doubted, but that the new-generated *Bile* is successively more assimilated to that in the Cystis and Biliary Ducts, that it may prove a kind of Ferment; for as the Blood, by its intestine Motion, helps the Transmutation of the new Chyle into Blood; and as Vinegar converts Wine pour'd to it into Vinegar, so the *Bile*, upon the Approach of the like Juice from the Blood, easily communicates its own Form and Texture to it.

Having thus consider'd the Nature of the *Bile*, and inquir'd into the particular Manner in which it is generated, I now come to shew, that the *Bile* is a noble and useful Medicine to every Species of Animals. This I shall endeavour to prove by the following Arguments. First, then, there is not in Nature an Animal destitute of this Liquor; for 'tis found not only in Quadrupeds and Birds, but also in the most inconsiderable and diminutive Insects; and tho' some Animals want a Gall-bladder, yet they by no means want a Liver and Ducts conveying the *Bile* from it, either to the Stomach or Intestines. Secondly, the Necessity of the *Bile* in Animals appears from this, that wise and unerring Nature has appointed so large an Organ, and which takes up so considerable a Space in the Abdomen, for no other End but to secrete and distribute it; now 'tis certain, that no Animal whatever wants this Organ. Thirdly, among other Things of an Anatomical Nature, 'tis worth while to observe, that, in most of the more noble Animals, the *Bile* is

convey'd by a double Way, or Duct, from the Liver to the Duodenum; for, besides the Hepatic Duct, which conveys the *Bile* immediately from the Liver, there is also a *Cystic Duct*; and these, for the most part, join, and coalesce into one common Duct, which is call'd the *Ductus Choleochus*. If we reflect rightly upon this surprising Contrivance, we must have our Minds fill'd with the most noble and elevated Ideas of its Author; for, since this Liquor is absolutely necessary to the Life of every Animal, if one of these Ducts should happen to be obstructed, so long as the other remains pervious, this balsamic Liquor may be carried to its destin'd Parts; or if, on any Occasion, it should be elaborated in too great a Quantity, it is, by this means, stor'd up for future Use, as it were, in a Repository. Fourthly, the Use of the *Bile* appears from this, that, in all Animals, it enters the first Intestine or Duodenum, very near the Stomach, and is there pour'd upon the Mass of Aliments. If then it had been an excrementitious Liquor, or hurtful to the Constitution, the all-wise Author of our Nature would have rather thrust it directly into the Intestinum Colon, or Rectum, that it might not, by its Sordes, contaminate and corrupt the Chyle, which is the Food and Nourishment of the Blood, and of the whole Body. In the last Place, its singular Use, and absolute Necessity, are sufficiently demonstrated, by its being generated in such a large Quantity; since, according to some, and especially *Borelli*, there is a Pound of this Liquor produc'd every Day in the larger and more bulky Animals.

Tho' the above-mention'd Arguments are founded only upon probable Conjectures; they are, nevertheless, sufficient for proving the Usefulness of the *Bile*. But that I may be a little more clear and explicit upon this Point, I lay it down as a Maxim not to be contested, that Life, and much more Health, depends upon a constant and uninterrupted, a due and equable Circulation of the Blood and Humours thro' the whole Body. This Motion of the Blood is justly dignify'd with the Epithet *Vital*; for it preserves the Body from Putrefaction, renders it found and durable, and nourishes or repairs that latent and inconceivable Principle, by means of which the Union and Correspondence between the Soul and Body are maintain'd. So long then as this Circulation of the Humours is free and uninterrupted, we are said to enjoy Life and Health; but as soon as it begins to be impair'd, various Indispositions, Pains, Depravations of the Actions of the Body, Putrefaction, and, at last, Death, happen. Now, in order to maintain and keep up this Circulation, 'tis absolutely necessary, that the Blood should be in such a State of Fluidity, as to be able to move freely thro' the smallest and most minute Ducts of the Body. 'Tis also requisite, that the component heterogeneous Particles of the Blood should be intimately mix'd and united, since this very Circumstance constitutes its Crasis and Texture. Now, 'tis confirm'd by Experience, that nothing is more prejudicial and injurious to the Texture of the Blood, than tenacious, viscid, and acid Substances; for these are destructive of Fluidity, are not easily put into an intestine Motion, and cannot be intimately mix'd with other Fluids. Now 'tis obvious, that we eat various Substances which abound with an acid, a viscid, and tenacious Principle, from which a thick, viscid, and immiscible Blood and Chyle must be produc'd. Besides, 'tis necessary for Life, not only that the Blood should be in a State fit for Circulation, but also that proper Motion should be us'd; for Motion is essential to Life and Health. 'Tis plain that those Fibres of our Bodies, which are destin'd for the Purposes of Motion and Contraction, perform their respective Offices better and sooner, when extraneous Bodies in Motion act upon them by their penetrating and active Qualities; for we observe, that only the penetrating Smell of Wine, spirituous Liquors, and volatile Salts, soon raise the faint and languid Motions of the whole Body. Nature has also need of such a natural Mover, to give due Motion and Impulse to the solid Parts, without which the Circulation could not be carried on, nor Life and Health preserv'd.

I now come to consider, by what means the *Bile* is the natural and universal Medicine of our Bodies; and how it comes to pass, that it affords all the Supplies necessary to the Fluidity and Motion of the Blood, by which Diseases and Death are prevented. I have already shew'd, that the *Bile* is a Liquor of a very active and penetrating Quality, since it is compos'd of sulphureous oily Parts, mix'd with volatile and fix'd Salts; and, at the same time, of a very temperate Nature, by reason of the Admixture of aqueous and earthy Parts. This Liquor, partly by its penetrating Quality, and partly by its Texture, incides, temperates, and corrects the viscid, thick, and acid Matter, which comes from the Stomach; and, which is a Circumstance of the greatest Importance, it contributes very much to render the Chyle, and consequently the Blood, volatile, mild, and spirituous. Now 'tis not to be doubted, but that, not only in the Stomach, but also in the small Intestines, the Aliments undergo an intimate Solution and Fermentation, whereby their Adhesion and Texture are intimately dissolv'd and destroy'd, as the Change induc'd upon their Taste, Smell, and Consistence, sufficiently proves. Now 'tis known, that spirituous and active

Liquors,

Liquors, added to Substances during their Fermentation, intimately dissolve these Substances by an intestine Motion, and add an excellent spirituous Quality to them. The same happens, when the *Bile* is pour'd upon the Aliments when under Fermentation; for, by this means, the acid and viscid Principles are not only corrected and subdued, but the chylous Mass itself is render'd gently spirituous, subtle, temperate, and of a sweetish Taste. But that the *Bile* undergoes a Fermentation in the Intestines, we may gather from its entirely laying aside its Bitterness; for the fermentative intestine Motion intimately dissolves, and fully inverts the Union, Crasis, and Texture of the Parts on which its Taste and Quality depend. Thus the *Bile* prepares the Chyle in the *Primæ Viæ*, and renders it fit and disposed for performing the vital Circulation, and conveying Nourishment to the whole Body; and without this Humour, the Chyle remains thick, crude, unsubdu'd, and unfit for progressive Motion; and when 'tis convey'd, in such a Condition, into the Mass of Blood, it must lay an effectual and sure Foundation for Disorders and Indispositions. *I have been obliged to preserve the Word FERMENTATION, in order to give the Meaning of Hoffman; but must confess, that it conveys to me no satisfactory Idea, and gives me no Information.*

A Chyle thus season'd with a spirituous Balsam, when it reaches the Blood, is intimately mix'd with it; for the more subtle and fine the Parts of Fluids are, the more easily they admit of an intimate Mixture; and, on the contrary, the thicker Fluids are, the more easily they recede from the other heterogeneous Particles. The Chyle, also, being impregnated with a certain stimulating Salt, proves an excellent Quickener of the Tone and Impulse of the moving Fibres of the whole Body; by this means the Circulation of the Humours, which remains active so long as the Fibres are in a due State of Vigour, becomes quicker and more free. For this Reason the *Bile* was by the Antients, and still is by the Moderns, justly styl'd the Balsam of the Body; not because by its balsamic Quality it prevented a Disposition to Putrefaction, but because it contributed much to a free and quick Circulation of the Blood; for this Circulation is, if I may so speak, the best Balsam to the Body, in which there can be no Corruption so long as it remains entire; for the perpetual progressive Motion of the Body, together with its Fluidity and spirituous Nature, resists the Tendency to Putrefaction; besides, by means of this circular Motion, many recrementitious and superfluous Parts, which are strongly inclin'd to Corruption, are evacuated, and carried off by the proper Emundatories.

There is still another very considerable and important Use of the *Bile* in the *Primæ Viæ*; for it proves a due and proper Stimulus to the Intestines, by means of which they are excited to their due peristaltic Motion, which is highly necessary both for pressing the Chyle into the lacteal Vessels, and continuing the Propulsion of the Feces. 'Tis certain that a due Tone of the Intestines, which consists in their proper *Systole* and *Diastole*, contributes very much to the Secretion and Expulsion of what is useless and recrementitious; for if the Excrements are not duly and regularly discharg'd, the Blood and Lymph must, by that means, not only be render'd highly impure, but also a strong Disposition to spasmodic Disorders is brought on. The *Bile* then, in its due and natural State, when pour'd into the Mass of Chyle, promotes the Discharge of the Excrements, partly by its irritating Acrimony, and partly by the elastic spirituous Quality it bestows on the Chyle.

Tho' I have already sufficiently prov'd, that the *Bile* is an excellent and useful Medicine, which preserves the Body from Disorders, and happily prevents the Tendencies and Dispositions to them; yet the uncommon Efficacy, and singular Virtue, of bitter Medicines, both in guarding against, and removing many Distempers, is a strong additional Proof of the Assertion. I have already observ'd, how great an Harmony and Affinity, in point of Mixture and Crasis, there is between the *Bile*, and the Extracts and Juices of bitter Herbs, especially of the lesser Centaury: Now daily Experience convinces us, that no Medicines are more safe and efficacious, either for preservative or curative Intentions, than those which come under the Denomination of *Bitters*. Elixir Proprietatis, and Aloes itself, reduc'd to a proper Form, with bitterish Extracts, and an Addition of the balsamic Gums, as also the Essences and Extracts of Wormwood, the lesser Centaury, Fumitory, and Gentian, are Medicines so safe and universal, both for guarding against, and curing, almost all chronical Disorders, that Medicine would be very imperfect and defective without them. Many Remedies might be discarded from Physic, without its sustaining any considerable Loss; but Bitters are absolutely necessary to its Perfection; for by these more happy Effects are in reality produc'd, than by volatile, spirituous, oleous, fix'd and earthy Salts; since they are more agreeable to the Constitution, more temperate in their Qualities, and correct and amend what is peccant in a more gentle and gradual manner; provided the Use of them is persisted in for a considerable Time. In short, Bitters must, in the very Nature of the Thing, be excellent and efficacious Remedies, since they perform the same friendly Offices with

the *Bile*, which they generate and augment, when deficient in Quantity, and correct, when deprav'd and vitiated in Quality. Nor, indeed, can we be deceiv'd with regard to the Propriety of Bitters, since provident and unerring Nature elaborates and prepares a bitter Liquor in the Body, which proves a mighty Preservative to it.

I now come to resolve this Question, *Whether the Bile circulates?* The first who advanc'd this Opinion was *Borelli*, in his Book *de Motu Animalium*; where he supposes, that the *Bile* being a highly useful Humour to our Bodies, some Ounces of it are every Hour convey'd from the *Biliary Ducts* to the Intestines; that such a Store of it could not be generated from the Blood; that the greatest Part of it was thence again pour'd into the Blood; by means of the meseraic Veins, which, like so many Leeches, sucking out the bilious Humour, convey it back again to the Liver; thro' the *Vena Portæ*; and that many of the active Particles of the *Bile*, being mix'd with the Chyle, were thence convey'd into the Blood, where they furnished new Matter for the *Bile*. This Opinion was some time ago broach'd at *Lejden*, in a formal Dissertation on the Circulation of the *Bile*. The Author of this Dissertation thinks, that, in the Space of twenty-four Hours, at least six Ounces of *Bile* were pour'd into the Duodenum, which he proves by an Experiment made on a Dog; and he is of Opinion, that such a large Quantity of *Bile* can by no means be generated in the Liver, unless we suppose a Circulation of it. But in Man, he supposes that a whole Pound of *Bile* is secreted every Day. In Confirmation of this, he draws an Argument from the meseraic Veins, which are so large, that they are not only destin'd for conveying the Blood, but another Humour also. He afterwards endeavours to prove the same Fact from the Feces of an Embryo; which he takes to be *Bile* stagnated in the Intestines. But, because this does not answer the Quantity of *Bile* which daily flows into the Intestine, he is of Opinion, that it again enters the Pores of the meseraic Veins: These he thinks most proper for this Purpose, because, by blowing thro' a Pipe introduc'd into the meseraic Veins, the Air enters the Intestines; and that, in feather'd Animals, which are destitute of lacteal Vessels, the Chyle is carry'd thro' the Veins of the *Mesentery*.

But several Circumstances hinder us from believing these Assertions; for, in the first Place, it is not as yet proved by any conclusive and satisfactory Argument, that so large a Quantity of *Bile* is secreted in Man: But tho' we should grant, that there really was, yet I am of Opinion, that the large Quantity of Serum produc'd by so much Aliment, is sufficient to generate it; for, since an uninterrupted Heat and Motion act upon the Aliments, they must necessarily be resolv'd into saline and excrementitious Parts, of various kinds. For, tho' our Aliments should be swallow'd down insipid, and without Salt, there will be, nevertheless, daily a large Accumulation of sulphureous Salts, conspicuous in the *Bile* and Urine; and the Quantity of these Salts is owing to the intestine Commotion of the Blood alone. Since, then, the Urine contains so large a Quantity of Salt, Sulphur, Fat, and Mucus, as we daily see excrend, and since it is furnish'd from the Blood, and not immediately from the Aliments, I see no Reason why the *Bile* should not, in like manner, receive a sufficient Supply from the Blood; so that there is no Necessity for its circulatory Motion: Nor, in Embryos, is the *Bile* generated in so large a Quantity, because the intestine Motion of their Fluids is very temperate, and already freed, as it were, from the bilious Sordes in the Viscera of their Mothers. Nor does the Largeness of the meseraic Veins add any Force to this Opinion; for the Veins of the whole Body are always larger than the Arteries; and when the Blood, carry'd thro' the Branches of the Liver, does not pass so expeditiously thro' the Ramifications of the *Vena Portæ*, it must be accumulated too largely there, and distend the Vessels. Besides, it can be proved by no Experiment, that, in Man, the meseraic Veins receive any humid Substance from the Intestines; and I cannot perceive why the *Bile* should not, in like manner, enter the Pores of the lacteal Vessels, as being more patent: much less can it be suppos'd, that the *Bile*, being mix'd with the chylous Juice, should afterwards be specifically separated by the meseraic Veins, without an Admixture of the Chyle. Besides, the *Bile* itself, mix'd in the Intestines, is in the small ones, by its Fermentation, and intimate Solution, evidently chang'd, its Crasis dissolv'd, its Bitterness laid aside, and, in short, it ceases to be real *Bile*. 'Tis not, however, to be deny'd, that the sulphureous and spirituous Parts of the *Bile*, being resolv'd by Fermentation, again pass into the Blood, but not under the Form of *Bile*. Nor do I deny, that when too much *Bile* is pour'd into the Duodenum, when the Stomach and Intestines are empty, as it sometimes happens in preternatural Cases, a Part of it may be actually received into the lacteal Veins. If it be granted, that this may happen upon taking too large a Quantity of bitter Medicines, I see no Reason why it should not happen, when too much *Bile* is accumulated.

Since I have already shewn the Necessity, and great Usefulness, of the *Bile*, and prov'd that it is an universal and natural Medicine to the Constitution, it evidently appears, that, when this

this Liquor is faulty either in Quantity, Quality, or an undue Degree of Motion, our Bodies must sustain very considerable Inconveniences, not only by having the Dispositions and Tendencies to Disorders, but the Disorders themselves, actually brought upon us. I must first then consider, whether too large a Quantity of *Bile* of a good Quality; and due Temperament, can prove disadvantageous and hurtful to the Body? To this I answer, that in Countries like ours, where the Air is dense, where the Inhabitants drink Malt Liquor, and where the Waters are not thin and subtil, a too large Quantity of good and laudable *Bile* cannot readily be generated. Yet I do not deny, but when People in the Vigour of their Youth indulge themselves wantonly in the Use of Wine, Aromatics, and sweet Aliments in the Summer Season, too large a Quantity of *Bile* descending to the Intestines, and again mixing with the Blood, may do very considerable Injuries; especially if solid Aliments are sparingly used: For 'tis sufficiently known, that the best active Medicines do Harm, if taken in too large a Quantity, which also holds with respect to Bitters: Thus also too large a Quantity of *Bile* gives too hot an Intemperies to the Blood, and disposes to Hemorrhages, disorderly and exorbitant Passions, Inflammations, Vomitings, Diarrheas, and Consumptions. But it is more frequently faulty with regard to its Deficiency, or the Smallness of its Quantity, to which old Age, Childhood, a serous and phlegmatic Constitution; too liberal an Use of Opiates and refrigerating Medicines, frequent Venesection, reiterated Purgations, and Loss of Strength by the Shocks of some long Disease, contribute not a little. A Defect of the *Bile*, as *Helmont* has well observ'd, disposes to Cachexies, Dropsies, hypochondriacal Disorders, and very terrible chronical Distempers. *Fernelius in Pathol.* very judiciously observes, "That many have died, in whom, when laid open, no other Cause of Death could be discover'd, except that the Gall-bladder was entirely destitute of *Bile*." And *Moebius* in his *Fundament. Physiol.* informs us, that in the Bodies of three Children, who died of Consumptions, there were not the least Remains of *Bile* to be observ'd. In the 224th Observation of Dec. 2. of the *Miscellanea Naturæ Cur.* 'tis shewn, that the Person who by frequent Vomitings of *Bile* drains his Body of that Fluid, must necessarily die.

A due Supply of *Bile* is greatly wanting in the Intestines, when the Orifice of the *Ductus Choleochus* is either block'd up by a Stone, or contracted by Spasms. This Disorder lays a Foundation for several very terrible Symptoms, and generally ends in a Jaundice; for when the *Bile* is not allow'd a Passage to the Intestines, and its Generation in the Liver is still carried on, it must of Necessity flow impetuously, not only to the Gall-bladder, which it wonderfully distends, but also to the biliary Ducts, and Glands of the Liver, where, by the too great Distension and Aperture of the Pores, it passes thro' the lymphatic Vessels into the Blood, and tinges the whole Mass of Serum with that yellow and disagreeable Colour, which appears all over the Surface of the Body. But that, in this Case, a large Quantity of *Bile* flows from the Liver into the Blood, we may conclude from this, that the Urine discharg'd is thick, resembles *Bile* in its Colour, and tinges Linen with a saffron Colour. Costiveness is also a Concomitant of the Jaundice, and white Feces are discharg'd with Gripes and Flatulencies; there is a heavy Pain in the right Hypochondrium, and sometimes a very acute and violent one, a Vomiting, Nausea, Loss of Appetite, and Cardialgia; especially if a Stone be lodged in the Ducts, or if the *Bile* be extravasated; for I have already observ'd, that the biliary Ducts are very sensible and nervous. If then these Ducts should be too much distended or vellicated, either by a Stone, or stagnating *Bile*; the Stomach, the Oesophagus, and the Duodenum, are at the same time drawn into Consent with them. More Circumstances concur to prove, that the biliary Duct, and its Aperture into the Duodenum, may be contracted; and that by this very means a Jaundice, which however is easily carried off, is generated. In hypochondriac and hysteric Patients, as also in those who labour under a violent Colic, or a severe Fit of Anger, we often find a yellow Colour dispersed over all the Body, accompanied with a heavy Pain in the Pit of the Stomach, towards the right Hypochondrium, and where the Duodenum, the Pylorus, and these Ducts, lie; for the Orifice being either clos'd up by Flatulencies, or contracted by Spasms, the *Bile* regurgitates to the Blood. Antispasmodic Carminative Medicines, and such as correct the Acrimony of the Humours, are of all others best calculated for the Removal of this Disorder. Hence, according to the Experiments of *Sylvius*, Saffron, Opiates, Milk, and Emulsions of Hempseed, are of singular Service in this Case; but hot Sudorifics, as also stimulating and operient Medicines, are less proper. Burning bilious Fevers, and tertian Fevers, whether of the continued or intermitting Kind, are also frequently accompanied with a Jaundice, which draws its Origin from no other Source, than either a Constriction or Obstruction of the biliary Ducts, which lead to the Duodenum. In burning Fevers an Inflammation of the Duodenum, and of that Part of the

VOL. I.

Pancreas which adheres to it, as also of the Pylorus, often happens, especially when the Fever is brought on by the Suppression of violent Grief, or the drinking of cold Liquors. Hence it is not to be doubted, but the Ducts being compressed by means of the Inflammation, Tumor, Pain, and Spasms of this Part, prevent the Afflux of the *Bile* to the Duodenum. Besides, 'tis known from Experience, that Poisons swallow'd, and the Bites of Vipers, or of mad Dogs, are frequently follow'd by the Jaundice; the Reason of which Phenomenon seems to be no other than the violent Spasms and Inflammation in the Stomach, and small Intestines, which at the same time shut up the Passages of the *Bile* to the Intestines.

When there is a violent Obstruction of the biliary Ducts, the Gall-bladder is on that Occasion surprisingly distended by too large an Influx of the *Bile*. Then, by reason of the Stagnation and Rest, the more thick and mucous Parts of the *Bile* are separated, collected, and lay a Foundation for a bilious Concretion. Besides, the thinner and more acrid Parts of the *Bile* issue thro' the dilated Pores of the Gall-bladder, and excite Gripes, Cardialgias, Vomitings, violent Constrictions of the Stomach and Intestines, and Convulsions: Instances of this may be read in the forty-seventh Observation of the first Century of Stalpart Vander Wiel. That the *Bile* may issue from the Gall-bladder, is confirm'd by *Tulpius*, where he brings an Instance of a pregnant Woman, in whose Body when laid open, besides an Abscess of the Mesentery broken during Labour, the Colon was found to float so freely in yellow *Bile*, that it might have been taken out by Spoonfuls. Something of a like Nature, *D. Melch. Fribe Ephem. Nat. Curios. German. Dec. an. 3. Obs. 100.* relates concerning a Coachman who died of a continual burning Fever, in whose Body, when laid open, he says he observed, that from the Gall-bladder as yet entire, and larger than a Pigeon's Egg, the thinner Part of the *Bile* had issued, and so drench'd and corroded the Parts below, above, and on every Side of it, tinging them of a saffron Colour, for two or three Inches all around, that it was plain the Parts bedew'd and ting'd with it had become manifestly putrid; and that, besides the Substance of the Liver, it had corroded and render'd putrid a great Part of the Hypochondrium, the Gall-bladder remaining, at the same time, evidently sound and unaffected.

Besides, the *Bile* is highly disturbed in its Motion, either when the Gall-bladder is filled with a Mucus, or when a Stone is lodg'd in its Neck; for in these Cases it cannot receive the hepatic *Bile*, which, of course, must flow into the Duodenum in a larger Quantity than it ought; and is by no means necessary, if the Stomach is empty: And if it is full, this *Bile* is by no means sufficient; but a Supply of thicker and better saturated *Bile* from the Gall-bladder is necessary for the Purposes of Chylification, and for exalting the Chyle. And such a Defect of *Bile*, at the Time of Meals, generates many acid and viscid Crudities, which dispose to Gripes, Constrictions of the Belly, Cachexies, and Dropsies. I remember there was some time ago a Sword-cutter laid open at *Fena*, who, for twenty Years before his Death, had been afflicted with violent Gripes, a Cardialgia, and Sense of Heat about the Pit of his Stomach. His Gall-bladder was of an uncommon Structure, and so large and long, that three thousand six hundred and forty-six Grains of *Bile* coagulated partly in the Form of Peas, and partly in that of Shot, were found in it. Cases of this Nature are very frequently accompanied with Pains of the right Hypochondrium, Vomitings, Jaundice, Colics, Hysteric and Spasmodic Disorders. And that a Dropsy frequently ensues such a Repletion of the Gall-bladder with a Stone, is confirm'd by *Cnoefelius, M. N. C. Dec. 1. an. 3. Obs. 260.* *Georgius Francus* also, Dec. 2. an. 6. *Obs. 194.* from the Observation of another Physician, gives the Case of a certain Soldier, who died of a Dropsy in his Breast, in whose Gall-bladder, upon opening him, there was a Stone found, which weigh'd half an Ounce and half a Dram. The Patient, during his Indisposition, complain'd of so violent a Pain in the Region of his Liver, that he could neither stand upright, nor walk, but was oblig'd till his Death to sit in his Bed in a crooked or bending Posture.

It sometimes also happens, that the *Bile* is irregularly, preternaturally, and in too large a Quantity, thrown out of the Ducts of the Liver into the Intestine; upon which Occasion, especially if it offends in Quality at the same time, it creates many Disorders, and produces very terrible Symptoms. This Case principally happens after a severe Fit of Anger; for then the muscular Fibres of the Gall-bladder, and biliary Ducts, being violently convulsed, not only a Bitterness in the Mouth, Nausea, and Loss of Appetite, and Cardialgias, but also Vomitings or Gripes, and a bilious Diarrhea, are excited. On this Occasion we are to observe, that where the *Bile* is immediately discharg'd, the Case is void of Danger. But if the Anger has been suppressed and restrained, it often happens, that the agitated *Bile*, remaining in the Cavities of the Intestines, is not discharg'd, but reaches the Mass of Blood, and generally excites

cites Fevers, violent Convulsions, Spasms and Pains. But, in this Case, the greatest Injury is done to the Constitution, when hot Sudorifics, or volatile spirituous Substances, are used, since by this means the impure *Bile* is plentifully convey'd to the Mass of Blood, and nervous Parts, and excites the most dangerous Symptoms. Concerning this, *Hippocrates* has left us a beautiful Passage in his Book *De Veteri Medicina*. "When," says he, a certain bitter Liquor, which we call yellow *Bile*, is diffused, what Anxieties, fervent Heats, and Weaknesses, forthwith seize the Patient! But when we are freed or purg'd of the Excess of this Liquor in due Time, either spontaneously, or by means of proper Medicines, then both the Pain, and intense Heat, are manifestly remov'd. But when by Length of Time, this Liquor is become crude, intemperate, and elevated above its natural State, neither the Fever nor Pains can be allayed by all the Suggestions of Art: And indeed what Madness, what Despair, what Gnawings of the Viscera and Breast, are those afflicted with, who abound too much with a stimulating, acrid and æruginous *Bile*!" *Hippocrates* very justly observes, that these Effects are only produced by an intemperate *Bile*; for if a temperate *Bile* is by a Fit of Anger thrown into the Intestine in too large a Quantity, it does not prove so hurtful, but rather a Remedy in cold Constitutions, as *Hippocrates* in a great many Passages observes.

I shall now inquire what Disorders may possibly arise from a tainted and perverted *Bile* convey'd into the Mass of Blood. Among these we may justly and principally reckon those Fevers called bilious, and continual double Tertian Fevers. And tho' Fevers themselves generate *Bile*, yet it is not to be doubted, but they may also arise, or be produced, from a bad and peccant *Bile*. *Hippocrates* concurs with me in this Opinion, who, in his Book *De Natura Hominis*, informs us, that most Fevers, especially a continual Quotidian, Tertian and Quartan, arise from the *Bile*. For, first, 'tis not to be doubted, and indeed we have the Sense of Antiquity full on our Side, that the proper Seat and Origin of most Fevers, especially those of the intermittent and burning Kinds, and such as are called *choleric*, is in the first Region of the Body, that is, about the *Præcordia*, the small Intestines, the Cavities of the Liver, the Spleen, the Pancreas, and the Omentum; for, as in these Organs the Circulation is generally slow, Impurities are generated, and corrupt acrid Humours flow from the Pancreas into the Intestines, and generally excite not only the spasmodic and feverish Symptoms which accompany hypochondriacal Disorders, but also the above-mentioned Fevers. For the Symptoms, which generally attend these Fevers, for the most part, make their first Appearance in the first Region of the Body, as evidently appears from the Inflation of the Stomach and Abdomen; the Pain of the Back, the Nausea, the Vomiting, and the Constipation of the Belly. And because, when any highly sensible Part of the Body is affected with Spasms, all the other Parts are readily drawn into Consent with it, hence the Horror, the Rigor on the Surface of the Body, the Coldness, the convulsive Pains of the external Parts, and Pandiculations, draw their Origin from the Irritation of the *Primæ Viæ*. Besides, the Diarrheas, the bilious Vomiting, the reddish high-colour'd Urine, the insatiable Thirst, the intense Heat, the violent Coughs, the Erosion of the Fauces, as also the Relief afforded by Refrigerants, gentle Evacuants, and such Preparations of Nitre as correct and allay the Acrimony of the *Bile*, and, on the contrary, the Mischiefs produc'd by volatile, hot, oily, and acrid Medicines, are Circumstances which manifestly declare, that a corrupted *Bile* is lodged in the *Primæ Viæ*, and Mass of Blood; and consequently fully prove my Assertion. Besides, we may observe, that young People, who have bilious Constitutions, and are prone to Anger, are easily thrown into Fevers; and that such as have formerly labour'd under critical bilious Diarrheas, if these do not return the following Year, are in their stead seized with tertian Fevers, accompanied with a pungent Pain, and Gnawing of the Stomach, which cease when plentiful Discharges of a yellow bilious Matter by Vomit and Stool come on.

Among many others, there is a beautiful Passage of *Hippocrates* in Confirmation of my Opinion, in his Book *de Affectionibus*. "Where," says he, there is a Fever, the Patient has "an insatiable Thirst, a rough and black Tongue, and a bilious Colour; his Spit is bilious; he is cold externally, but pretty hot internally. Refrigerants are proper in this Case, and the Disorder proceeds from agitated *Bile* pent up in the Body."

Fevers of this kind generally terminate on the seventh Day; nor does the Method, in which these Fevers terminate, less confirm my Opinion; for they generally terminate on the seventh Day, by a critical Jaundice, without any Sense of Heaviness, Tension, or Pain, in the Right Hypochondrium, especially in Patients labouring under continual tertian Fevers. *Hippocrates*, in his Book *de Morbis*, justly observes, that it conduces very much to the Relief and Safety of feverish Patients, and

such as abound with *Bile*, to have the *Bile* evacuated in due Time.

The Antients, and particularly *Hippocrates*, as also, among the latter Physicians, *Fernelius*, assign the Putrefaction of the *Bile* as the Reason why Fevers are augmented. Accordingly, the last-mention'd Author, in his *Patholog. de Febris*, has these Words: "In Fevers the *Bile*, becoming putrid, acquires "a malignant Quality; and that in the Beginning of the Access, it rushes violently, and in large Quantities, into the Membranes of the Duodenum, is sufficiently proved from "the dry Cough, the Oscitation, the Suffocation, the Anxiety, the Distension of the *Præcordia*, the Pain, the Nausea, the Vomiting, and the white thin Urine."

And indeed 'tis certain, that the *Bile*, when in a State of Rest and Stagnation, very easily becomes putrid. Now nothing is more injurious to the human Constitution, nothing more impairs its Strength and Vigour, nothing more disturbs and perverts its natural Motions, than corrupt and putrid Substances. For which Reason, we justly deduce the Origin of violent Fevers in cachectic and phlegmatic Patients, from a large Quantity of corrupted *Bile* in the *Primæ Viæ*. Besides, if putrid *Bile* is lodged in the *Primæ Viæ*, it easily admits, multiplies, and renders active, the Contagion of the Plague, malignant and petechial Fevers, Small-pox, Measles, Dysenteries, and other contagious Diseases. Hence those Medicines which either by Vomit or Stool discharge the Sordes from the *Primæ Viæ*, such as the *Acidula*, purging Flax, Nitre, Spirit of Vitriol, Spiritus Vitrioli dulcis, and Elixir Proprietatis prepared with a proper Acid, prove excellent Preservatives against Contagion, and malignant Distempers. Nay farther, an impure *Bile*, generated afresh in a considerable Quantity, lays a new Foundation for the Paroxysms of intermittent Fevers. Hence the Reason is obvious, why Evacuants, which operate without inducing Spasms, and do not injure the Tone of the Intestines, such as the *Pilulæ amaræ*, neutral Salts exhibited in large Doses, Mercurius dulcis, as also those Medicines which correct the too great Acrimony of the *Bile*, such as Preparations of Nitre, and those which prevent its Corruption, such as bitter earthy Substances, and *Peruvian Bark*, and such as strengthen the Tone of the nervous Parts, in order to prevent spasmodic Contractions in them, are of all others best calculated for removing the Cause and Origin of intermittent Fevers.

I now come to consider a Phenomenon of the highest Importance in the Practice of Physic, which is, that, in all feverish Disorders, the *Bile* is not only plentifully generated, but also vicious and peccant, by reason of the Dyscrasy of the Humours, and the disorderly Circulation of the Blood. Now this *Bile* necessarily flows into the Intestines, and, if it is not evacuated, lodges in them, and passes into the lacteal Vessels, and the Blood itself, by which means the most terrible Disorders are produced. For which Reason in all Fevers a soluble Belly, whether 'tis so naturally, or made so by Medicines, is a highly lucky and salutary Circumstance (a most excellent Remark!) Hence when Fevers of this kind are accompanied with Costiveness, we generally observe, that purple Fevers, Aphthæ, Inflammations of the Mouth and Fauces, and exanthematous Eruptions of various kinds, appear; the Reason of which is no other than this, that the corrupt and bilious Humours generated during the preternatural and febrile Commotion of the Blood, coming into the Blood itself, are thrown out to the Surface of the Body. I must on this Occasion observe, that the Purples, which appear principally in the Summer, and generally seize People whose Fluids are impure, as those of pregnant Women, and scorbutic Constitutions, for the most part are, and which often appear on the seventh or ninth Day of many acute Fevers, arise principally from bilious Humours fluctuating in the *Primæ Viæ*. For this Reason all Medicines which correct Acrimony, and evacuate gently, not only guard against, but also remove the Purples, especially if gentle Diaphoretics, in Conjunction with proper Acids, are now-and-then duly interposed. Women in Child-bed are frequently seized with a purple Fever, which arises from the Lochia not being discharg'd, and the *Primæ Viæ* evacuated; and this Species of the Disorder, if not judiciously treated, proves mortal.

I now come to consider some other Distempers, whose Origin is properly deduced from a Fault in the *Bile*; and the first I shall mention is the Erysipelas, especially if the Patient is costive, and Transpiration is obstructed; for nothing more corrupts the *Bile*, or more effectually stores it with impure and caustic Salts, than an Obstruction and Suppression of the usual cutaneous Evacuations. When, then, a *Bile* of this caustic Quality is lodged in the *Primæ Viæ*, it excites Horrors, Anxieties, and Vomiting; and being afterwards received into the Blood, is generally thrown off the third Day by the febrile Motion. Arthritic Pains, which, according to the Antients, draw their Origin from a hot Cause, are in like manner principally produced by a Fault in the *Primæ Viæ*, arising from a vitiated

vitiated *Bile*, which being convey'd into the Blood, proves the Cause of all these Pains, whilst the caustic Salts with which the *Bile* is impregnated, are fix'd upon the Membranes of the Joints. And this is the Reason why Fits of the Gout are for the most part usher'd in by Pains of the Stomach, Anxieties, Nauseas, and Loss of Appetite. Hence the Person who knows how, on these Occasions, to evacuate the *Primæ Viæ* without raising tumultuous Commotions in the animal Oeconomy, and at the same time to correct the Acrimony of the Humours, is the likeliest to succeed in removing, or at least mitigating, arthritic Pains.

It also deserves our greatest Attention, that Hæmorrhages, which either happen at stated Periods, or such as are critical and symptomatic in Diseases, have their chief Cause and Origin in the *Primæ Viæ*: For in these, Flatulences, Coarctations, and Constrictions, are perceiv'd; a heavy depressing Pain is felt in the Hypochondria and Back, the Patient is costive, the extreme Parts are cold, and the Impetus of the Blood is afterwards directed to some particular Part of the Body, whether the Head or Lungs, the Anus or the Uterus. But the Medicines which are best calculated for allaying and restraining the Violence of the Flux, are those which are gently purgative, but which, at the same time, preserve the Tone of the Intestines, and render the *Bile* temperate and balsamic; such as Preparations of Rhubarb, the *Pilulæ Becherianæ*, the *Pilulæ Macrocotinæ*, my balsamic bitter Elixir corrected, and volatile oily Salts frequently exhibited; but in small Doses; but for correcting the Acrimony and Volatility of the caustic and corrosive *Bile*, Preparations of Nitre, and the precipitating Powders, as they are sometimes call'd, are of all others the most effectual.

Can it now be doubted, whether from these Circumstances we may not justly conclude, that a vitiated *Bile*, accumulated in the *Primæ Viæ*, proves an Occasion and Stimulus to Hæmorrhages, in Constitutions disposed to them, by the preceding Spasms of the *Primæ Viæ*? And on this Occasion it must be observed, that periodical and stated Evacuations of Blood, as also arthritic and catarrhus Disorders, appear for the most part in the Autumn or Spring; or about the Months of *October* and *March*; for which no other Reason can be assign'd, than that the equable Tone of the Fibres is at these Seasons lost; in Consequence of the Inequalities in the State of the Atmosphere and Weather; and thus the Equilibrium of the Fluids and Solids, in which Health consists, is destroy'd; and that at these Times the active excrementitious Salts, which ought to be carried off by Transpiration, pass principally into the *Bile*, where, with their united Force, they descend to the Intestines, and produce numberless Disorders.

But 'tis particularly to be adverted to, that by the Corruption, Acrimony, and corrosive Quality of the *Bile*, in Consequence of an Admixture of many stimulating heterogeneous and corrosive Parts, violent Defluxions are excited in the Intestines themselves; for hence arise Diarrheas, Choleras, violent Vomitings, Gripes, and Dysenteries. The Antients, as well as the Moderns, ascribe these Disorders to an æruginous, porraceous *Bile*, which preternatural Colour sufficiently manifests, that its due Crasis and natural State are destroy'd by an Admixture of some corrosive Acid; for 'tis certain, that the *Bile* acquires a greenish Colour by the Addition of an Acid; and green Fæces in Children are manifest Proofs, that there is a large Quantity of Acid generated from the Milk they suck; for by Acids the natural Colour is destroy'd, and a Disease is brought on. *Hippocrates*, in his Book *de Natura Hominis*, has long ago condemn'd a greenish-colour'd *Bile*, in the following Words: "Green *Bile* stagnating near the Liver, where 'tis always in an Ebullition, is the Cause of Corruption, and a troublesome Inmate." Besides, practical and anatomical Observations sufficiently confirm, that a green *Bile* is the Cause of the above-mentioned Disorders: Thus *Diemerbroeck* affirms, that upon opening the Body of a Patient who died of a violent bilious Diarrhea, in which the Excrements were green, he found the Gall-bladder filled with a deep-green *Bile*, and distended to the Bulk of a Hen's Egg. The same Author informs us, that, in the Hospital in which he was concern'd, the *Bile* lodg'd in the Gall-bladders of some of the Patients, was, upon their being dissected, found highly green, æruginous, and of a somewhat blackish Cast; nay, in a young Daughter of Mr. *Ulyches*, who died of a Flux, in which the Excrements were æruginous, and who was laid open by myself in the Presence of several Physicians, I found the Gall-bladder distended to the Bulk of a Hen's Egg, and fill'd with æruginous *Bile*; which Circumstance I have also observed in other Children who have died of a like Diarrhea, and in some to whose Lives the Cholera Morbus has put a Period. *Pechlinus*, in his *Exercitatio de Purgantibus*, affirms, that he has often found the hepatic *Bile* black and livid, or of a leaden Colour. In a young Student of Distinction, and of a melancholic Habit, I observed the *Bile* in the Gall-bladder thick and black, like that of a Fish; which Circumstance I also remember to have seen in a *Maniac*, who after his Death was laid open. By *Bontius de Medicina Indorum* we are inform'd, that in an asthmatic Boy, who died

of a Dysentery, the Gall-bladder was found stuffed with a blackish Humour; and this black Colour is to be ascribed to no other Cause than the large Quantity of an Acid, which, by inducing a Stagnation of the *Bile*, renders it in Process of Time black. The Reason is therefore obvious, why in the above-mentioned Diseases, and in their Beginnings especially, gentle Emetics, Rhubarb; as also the precipitating nitrous Powders, Milk, Whey, Oil of sweet Almonds, anodyne and emollient Clysters, and the Cremor of Pisan, of all other Medicines prove the most effectual; for the *Bile*, when rendered highly acrid and caustic, excites Symptoms like those produced by Poison. *Borrichius in Art. Med. Haffn. Tom. 3. Obs. 36.* gives us the Case of a Youth afflicted with the same Symptoms which are generally produced by Poison, for an Erosion of his Stomach by an highly acrid *Bile* ensued. The same Author writes, that not only the *Bile*, but other Humours affect the Body and Stomach in such a manner, that one would be induc'd to think the Patient had taken a Dose of Poison, in which Case they undoubtedly acquire a malignant Quality, by which they corrode and vellicate the Membranes, and other sensible Parts, in the most violent manner, and excite the most intolerable and rack-ing Pains. For a Proof that the *Bile* may become so corrosive as to raise an Ebullition like *Aqua-fortis*, when thrown upon the Earth, see *Borelli, Observat. 1. Cent. 2.*

From what has been said, I think it plainly appears, that the *Bile*, when in its natural State, both as to Quantity and Quality, is a Medicine, and an Humour of the highest Use and Importance to the Body, and a Poison when vitiated; and that consequently the Health of Man may either be preserved or destroyed by the *Bile*; and that for this very Reason, both in accounting for the Symptoms of Diseases, taking our Indications, and prescribing the Means of Relief, we are in a particular manner to advert to the State and Condition of this Humour; and carefully observe whether it is faulty, either with regard to its Quantity, its Quality, and the Degree of its Motion; for certainly many Medicines, which are very efficacious in the Cure of Diseases, operate no otherwise than by increasing the Quantity of *Bile* when deficient, evacuating it when redundant and superfluous, correcting it when vitiated, and preserving its Motion to the Intestines in its due and proper State; for few Medicines act directly and immediately upon the Blood and Humours, but most of them exert their Virtues and Efficacy upon the *Primæ Viæ*, where, in a secondary manner, they correct the vitious Humours, of which the *Bile* is the principal, which are the direct and formal Causes of Diseases. This Observation holds good in a particular manner with regard to Emetics, Laxatives, Absorbents, Acids, Preparations of Nitre, tempering Medicines, Emollients, Bitters, fix'd Salts, Chalybeates, Corroboratives, and others of a like Nature. *Hoffman.*

The above-quoted Author, in another Part of his Works, makes the ensuing Remarks relative to the *Bile* and its Organs.

The Blood is conveyed to the Liver by the *Vena Portæ*, which being a venous Vessel, the Motion of the Blood through it must of course be slow. The *Vena Cava* carries back the Blood to the Heart. The hepatic Artery conveys Nourishment to the Parts of which the Liver is composed; and the biliary Ducts carry the secreted *Bile* partly through the *Ductus Cholochochus* to the Duodenum, and partly through the *Cystic Duct* to the Gall-bladder; for indeed the only Use and Design of the Liver is to separate the sulphureous, torrefied, and lixivial Parts of the Blood and Serum convey'd to it through the *Vena Portæ*; so that the Antients were mistaken when they believ'd, that the Liver was the principal Laboratory of Sanguification.

The *Bile*, which is a thick Humour, and heavier than the Blood itself, requires a mechanical Apparatus of a particular Kind, for its Secretion.

For the Secretion of a thick Humour, 'tis necessary that the Blood flowing into the secretory Organ should be thick, that a fine Liquid may not pass in too large a Quantity through its capacious Ducts.

As the Separation of thick Humours requires pretty large Canals and Ducts; and as a thin Liquid passes through these with ease, and even greater Ease, than a thick one; hence, lest too thin a Lymph should be secreted, it was necessary that the Blood should in a great measure be previously deprived of its thin lymphatic Part, which is done in the Kidneys, the Stomach, the whole intestinal Tube, the Omentum, and Pancreas, through all which Parts the Blood must necessarily pass before it reaches the Liver.

That the *Bile* may be secreted in the Liver, 'tis requisite that its Motion and Progress through that Organ should be slow.

For in general all the Secretions and Excretions are more advantageously carried on by a slow than an accelerated and rapid Motion; because, during the former, the fluid Parts are more easily separated from those which are more thick and solid, and the fine aqueous Parts are carried into the lymphatic Vessels, of which there is a great Number in the Liver; and those that are thicker are convey'd through the biliary Ducts.

In order to form a clear Idea of the Separation of the thick bilious Humour, we must carefully attend to the singular Structure of the Vena Cava, and its Connexion with the Vena Portæ, since in these there is a peculiar Kind of Mechanism, not to be observed in any other Parts of the Body.

For though in other Parts the Extremities of the Arteries are joined to those of the Veins, and form one continued Canal; yet this does not happen in the Liver; for the minute Ramifications of the Vena Cava are inserted into the Sides of the Vena Portæ in such a manner, as to form right Angles with them; for no other Reason, than that the Blood, which is thinner than the Bile, may be forced into the Orifices of the Vena Cava, just as the Chyle is into the Intestines, after it has left the thick Bile, which is then convey'd into the *biliary Ducts*, adjacent to the Vena Portæ, and thence forced through the Ductus Cholodochus, and Communis, to the Duodenum, and through the Ductus Cysticus to the Gall-bladder.

Though the Bile, in Consequence of the Ingredients of which it is composed, is an Humour disagreeable both to the solid and fluid Parts of the human Body, and in this Sense excrementitious, yet, with regard to the Elaboration of the Chyle, 'tis highly useful and necessary, and consequently ought not to be discharged from the Body, till it has exerted itself to that Purpose.

The Expansion of the Stomach by means of the Aliments, and the Fermentation they undergo in it, very much assist the Conveyance of the Bile from the Gall-bladder to the Duodenum.

The Situation of the human Gall-bladder is very remarkable, since its Neck is higher than its Bottom; for which Reason the Ascent of the Bile is very difficult, especially since it must flow from a wide to a narrower Place. Then again, because the Ductus Cholodochus passes a long Way between the second and third Coats of the Duodenum, and at last opens with a round Orifice into its Cavity, the Bile cannot at all times be discharged into the Duodenum, but only when the Intestines are relaxed, and the Gall-bladder compress'd by the right Side of the Stomach, when rendered turgid by the Quantity and Fermentation of the Aliments.

The larger the Quantity of Aliments taken into the Stomach is, the more it must be expanded, and consequently the greater the Compression of the adjacent Gall-bladder must necessarily be; for which Reason the Bile must on these Occasions flow plentifully to the Intestines.

It is a Circumstance deserving our Attention, that in Animals whose Stomachs are become flaccid by long Fasting, the Gall-bladder is turgid and distended, whereas, after they have taken a large Quantity of Aliments, it is observed to be only half-full. It is also remarkable, that in human Fetuses the Gall-bladder is found distended with Bile, because in them the Stomach is collapsed, and free from Expansion. *Hoffman*.

There are some farther Circumstances relative to the Bile, of too much Importance to be omitted.

The Bile, when out of the Body, is highly bitter, and the most acrid of all the animal Fluids; it is neither of an alkaline, nor an acid Quality. It resists Acefence, and conveys the same Quality to other Substances with which it is mixed. It tends very much to Putrefaction, which it promotes, when added to other Substances disposed to it. It very soon mixes with Water; and when inspissated over a gentle Fire, it dissolves, if exposed to the Air. It does not burn in the Fire, unless it be previously dry'd. It renders Oils, and oleaginous Substances, miscible with Water. If it is rubb'd with any tenacious Substances, such as Resins and Gums, it resolves and attenuates them. It is coagulated by Fire, Alcohol of Wine, acid Spirits, and Extract of Galls: See *Boerhaave Chym. Vol. I. P. 343, 732, 736, 842.* and his *Institut. Med. Sect. 99.* I shall now take a brief Survey of the several Experiments which the Curious have made on the Bile of various Animals. When the Bile, then, of an Ox was put into different Vessels, and mixed with various Liquors, in order to discover what Changes they produced, either in its Consistence or Colour, it was found to hold universally, that Spirit of Sal-Ammoniac produced no Coagulation in it, tartarated Spirit of Wine a very small one, pure Spirit of Wine a somewhat greater in some Parts of the Bile, and Oil of Tartar per Deliquium none at all. Spirit of Vinegar, and Vinegar itself, produced large and fibrous Concretions in it. Spirit of Verdegrise and Sulphur, Oil of Vitriol, Spirit of the Butter of Antimony, Spirit of Honey, and Extract of Galls prepared with common Water, produced a very firm Coagulum in the Bile; but Spirit of Nitre a very small one, and Aqua-fortis but a moderate one. The express'd Juices of Monkshood or Hemlock produced no Coagulum in it; and a Mixture of the Juices of Deadly Nightshade, Onion, Horseradish, and Vipers-grass, produced a very small Coagulum with it. No Condensation or Change at all was produced in it by the Juices of Tansey, Sage, Mint, Masterwort, Angelica, Lavender, and Baum; but a small Condensation and Change were produc'd in it by the Juices of Succory, Smallage, Bistort, Mugwort, and Pilewort. When all these Liquors were mix'd with the Bile, and kept till the next Day, whatever Concre-

tions were produc'd were fibrous and light; for they floated in the Liquor, and contained nothing solid: But the Parts not condens'd were serous like Whey, or the Serum of the Blood. Besides these coagulated and serous Parts, some pinguious Portions adher'd to the Sides of the Vessels. The Concretions produced by Spirit of Nitre, or Aqua-fortis, were alone not fibrous, but divided into Grumes and Froth. The Coagulum produced by the Extract of Galls seemed to be the firmest of all, and almost free from all Serosity, which being condens'd separately, assum'd the Consistence of a Jelly. *Du Hamel Hist.*

Ox's Gall mixed with Powder of Alum, by shaking them gently together, excited a perceptible Effervescence. The Mixture became turbid, but the Colour of the Bile remain'd the same it was before, and a Precipitation was insensibly made. If this Mixture is exposed to the Rays of the Sun, the Liquor becomes clear, and assumes a reddish Colour. If five or six Days after this the floating Sordes and the Sediment are separated, and the clear Liquor again exposed to the Heat of the Sun for three or four Months in a close-stopp'd Phial, it deposits still another Sediment, and gradually exhibits on its Surface a white, hard, and sebaceous Fat; but the Liquor itself assumes a yellow citron Colour, and a Smell resembling that of boiled Crabs. To one Pound of the Bile there was half an Ounce of Alum added, and the Quantity of the Matter precipitated exceeded that of the Alum; which is an evident Proof, that some Part of the Bile, that is, its earthy Portion, had been carried to the Bottom of the Vessel along with the Alum; but we may reasonably conclude, that the Fat floating on the Top was separated from the Bile. *Homburg* has described this Experiment, and at the same time taught us a Method of preparing a Medicine from it, when it is freed from its earthy and pinguious Parts, by being exposed to the Heat of the Sun for at least two or three Months. The Design of the Medicine is to remove those Blemishes in the Face, especially the Nose, which arise from a thick and unctuous Matter collected and treasured up in the cutaneous Ducts; and which, when express'd, are of the Form of a Worm, and become black in the Air. The Method of preparing this Medicine is as follows:

Mix half a Dram of Bile prepared as above, with an equal Quantity of Oil of Tartar per Deliquium; then adding an Ounce of River-water, keep it for Use in a close-stopp'd Phial.

The Method of applying it is to dip the Point of the Finger in it, and anoint the Part affected seven or eight times a Day. *Mem. Ac. R. Sc. A. 1709.*

I shall now mention some of the Experiments try'd on the Bile of an Ox by *Bagliu*.

Ox-gall then, upon the Admixture of Oil of Tartar per Deliquium, was concreted into a kind of fibrous Coagulum with a Froth, but its Colour remain'd unchang'd. The Bile of an Ox, upon an Admixture of Mercury sublimatè, was forthwith coagulated, and assumed an obscure greenish Colour, which daily increased. Ox-gall, mixed with Spirit of Vitriol, first produced a great Froth, and then coagulated into a greenish Mass, the Acidity and Greenness remaining unchanged. Twenty-four Hours after there was a green thick Sediment found in the Bottom of the Vessel, but the Taste of the Liquor remained the same. The Bile of a Calf newly kill'd immediately quitted its yellow Colour, and became green by the Admixture of Oil of Vitriol, and retained that Colour for three Days: It was render'd less green by Spirit of Nitre. With Oil of Tartar the same Bile was in a great measure coagulated into white Clots, which floated up-and-down in the rest of the Liquor. *Bagliu*.

Six Pounds of Ox-gall upon Distillation, yielded almost eighty Ounces of Liquor, three Ounces and two Drams of Oil, twenty-four Drams of volatile Salt, and five Drams of fixed Salt. *Hist. Ac. R. Sc.*

Hartman made the Analysis of Ox-gall in two different manners: And, first, for Distillation from a Retort, he took nine Ounces and five Drams of Bile, and having mixed them with Sand, he put the Whole into a Retort; and first of all seven Ounces of a watery-coloured Phlegm were yielded; after this there succeeded another Phlegm of a milky Colour, mixed with an Oil, which, taken together, amounted to two Ounces and three Drams. This Oil was of two Kinds; for one Part of it floated on the milky Phlegm, and another subsided to the Bottom of the Vessel: But after some Weeks the greater Part of that which floated on the Top fell to the Bottom, at which time it was observed to assume a Lentor, not unlike that of Pitch. The Form of a volatile Salt was not to be discovered, tho' the Smell of it struck the Nostrils. From the Caput Mortuum calcin'd, seven Grains of a fixed Salt were procured. A dusky, black, and almost insipid Matter, without the least Degree of Tenacity, adher'd to the Neck of the Retort. The Distillation of Ox-gall by the Alembic, he managed in this manner: First he took one Pound three Ounces and two Drams of the Gall.

The Phlegm yielded by this was all of one Colour, that is, an aqueous one; and it diffused a sulphureous saline Smell, resembling that of the milky Phlegm yielded by the Retort.

Nor was the Phlegm of any other Smell which was distilled afterwards with the Oil, and which was not of a milky Colour, but rather resembling that of Fire, when the rest of the Mass appear'd thick and black in the Alembic.

The Weight of this Oil and Phlegm together amounted to an Ounce and an half: But 'tis something remarkable, that the Oil yielded by this Distillation was not like that yielded by the Retort of two Kinds; for it constantly floated on the Surface of the Phlegm, and retain'd the Form of a fluid Oil.

There was no refinous Colophony, but a dusky black Caput Mortuum remain'd.

Volatile Salt, which would have adher'd to the Alembic, in its proper Form, and shewn its pure saline Spicula, did not at all appear.

One Dram and thirteen Grains of fix'd Salt were procured from the Caput Mortuum. *Burgrav. Lex.*

Baglioli makes the following Experiments on Sheeps Gall. I divided, says he, Sheeps Gall into several Cups one Morning, when the Weather was rainy. Its ungrateful, and; as it were, urinous and putrid Smell irritated my Throat, and created a small Pain in my Head. The Bile itself was transparent, and of a Colour resembling that of Tobacco. The Fingers which were employ'd in handling it were clean and white, and the Skin somewhat corrugated, just as when we wash our Hands with Soap.

I. The Bile, mixed with rectified Spirit of Wine, produced no Fermentation whilst the Substances were mixing. Twenty-four Hours after, it was of a brownish Colour. In the transparent brownish Liquor, white small Filaments floated confusedly; and at the Bottom of the Vessel there was a farinaceous Sediment. The Bitterness was the same, or rather somewhat increased. On the third Day it was the same. By the Addition of common Water the brownish Colour became somewhat more clear. On the twelfth Day the Smell was grateful, the Liquor transparent, but its Colour brownish; and in the Bottom of the Vessel there was a Sediment.

II. Oil of Tartar, added to the Bile, produced no new Phenomenon upon their being mix'd. Twenty-four Hours after, it assumed an obscure-brownish Colour, but the Liquor was entirely limpid and transparent; and in the Bottom of the Vessel there was a small Quantity of a white Sediment. Its Smell resembled that of over-roasted Eggs. The Bitterness was the same, but rather more intense. On the third Day it was still the same; and the Addition of common Water produced no new Phenomenon. On the twelfth Day the Smell resembled that of Lime. There was a small Sediment at the Bottom; the Liquor above it was transparent, and its Colour somewhat greenish.

III. Salt of Wormwood, reduced to Powder, and added to the Bile, at first produced no Change in it. Twenty-four Hours after, the Salt lay entirely undissolved at the Bottom. The Liquor itself was somewhat transparent, and its Colour was darkish, resembling that of Tobacco. It had the same urinous and putrid Smell, the same Bitterness; but soon after, becoming more acrid, and its Bitterness being much increased, a small Quantity of it, which I tasted, excited a violent Vomiting. By adding common Water its Colour was changed into a Dark-yellow. On the third Day after the Addition of the Water it became somewhat fetid, but its Colour remained the same. The Salt was not as yet dissolved in the Bottom of the Vessel, but remained without any Alteration for fifteen Days.

IV. Crude Alum, reduced to Powder, produced no remarkable Change in it, when first mix'd with it. The second Day, however, the Liquor was highly turbid; its Colour obscure, but transparent, and greenish towards the Surface. Towards the Bottom of the Vessel it was viscid, dense, and a cineritious Portion settled at the Bottom. Its Smell resembled that of salted Fish. Its Bitterness was somewhat diminish'd. On the third Day it was the same in every respect. Upon an Admixture of common Water it immediately acquired a Colour resembling that of Butter. On the twelfth Day the Liquor was transparent, but its Colour remain'd the same; and in the Bottom of the Vessel there was a brownish Sediment.

V. Twenty-four Hours after an Admixture of Cinnamon-water, there was a white cineritious Sediment in the Bottom of the Vessel; but the Liquor above it was transparent, and of a brownish, but not very dark Colour. The Smell was the same with that of the Cinnamon-water, which had proved more than a Balance for the urinous putrid Smell of the Sheeps Gall. The Bitterness was grateful enough to the Taste, and not very pungent, but resembling that which I observed produced by the Salt of Wormwood. The third Day after, it was the same in all respects. Upon an Addition of common Water, there was no Change produced in its Colour; but the Smell became highly grateful: On the twelfth Day the Liquor became turbid, and its Smell disagreeable.

VOL. I.

VI. Tincture of Cantharides extracted upon hot Athes, with common Water, and added to the Bile, produced no Change when first mix'd. The second Day after, there was a small Quantity of a thin farinaceous Sediment found at the Bottom; but the Liquor about it was transparent, and of the Colour of Tobacco. Its Smell was ungrateful, like that of the Leaves of Dwarf-elder bruised. Its Bitterness was not very ungrateful; and on the third Day its State was the same. Upon an Addition of common Water nothing new happen'd. On the twelfth Day all the Parts of the Liquor were turbid; it assum'd a feculent reddish Colour, and an ungrateful Smell.

VII. Upon an Addition of common acid Spirit of Salt, there was a Fermentation, and a Change of the Colour, into an Obscure-yellow, produced. On the second Day the Colour was highly green, and in the Bottom of the Vessel there was a gross white Meal. The Smell was ungrateful, and resembled that of salted Fish. Its Bitterness was ungrateful, and a small Quantity of it, being tasted, excited a kind of Inclination to vomit. On the third Day it was the same in every respect. Upon an Admixture of common Water, the Liquor became more transparent, and somewhat whitish. On the fifteenth Day the Smell was the same, but somewhat less intense. In the Bottom there was a greenish Sediment, and the Liquor above it was green and transparent.

VIII. Spirit of Hartshorn, added to the Bile, immediately changed its Colour into a beautiful, but somewhat obscure Yellow; and there was no Sediment to be seen at the Bottom. The Smell of the Spirit proved more than a Balance to that of the Bile. Its Bitterness was grateful, almost like that produced by the Cinnamon-water. On the third Day the Colour of the Bile, its Transparency, and Smell, remain'd the same till the eighth, when, upon an Addition of common Water, all its Parts became clearer. On the twenty-fifth Day, by adding warm Water, the Liquor became turbid and foul, and assum'd an ungrateful Smell, and a Colour resembling that of the Yolks of Eggs.

IX. Eighteen Hours after an Admixture of Spirit of Sal Ammoniac, it assum'd an universally transparent beautiful Colour, like that of a Ruby. The Smell of the Sal Ammoniac was stronger than that of the Bile. The Taste was gratefully bitter, like that produced by the Cinnamon-water and the Spirit of Hartshorn. On the third Day it was in the same State; but its Colour was a little more obscure, and continued so till the tenth Day; when, by an Addition of common Water, it assumed a beautiful transparent Colour, like that of pure White-wine. After which, by reason of the Admixture of the Water, it became turbid, foul, and assumed an ungrateful Smell.

X. Upon an Addition of Spirit of Nitre, it was immediately changed to a Colour resembling that of the Yolks of Eggs, and a gentle Fermentation was produced. On the second Day its Colour was intensely green, and rather more so than when mix'd with Spirit of Vitriol. Its Smell was acid and ungrateful, and in the Bottom of the Vessel there was a thick white Mass. The superior Part of the Liquor was green, and somewhat transparent and limpid; but its Taste was acid and bitter. On the third Day it was the same in all respects; but upon the Addition of common Water, its intense Greenness was somewhat abated. On the twelfth Day there was a large Quantity of Sediment at the Bottom, and the Liquor above it was transparent, but of a high-green Colour, which remained the same.

XI. Upon an Addition of Spirit of Vitriol, it was changed from its natural brownish Colour to one resembling that of the Yolks of Eggs, and a small Ebullition was produced. On the second Day all the Parts of the Liquor were become turbid, and gross Filaments floated confusedly in it. Its Colour was everywhere greenish, and somewhat inclined to an azure Blue. Its Smell was like that of salted Fish, and its Taste entirely acid. On the third Day its State was the same in every respect: Its acid Smell strongly affected the Nostils.

XII. When the Bile was mix'd with Aqua-fortis, Bubbles were immediately produced, which forthwith became green, and a kind of azure-colour'd Scum floated on the Top of the Liquor. Twenty-four Hours after, its Smell was highly penetrating and acid; and the Liquor itself being highly turbid, a gross farinaceous Sediment was observed at the Bottom of the Vessel. In the Middle the Liquor was somewhat transparent; on the Surface there floated a gross kind of Mucilage, of a white cineritious Colour; and a Froth and Bubbles appear'd about the Sides of the Vessel. On the third Day the Appearances were the same, except that the Smell resembled that of acid and corrupted Milk. On the twelfth Day its State was the same.

XIII. By an Addition of Vinegar the Colour of the Bile was immediately changed into that of the Yolks of Eggs, and render'd entirely thick. On the second Day there was a gross farinaceous Sediment deposited at the Bottom of the Vessel: The Liquor above this Sediment was of a greenish Colour, but turbid. Its Smell was urinous and putrid, like that of salted Fish; and its Bitterness was somewhat abated. On the third

Day it was in the same State, and remain'd so till the thirteenth.

XIV. Common Water, added to the *Bile*, changed its Colour immediately from a dark-brown to a yellow; but it was not so pellucid as before. The sharp Smell of the *Bile* was the same, but rather more intense. Twenty-four Hours after, it had the same urinous putrid Smell, and its Colour became a little greenish. Upon an Addition of a small Quantity of fresh Water the same greenish Colour remain'd, but the Bitterness was abated. On the third Day the Liquor was turbid; and on its Surface there was a Pellicle, like that which usually floats on corrupted Liquors: It was also highly fetid.

XV. This *Bile*, when mix'd with moderately sweet White-wine, became immediately turbid, and its Colour was changed into that of a foul Yellow. The Acrimony of the *Bile*, which before acted so forcibly on the Nostrils, was immediately abated. Twenty-four Hours after, its ungrateful Smell ceased altogether. In the Bottom there was a Substance like a white Meal deposited; and the Liquor above it was yellow, transparent, and intensely bitter. On the third Day it was in the same State, but without any fetid Smell. On the twelfth Day all the Parts of the Liquor became fetid and turbid. *Bagliv.*

Five Pounds of Hogs Gall, newly taken from the Animals, upon Distillation, yielded almost seventy-one Ounces of various, and those sulphureous Liquors; and five Ounces and an half of Oil: Among all which there was an Ounce and an half of a thick and compact Matter, like Colophony or Bitumen; and two Drams of a fix'd Salt. These Liquors remain'd without a Sediment, neither did they become fetid, nor undergo any Change. When digested together, by a gentle Heat, for thirty-one Days, they lost four Ounces of their Weight: And the four Pounds and eleven Ounces which remain'd, left between four and five Ounces of a thick Sediment in the Bottom of the Vessel; and the Liquor above this Sediment was pellucid, and of a greenish-brown Colour. *Du Hamel Hist. Ac. R. S.*

The *Bile* of a human Body, subjected to Distillation with a gentle Fire, immediately yields a Phlegm, and a thick and quickly inflammable Resin remains at the Bottom of the Vessel. By increasing the Fire there ascends a moderate Quantity of a volatile acrid Salt, which leaves behind it, in the inferior Part of the Vessel, a large Quantity of a fix'd, acrid, and lixivial Salt, in form of a dark-colour'd Mass, of a highly acrid Taste, and penetrating Smell. Human *Bile*, when mix'd with Acids, especially those furnish'd by the Mineral Kingdom, produces a gentle Effervescence, and is very sensibly changed as to its Colour. Upon an Admixture of Spirit of Vitriol, or that of Sulphur, there is a gentle Ebullition, produced in it, and it becomes more or less green; letting fall at the same time an acrid Sediment to the Bottom, and losing somewhat of its Bitterness. On the contrary, volatile alkaline Substances not only render it more thin and transparent, but also increase its yellow Lemon-colour. *Bagliv.*

From the above-enumerated Experiments it plainly appears, that the *Bile* is an Humour composed of an Oil, a Salt, and Water. It may therefore be consider'd as a liquid Animal Soap, so that it is of an abstergent and resolvent Quality. That it is so, the Practice of some Tradesmen is a sufficient Proof; for Dyers of Cloth, in order to take out the Grease which sticks to the Wool, and hinders the Adhesion of the Colour, use Soap, or putrid Urine, after it has assumed an alkaline Nature, or a Lixivium of some fix'd Alkali. But they may, with equal Success, use Ox-gall for the same Intention. Painters also use the *Bile* of Animals for mixing and diluting their Paints. It discovers its Efficacy to be the same in Medicine, where a saponaceous Quality is requir'd, or where the Intention is to absterge, where the sluggish Vessels are to be stimulated, where a tenacious Substance is to be resolved, or a viscid one attenuated (*See Boerh. Aph. 75. 5.*). Besides, as *Bile* has for an Ingredient a Salt, which, tho' not an Alkali, yet inclines, and, as it were, approaches to it, like other animal Salts, it must of course prove an efficacious Medicine, in those Disorders, where an Acid is to be resisted and corrected: So that it must be beneficial to Bodies which are prone to generate Acids, to such as abound with mucous and pituitous Humours, and to those who lead a sedentary Life, or labour under Loss of Appetite. It is also added to purgative Medicines, with a View to lubricate, stimulate, and resolve. The Method of using it is to dry it a little, and make it up into small Pills: Three or four Grains may be given for a Dose to Adults; but, for Infants, one Grain of it is sufficient for a Dose. It seems to be owing to this saponaceous resolvent Quality, that a few Drops of the *Bile* extracted from a living Dog, and mix'd with the *Aqua Epileptica* of *Langius*, produce the desired Effect in the Cure of the Epilepsy. *See Astr. Hassl. Vol. 3. Obs. 20.* From these Circumstances we are enabled to discover the Reason, why *Boerhaave* recommended the Use of *Bile*, not only against a spontaneous Gluten, or viscid Humours in general; but more especially prescrib'd it against those Coagulums form'd in the *Primæ Viæ* of Children.

For this Intention he recommends the Galls of Quadrupeds

and Fish, especially those of the Pike and Eel. His Method of prescribing is as follows:

Take of the Galls of a Bull and of a Pike, each four Drams; let them evaporate slowly, on a gentle Fire, till they have acquired the Consistence of Honey; then add a sufficient Quantity of the Powder of fresh *Arum-root*. Make into Pills, weighing three Grains each, to be cover'd with Leaf-gold. Let the Patient take one of these in the Morning, at Noon, and at Night, an Hour before his Meals.

To this Class belongs also the Stone call'd, by the *Spaniards*, *Pedra del Porco*; an Infusion of which, in distill'd Water of *Carduus Benedictus*, or *Rhenish Wine*, may be drank, taking two or three Ounces for a Dose.

To this Class also belongs *Helmont's Medicine*, prepar'd of the Liver and Gall of an Eel, reduced to a Powder by a gentle Fire; one Dram of which is to be given, with three Ounces of *Rhenish Wine*, for a Vehicle. *Boerh. Mater. Med.*

In Page 228. of the same Work, he prescribes a Clyster in the following manner, which he recommends against Disorders of Children, arising from a caseous Coagulation of the Milk they feed on:

Take of Ox's Gall, half a Dram; of the Honey of Mercury, half an Ounce; of distill'd Mint-water, an Ounce and an half: Mix up for a Clyster.

Bile may also be used in deterging glutinous fordid Ulcers. It may also be successfully used in Disorders of the Eyes, where Deterging is indicated as proper: For which Reason *Pliny*, *L. 28. C. 1.* informs us, that Suffusions are cured by the Gall of a Man. *See Dioscor. L. 2. C. 17.* *Etmuller* informs us; that the Gall of Fish, especially that of the Sea-lamprey and Pike, the distill'd Water of it, and its Essence, are proper for curing the *Pannus Oculi*, or that Disorder of the Eyes which is caused by an Inflammation in the small Vessels of the *Adnata* (*see PANNUS*); and that the Secret of *Burrhus*, for this Disorder, was human *Bile*, distill'd from a low Glass Cucurbit, by means of a Brass or Copper Alembic. From what has been said it appears, that the Gall of Animals may be reckon'd among those Medicines which are of a detergent, anti-acid, and resolvent Nature. Hence it is also plain, that the stimulating and anti-acid Virtues of those Stones which are found in the Gall-bladders of Animals, are owing to the *Bile*, which is, in a particular manner, proved by the Stone call'd *Pedra del Porco*. But as the *Bile* soon becomes putrid, and consequently acrid, it is obvious, that it is safer to use it as recent as possible, rather than when old: But it appears that *Bile*, administer'd internally, in hot Constitutions, and such Patients as are choleric, must always do Harm rather than Good, by what has already been said. If, then, the Gall of Animals is unseasonably used, or exhibited in too large Doses, it is then supposed to exert an acrimonious Quality prejudicial to Health; for which Reason every kind of Gall is by some rank'd among Poisons, because it excites bilious Vomitings and Syncopes. *See Forest. Obs. Med. L. 30. Obs. 7. Schol.* But whether the Notion of Poisons is not render'd more intricate than it otherwise might be, by thus ranking among them whatever produces fatal Effects, by being imprudently used, I leave to others to judge. As for the other Properties of Gall, *Pliny*, *L. 18. 9.* seems to be well enough acquainted with them. "Among all the other Substances, says he, common to Animals, the Gall produces the most important and salutary Effects; for it is possess'd of a heating, pungent, incising, extracting, and discutient Quality. The Gall of the smaller Animals is thought to be of a more subtle Nature than that of the larger, and consequently better adapted to the Disorders of the Eyes. It is probable there is some Difference between the Biles of different Animals; for, first, the *Bile* of Fish is more acrid than that of Land-animals. Secondly, among Land as well as Water-animals, those which have the smallest Bodies, are most habituated to Motion, and feed upon other Animals, have a more acrid *Bile* than such as are larger, and feed otherwise. Among Fish, the Preference is given to that of the Pike and Eel; among Land-animals, to the Hawk and Serpent." *Dioscorides*, *L. 2. C. 17.* has observed, that the Biles of some Animals are preferable to those of others in point of Acrimony. But *Paulus Aegineta* is so explicit and distinct upon this Subject, that his Words deserve our Attention. See the Quotation before from this Author. With regard to keeping *Bile* in the Shops for medicinal Purposes, we find the following Directions: The Gall is to be taken from Animals of a middle Age, which have neither suffer'd Hunger nor Thirst, and which have neither been fatigued by too violent Exercise, nor been too much provoked. Having first tied the Vessels which give Ingress and Egress to the *Bile*, it is to be taken immediately from the Liver itself, and put for some time into boiling Water; after which it is to be taken out of the Water, dried in a proper Place, and close kept for Use. It is also sometimes hung up in a Chimney,

in order to dry, without being put into boiling Water. Bile is sometimes used recent and newly taken from Animals, especially from Cocks, Partridges, Fish, and other Animals that may easily be obtain'd, and purchased at a cheap Rate. The Gall of Animals is, by the *Chinese*, applied to the worst and most detestable of Purposes, since they secretly mix it up with other Ingredients, in order to protract the Cure of Wounds, and increase the Misery of their Patients. That the Gall of Bulls produces a golden Colour, when applied to Objects, has been long ago observed by *Pliny*, L. ix. C. 37. There remains another medicinal Preparation of Ox-gall, to be met with in *Le-mery's Pharmacop. Univers.*

Ox-gall, says he, contains a volatile Salt, which renders it deterfive, and proper to cleanse the Skin; but as it is very viscid, and will not keep without corrupting, a Preparation may be made of it in the following manner:

Take of Sugar-candy, two Ounces; of Roch-alum, half an Ounce; of Borax, and Sandiver, or Salt of Glas, each three Drams. After having reduced all these Ingredients to a Powder, and put them into a Glas Vessel, add to them four Pounds of Ox's Gall, distil'd by a Sand-heat from a Glas or Earthen Cucurbit: Stop the Vessel well, and expose it to the Heat of the Sun, or the Smoke of a Fire, for the Space of fifteen Days, shaking it now-and-then; after which filtrate the Liquor, and preserve it for Use.

This Medicine renders the Skin delicate, smooth, and soft, and is esteem'd singularly efficacious in removing Freckles and Sun-burning. It is to be applied to the Face at Night, going to Bed; and is to be wash'd off next Morning with the Water of Lilies, or that of the Water-lily. This Medicine may also be laid on the Face in the Morning when one goes into the Fields, and continue till Night, that the Face may be the better guarded against the scorching Heat.

The Design of distilling the Ox-gall is, that it may preserve itself the better from Corruption, and be the more agreeable to the Ladies Faces. Camphire is generally added to this Preparation; but it is of little or no Use, since it not only remains undissolved, but also gives it a disagreeable Smell. I have also retrench'd the plumous Alum, and the corrosive Sublimate, by some used in this Medicine, because I judged them unsafe.

The Salts which enter this Preparation of Ox's Gall, serve to render it more deterfive and penetrating, that it may the more effectually remove the Blemishes of the Face.

The Vessel into which this Preparation is put must not be entirely full, that the Liquor may be the more commodiously shaken at proper Intervals.

A Preparation of Bile, for cosmetic Purposes, is more easily obtain'd, by dissolving inspissated Bile with tartarated Spirit of Wine, and precipitating it with Water of Frogs-spawn, according to *Hoffman* in his Notes to *Poteries*.

BINARIUS.

Tho' the Word *Binarius*, among the antient *Romans*, implied no more than the Number Two; yet the *Spagiric* Philosophers affix'd an Idea to it, which I cannot convey by any Words. I shall therefore represent their Sentiments in their own Terms. The *Binarius* then, according to them, was either *Naturalis*, or *contra Naturam*. The *Naturalis Binarius* was that which was produc'd by God, in consequence of the Division made between superior and inferior Objects, and which, when wrapt up, as it were, and included under the Bond of Unity, constitutes the *Ternarius*, when it is fit for returning into Unity. The *Binarius contra Naturam* is that very Thing, which, being highly inimical not only to Nature, but more especially to God, of old endeavour'd to destroy all created Objects. This, according to them, is the Source of all Diseases, and of Death; since it is not confin'd under any Bonds, but is rather the first Divorce, strongly endeavouring to break the Bond of Peace and Concord, not only among the supernatural, but also the natural Creatures of the omnipotent God, who form'd all things. *Theat. Chym. Vol. i.*

By these he should mean the same which the *Persians* understand by their *Ormuzd* and *Arimanius*.

BINSICA, A Rabbinical Term, according to *Helmont*, denoting mental Sickness, and particularly a distemper'd Imagination; or, as *Helmont*, in his mystical Way, terms it, an Atrophy of the Organ of the Phantasy, such as, he says, is excited by the Bite of a Tarantula, or a mad Dog, the Consequence of which is what he calls *Mors Binsica*, "a Binsical Death."

BINTAMBARU *Zeylanensis*. *Convolvulus maritimus Zeylanicus*, *Folio crasso cordiformi*. *Pes Capræ (à Folii Similitudine) Lusitanis*. *Herman. Catal. Hort. Leyd.*

It grows in *Malabar*, the Island of *Ceylon*, and other Parts of the *East-Indies*. *M. Herman* supposes this *Convolvulus*, as well as others of that Species, to abound with a purgative Salt, which he infers both from the Acrimony of its milky Juice, which strikes the Tongue and Fauces, and from repeated Experiments; for a Dram of the Resin of the Root, given in the

Yolk of an Egg, or any other convenient Emulsion, gently purged Water from Hydropical Patients: An Extract of the Root, prepar'd with Spirit of Wine, had the same Effect. Hence he believes, that the Opinion which the *Portuguese* and some *Indians* have conceiv'd of its diaphoretic Virtues, (which, perhaps, they entertain'd from its external Resemblance to *Sarsaparilla*) is merely imaginary. Tho' the Root be in the List of Cathartics, its Leaves are the common Food of Rabbits, Deer, and wild and tame Goats. *Raii Hist. Plant.*

BIOLYCHNIUM, *βιολύχνιον*, from *bios*, Life, and *λυχνιον*, a Candle, or Lamp. The Lamp of Life; a Term much us'd by some late Writers, and signifies the same as the *vital Flame*, or the *natural Heat*: It signifies also a sort of Secret prepared of human Blood, mention'd by *Beguinus Castellus*.

BIOS, *βίος*, *βιός*, *βίση*; generally signifies Life, and its Course; but sometimes means no more than *Vitus*, *Victuals*, or Food necessary for Life. *Castellus*.

BIOTE, *βίση*, Life, in an affected Sense, signifies the Time of Continuance of Aliment in the Body, according to *Galen*, *Aph. 20. Lib. 6. Epid. Sect. 5. τὰ ἀδυνάιστα οὐκ ἔλγυρον βίον ἔχει*, "weak Food has a short Life annexed;" that is, weak Aliment makes Persons short-liv'd; or, in the Sense before, is but of short Continuance in the Body.

BIOTHANATI, *βιοθάνατος*, from *bios*, Life, and *θάνατος*, Death. A Term applied to those who die a violent Death. *Castellus*.

BIPINELLA, an Herb, the same as *PIMPINELLA*, which see.

BIPULA, a sort of Worm in *Aristot. Hist. Animal.* as *Gaza* interprets him. *Castellus*.

BIRA. Beer. The same as *CEREVISIA*, which see. *Castellus*.

BIRSEN, an *Arabian* or *Persian* Word, signifying an Inflammation or Impostume of the Breast; for *Bir* signifies a Breast, according to *Avicenna* and others. *Castellus*.

BISCOCTUS, *βισκοκτος*, twice dress'd, or that has twice felt the Fire; chiefly applied to Bread twice bak'd, or that is much bak'd. *Biscuit*.

BISEMATUM. The lightest, palest, and basest Lead. *Rulandus*.

BISERMAS. A Species of *Horminum*. See *HORMINUM*.

BISLINGUA, *Hippoglossum*, *Uvularia*, *Offic. Hippoglossum sive Bislingua*, *Park. Theat. 702. Hippoglossum mas & femina*, *Ger. 761. Emac. 908. Bonifacia sive Bislingua*, *J. B. 1. 575. Hippoglossum, Bislingua, Bonifacia*, *Chab. 45. Laurus Alexandrina, fructu pediculo insidente*, *C. B. Pin. 305. Rufus angustifolius, fructu folio imascente*, *Tourn. Inst. 79. Elem. Bot. 70. Boerh. Ind. A. 2. 63. DOUBLE-TONGUE*.

This Plant is commonly cultivated in the Gardens of Botanists, and is said to be of a vulnerary Quality. *Dale Pharmacologia*.

BISMALVA. The same as *ALTHÆA*, which see.

BISMUTHUM, *Offic. Charlt. Foss. 49. Aldrov. Mus. Metal. 161. Bismutum plumbum cinereum*, *Worm. 125. Marcasita sive Bismutum*, *Schrod. 456. Marcasita argentea*, *Cæsalp. Galena inanis, Germanis Blende*, *Woodw. Att. Tom. 1. 182. Bismuthum*, *Idem, Tom. 2. P. 1. p. 28. MARCASITE OF SILVER, or TIN-GLASS. Dale*.

Bismuth is a Species of Tin, or a white and brittle metallic Substance, dispos'd in small Laminæ, shining like Glas; for which Reason it is call'd Tin-glass. It seems to be compos'd of a mineral Salt, a gross Sulphur, Mercury, a small Quantity of Arsenic, and a great deal of Earth. *Mr. Poli*, having pound-ed separately one Part of Bismuth, and two of corrosive Sublimate, and mix'd them in a Retort, to which a Receiver was adapted, extracted from them, by Distillation, a sort of Gum or Butter, which partly adhered to the Neck of the Retort, and partly fell into the Receiver. This Butter he distill'd a second time, and, besides another Butter yielded like the former, there remain'd in the Bottom of the Retort a very fine Powder, of the Colour of oriental Pearls, soft to the Touch, and somewhat glutinous. A third Process yielded him a Powder still more fine and beautiful. In short, he repeated the Operation till the Butter was entirely chang'd, partly into running Mercury, and partly into a pearl-colour'd Powder. This Powder may be used either in representing fine Pearls in Painting, or in giving their agreeable Colour to any Objects. *Histoire de l'Académie Royale, 1713.*

Bismuth, or *Tin-glass*, named *Bismuthum*, *Officin. Plumbum cinereum agricolæ, Marcasita argentea*, *Quorund.* is a metallic, fusible, but not ductile Substance; very brittle and heavy, and distinguishable from Lead and Tin by its Colour, which is sometimes shining, like Silver, sometimes of a faint Purple, resembling the *Regulus* of Antimony, but consisting of broader Laminæ, and staining the Fingers. It is prepared by Artists, by being first torrefy'd, and then melted into a *Regulus*. It is often found in Silver Mines; and where-ever the Miners find *Bismuth*,

Bismuth, they conclude they shall find Silver; and hence they call it the Proof of Silver. The Mines of *Bismuth* are in *Bohemia* and *Misnia*. Some pretend that it may be extracted from Cobalt melted into a Regulus, by a particular Process; but this is not certain.

Bismuth seems to have been unknown both to the *Greeks* and *Arabians*; for the *Arabian Marcasite* was the *Lapis Pyrites*. It is very seldom used in Physic, tho' some prepare Flowers from it, which they say are diaphoretic; but most Physicians have been afraid to use it inwardly, because of the arsenical Parts contain'd in it. The Magistery of *Bismuth* is prepared by dissolving the Metal in Spirit of *Nitre*, then precipitating it with a Solution of Sea Salt in Water. This Precipitate, beingedulcorated by frequent Lotions, becomes a very white Powder, much valued by the Ladies as a Cosmetic, and much used by Dealers in Hair, to improve the Colour of it when dark or red. Pewterers mix it with Tin to harden it, and give it a more shining Colour. *Geoffroy*.

PROCESSES upon BISMUTH.

FLORES BISMUTHI: Flowers of Bismuth.

Beat the *Bismuth* into very fine Powder, and to four Ounces of it put half a Pound of *Nitre*, also in fine Powder; put in that Mixture, by half a Spoonful at a time, into an earthen Body, perforated in the Side; when the Body is red-hot, and the Operation is over, take away the Aludels, and wipe off the Flowers with a Feather.

These are very white, and used as an excellent Fucus, mix'd with Pomatum, or Rose-water; but they must not be too busy with it, who try it upon their Complexions; for the saline Parts of the Arsenic may do Mischief many ways. But if the *Nitre*, and the Arsenical Salts, are wash'd away by frequent Solutions in warm Water, it will not only continue to be a good Cosmetic, but also may with Safety be given internally, and by some is reckon'd a good Diaphoretic. Yet, as the Materia Medica is large enough in its Supply for that Intention, there is no Occasion to torture a Poison to make a Medicine of it. Its Dose is from ten Grains to two Scruples or a Dram. *Quincy's Dispensatory, from Wilson's Chymistry.*

Lemery's Method of making these Flowers is somewhat different.

The Flowers of *Bismuth* are nothing but a Portion of Tin-glass, elevated in form of a fine Powder, by means of volatile Salts.

Calcine the *Bismuth* in the manner Lead is commonly calcin'd, then mixing it with an equal Quantity of Sal Ammoniac, put your Mixture into an earthen Cucurbit capable of bearing the Fire; but two Thirds of the Cucurbit must at least be left empty. Adapt a Blind-head to it. Lute the Juncture carefully. Place your Vessel in a small Grate-furnace, with an open Fire, but yet in such a manner, as that the Fire may breathe only thro' the Registers, for which Purpose the Top of the Furnace must be closed up with Bricks and Clay. The Cucurbit must also be sunk a Third, or thereabouts, of its Height in the Furnace. Apply a small Fire at the Beginning; then augment it gradually, till the Bottom of the Vessel becomes red; and then continue it in the same Degree, till nothing ascends any longer, which may be known when the Head is become cold, and then the Sublimation is completed. Then allow the Vessels to cool, and unlute them. By this Process you will obtain Flowers, which may be dissolv'd in Water, and precipitated with Spirit of Sal Ammoniac, or Oil of Tartar.

This Magistery, or Precipitate, may be applied to the same Uses with the following.

MAGISTERY of BISMUTH.

Magistery of *Bismuth* is nothing but *Bismuth* dissolv'd, and precipitated into a very white Powder.

Dissolve in a Matrafs one Ounce of the gross Powder of *Bismuth*, with three Ounces of the Spirit of *Nitre*; pour the Dissolution into a clean earthen Vessel, and add to it five or six Pounds of Spring-water, in which half an Ounce of Sea Salt has been previously dissolv'd; upon which a white Powder will be precipitated to the Bottom. Pour off the Water by Inclination, and wash the Magistery several times; then dry it in a Shade. This is the Cosmetic which the *French* call *Blanc-d'Espagne*, or the celebrated *white Spanish Cosmetic*, which is esteemed so fine a Cleanser and Whitener of the Face. The Method of using it is, either to mix it with Pomatum, or with Oil of Lilies. Wig-makers also use it, in order to beautify their Hair.

REMARKS.

A pretty large Matrafs ought to be employ'd in dissolving this *Bismuth*, in order to give room for a violent Effervescence, which is produc'd as soon as the Spirit of *Nitre* is pour'd upon that Mineral. The Operator must guard, as much as he possibly can, against admitting the Steam either into his Nostrils or Mouth, because it is highly prejudicial to the Breaft.

This quick and violent Effervescence proceeds from this; that the Pores of the *Bismuth* being pretty large, the Acid immediately makes its Way into them, and violently removes every thing that opposes its Motion. On this Occasion it also happens, that the Matrafs is so heated, that one cannot hold a Hand upon it; because the Points of the Dissolvent strike with a great deal of Force upon the solid *Bismuth*, by which a Heat is produc'd, resembling that which results from the Friction of two solid Bodies upon each other for a considerable time. Besides, the Quantity of fiery Particles contain'd in the Spirit of *Nitre*, may contribute very considerably to the Production of this Heat.

If the Solution is turbid, on account of any Impurities contain'd in the *Bismuth*, a double Quantity of Water being mix'd with it, it must be filtrated; for, if an Attempt should be made to filtrate it without Water, it would coagulate in the Form of a Salt, and, consequently, become incapable of passing thro' the Filtre. This Coagulation proceeds from this, that the acid Spirits of the *Nitre*, which are sheath'd up in the Particles of the *Bismuth*, finding too small a Quantity of Liquor to float and disperse themselves in, unite together in the Form of Crystals, when the Solution becomes cold.

The Impurity which generally floats upon the Solution of *Bismuth*, is a pinguious and bituminous Substance, which is not dissolvable by the Spirit of *Nitre*.

This Magistery may be made, by pouring a large Quantity of Spring-water without Salt into the Solution; but it is more quickly done, and the Precipitation more exactly made, by the Addition of the Salt, which agitates and breaks some of those acid Parts, which the Water alone was not powerful enough to subdue and divide. A Difficulty here arises, and that is, why common Water alone precipitates the *Bismuth*, Lead, or Antimony, which an Acid has previously dissolv'd, but can neither precipitate Gold, Silver, nor Mercury, without the Assistance of some Salt, or some other proper Substance. I suppose this Phenomenon is produc'd, because the former Substances having large Pores, the Acids are not so strongly lock'd up in them, but that they may be dislodg'd by Water; whereas Gold, Silver, and Mercury, having Pores comparatively very small and minute, keep the Acid so strongly lock'd up, that it cannot be separated by the too languid Agitation of the Water alone, which, to produce this Effect, requires the Addition of some other Substance, capable of giving stronger and more violent Shocks.

The Augmentation happening to the *Bismuth*, when reduc'd to a Magistery, proceeds from some Part of the Spirit of *Nitre* being retain'd in it, notwithstanding the Precipitation and Lotion. If we incline to have it exceedingly white, 'tis not only necessary, that the Water us'd in washing it should be very pure and transparent, but, after it has been thoroughly dried in a Shade, it must be carefully kept in a Glass-phial, well stopp'd; for the Air renders it of a dark and brownish Colour.

As for the Method of using this Magistery, a Dram of it is ordinarily mix'd with four Ounces of the Lily or Bean-flower Water, or with an Ounce of Pomatum. This Medicine is good for the Itch, because it destroys the Acids, or Salts, which foment and nourish that Disorder: But this Magistery is rarely used in any other Shape than that of a Cosmetic: It is the Paint most generally used by Women who incline to improve their Complexions, because it is more easily laid on, and adheres more firmly, than other Paints. But as the Marcasite, from which it is drawn, is of the metallic Kind, the Heat of the Skin reunites, revivifies, and renders brown, its Particles, which ow'd their Whiteness only to their Division; for which Reason, those who make frequent Use of this Paint, have generally a livid Countenance, and the Skin of it more rough and unpolish'd, than it was before they began to use it.

If, for the sake of Curiosity, we filtrate the Water used in precipitating the Magistery of *Bismuth*, and, with a new Pen, write any thing with it on white Paper, the Letters will not at all appear; but if, after they are thoroughly dry, we rub them gently with a little Cotton, dipt in a Decoction of the Scoriz of Antimony, they become very black. *Lemery Cours de Chymie.*

BISON.

This is a Sort of wild Ox in the *Indies*. His Forehead is large, his Horns crooked, sharp at the Points, black and shining;

ing; his Eyes are large, fierce, terrible, and flaming; his Tongue is so rough, that the Part lick'd with it is excoriated, and Blood is drawn from it. In his Tail there is a large Quantity of Hairs, which smell like Musk. This Animal frequents the Woods, and is of so savage and cruel a Nature, that 'tis dangerous to come in his Way. The Horns of this Animal, when reduced to a Powder, and taken internally, are esteemed sudorific, and proper for resisting Poisons. The Dose of this Powder is from half a Scruple to one Dram.

The Excrements of this Animal are possessed of a highly resolvent Quality. *Lemery des Drogues.*

BISTACIUM, for PISTACIUM, or PISTACIA, which see.

BISTORTA, Offic. *Bistorta Serpentina*, Chab. 507. *Bistorta major*, Ger. 322. Emac. 399. Raii Hist. 1. 186. Synop. 59. *Bistorta major vulgaris*, Park. 391. *Bistorta major, rugosioribus foliis*, J. B. 3. 538. Dill. Cat. 89. *Bistorta radice minus intorta*, C. B. 192. Hist. Oxon. 2. 585. Tourn. Inf. 511. Boerh. Ind. A. 2. 86. Buxb. 39. BISTORT or SNAKE-WEED.

The Roots of the great Bistort are about as thick as the little Finger, brown on the Outside, and reddish within; somewhat curled and twisted, with many small Fibres growing out on every Side. The Leaves resemble somewhat the Leaves of the common Dock, but are of a firmer Substance, of a bluish-green Colour above, and ash-colour'd underneath, much narrower at the End next the Root, having only a narrow Film running on each Side the Stalk. The Flowers grow in Spikes like Ears of Corn, of a pale-red Colour, made up of several small, imperfect, staminate Flowers, in which grow black triangular Seeds; they stand on Stalks a Foot or a Foot and a half high, which have a Leaf or two at the Joints, encompassing them round next the Stalk, and growing narrower, and sharp-pointed at the End.

Bistort grows in several moist Meadows, tho' it is not very common about London. It is to be met with in *Battersea Meadow*, near the *Thames* Side, flowering in May.

The Roots of Bistort, which are the only Part that is used, are drying and binding, of Service in all kind of Fluxes and Hemorrhages, either from the Bowels, or any other Part; they help the Incontinence of Urine, and the making bloody Water. They are also Alexipharmic, and good in pestilential Fevers; they resist Poison, and the Bites and Stings of venomous Creatures. *Miller's Bot. Off.*

The Root is mostly used in the Shops, and is of a healing, astringent Quality, especially in Dysenteries, bloody Fluxes, Dysenteric Exulcerations of the Intestines, and Vomitings of Blood. It cures an excessive Flux of the Menfes and Hemorrhoids, and removes violent Vomitings. It quenches Thirst, for which Reason it is by *Paracelsus* called *Anasakra*, by which he perhaps meant *Anasarca*. The principal way of using it is to mix it with other proper Herbs for the Cure of the Dropsy. *L. Thurneisser, de Aquis Miner. & Metall. L. 6. C. 67.* affirms, that it kills Worms in the Intestines. It is also used in Defluxions, and Pains of the Head, malignant Fevers, Small-pox, Measles, and the Plague. It proves a Check to the too violent Ebullition of the Blood, and prevents the overheating of its more spirituous Parts. It prevents Miscarriages, and cures Wounds and Ruptures. And when any Vessel in the Abdomen is broken, it is often made an Ingredient in vulnerary Drinks, prepar'd as a Remedy. The Root powder'd, and thrown into recent Wounds, stops the Effusion of Blood, and cures them. A Decoction of the Root also, with Wine and Vinegar, stops immediately the most violent Effusions of Blood from Wounds, if washed with it. Some take two Parts of the Root reduc'd to Powder, and one Part of Quick-lime, and mix them with Wine and Vinegar, and, after having evaporated the Humidity, use the Powder which remains in the Vessel for curing the Cancer. The Root mix'd with some Water proper for Disorders of the Mouth cures Tooth-achs, fixes loose Teeth, and hardens the Gums, by preventing a Fluxion of Humours to them. Some distil a Water from the Root, Leaves, and Flowers. Others prepare a Syrup from the Root, which they call *Syrupus Colubrinus*. Both these Medicines are accounted excellent against the Plague, Dysentery, Fluxes, Vomitings of Blood, immoderate Discharges of the Menfes, and Vomitings. The Water cleanses and heals all old Ulcers and Cancers, if they are washed with it, and some of the Powder of the Root is sprinkled upon them. It is confidently affirmed, that it banishes all Insects from a House. *Barthol. Zorn Botanologia.*

BITHNIMALCA and GASTERANAX are Words coined by *Dolæus*, to signify a peculiar active Principle residing in the Stomach, and presiding over the several Functions of Chylification, Distribution, and Secretion.

BITHYNICI *Tensoris Emplastrum*. The *Bithynian Barber's* Plaster for splenetic and hydropical People. It is describ'd by *Aetius, Tetrab. 3. Serm. 2. cap. 22.*

BITHYNOS, *Bithyos*, the Name of a Plaster described by *Galen, L. 9. de comp. Med. Sec. Loc. cap. 31.* also

a Troche in the same Author, *Lib. 5. de comp. Med. per Gen. cap. 12.*

BITI. The Name of a tall and evergreen Tree growing in *Malabar*, and other Parts of the *East-Indies*; all the Use it is known to have in Medicine is, that an Oil is prepared of the Root, which cures an Alopecia. *Ray.*

BITRINATI. Glased. *Rulandus.*

BITTERN. At the Salt-works, where Salt is made from the Sea Water, that Liquor which runs from the common Salt, when taken out and put into proper Vessels, is called Bittern.

Or it is the Liquor which remains after the CrySTALLIZATION of the common Salt. *Phil. Transact.* See SAL CATHARTICUM AMARUM.

BITUMEN, Offic. *Bitumen vulgare Pissasphaltum*, Mont. Exot. 12. Gæbal. 20. *Pissasphaltos nativum*, Schrod. 4. 208. Diosc. *Pissasphaltum*, Worm. Mus. 30. Charlt. Foss. 14. *Bitumen Fossile*, Aldrov. Mus. Metall. 382. COMMON FOS-SILE PITCH.

The *Pissasphaltos* is produced in *Apollonia* near *Epidamnus*; and is carried down the *Ceraunian* Mountains by the Current of a River, and thrown upon the Shores, where it concretes into Masses, and smells like Pitch mixed with Brimstone. *Dioscor. lib. 1. cap. 100.*

The *Pissasphaltum* of *Dioscorides*, and of the Shops, or mineral Pitch, is a black or red kind of *Bitumen*, of a fragrant and not unpleasant bituminous Smell, viscid, or of a middle Consistence between *Petroleum*, and a solid *Bitumen*; not unlike the common Pitch, fusible by Fire, concretescible by Cold, and easily inflammable. It is compounded of two Greek Words, which signify Pitch and *Bitumen*, and the Compound might be rendered a bituminous Pitch, or pitchy *Bitumen*; the Reason of which Name is not, that it consists of an artificial Mixture of these two Substances, but it smells like such a Mixture. It distils from Rocks, or springs from the Earth in several Countries. In *Italy* they use that which is found in the *Campania di Roma*; about sixty Miles from the City, near a little Town called *Catho*. It issues through the Crannies of Rocks in the Summer-time, of the Consistence of Honey, of a black Colour, and penetrating Smell. There is likewise a plentiful Spring of this *Bitumen* in *Auvergne* in *France*, which is soft and black like Pitch, and of a bituminous Smell. If it be kept a great while, it grows hard, retaining still something of its fatty Consistence, and never grows so dry or hard as the solid *Bitumens*.

Fresh *Pissasphaltum* is digestive, maturating, and resolvent. It is used in ripening Buboës, resolving Tumors, discussing sciatic Pains, and to strengthen luxated Parts after they have been reduced. A Mixture of this, and slimy or muddy Clay, is called *Maliba*, and was used as Morter in building the Walls of *Babylon*, according to *Vitruvius*. *Geoffroy.*

The *Asphaltus*, of which an Account is given under the Word, is a Species of *Bitumen*, of which Dr. *Shaw* in his Travels gives the following Relation; this Author speaking of the *Dead Sea*, says thus.

I was informed, that the *Bitumen*, for which the Lake hath been always remarkable, is raised at certain times from the Bottom in large Hemispheres; which, as soon as they touch the Surface, and so are acted upon by the external Air, burst at once with a great Smoak and Noise, like the *Pulvis Fulminans* of the Chymists, and disperse themselves round about in a thousand Pieces. But this happens only near the Shore; for in greater Depths, the Eruptions are supposed to discover themselves only in such Columns of Smoke, as are now-and-then observed to arise from the Lake. And perhaps to such Eruptions as these we may attribute that Variety of Pits and Hollows which are found in the Neighbourhood of this Lake, and compared very justly, by Mr. *Maundrell*, to those Places in *England*, where there have been formerly Lime-kilns. The *Bitumen*, in all Probability, is accompanied from the Bottom with Sulphur, inasmuch as both of them are found promiscuously upon the Wash of the Shore. The latter is exactly the same with common native Sulphur; the former is friable, heavier than Water, yielding upon Friction, or by being set on Fire, a fetid Smell. Neither doth it appear to be, as *Dioscorides* describes his *Asphaltus*, of a purplish Colour; but is as black as Jet, and exactly of the same shining Appearance.

BIVALVA, BIVALVULA. Bivalve. A Term in Botany, apply'd to the Pods or Husks of Plants, which open lengthwise in two Parts, like the Shell of a Muscle. *Miller's Dict.*

BIVENTER, *δυσασπιδος*, double-belly'd. The same as DIGASTRICUS, which see.

BIXA OVIEDI. A Name for the *ACHIOU*, which see. BLABE, *βλαβη*. Hurt, Injury, Prejudice. Hence *βλαβερος*, noxious, injurious.

BLACCIE. A Name in *Rhazes* for the Measles.

BLACHMAL. *Johnson* says, that this imports a Matter consisting of various Metals melted together, and cast into Sulphur.

BLACTARA. Cerufs, white Paint.

BLÆSITAS. Stammering, or Lipping. The same as **BALBUTIES.**

BLÆSUS also signifies a Person whose Legs are distorted and crooked, being bent outwards.

BLANCA. Cerufs, white Paint.

Blanca is also the Name of a compound lenitive purging Medicine, described in the *Antidotarium* of *Nicolaus*.

BLANCNON. A Name for Fern in *Oribasius*, *Med. Coll. lib. 12.*

BLANDUS, εὐς, ἥς. Gentle. An Epithet in Use among the Chymists, and Preparers of Medicines, and commonly applied to Fire or Heat, by way of Opposition to *fortis*, or *vehemens*, strong, or violent. Thus in the Affair of the Philosopher's Stone there is required *blandus Ignis*, a gentle Fire.

BLAPTISECULA. A Græco-latin Name for *Cyanus*, Blue-bottle, from *βλάπτω*, to hurt, and *seca*, because it incommodates the Mowers, by blunting the Edges of their Scythes. *Blancard.*

BLAS. A Term coined by *Helmont*, by which he means, as he says, the Force of Motion, both alterative and local; of this he makes two Kinds, the *Blas Meteoron*, and the *Blas humanum*. The first belongs to the Stars, whose *Blas motivum*, he says, is the pulsive Virtue by which they perform their Courses, and present their Aspects according to their Places; and this is their local *Blas*. The Alterative *Blas* of the Stars consists in the Production of Heat and Cold, especially by the Change of the Winds. Analogous to this *Blas Meteoron* is the *Blas Humanum*, which operates in Men and Brutes; and this is of two Kinds, *natural* and *voluntary*: the former is what every one of the Viscera forms to itself, according to the Model of its Constellation, whence it is called the *astral Blas*; the other is impelled, and put in Motion, by the Will of Animals, and is no way connected with the upper Motion, that is, the *Blas* of the Heavens.

BLASIUS. A Martyr, whose Name *Aetius* represents as effectual in making any thing, which sticks in the Throat, either come up or go down. See the Life of *AETIUS*.

BLASO, or **PLASO,** (for I am not certain which is the right) is the *Indian* Name for a Tree, otherwise called, *Arbor filiquosa trifolia Indica, flore papilionaceo, filiqua grandipilosa, uncam intus fabam continente*. The Fruit reduced to Powder, and taken internally, kills Worms. The Bark also powder'd, and taken with dried Ginger in Powder, is given for the Bite of a Viper. *Raii Hist. Plant.*

BLASTEMA, βλάστημα, from *βλάσσω*, to germinate, signifies properly a Bud, or Off-set, or Shoot of a Plant. But it is used by *Hippocrates* to express a cutaneous Eruption or Pimple. *Foesius* seems to suspect, that it may mean a Bubo, or glandular Tumor; but I see no Reason for this Supposition.

BLATTA BYZANTINA, Offic. *Blatta Byzantia*, Schrod. 5. 325. *Blatta Byzantia sive Unguis odoratus*, Park. Theat. 1573. Ind. Med. 21. *Blatta Byzantina, Unguis odoratus*, Mont. Exot. 6. *Operculum cochlearum marinarum subtundum vulgare*, Lang. Meth. Test. 56. *Blatta Byzantia Arabum*, Aldrov. de Exang. 346. *Operculi Conchylii & Buccini*, Rondel. de Pisc. 2. 86. **THE CONSTANTINOPLE SWEET HOOF.** *Dale.*

When exhibited internally, it renders the Belly soluble, softens the Spleen, and discusses peccant Humours. When used externally by way of Fumigation, it restores epileptic Patients, and Women labouring under a Strangulation of the Uterus. In other Disorders its Effects are the same with those of most other testaceous Substances. *Dale Pharmacologia from Schroder.*

The common Druggists and Apothecaries apply both the Name and Virtues of the *Unguis Odoratus* or *Indicus* of the Antients, the *ὄνυξ Ἰνδικός* of *Dioscorides*, to the *Blatta Byzantia*, and make the same Use of it. *Myrepsus* mentions the *Unguis odoratus* in some Places under the Name of *ὄνυχος Ἰνδικός*, (*Onychus Indicus*) particularly in the Antidote of fifty Ingredients. And in many Places we meet with his *βλάττα Βυζάντια*, which, he informs us, is the Name by which the *Italians* call τὸ ὄνυξ τῆς ῥινός τῆς κορυφῆς, "the Bone of the Nose of the Purple-fish." The Translators of the *Arabian* Authors have rendered the *Arabic* Words *adfar althabib*, which in *Latin* signify *Ungues Odorati*, or *Aromatici*, and literally express the *Greek* Denomination *ὄνυξ ἀρωματιστῶν*, by *Blatta Byzantia*, how truly we shall by-and-by examine; but our first Inquiry shall be concerning the Name.

Blatta, or *Blattea*, was the Name which the ancient *Latins* gave to a Bubble of Clay, as *Paulus* remarks out of *Festus*; afterwards it came to signify a Clot of Blood, as the Author of the old Glosses observes: *Blattea*, θρόμβος αἱματος, "Blattea, a grumous Concretion of Blood;" and Use at last appropriated it to the concreted Blood or Sanies of the Purple-fish, as the forementioned Glosses also take Notice: *Blattea*, θρόμβος αἱματος τῶν κογχυλίων. Hence *Blatteum*, under the Emperors of the middle Ages, signified any thing

dy'd with Purple, and *Blatta infectum*, Purple. The *Byzantine* Purple-fishes are also mentioned by the Antients, which are called *Blattæ Byzantiæ*, and by the *Greeks* of the *Constantinopolitan* Empire *βλάττα Βυζάντια*, whence *Anastasius* the Library-keeper, in his Lives of the Popes, often mentions *Pallia e Blattio Byzantino*. It appears then, that by the *Blattæ Byzantiæ* can be meant nothing but the *Conchyliæ Byzantiæ*, or *Byzantine Purple-fish*. As *κογχύλιον*, (*Conchylium*) as well among the *Greeks* as the *Latins*, is sometimes taken for the Flesh of an Oyster, sometimes for the Shell, so the Name of *Blatta Byzantia* has by Use been appropriated to the flinty Cover of the Purple-fish.

Consider'd therefore in this respect, the *Blattæ Byzantiæ* are a quite different thing from the *Unguis Odoratus* of the Antients, which was gather'd out of the *Indian* Marshes, and for that Reason called by the *Greeks* *ὄνυξ Ἰνδικός*. But *Dioscorides* tells us, that this *Indian Onyx* was like the Cover of the Purple-fish: *ὄνυξ ἐστὶ πῶμα κογχυλίου, ὁμοίον τῷ τῆς κορυφῆς, "The Onyx is the Cover or Lid of a Shell-fish, like that of the Purple-fish."* Let us grant then, that, on account of the Likeness, the Name of the Purple-fish is justly due, and may be given, to that *Indian* Shell-fish. All the Difficulty does not lie here, but in what *Dioscorides* properly calls the *πῶμα κογχυλίου*, "The Cover of the Conchylium, or Shell-fish." All our modern Interpreters take it for the Shell of the Conchylium, because the Conchylium is empty. *Brassavolus* renders it the Crust and Shell of the Conchylium, (*Crustas & Conchas Conchyliorum*) which, I am sure, is far wide of the Truth, and the genuine Signification of the Word *πῶμα*. The *Greeks* call the Shell of any sort of Oyster *ὄστρεον* (*Ostracum*). Thus *Dioscorides* speaking of Lime: *τὸν θαλαττίον κλύζον τὰ ὄστρεα*, "The Shells of Sea-whelks." Besides, that *Dioscorides* did not take the Word *ὄνυξ*, which, he says, is the *πῶμα* Conchylii, for the whole Shell, appears from his own Words towards the End of the Chapter, where he says, that "The Conchylium calcined produced the same Effects as the Purple-fish and Whelk," *ὁμοίον δὲ τὸ κογχύλιον καὶ πῶμα ὄστρεα καὶ ἡ κορυφή*. Therefore the *ὄνυξ*, *Unguis*, is a Part of the Conchylium, not its whole Inclosure or Shell. The *Arabians* took it right. *Avicenna's* Words, *adfar althabib*, by which he expresses the *ὄνυχες ἀρωματιστῶν* of *Dioscorides*, are rendered by *Frusta vel Fragmenta similia Unguibus*, "Bits or Fragments resembling Nails;" for this is the Sense used by him in the plural Number, which in a very antient Glossary is expounded by *Conciso, Inciso, Deciso, Comma, Morsum*, "Concision, Incision, Decision, Fragment, Bit." In the same Glossary *Mukatha* is explained by *decerptum*, "cropt," what is cropt or cut off from an entire Body. So here *ὄνυξ* is to be taken for a Piece cut off from the Conchylium, and for a Part of it, not for the whole Shell; and this is the *πῶμα κογχυλίου* of *Dioscorides*, which now comes to be explained.

In Vessels of a long Neck, and narrow Mouth, that which closes the Summit of the Mouth, by which Liquors are poured in and out, is called in *Latin* *Operculum*; in *Greek* *πῶμα*, "a Cover." *Severus Sulpitius*, from its Figure, calls it *Umbo*, "a Buckler." In every Vessel also which has a wide Mouth, what covers the Opening goes by the Name of *πῶμα*; thus we have *πῶμα χύτρας*, *πῶμα φιάλης*, "the Cover of a Pot, the Cover of a Well." The Purple-fish, Whelk, and other Fish of that kind, which the *Greeks* call *σπομβόδη*, turbinated, or wreathed, may, in some measure, be likened to Vessels with a narrow Mouth; for they have but one Perforation, through which they put forth their Tongue, and take their Food. They have also a sort of a Cover, at the Part where the Neck is situated, under which they thrust out their Tongue to feed, and draw it back as they please. This is called by *Dioscorides* *πῶμα*, by *Aristotle* *ἐπιπάλυμμα* (*Epicalumma*), who thus speaks of the Purple-fish; *ἔχει δὲ καὶ ἀντὶ καὶ τῆς ἐπιπάλυμματος καὶ τὰ ἀντὶ καὶ τὰ ἄλλα τὰ σπομβόδη ἐκ γενεῆς πάντα νέμονται δ' ἐξείρευσαν τὴν καλυμένην γλῶτταν ὑπὸ τῷ κάλυμματι*. "This Fish the Whelk, and all others of the turbinated Species, are furnished with Covers alike situated, under which they thrust out what is called their Tongue, and so feed." Nothing can be expressed plainer. The *Calumma*, κάλυμμα, is the same as the *Poma*, *πῶμα*, which belongs to the Purple-fish, Whelks, and other turbinated Kinds, among which is comprehended the *Indian* sweet-scented Conchylium, which resembles the Purple-fish, and whose Cover is called *ὄνυξ*, *Unguis*, from its resembling in Shape and Whiteness a Man's Nail. In the Purple-fish, this Cover is what we properly call *Blatta Byzantia*, because out of that Part is taken the *Blatta*, that is, the Part which is used in Dying. *Pliny* writes, that it lies in the middle of the Jaws of the Purple-fish. *Aristotle*, *ἀνὰ μέσον τραχήλου καὶ μύκωνος*, "betwixt the Neck and the Excrement." Hence *Blatta* came to be used for the Cover itself, which is the *πῶμα* that the latter *Greeks* called *ὄνυξ τῆς ῥινός τῆς κορυφῆς*, "the Bone of the Nose of the Purple-fish;" and sometimes *ὄνυξ τῆς κορυφῆς*, "the Bone of the Purple-fish;" which must be understood of this Bone, which serves for a Cover to the Shell of the Purple-fish.

Serapion, Cap. 433. treating of the Parts of the Purple-fish, mentions, among the rest, *Adfer*, that is, *Ungues*; and says, they are Covers by which they are closed within their Perforation. The Translator gives this Chapter the Title of *Blatta Byzantia*, in which he is right; for these Covers of the Purple-fish are properly the *Blatta Byzantia*, which were collected at *Byzantium*. *Serapion* has another Chapter on the *Ungues Odorati*, which were the Covers of the *Indian* Shell-fish that resembled the Purple-fish; and are, by the Interpreter, wrongly expounded by the *Blatta Byzantia*; whereas the *Blatta Byzantia* is the *Unguis* of the Purple-fish, and has nothing of an aromatic Smell in it. But the *Unguis Odoratus* was the Cover of the *Indian* Shell-fish, and was commonly used with other sweet-scented Ingredients in Suffumigations. *Myrepsus*, on *Suffumigations*, often mentions them, and calls them *ovras megales* & *ovras*, "the great and small Ungues," because there were two Sorts of them. The larger were brought from *Arabia*, and the smaller from *Babylon*, according to *Dioscorides*: *Myrepsus* sometimes calls them simply *ovras*, *Ungues*; sometimes *ovras Indicus*, which must be understood of these *Ungues*; but when he calls them *ἐκ τῆς ῥινός τῆς πορφυρέας*, "the Bone of the Nose of the Purple-fish," you are to take it for the Cover of that Fish which was call'd *Blatta Byzantia*, by the *Greeks* *βλάττιον πορφυρέον*, and had nothing of a sweet Scent, but rather stunk when it was handled; both Sorts, however, went commonly under the Name of the *Blatta Byzantia*. *Alpagus*, in his Lexicon, writes, that the *Blatta Byzantia* is the Cover of a certain Shell-fish found in the *Red Sea*; and that this Cover was in the very Mouth of these Shell-fishes, and was open'd and shut at the Pleasure of the included Animal; that it was call'd *Blatta Byzantia*; and that he had often seen them adhering to their Shells. Nothing better could be said for the Explication of the *Poma* and *Calumma*, as well in Purple-fish and Whelks, as in the sweet-scented *Indian* Shells.

Ovras was also a Name among the *Greeks* for a kind of Oyster, otherwise call'd *σολὴν* & *αὐλός*, "Solen and Aulus." *Pliny* calls them *Ungues*, *Lib. 9. Cap. 31*. *Isidore*, of Oysters, *Ungues a similitudine humanorum unguium dictæ*, "call'd *Ungues* from their resembling human Nails."

I wonder that *Dioscorides* should tell us, that this *Indian* Conchylum was found in the dried Marshes of *India*, which produce Nard, and that this was the Cause of its Fragrancy, because it was fed with Nard; and yet, in reckoning the Kinds of this Conchylum, should only mention the *Babylonian*, and the *Arabian* which comes from the *Red Sea*. If it be found in the nardiferous Marshes of *India*, why should he make one Kind come from *Babylon*, and another from the *Red Sea*? Nard, indeed, is not produced in *Babylon*, nor in the *Red Sea*, but in *India* about the *Ganges*; whence it is call'd *Γανgeticum* *vāpē*, "Gangetic Nard." But what he says about the nardiferous Marshes, is Matter of Laughter; for what Author among the Antients ever told us, that *Indian* Nard grew in Water and Marshes? *Dioscorides* himself tells us, that it was produced on a Mountain of *India*; he mentions indeed another Sort, which grew "in watery Places," *ἐν ὑδατοῦσιν*. But it is one thing to grow in moist and well-water'd Places, and another thing to spring up in the Middle of Marshes and standing Waters. *Garcias* informs us, that Nard is seldom found in *India* of spontaneous Growth, but that it is always propagated by Culture. *Dioscorides* compiled his Chapter of the *Unguis Odoratus* from two Authors, without considering that they contradicted one another; for it is impossible to reconcile the collecting the *Unguis Odoratus* of the Conchylum from the Marshes of *India*, with the Account of two Kinds of it, one coming from the *Red Sea*, and another from *Babylon*, differing in Colour and Bigness. Nor shall I regard what may possibly be pretended, that the *Indian* Ungues may come in Ships by Way of the *Red Sea*, and to *Babylon* by Land. This will by no means bring him off; for he mentions only one Kind in the Beginning, which was found in *India*, and assigns the Cause of its Fragrancy to its feeding on Nard: Now it is certain, that Nard grows no-where but in *India*; besides, he every-where distinguishes the *Indian* Species from the *Arabian*.

Upon the Whole, it is evident, that the *Unguis Odoratus* of the *Arabians* was the same with the *Ovras Indicus* of the Antients; which, however, was not brought out of *India*, but from *Babylon* and the *Red Sea*; and that what *Dioscorides* tells us about the nardiferous Marshes, and the aromatic Conchylia there collected, is mere Romance. It appears also, that the *Blatta Byzantia* are properly a different Thing from the *Ungues Odorati*, tho' their Names are commonly confounded; for the former are the Covers of the *Byzantine* Conchylum, or Shell-fish, which were formerly used to dye a Purple; but the *Ungues Odorati* belonged to the *Arabian* Conchylum, which was like the Purple-fish. *Salmasius de Homonym. Hyl. Iatr. Cap. 98*.

In the *Philosophical Transactions* I find the following Remarks of Dr. Lister upon the *Blatta Byzantia*, in Answer to a Query of Mr. Dale's.

I take the *Blatta Byzantina* to have succeeded the *Unguis*

Odoratus, and to have been brought into the Shops in its Place.

I conjecture, therefore, that the true *Unguis Odoratus* was something like the half of a *Pectunculus Fluvialis*; so common in the River *Thames*, of the Bigness and Thickness of a Thumb-nail, and that for these Reasons:

1. That the *Unguis Odoratus* seems to have been a fresh-water Bivalve or Muscle, for that they staid till the Lakes on the River *Ganges* were dried up before they gather'd them. Now Bivalves are ever buried in Sand and Mud, and never rise up, and swim about, and float, as the Turbinate Snails do; to which latter only the Operculum belongs, and which therefore were always, and easily, to be caught.

2. *Dioscorides* calls this Snail *Conchylum*, and by that general Name distinguishes it from all the other Sorts, concerning which he treats in several Chapters; which, tho' in general it takes in both Kinds, as well Turbinate as Bivalve, yet it does more particularly denote a Concha or Bivalve.

3. The Onyx is expressly reckon'd by *Pliny* amongst the Bivalves. For (*L. 32. C. 11.*) he makes all these synonymous, *Solen, five Aulos, five Donax, five Onyx, five Daitylus*. And again, more particularly, (*Lib. 2. Cap. 61.*) he says, *Ex Concharum genere sunt Daityli, ab Humanorum Unguium similitudine appellati*; so that, in all Probability, the *Onyx Odoratus*, brought more antiently out of the fresh-water Lakes about *Ganges* in *India*, was not unlike the common Onyx of the *Mediterranean*, which was of the *Solen* Kind.

Whatever the *Blatta Byzantia* of our Shops is, which has certainly nothing of the Characters of the antient Aromatic Unguis; and which, in all Probability, was lost upon the Account of the difficult Passage from *Ganges* into *Europe*; I lament its Loss, which I have Reason to believe was a good Medicine, from its strong aromatic Smell; which is much wanting in our testaceous Powders, of which this was one of the Number, so much used, and that not without good Reason now-a-days, which are all very flat and insipid.

BLATTA, Offic. Aldrov. de Insect. 499. *Blatta foetida*, Mouffet. Insect. 138. Charlt. Exer. 49. Jonst. de Insect. 82. Mer. Pin. 202. *Scarabeus impennis tardipes*, Pet. Gazophylac. Nat. & Art. Tab. 27. Fig. 7. THE SLOW-LEGG'D BEETLE. Dale.

The Inside of the *Blatta*, which is found in Bake-houses, bruised or boiled in Oil, and dropp'd into the Ears, eases the Pains thereof. *Dioscorides*, *Lib. 2. Cap. 38*.

Dale has, by Mistake, attributed the Virtues of the *Blatta* or Beetle found in Bake-houses, which is a very nimble Insect, to the slow-leg'd Beetle.

BLATTARIA, Offic. BLATTARIA LUTEA, J. B. 3. 874. Raii Hist. 2. 1096. Synop. 3. 288. *Blattaria vulgaris lutea*, Chab. 495. *Blattaria lutea, folio longo laciniato*, C. B. Pin. 240. Tourn. Inst. 147. Elem. Bot. 123. Boerh. Ind. A. 147. Buxb. 40. Rupp. Flor. Jen. 195. *Blattaria Plinii*, Ger. 633. Emac. 776. Mer. Pin. 16. *Blattaria major, flore luteo, vel Blattaria Plinii*, Merc. Bot. 24. Phyt. Brit. 16. *Blattaria lutea minor seu vulgaris*, Park. Theat. 64. *Blattaria annua ramosa, floribus luteis, staminibus purpureis*, Hist. Oxon. 2. 489. MOTH-MULLEIN.

Authors have said very little with respect to the Medicinal Virtues of this Plant, but inform us, that it is possess'd of the same as the *Verbascum*.

There is an Herb like Mullein, and often taken for it; but it has more Stalks, a Leaf not so white, and a yellow Flower. When thrown abroad, it gathers Moths (*Blattas*), and therefore at Rome they call it *Blattaria*. *Pliny*.

Ray, besides this, mentions the following Species of *Blattaria*:

Blattaria magno flore, C. B. J. B. *Flore amplo*, Ger.
Blattaria lutea major seu Hispanica, Park.
Blattaria flore caeruleo vel purpureo, J. B. *Flore purpureo*, Ger. Park. *Purpurea*, C. B.
Blattaria perennis, flore gilvo seu obsoleto coloris, Morif.
Blattaria lutea odorata, Park.
Blattaria pilosa Cretica, seu Arctos quorundam, J. B. *Verbascum humile Creticum laciniatum*, C. B. *Verbascum Brassicae folio*, Col.
Blattaria Cretica incana, rotundo laciniato folio, Park. This is the *Arcturus Creticus Belli*.
Ab hac diversam, C. Bauhinus. *Eumq; secutus*, Parkinsonus. *Verbascum suum foliis subrotundis, flore Blattariae, quod in Prodroma sic describit*.
Blattaria Cretica spinosa, Park. *Leucoium Creticum spinosum*, Clus. J. B. *Creticum spinosum incanum luteum*, C. B. *Galastroida Cretensium Belli*. *Leucoium spinosum cruciatum*, Alp. *Spinosum Creticum*, Ger. Emac.
Blattaria incana multifida, Bocconi.

BLECHNON.

Blechnon minus, pinnulis integris. *Filix querna*, C. B. Pin. 358. *Filix ramosa minor*, J. B. 3. 741. *Filix arborea*, Trag. 538. THE LESSER BRANCHED FERN.

It grows in shady Places, but very rarely.

C. Baubine had no Reason to refer *Tabernaemontanus's Filicula petraea foemina*, ii. to this Species; we must rather, with *J. Baubine*, refer it to the *Filicula petraea foemina* iv. of this Author; therefore we ought not to distinguish this from the *Filix ramosa minor*, *pinnulis dentatis*, Pin. *C. Baubine* was mistaken when he said, that the *Pteridion masculum Cordi* was the same with this; for *Cordus* compares it to the unbranch'd Male Fern, and he finds in it no other Difference than that of Bigness. *J. Baubine* knew these Species better than his Brother, who has separated from his *Filix querna* the *Filix pumila saxatilis*, Clus. Those who examine *Clusius's* Figure well, will not distinguish it from that of *Tragus*. Therefore this Plant is thrice repeated in the *Pinax*, under the Names of *Filix querna*, of *Filix ramosa minor*, *pinnulis dentatis*, and of *Filix saxatilis ramosa*, *nigris maculis punctata*. *Pena* and *Lobel* have given a sorry Figure of it. That of *Camerarius* seems to be but a Copy of *Matthioli's* Figure. *Martyn's Tournefort*. See **FILIX**.

BLECHROS, βληχερός. Weak, slight. βληχερός πυρετός, in *Lib. 5. Epid.* is a slight Fever, and opposed to *πνευμαίνης*, a burning (Fever), *Aph. 17. Lib. 6. Sect. 1.* And βληχερός σφυγμός, a weak low Pulse, is opposed to *ξύς*, a smart strong one, *Lib. 1. πεί γυναικ.* βληχερός, in *Galen's Exegesis*, is expounded a kind of Pulse, otherwise written βλήχιον.

BLEMA, βλήμα. See **INTRITUM**.

BLENNA, *Blenna*, βλέννα, μύξα, κορύζα, in *Hippocrates*, is a thick Phlegm and Mucus flowing from the Brain through the Nostrils, and shewing Signs of a beginning Concoction, as *Galen* explains him in several Places of his Works. He says also, that φλέγμα (Phlegm) is by some call'd βλέννα, or βλίνα. It is also read βλαίνα, in *Hippocrates's* second Book of Diseases: "If there be an Eruption of Water or Mucus [βλαίνα] by the Nostrils, there is a Solution of the Disease." It is also written πλέννα, and expounded by μύξα in *Galen's Exegesis*. *Hesychius* explains βλενός by νόθος, and μωρός, a Blockhead, or a Fool, and as it were mucous, from the excessive Humidity of his Brain. *Blennus* also, in *Plautus*, has the same Signification, as *Festus* observes. βλέννα, in *Erotian*, is the Name of a Fish, which he also calls βλαξ or βλαίς.

BLENNUS, βλέννος, βλίνος, βλινός, in *Suidas* βλίον. A Fish found in shallow Waters, of little or no Value, which is denoted by its Name, signifying mucous, as being of a soft, excrementitious, and insipid Flesh. It is described by *Aldrovandus*.

BLEPHARA, βλέφαρον. The Eyelids. See **PALPEBRÆ**.

BLEPHARIDES, βλέφαριδες. The Hairs on the Extremities of the Eyelids, as expounded by *Hesychius* and *Celsus*. In *Hippocrates's Coac.* it is put for the Eyelids, as βλέφαρίδιον καμπύλιον, there signifies a Retortion of the Eyelids. *Caelius Aurelianus*, *Lib. 4. Cap. 3. Tard. Pass.* renders the Greek βλέφαριδα, *Palpebraria* (Collyria).

BLEPHAROXYSTUM, βλέφαροξύστον, from βλέφαρον, an Eyelid, and ξύω, to scrape, shave. A Surgeon's Instrument for scraping or scarifying the Eyelids.

There have been various Forms of Instruments for these Purposes. *Hippocrates* seems to have used a Thistle, or some prickly Herb, such as the *Atractylis*. Others of the ancient Physicians invented an Instrument of Iron or Steel, not unlike a fine Rasp, delineated *Tab. 37. Fig. 5.* and shaped like a Spoon; and with this they used to scrape the Inside of the Eyelids till the Blood flow'd, as we are told by *Celsus* and *Egineta*, the latter of whom calls this Instrument *Blepharoxyston* [Eyelid-scraper]; the other calls it *Asperatum Specillum*, the Rasp-like Probe. Some used that rough Herb which the Botanists call'd *Equisetum majus*; others, among whom was *Celsus*, the Leaves of the Fig-tree; others a Pumice-stone, or the Bone of a Cuttle-fish, or any other Thing that seem'd most convenient for the Purpose. *Heister*.

BLESTRISMUS, βλησεισμός, from βάλλω, to toss, in *Hippocrates*, is a disorderly Jactation, or Tossing, and Restlessness of the Body, by which it is perpetually disturb'd, and thrown out of one Posture into another. It is also call'd βίσησις, which is a Word used in several Places of the *Epidemics*. *Aretæus* uses βλησειζέειν to express the disorderly Tossing and Tumbling of a Person in a Phrensy.

BLETA, *White*, is an Epithet for milky Urine, proceeding from diseased Kidneys; and is reckon'd among the Causes of a Phthisis by *Paracelsus*, *de Tartaro, Tract. 3. Cap. 3. Castellus*.

BLETI, βλήτοι, from βάλλω, to strike. Struck. So the Antients call'd those who were suddenly seiz'd with a Suffocation, Stertor, and Difficulty of Breathing, from an Inflammation of the Pleura, the Side being mark'd with black and blue Spots, as from Blows; for which Reason they were call'd *Bleti*, struck or smitten, and *Syderati*, Planet-struck. *Hippocrates de Rat. Viæ. in Morb. acut. and Coac.* In *Lib. 1. πεί γυναικ.* an Echolium, ἐχόλιον, is describ'd to be τὸ παίδιον βλήτον γυναικὸν ἐκ βάλαντος, "what expels the kill'd or dead Child." *Blasphes*

is expounded in *Hesychius* by ἀποπληξίς, ἡ ὁ ὕπνῳ ἔχειν νεοματών ἀποπληξίως τελευτῆν, "one seiz'd with an Apoplexy, or that dies suddenly of some acute Disease." And βλήσις, in *Varinus*, is *Syderatus*, labouring under an Apoplexy, or Stupor of the Body.

βλήσις, in *Hippoc. Lib. 2. πεί γυναικ.* is an Herb of the Figure of a Tongue. And you meet with βλήτον in *Theophrastus, Hist. Plant. Lib. 7. Cap. 1.* and βλήτιον in *Dioscorid. Lib. 2. Cap. 143.* for βλήτον.

BLICARE. Prepar'd Præfil, as defin'd by *Rulandus*; but I do not know what Præfil is.

BLICHODES, βλιχῶδες, is expounded, by *Epicles* in *Erotian*, by τὸ λελεπασμένον μέλα γλοιώδες ὑγροσίας ἀναβάσει, "turgid with some impure viscous Humour." *Euphorion* explains it by τὸ ἐμπνευσμένον ἢ κατέχευον, "express'd and dried." *Bacchius* and *Lyfimachus*, in the same Author, read βλιχῶδες with a π, and explains it by ἔξεστυγμένον, "smooth'd," as much as to say, full distended, and void of Folds or Wrinkles. *Erotian* adds, that some for βλιχῶδες read γλιχῶδες, glutinous or viscous, which agrees very well with the Exposition of *Epicles*. βλιχῶδες is expounded by *Suidas*, out of *Hippocrates*, and also by *Hesychius*, τὸ λελεπασμένον ἢ καθαρόν, "decorticated and pure."

BLINCTA is explain'd, by *Rulandus*, *Terra rubra*, red Earth.

BLITUM, *Blite*. A sort of Herb.

This Herb is cultivated in Gardens allotted for Pot-herbs, and is used in Food. It affords little Nourishment, and generates a very bad Blood. *Plin. Lib. 20. Cap. 22.* has these Words: "Blitum seems to be without any Virtues, without any Taste or Acrimony; for which Reason the Poet *Menander* makes cold and indifferent Husbands compare their Wives to it, by way of Contempt." It is prejudicial to the Stomach; and raises such a Commotion in the Intestines, as, in some, to excite a *Cholera*. These Verses of *Eoban. Heff. Lib. de Bona Valetudine*, must not, on this Occasion, be forgotten:

*Ignarum sine honore Blitum; sine viribus estur,
Hoc solo: Ventrem quod bene deiciat.*

Galen, Lib. 2. de Alim. fac. c. 45. ranks it among the Pot-herbs without Taste; for which Reason it is so little used in the Kitchen, that it is become a Proverb of Contempt to say, that a Person is more despicable than *Blites*. Hence it also happens, that every thing of no Worth or Value is call'd *Blites*; for the Greeks call it βλίτον, as it were βλητόν, a Thing to be thrown away. *Isidorus, Lib. 17. Orig. C. 10.* is of Opinion, that *Blitum* is so call'd, as it were, from *Vilis Beta*. In *Suidas* we read, that among the Greeks the Whores were call'd βλιταρίδες or βλιταδες, *Bliteæ Uxores*. *Plautus* also speaks of *blitea* & *lutea meretrice*, that is, a most contemptible, wither'd, and insipid Whore. *Catullus* has an Expression to the same Purpose, *Non assis facis, oblitum Lupanar*: "Thou art good for nothing, thou contemptible Whore. The Greeks also, according to *Hesychius*, call'd Fools and Idiots βλίτας and βλίτῶνας, probably from the Greek Word βλαξ, which signifies stupid. See *Joh. Ruell. de Natura Stup. L. 1. C. 20.*

The Seeds of this Herb are good in Dysenteries, and immoderate Fluxes of the Menfes; and, according to *Tabernaemontanus*, the Seeds of it are boil'd like Millet in *Silesia*, and afford the common People a grateful Food. The Juice of the Herb, express'd, cures Corns of the Feet, if applied to them. A Fumigation of the Herb promotes the Menfes, when stopp'd; and expels false Conceptions, and the Secundines. According to *Casp. Schwenkf. in Catal. Stirp.* the Country-people use it as a Remedy against Hemorrhages in their Cattle: And *Tabernaemontanus* informs us, that its Juice, exhibited in Wine, cures the Bites of Scorpions and Spiders. *Barthol. Zorn Botanolog.*

There are many Sorts of *Blites*, the common Sort of which is thus distinguish'd.

BLITUM ALBUM, *Offic. Park. Parad. 488. Blitum album majus*, or the great white *Blite*, *Ger. 252. Emac. 320. C. B. 118. Tourn. Inst. 507. Hist. Oxon. 2. 599. Boerh. Ind. A. 2. 91. Dill. Cat. 164. Buxb. 40. Blitum pulchrum album magnum, J. B. 2. 967. Raii Hist. 1. 200. GREAT WHITE BLITE.*

The common *Blite* grows to be two Foot high, with thick hollow Stalks, cloath'd with a great many Leaves, somewhat like Beet-leaves, but less, growing on long Foot-stalks, and of a thinner Texture. The Flowers consist of long Spikes, of small, mossy, greenish *Flosculi*, in which lie small, round, black Seeds. The Root is pretty thick, but perishes every Year. The whole Plant has a flashy insipid Taste. It is planted in Gardens, and flowers in *July*.

The Leaves, which are only used, and those but seldom, are much of the Nature of *Arrache*, being cooling and emollient; and are sometimes put into Clysters. *Miller's Bot. Off.*

Blites are eaten among other Greens; and are good for the Belly, participating of no purgative Quality. *Dioscorides, Lib. 2. Cap. 143.*

Another Species of this Plant is the
BLITUM RUBRUM, Offic. Park. Parad. 489. *Blitum ru-*
brum majus, or the Great Red Blite, Ger. 252. Emac. 320.
Raii Hist. 1. 200. C. B. Pin. 118. Tourn. Inst. 507. Elem.
Bot. 407. Boerh. Ind. A. 2. 91. Hist. Oxon. 2. 599. *Blit-*
um pulchrum rectum magnum rubrum, J. B. 2. 966. Buxb.
40. *Blitum*, Chab. 304. RED BLITES.

The medicinal Virtues of this are much the same as those of
the preceding.

BLITUM, Cod. Med. 21. *Blitum sylvestre spicatum*, Tourn.
Inst. 507. Herb. Par. 399. Mart. Hist. 106. Vaill. Bot. Par.
21. *Blitum minus album*, C. B. Pin. 118. Hist. Ox. 2. 599.
J. B. 2. 967. Raii Hist. 1. 200. Boerh. Ind. A. 2. 91. Ger.
252. Emac. 321. *Blitum album sylvestre minus*, Park. Theat.
752. SMALL WHITE BLITE.

Camerarius is the only Author who has given a good Figure
of this Plant; it is so like the *Blitum rubrum minus*, that it is
impossible to distinguish them without the Fruits. This Species
is quite loaded with them, but they are not only placed in the
Bosoms of the Leaves, but form also a very considerable Spike at
the Top of the Stalks; and, besides, each Fruit is a sort of
membranous greyish Bladder, reddish, oval, pointed, flat, a
Line long: It does not open transversely, like the *Blitum ru-*
brum minus, but bursts like a Bladder which is press'd, and lets
out a very small, black, smooth, shining Seed, shap'd like a
Lentil.

Tournefort takes Notice of another Species of *Blitum*, which
is the

Blitum rubrum minus, C. B. Pin. 118. J. B. 2. 967. *Blit-*
um rubrum supinum, Lib. Icon. 250. *Amaranthus sylvestris*
& vulgaris, Inst. THE SMALL WILD RED BLITE.
It is often found on Dung-hills.

J. Bauhine and *Lobel* have given good Figures of this Plant.
That of the *Blitum rubrum minus*, Cam. Epit. 235. agrees
better with the *Blitum album minus*, C. B. Pin.

The Root of this Plant is whitish, sometimes purple, about
half a Line long, four or five Lines thick at the Neck, divided
into capillaceous Fibres. The Stalks are procumbent, branch'd,
about a Foot long, chanel'd, two or three Lines thick, red-
dish, full of Juice, adorn'd with alternate Leaves, resembling
those of Pellitory, about two Inches long, taking in the Tail,
which is very slender, and almost as long as the rest of the Leaf.
This Leaf is a bright-green, sometimes having purplish Edges,
seven or eight Lines broad, divided into two equal Parts, by a
Rib which extends itself from one End to the other, and forms
little crooked Veins, which lose themselves in the Edge. Out
of the Bottom of each Leaf sometimes proceed others, which
are much smaller; these Bosoms are fill'd with many Flowers,
growing upon one another in rounded Clusters, three or four
Lines in Diameter. Each Flower usually consists of three very
narrow, pointed, gutter'd Leaves, one Line long, whitish,
with a greenish Back: From the Middle of the Flower arises
an oval-pointed Pointal, encompassed with three very slender
Chives, which are scarce a Line long, and sustain each a yellow-
ish Summit. This Pointal afterwards becomes an oval, flat,
membranous, reddish Capsule, one Line long, terminated by a
little Thread. It is composed of two Pieces, placed one upon
the other, and opening transversely. In each Capsule is one
Seed, almost round, black, smooth, shining, shap'd like a
little Lentil.

We have no good Figure of this Plant; for that of *J. Bau-*
hine has its Leaves too obtuse, and represents the preceding Spe-
cies better; and that of the *Blitum rubrum minus*, Cam. which
agrees better with it in the Leaves, makes a Spike of Flowers,
which we do not see in our Plant. *Lobel's* Figure has the very
same Fault. *Vaill. Martyn's Tournefort.*

BLITYRI. Βαλϋρι. A fictitious Word, with no Significa-
tion annex'd to it, but proverbially used by *Galen*; as is also
another Word, *Scindapsus*, σκινδᾶψος, to ridicule the Vanity
of coining new Terms. *Gal. de Diff. Puls. Lib. 3. Cap. 1.*
& Meth. Med. Lib. 2. Cap. 7.

BLUMATI terreum. A glaz'd Vessel. *Johnson.*

BOA, Jonst.

Is an aquatic Serpent of a prodigious Size, which follows
the Herds of Oxen, from whence it takes its Name; it sucks
the Cows Teats, for it loves Milk very well. It is found some-
times in *Calabria*. One of these was kill'd in the Reign of the
Emperor *Claudius*, in the Belly of which they found a Child,
which it had swallowed whole. The Bite causes an Inflamma-
tion of the Part bit. They say that this Serpent is sometimes
so big, that it can swallow a whole Ox, which is not to be
credited. *Lemery des Drogues.*

BOANTHEMON, βοανθημων, is expounded in *Galen's* Exe-
gesis by τὸ βύβθαλλον, (*Bupththalmum*) which, he says, is also
call'd *χρυσάνθεμον*, *Chrysanthemum*. *Poesius.*

BOAX. See Boops.

BOCCA. The large Mouth or Opening of a Glass-house
Furnace.

BOCCARELLA. A small Hole, or Mouth, one of which
is on each Side the *Bocca* of a Glass Furnace, lying almost hori-
Vol. I.

zontally with it. Out of these the Workmen take colour'd or
finer Metal from the Piling-pot.

BOCCONIA. A Plant so call'd from *P. Boccone* of *Sicily*,
who has publish'd several curious Books of Botany. It has a
Flower, consisting of one Leaf; from the Middle arises the
Pointal, which afterwards becomes an oval-shap'd pointed
Fruit, which is full of Juice, each containing one round Seed.
We have but one Species of this Plant, which is a Native of
Jamaica, and call'd by Sir *Hans Sloane*, in his Nat. Hist.
Chelidonium majus arborescens, foliis quercinis. I find no me-
dicinal Virtues attributed to it.

BOCHETUM. The second Decoction of Lignum San-
ctum, Sarsaparilla, China-root, and other Sudorifics. *Castellus.*

BOCIA. A Glass Vessel, firmly clos'd, and shap'd with a
round Belly, and long Neck, about half a Foot in Diameter.
It is otherwise call'd *Ovum*, *Sublimatorium*, *Urinale*, and *Cu-*
curbita. This must not be touched with the cold Hand in time
of working, for fear of breaking it. *Castellus.*

BOCIUM. The same as BRONCHOCELE, which see.

BODAGI is defin'd by *Rulandus*, Aliud Vas.

BODID. An Egg. *Idem.*

BOE, Bon. See CLAMOR, and ANAPHONESIS.

BOERHAAVE. The Figure this illustrious Physician
made whilst alive, and the Reputation of his Works now he is
no more, demand some Account of his Life and Writings.

Herman Boerhaave was born on the last Day of *December*
1668. about One in the Morning, at *Voorhout*, a Vil age two
Miles distant from *Leyden*: His Father, *James Boerhaave*,
was Minister of *Voorhout*, of whom his Son, in a small Account
of his own Life, has given a very amiable Character, for the
Simplicity and Openness of his Behaviour, for his exact Fruga-
lity in the Management of a narrow Fortune, and the Prudence,
Tenderness, and Diligence, with which he educated a numerous
Family of nine Children. He was eminently skill'd in History
and Genealogy, and well versed in the *Latin*, *Greek*, and *He-*
brew Languages.

His Mother was *Hagar Daelder*, a Tradesman's Daughter
of *Amsterdam*, from whom he might, perhaps, derive an he-
reditary Inclination to the Study of Physic, in which she was
very inquisitive, and had obtained a Knowledge of it not com-
mon in Female Students.

This Knowledge, however, she did not live to communi-
cate to her Son; for she died in 1673, ten Years after her
Marriage.

His Father, finding himself encumber'd with the Care of
seven Children, thought it necessary to take a second Wife, and,
in *July* 1674. was married to *Eve du Bois*, Daughter of a
Minister of *Leyden*, who, by her prudent and impartial Con-
duct, so endear'd herself to her Husband's Children, that they
all regarded her as their own Mother.

Herman Boerhaave was always design'd by his Father for the
Ministry, and with that View instructed by him in Grammatical
Learning, and the first Elements of Languages; in which he
made such a Proficiency, that he was, at the Age of eleven
Years, not only Master of the Rules of Grammar, but capable
of translating with tolerable Accuracy, and not wholly ignorant
of critical Niceties.

At Intervals, to recreate his Mind, and strengthen his Consti-
tution, it was his Father's Custom to send him into the Fields,
and employ him in Agriculture, and such kind of rural Occu-
pations, which he continued thro' all his Life to love and
practise; and, by this Vicissitude of Study and Exercise, pre-
serv'd himself, in a great measure, from those Distempers and
Depressions, which are frequently the Consequences of indiscreet
Diligence, and uninterrupted Application; and from which
Students, not well acquainted with the Constitution of the hu-
man Body, sometimes fly for Relief to Wine instead of Exercise,
and purchase temporary Ease at the Hazard of chronical Dis-
tempers.

The Studies of young *Boerhaave* were, about this Time, in-
terrupted by an Accident, which deserves a particular Mention,
as it first inclin'd him to that Science, to which he was by Na-
ture so well adapted, and which he afterwards carried to so great
Perfection.

In the twelfth Year of his Age, a stubborn, painful, and
malignant Ulcer, broke out upon his Left Thigh; which, for
near five Years, defeated all the Art of the Surgeons and Phy-
sicians, and not only afflicted him with most excruciating
Pains, but expos'd him to such sharp and tormenting Applica-
tions, that the Disease and Remedies were equally insufferable.
Then it was that his own Anguish taught him to compassionate
that of others, and his Experience of the Inefficacy of the Me-
thods then in Use incited him to attempt the Discovery of
others more certain.

He began to practise at least honestly, for he began upon
himself; and his first Essay was a Prelude to his future Success;
for, having laid aside all the Prescriptions of his Physicians, and
all the Applications of his Surgeons, he at last, by fomenting
the Part with Salt and Urine, effected a Cure.

That he might, on this Occasion, obtain the Assistance of Surgeons with less Inconvenience and Expence, he was brought by his Father, at Fourteen, to *Leyden*, and placed in the fourth Class of the public School, after having been examined by the Master: Here his Application and Abilities were equally conspicuous. In six Months, by gaining the first Prize in the fourth Class, he was raised to the fifth; and in six Months more, upon the same Proof of the Superiority of his Genius, rewarded with another Prize, and translated to the sixth; from whence it is usual in six Months more to be removed to the University.

Thus did our young Student advance in Learning and Reputation, when, as he was within View of the University, a sudden and unexpected Blow threaten'd to defeat all his Expectations.

On the 12th of *November* in 1682. his Father died, and left behind him a very slender Provision for his Widow and nine Children, of which the eldest was not yet seventeen Years old.

This was a most afflicting Loss to the young Scholar, whose Fortune was by no means sufficient to bear the Expences of a learned Education; and who therefore now seem'd to be summoned by Necessity to some Way of Life more immediately and certainly lucrative; but with a Resolution equal to his Abilities, and a Spirit not to be depress'd or shaken, he determin'd to break thro' the Obstacles of Poverty, and supply by Diligence the want of Fortune.

He therefore ask'd and obtain'd the Consent of his Guardians to prosecute his Studies as long as his Patrimony would support him, and, continuing his wonted Industry, gained another Prize.

He was now to quit the School for the University, but, on account of the Weakness yet remaining in his Thigh, was, at his own Intreaty, continu'd six Months longer under the Care of his Master, the learn'd *Wynschotan*, where he once more was honour'd with the Prize.

At his Removal to the University, the same Genius and Industry met with the same Encouragement and Applause. The learned *Triglandius*, one of his Father's Friends, made soon after Professor of Divinity at *Leyden*, distinguish'd him in a particular manner, and recommended him to the Friendship of Mr. *Van Apphen*, in whom he found a generous and constant Patron.

He became now a diligent Hearer of the most celebrated Professors, and made great Advances in all the Sciences, still regulating his Studies with a View principally to Divinity, for which he was originally intended by his Father; and for that Reason he exerted his utmost Application to attain an exact Knowledge of the *Hebrew* Tongue.

Being convinc'd of the Necessity of mathematical Learning, he began to study those Sciences in 1687: but without that intense Industry with which the Pleasure he found in that kind of Knowledge induc'd him afterwards to cultivate them.

In 1690. having perform'd the Exercises of the University with uncommon Reputation, he took his Degree in Philosophy; and, on that Occasion, discuss'd the important and arduous Question of the distinct Natures of the Soul and Body, with such Accuracy, Perspicuity, and Subtlety, that he entirely confuted all the Sophistry of *Epicurus*, *Hobbes*, and *Spinoza*, and equally rais'd the Character of his Piety and Erudition.

Divinity was still his great Employment, and the chief Aim of all his Studies. He read the Scriptures in their original Languages, and, when Difficulties occur'd, consulted the Interpretations of the most antient Fathers, whom he read in Order of Time, beginning with *Clemens Romanus*.

In the Perusal of these early Writers, he was struck with the profoundest Veneration for the Simplicity and Purity of their Doctrine, the Holiness of their Lives, and the Sanctity of the Discipline practis'd by them; but, as he descend'd to the lower Ages, he found the Peace of Christianity broken by useless Controversies, and its Doctrines sophisticated by the Subtleties of the Schools. He found the holy Writers interpreted according to the Notions of Philosophers, and the Chimeras of Metaphysicians adopted as Articles of Faith. He found Difficulties rais'd by idle Curiosity, and fomented by Bitterness and Rancour. He saw the Simplicity of the Christian Doctrine corrupted by the private Notions of particular Parties, of which each adhered to its own Philosophy, and Orthodoxy was confined to the Sect in Power.

Having now exhausted his Fortune in the Pursuit of his Studies, he found the Necessity of applying to some Profession, that, without engrossing all his Time, might enable him to support himself; and, having obtain'd a very uncommon Knowledge of the Mathematics, he read Lectures in those Sciences to a select Number of young Gentlemen in the University.

At length, his Propension to the Study of Physic grew too violent to be resisted; and, tho' he still intended to make Divinity the great Employment of his Life, he could not deny himself the Satisfaction of spending some Time upon the medicinal Writers; for the Perusal of which he was so well qualified by his Acquaintance with the Mathematics and Philosophy.

But this Science corresponded so much with his natural Genius, that he could not forbear making that his Business, which

he intended only as his Diversion; and still growing more eager, as he advanced further, he at length determin'd wholly to master that Profession, and to take his Degree in Physic, before he engaged in the Duties of the Ministry.

It is, I believe, a very just Observation, that Mens Ambition is generally proportion'd to their Capacity. Providence seldom sends any into the World with an Inclination to attempt great Things, who have not Abilities likewise to perform them. To have form'd the Design of gaining a competent Knowledge in Medicine by way of Digression from Theological Studies, would have been little less than Madness in most Men, and would have expos'd them to Ridicule and Contempt. But *Boerhaave* was one of those mighty Capacities to whom scarce any thing appears impossible, and who think nothing worthy of their Efforts but what appears insurmountable to common Understandings.

He began this new Course of Study by a diligent Perusal of *Vesalius*, *Bartholine*, and *Fallopian*; and, to acquaint himself more fully with the Structure of Bodies, was a constant Attendant upon *Nuck's* public Dissections in the Theatre, and himself very accurately inspected the Bodies of different Animals.

Having furnish'd himself with this preparatory Knowledge, he began to read the antient Physicians in the Order of Time, pursuing his Inquiries downwards from *Hippocrates*, thro' all the *Greek* and *Latin* Writers.

Finding, as he tells us himself, that *Hippocrates* was the original Source of all medicinal Knowledge, and that all the later Writers were little more than Transcribers from him, he returned to him with more Attention, and spent much Time in making Extracts from him, digesting his Treatises into Method, and fixing them in his Memory.

He then descend'd to the Moderns, among whom none engaged him longer, or improved him more, than *Sydenham*, to whose Merit he has left this Attestation, *that he frequently perused him, and always with greater Eagerness.*

His insatiable Curiosity after Knowledge engaged him now in the Practice of Chymistry, which he prosecuted with all the Ardor of a Philosopher, whose Industry was not to be wearied, and whose Love of Truth was too strong to suffer him to acquiesce in the Reports of others.

Yet did he not suffer one Branch of Science to withdraw his Attention from others: Anatomy did not withhold him from the Prosecution of Chymistry, nor Chymistry, enchanting as it is, from the Study of Botany. He was not only a careful Examiner of all the Plants in the Garden of the University, but made Excursions, for his further Improvement, into the Woods and Fields, and left no Place unvisited where any Increase of Botanical Knowledge could be reasonably hoped for.

In Conjunction with all these Inquiries, he still pursued his Theological Studies, and still, as we are inform'd by himself, *proposed, when he had made himself Master of the whole Art of Physic, and obtain'd the Honour of a Degree in that Science, to petition regularly for a License to preach, and to engage in the Cure of Souls*; and intended, in his Theological Exercises, to discuss this Question, *Why so many were formerly converted to Christianity by illiterate Persons, and so few at present by Men of Learning.*

In pursuance of this Plan he went to *Hardewich*, in order to take the Degree of Doctor in Physic, which he obtain'd in July 1693. having perform'd a public Disputation, *De utilitate explorandorum excrementorum in agris, ut signorum.*

Then returning to *Leyden*, full of his pious Design of undertaking the Ministry, he found, to his Surprise, unexpected Obstacles thrown in his Way, and an Insinuation dispers'd thro' the University, that made him suspected, not of any slight Deviation from received Opinions, not of any pertinacious Adherence to his own Notions in doubtful and disputable Matters, but of no less than *Spinozism*, or, in plainer Terms, of Atheism itself.

How so injurious a Report came to be rais'd, circulated, and credited, will be, doubtless, very eagerly inquir'd; and an exact Relation of the Affair will not only satisfy the Curiosity of Mankind, but shew that no Merit, however exalted, is exempt from being not only attack'd, but wounded, by the most contemptible Whispers. Those who cannot strike with Force, can, however, poison their Weapon, and, weak as they are, give mortal Wounds; and bring a Hero to the Grave: So true is that Observation, that many are able to do Hurt, but few to do Good.

This detestable Calumny owed its Rise to an Incident, from which no Consequence of Importance could be reasonably apprehended. As *Boerhaave* was sitting in a common Boat, there arose a Conversation among the Passengers upon the impious and pernicious Doctrine of *Spinoza*, which, as they all agreed, tends to the utter Overthrow of all Religion. *Boerhaave* sat, and attended silently to this Discourse for some time, till one of the Company, willing to distinguish himself by his Zeal, instead of confuting the Positions of *Spinoza* by Argument, began to give a Loose to contumelious Language, and virulent Invectives; with which *Boerhaave* was so little pleased, that at last

last he could not forbear asking him, whether he had ever read the Author against whom he declaim'd.

The Orator, not being able to make much Answer, was check'd in the Midst of his Invektives, but not without feeling a secret Resentment against him who had at once interrupted his Harangue, and expos'd his Ignorance.

This was observed by a Stranger, who was in the Boat with them; he inquir'd of his Neighbour the Name of the young Man, whose Question had put an End to the Discourse; and, having learn'd it, set it down in his Pocket-book, as it soon appear'd, with a malicious Design; for, in a few Days, it was the common Conversation at *Leyden*, that *Boerhaave* had revolted to *Spinoza*.

It was in vain, that his Advocates and Friends pleaded his learned and unanswerable Confutation of all atheistical Opinions, and particularly of the System of *Spinoza*, in his Discourse of the Distinction between Soul and Body. Such Calumnies are not easily suppress'd, when they are once become general. They are kept alive and supported by the Malice of bad, and sometimes by the Zeal of good Men, who, tho' they do not absolutely believe them, think it yet the surest Method, to keep not only guilty, but suspected Men out of public Employments, upon this Principle, That the Safety of many is to be prefer'd before the Advantage of a few.

Boerhaave, finding this formidable Opposition rais'd against his Pretensions to Ecclesiastical Honours or Preferments, and even against his Design of assuming the Character of a Divine, thought it neither necessary nor prudent to struggle with the Torrent of popular Prejudice, as he was equally qualified for a Profession, not indeed of equal Dignity or Importance, but which must undoubtedly claim the second Place among those which are of the greatest Benefit to Mankind.

He therefore applied himself to his medicinal Studies with fresh Ardor and Alacrity, reviewed all his former Observations and Inquiries, and was continually employed in making new Acquisitions.

Having now qualified himself for the Practice of Physic, he began to visit Patients, but without that Encouragement which others, not equally deserving, have sometimes met with. His Business was, at first, not great, and his Circumstances by no means easy; but still, superior to any Discouragement, he continued his Search after Knowledge, and determin'd that Prosperity, if ever he was to enjoy it, should be the Consequence, not of mean Art, or dissingenuous Solicitations, but of real Merit, and solid Learning.

His steady Adherence to his Resolutions appears yet more plainly from this Circumstance: He was, while he yet remain'd in this unpleasant Situation, invited by one of the first Favourites of King *William III.* to settle at the *Hague* upon very advantageous Conditions, but declined the Offer. For having no Ambition but after Knowledge, he was desirous of living at Liberty, without any Restraint upon his Looks, his Thoughts, or his Tongue, and at the utmost Distance from all Contentions and State-parties. His Time was wholly taken up in visiting the Sick, studying, making chymical Experiments, searching into every Part of Medicine with the utmost Diligence, teaching the Mathematics, and reading the Scriptures, and those Authors who profess to teach a certain Method of loving God.

This was his Method of living to the Year 1701, when he was recommended by Mr. *Van Berg* to the University, as a proper Person to succeed *Drelincourt* in the Office of Lecturer on the Institutes of Physic, and elected without any Solicitation on his part, and almost without his Consent, on the 18th of May.

On this Occasion, having observ'd, with Grief, that *Hippocrates*, whom he regarded not only as the Father, but as the Prince of Physicians, was not sufficiently read or esteem'd by young Students, he pronounced an Oration, *de commendando Studio Hippocratico*; by which he restor'd that great Author to his just and antient Reputation.

He now began to read public Lectures with great Applause, and was prevail'd upon by his Audience to enlarge his original Design, and instruct them in Chymistry.

This he undertook, not only to the great Advantage of his Pupils, but to the great Improvement of the Art itself, which had been hitherto treated only in a confus'd and irregular manner, and was little more than a History of particular Experiments, not reduced to certain Principles, nor connected one with another: This vast Chaos he reduced to Order, and made that clear and easy, which was before to the last degree perplex'd and obscure.

His Reputation began now to bear some Proportion to his Merit, and extended itself to distant Universities; so that in 1703, the Professorship of Physic being vacant at *Groningen*, he was invited thither; but he chose to continue his present Course of Life, and therefore refus'd to quit *Leyden*.

This Invitation and Refusal being related to the Governors of the University of *Leyden*, they had so grateful a Sense of his Regard for them, that they immediately voted an honorary In-

crease of his Salary, and promised him the first Professorship that should be vacant.

On this Occasion he pronounc'd an Oration upon the *Use of Mechanics in the Science of Physic*, in which he endeavour'd to recommend a rational and mathematical Inquiry into the Causes of Diseases, and the Structure of Bodies; and to shew the Folly and Weakness of the Jargon introduc'd by *Paracelsus*, *Helmont*, and other chymical Enthusiasts, who have obtruded idle Dreams upon the World, and, instead of enlightening their Readers with Explications of Nature, have darkened the plainest Appearances, and bewilder'd Mankind in Error and Obscurity.

Boerhaave had now for nine Years read physical Lectures, but without the Title or Dignity of a Professor, when, by the Death of Professor *Hotten*, the Professorship of Physic and Botany fell to him of course.

On this Occasion he asserted the Simplicity and Facility of the Science of Physic, in Opposition to those who think, that Obscurity contributes to the Dignity of Learning, and that, to be admired, it is necessary not to be understood.

His Profession of Botany made it Part of his Duty to superintend the physical Garden, which he improv'd so much by the immense Number of new Plants which he procur'd, that it was enlarg'd to twice its original Extent.

In 1714, he was deservedly advanc'd to the highest Dignities of the University, and in the same Year made Physician of St. *Augustine's* Hospital in *Leyden*, into which the Students are admitted twice a Week to learn the Practice of Physic.

This was of equal Advantage to the Sick and the Students; for the Success of his Practice was the best Demonstration of the Soundness of his Principles.

When he laid down his Office of Governor of the University in 1715, he made an Oration upon the Subject of *attaining to Certainty in Natural Philosophy*; in which he declares himself, in the strongest Terms, a Favourer of experimental Knowledge, and reflects with just Severity upon those arrogant Philosophers, who are too easily disgust'd with the slow Methods of obtaining true Notions by frequent Experiments, and who, possess'd with too high an Opinion of their own Abilities, rather chuse to consult their own Imaginations, than inquire into Nature; and are better pleas'd with the delightful Amusement of forming Hypotheses, than the toilsome Drudgery of amassing Observations.

The Emptiness and Uncertainty of all those Systems, whether venerable for their Antiquity, or agreeable for their Novelty, he has evidently shewn; and not only declar'd, but prov'd, that we are entirely ignorant of the Principles of Things, and that all the Knowledge we have is of such Qualities alone as are discoverable by Experience, or such as may be deduced from them by Mathematical Demonstration.

This Discourse, fill'd as it was with Piety, and a true Sense of the Greatness of the Supreme Being, and the Incomprehensibility of his Works, gave such Offence to a Professor of *Franker*, who, having long entertain'd a high Esteem for *Descartes*, consider'd his Principles as the Bulwark of Orthodoxy, that he appear'd in Vindication of his darling Author, and complain'd of the Injury done him with the greatest Vehemence, declaring little less than that the *Cartesian* System and the Christian must inevitably stand and fall together, and that to say we were ignorant of the Principles of Things, was not only to enlist among the Sceptics, but to sink into Atheism itself.

So far can Prejudice darken the Understanding, as to make it consider precarious and uncertain Systems as the chief Support of sacred and unvariable Truth.

This Treatment of *Boerhaave* was so far resent'd by the Governors of his University, that they procur'd from *Franker* a Recantation of the Invektive, that had been thrown out against him. This was not only comply'd with, but Offers were made him of more ample Satisfaction; to which he return'd an Answer not less to his Honour than the Victory which he gain'd; "That he should think himself sufficiently compensated, if his warn'd Adversary received no farther Molestation on his Account."

So far was this weak and injudicious Attack from shaking a Reputation not casually rais'd by Fashion or Caprice, but founded upon solid Merit, that the same Year his Correspondence was desired upon Botany and Natural Philosophy by the Academy of Sciences at *Paris*, of which he was, upon the Death of Count *Marfigli*, in the Year 1728, elected a Member.

Nor were the *French* the only Nation by which this great Man was courted and distinguished; for, two Years after, he was elected Fellow of our Royal Society.

It cannot be doubted, but, thus caref'd, and honoured with the highest and most public Marks of Esteem by other Nations, he became more celebrated in his own University; for *Boerhaave* was not one of those learned Men, of whom the World has seen too many, that disgrace their Studies by their Vices, and by unaccountable Weaknesses make themselves ridiculous

at Home, while their Writings procure them the Veneration of distant Countries, where their Learning is known, but not their Follies.

Not that his Countrymen can be charged with being insensible of his Excellencies, till other Nations taught them to admire him; for in 1718. he was chosen to succeed *Le Mort* in the Professorship of *Chymistry*; on which Occasion he pronounced an Oration, *De Chymia errores suos expurgante*; in which he treated that Science with an Elegance of Style not often to be found in chymical Writers, who seem generally to have affected not only a barbarous, but unintelligible Phrase, and, like the *Pythagoreans* of old, to have wrapt up their Secrets in Symbols, and enigmatical Expressions, either because they believed, that Mankind would reverence most what they least understood, or because they wrote not from Benevolence, but Vanity, and were desirous to be praised for their Knowledge, though they could not prevail upon themselves to communicate it.

In 1722. his Course both of Lectures and Practice was interrupted by the Gout, which, as he relates it in his Speech after his Recovery; he brought upon himself, by an imprudent Confidence in the Strength of his own Constitution, and by transgressing those Rules which he had a thousand times inculcated to his Pupils and Acquaintance. Rising in the Morning before Day, he went immediately, hot and sweating, from his Bed into the open Air, and exposed himself to the cold Dews.

The History of his Illness can hardly be read without Horror. He was for five Months confined to his Bed, where he lay upon his Back without daring to attempt the least Motion, because any Effort renewed his Torments, which were so exquisite, that he was at length not only deprived of Motion, but of Sense. Here Art was at a stand; nothing could be attempted, because nothing could be proposed with the least Prospect of Success. At length having, in the sixth Month of his Illness, obtained some Remission, he took simple Medicines in large Quantities, and at length wonderfully recovered.

Succos pressos bibit Noster herbarum Cichorea, Endivia, Fumaria, Nasturtii aquatici, Veronica aquatica latifolia, copia ingenti: Simul deglutiens abundantissime gummi ferulacea Asiatice.

His Recovery, so much desired, and so unexpected, was celebrated on January 11. 1723. when he open'd his School again with general Joy, and public Illuminations.

It would be an Injury to the Memory of *Boerhaave*, not to mention what was related by himself to one of his Friends, that when he lay whole Days and Nights without Sleep, he found no Method of diverting his Thoughts so effectual as Meditation upon his Studies, and that he often relieved and mitigated the Sense of his Torments by the Recollection of what he had read, and by reviewing those Stores of Knowledge which he had repositied in his Memory.

This is, perhaps, an Instance of Fortitude, and steady Composure of Mind, which would have been for ever the Boast of the Stoic Schools, and increased the Reputation of *Seneca* or *Cato*. The Patience of *Boerhaave*, as it was more rational, was more lasting than theirs; it was that *Patientia Christiana*, which *Lipsius*, the great Master of the Stoical Philosophy, begged of God in his last Hours; it was founded on Religion, not Vanity; not on vain Reasonings, but on Confidence in God.

In 1727. he was seized with a violent burning Fever, which continued so long, that he was once more given up by his Friends.

From this time he was frequently afflicted with Returns of his Distemper, which yet did not so far subdue him, as to make him lay aside his Studies, or his Lectures, till in 1726. he found himself so worn out, that it was improper for him to continue any longer the Professorships of Botany and Chymistry, which he therefore resigned April 28. and upon his Resignation spoke a *Sermo Academicus*, or Oration, in which he asserts the Power and Wisdom of the Creator, from the wonderful Fabric of the human Body; and confutes all those idle Reasoners who pretend to explain the Formation of Parts, or the animal Operations, to which he proves that Art can produce nothing equal, nor any thing parallel. One Instance I shall mention, which is produced by him, of the Vanity of any Attempt to rival the Works of God. Nothing is more boasted by the Admirers of Chymistry, than that they can, by artificial Heats and Digestion, imitate the Productions of Nature. *Let all these Heroes of Science meet together, says Boerhaave, let them take Bread and Wine, the Food that forms the Blood of Man, and by Assimilation contribute to the Growth of the Body: Let them try all their Arts, they shall not be able from these Materials to produce a single Drop of Blood.* So much is the most common Act of Nature beyond the utmost Efforts of the most extended Science!

From this time *Boerhaave* lived with less public Employment indeed, but not an idle or an useless Life; for, besides his Hours spent in instructing his Scholars, a great Part of his Time was taken up by Patients, who came, when the Distemper would admit it, from all Parts of Europe to consult him, or

did it by Letters, which, in more urgent Cases, were continually sent to inquire his Opinion, and ask his Advice.

Of his Sagacity, and the wonderful Penetration with which he often discovered and described, as the first Sight of a Patient, such Distempers as betray themselves by no Symptoms to common Eyes, such wonderful Relations have been spread over the World, as, though attested beyond Doubt, can scarcely be credited. I mention none of them, because I have no Opportunity of collecting Testimonies, or distinguishing between those Accounts which are well proved, and those which owe their Rise to Fiction and Credulity.

Yet I cannot but implore, with the greatest Earnestness, such as have been conversant with this great Man, that they will not so far neglect the common Interest of Mankind, as to suffer any of these Circumstances to be lost to Posterity. Men are generally idle, and ready to satisfy themselves, and intimidate the Industry of others, by calling that impossible which is only difficult. The Skill to which *Boerhaave* attained, by a long and unwearied Observation of Nature, ought therefore to be transmitted in all its Particulars to future Ages, that his Successors may be ashamed to fall below him, and that none may hereafter excuse his Ignorance, by pleading the Impossibility of clearer Knowledge.

Yet so far was this great Master from presumptuous Confidence in his Abilities, that in his Examinations of the Sick he was remarkably circumstantial and particular. He well knew, that the Originals of Distempers are often at a Distance from their visible Effects; that to acquiesce in Conjecture, where Certainty may be obtained, is either Vanity or Negligence; and that Life is not to be sacrificed, either to an Affectation of quick Discernment, or of crowded Practice; but may be required, if trifled away, at the Hand of the Physician.

About the Middle of the Year 1737. he felt the first Approaches of that fatal Illness that brought him to the Grave, of which we have inserted an Account written by himself Sept. 8. 1738. to a Friend at London; which deserves not only to be preserved as an historical Relation of the Disease which deprived us of so great a Man, but as a Proof of his Piety and Resignation to the Divine Will.

Ætas, labor, corporisque opima pinguetudo, effecerant, ante annum, ut inertibus refertum, grave, hebes, plenitudine turgens corpus, anhelum ad motus minimas, cum sensu suffocationis, pulsu mirifice anomalo, ineptum evaderet ad ullum motum. Urgebat præcipue subsistens prorsus & intercepta respiratio ad prima somni initia: Unde somnus prorsus prohibebatur, cum formidabili strangulationis molestia. Hinc hydrops pedum, crurum, femorum, scroti, præputii, & abdominis. Quæ tamen omnia sublata. Sed dolor manet in abdomine, cum anxietate summa, anhelitu suffocante, & debilitate incredibili: Somno paucio, eoque vago, per somnia turbatissimo: Animus vero rebus agendis impar. Cum bis luctor fessus, nec emergo: Patienter expectans Dei jussa, quibus resigno data, quæ sola amo, & honoro unice.

In this last Illness, which was to the last Degree lingering, painful, and afflictive, his Constancy and Firmness did not forsake him. He neither intermitted the necessary Cares of Life, nor forgot the proper Preparations for Death. Though Dejection and Lowliness of Spirit was, as he himself tells us, Part of his Distemper; yet even this, in some measure, gave way to that Vigour which the Soul receives from a Consciousness of Innocence.

About three Weeks before his Death he received a Visit at his Country-house from the Rev. Mr. *Schultens*, his intimate Friend, who found him sitting without Door, with his Wife, Sister, and Daughter. After the Compliments of Form, the Ladies withdrew, and left them to private Conversation; when *Boerhaave* took Occasion to tell him what had been, during his Illness, the chief Subject of his Thoughts. He had never doubted that he had lately had a kind of experimental Certainty of the Distinction between corporeal and thinking Substances, which mere Reason and Philosophy cannot afford; and Opportunities of contemplating the wonderful and inexplicable Union of Soul and Body, which nothing but long Sickness can give. This he illustrated by a Description of the Effects which the Infirmities of his Body had upon his Faculties; which yet they did not so oppress or vanquish, but his Soul was always Master of itself, and always resigned to the Pleasure of its Maker.

He related, with great Concern, that once his Patience so far gave way to Extremity of Pain, that, after having lain fifteen Hours in exquisite Tortures, he prayed to God, that he might be set free by Death.

Mr. *Schultens*, by way of Consolation, answered, That he thought such Wishes, when forced by continued and excessive Torments, unavoidable in the present State of human Nature; that the best Men, even *Job* himself, were not able to refrain from such Starts of Impatience. This he did not deny, but said, "He that loves God, ought to think nothing desirable, but what is most pleasing to the supreme Goodness."

Such were his Sentiments, and such his Conduct, in this State of Weakness and Pain: As Death approached nearer, he was so far from Terror or Confusion, that he seemed even less sensible of Pain, and more chearful under his Torments, which continued till the 23d Day of September 1738. on which he died, between Four and Five in the Morning, in the 70th Year of his Age.

Thus died *Boerhaave*, a Man formed by Nature for great Designs, and guided by Religion in the Exertion of his Abilities. He was of a robust and athletic Constitution of Body, so hardened by early Severities, and wholesome Fatigue, that he was insensible of any Sharpness of Air, or Inclemency of Weather. He was tall, and remarkable for extraordinary Strength. There was in his Air and Motion something rough and artless, but so majestic and great at the same time, that no Man ever looked upon him without Veneration, and a kind of tacit Submission to the Superiority of his Genius.

The Vigour and Activity of his Mind sparkled visibly in his Eyes, nor was it observed, that any Change of his Fortune, or Alteration in his Affairs, whether happy or unfortunate, affected his Countenance.

He was always chearful, and desirous of promoting Mirth by a facetious and humorous Conversation; he was never soured by Calumny and Detraction, nor ever thought it necessary to confute them; for *they are Sparks*, said he, *which, if you do not blow them, will go out of themselves*.

Yet he took care never to provoke Enemies by Severity of Censure; for he never dwelt on the Faults or Defects of others, and was so far from inflaming the Envy of his Rivals by dwelling on his own Excellencies, that he rarely mentioned himself, or his Writings.

He was not to be overaw'd or depress'd by the Presence, Frowns, or Insolence of great Men, but persisted on all Occasions in the right; with a Resolution always present, and always calm. He was modest, but not timorous; and firm without Rudeness.

He could, with uncommon Readiness and Certainty, make a Conjecture of Mens Inclinations and Capacity by their Aspect.

His Method of Life was to study in the Morning and Evening, and to allot the Middle of the Day to his public Business. He rose at Four in the Summer, and Five in Winter. His usual Exercise was Riding, till, in his latter Years, his Distempers made it more proper for him to walk; when he was weary, he amused himself with playing on the Violin.

His greatest Pleasure was to retire to his House in the Country, where he had a Garden of eight Acres, stored with all the Herbs and Trees which the Climate would bear: Here he used to enjoy his Hours unmolested, and prosecute his Studies without Interruption.

The Diligence with which he pursued his Studies, is sufficiently evident from his Success. Statesmen and Generals may grow great by unexpected Accidents, and a fortunate Concurrence of Circumstances, neither procured nor foreseen by themselves: But Reputation in the learned World must be the Effect of Industry and Capacity. *Boerhaave* lost none of his Hours, but when he had attained one Science, attempted another: He added Physic to Divinity, Chymistry to the Mathematics, and Botany to Anatomy. He examined Systems by Experiments, and formed Experiments into Systems. He neither neglected the Observations of others, nor blindly submitted to celebrated Names. He neither thought so highly of himself, as to imagine he could receive no Light from Books; nor so meanly, as to believe he could discover nothing but what was to be learned from them. He examined the Observations of other Men, but trusted only to his own.

Nor was he unacquainted with the Art of recommending Truth by Elegance, and embellishing Philosophy with polite Literature; he knew that but a small Part of Mankind will sacrifice their Pleasure to their Improvement; and those Authors who would find many Readers, must endeavour to please while they instruct.

He knew the Importance of his own Writings to Mankind; and lest he might by a Roughness and Barbarity of Style, too frequent among Men of great Learning, disappoint his own Intentions, and make his Labours less useful, he did not neglect the Arts of Eloquence and Poetry. Thus was his Learning at once various and exact, profound and agreeable.

He was not only skilled in the learned Languages, and the Tongues in which the Old Testament was written, but was able to converse in many of the modern Languages, and to read others which he could not speak.

But his Knowledge, however uncommon, holds, in his Character, but the second Place; his Virtue was yet much more uncommon than his Learning. He was an admirable Example of Temperance, Fortitude, Humility, and Devotion. His Piety, and a religious Sense of his Dependence on God, was the Basis of all his Virtues, and the Principle of his whole Conduct. He was too sensible of his Weakness to ascribe any thing to himself, or to conceive that he could subdue Passion, or withstand Temptation, by his own natural Power; he attributed every good

Thought, and every laudable Action, to the Father of Goodness. Being once asked by a Friend, who had often admired his Patience under great Provocations, whether he knew what it was to be angry; and by what means he had so entirely suppressed that impetuous and ungovernable Passion; he answer'd; with the utmost Frankness and Sincerity, That he was naturally quick of Resentment, but that he had, by daily Prayer and Meditation, at length attained to this Mastery over himself.

As soon as he rose in the Morning; it was, throughout his whole Life, his daily Practice to retire for an Hour to private Prayer and Meditation; this, he often told his Friends, gave him Spirit and Vigour in the Business of the Day; and this he therefore commended as the best Rule of Life; for nothing, he knew, could support the Soul in all Distresses but a Confidence in the Supreme Being, nor can a steady and rational Magnanimity flow from any other Source than a Consciousness of the Divine Favour.

He asserted on all Occasions the Divine Authority, and sacred Efficacy, of the Holy Scriptures; and maintained that by them alone was taught the Way of Salvation, and that they only could give Peace of Mind. The Excellency of the Christian Religion was the frequent Subject of his Conversation. A strict Obedience to the Doctrine, and a diligent Imitation of the Example, of our blessed Saviour, he often declared to be the Foundation of true Tranquillity. He recommended to his Friends a careful Observation of the Precept of *Moses* concerning the Love of God and Man. He worshipped God as he is in himself, without attempting to inquire into his Nature. He desired only to think of God, what God has reveal'd of himself. There he stopped, lest by indulging his own Ideas he should form a Deity from his own Imagination, and commit Sin by falling down before him. To the Will of God he paid an absolute Submission, without endeavouring to discover the Reason of his Determinations; and this he accounted the first and most inviolable Duty of a Christian. When he heard of a Criminal condemned to die, he used to think, and often to say, Who can tell whether this Man is not better than I? Or, if I am better, it is not to be ascribed to myself, but to the Goodness of God.

So far was this Man from being made impious by Philosophy; or vain by Knowledge, or by Virtue, that he ascribed all his Abilities to the Bounty, and all his Goodness to the Grace of God. May his Example extend its Influence to his Admirers and Followers! May those who study his Writings, imitate his Life; and those who endeavour after his Knowledge, aspire likewise to his Piety!

He married, September 17. 1710. *Mary Drolenveaux*, the only Daughter of a Burgomaster of *Leyden*, by whom he had *Joanna Maria*, who survives her Father, and three other Children, who died in their Infancy.

The genuine Works of *Boerhaave*, according to his own Catalogue of them, are as follows; and he declares, in 1732. that all others under his Name are spurious, unless some few Prefaces to new Editions of Books.

Oratio de commendando Studio Hippocratico, habita & impressa Lugd. Bat. 1701. apud Abrab. Elsevier.

Aphorismi de cognoscendis & curandis Morbis, in usum doctrinæ domesticæ, 1709. apud Joannem Vander Linden.

Qui dein auctior aliquoties recusus in 8vo.

Index plantarum, quæ in Horto Academico Lugduno-Batavo reperiuntur, 1710. apud Cornelium Boutestsein, in 8vo.

Libellus de Materie Medicæ, & Remediorum Formulæ, 1719. apud Isaacum Severinum, in 8vo.

Qui iterum prodit in 8vo.

Index alter plantarum, quæ in Horto Academico Lugduno-Batavo aluntur, 1720. apud Petrum Vander Aa, in 4to.

Atrocis, nec descripti prius, Morbi Historia, secundum Medicæ Artis leges conscripta, 1724. apud Boutestsein, in 8vo.

Atrocis, rarissimique, Morbi Historia altera, 1728. apud Samuelem Luchtmans & Theodorum Haak, in 8vo.

Tractatus Medicus de Lue Aphrodisiaca, præfixis Aphrodisiaco, 1728. apud Job. Arn. Langerak, & Job. & Herm. Verbeek, in Folio.

Besides these, he communicated to the Royal Society, and to the Royal Academy of Sciences, some Observations upon Quicksilver, which are published in the *Philosophical Transactions*.

Having given this Account of the Life and Writings of *Boerhaave*, it remains, that I take some Notice of his capital Works, which are his Institutes, his Aphorisms, and his Chymistry.

His Institutes were designed as little more than a Syllabus to his Lectures. They are written in a very concise and close Style, but abound in Matter containing all the modern Discoveries in Anatomy, Physiology, and whatever relates to the Laws of the Animal Oeconomy, and the Action of Medicines upon the Body, with considerable Improvements of his own, which are specify'd under their proper Articles. This Treatise is very methodical and distinct; but I apprehend it is utterly unintelligible to any one who is not in some Degree previously acquainted with the Subjects of which he treats.

His Aphorisms are, as he tells us himself, collected from the Greek Medicinal Writers, the *Arabians*, and some few of the Moderns; and his Reasonings are founded on the Structure of the Parts, and the Laws of Mechanics. I must here observe, that *Boerhaave*, to his great Honour, seems to have gone counter to most Writers of Institutes, and Compilers of Systems. For they have generally endeavour'd to lead Nature as it were captive, and make her act conformable to their preconceived Notions, however crude and chimerical; imposing Laws upon the Animal Oeconomy, which have no Reality, and establishing with great Pains and Industry, Sources of Action, which exist no-where but in their own Imaginations. *Boerhaave*, on the contrary, was convinced by daily Experience, and a Fund of good Sense, that the Greek Physicians by diligent Observation had determin'd with great Accuracy, how Nature acts in producing the Symptoms of Distempers, and her Methods of relieving her herself, either with or without the Assistance of Art; and that their Experience had furnish'd them with very successful Methods of Cure. The two Points therefore which he seems to have had perpetually in View were, to establish on Mechanical Principles, as much as was possible, the Doctrine of the Antients with respect to the Diagnostics and Prognostics of Diseases, and shew that they could not be otherwise than they have represented them.

But the second View is of more Importance than the first, it being no less than to demonstrate, that the Methods of Cure, pursued by the ancient Physicians, were generally the best that could possibly have been contriv'd with the Materials they were acquainted with, tho' for Reasons to which they were probably Strangers. This appears to me the distinguishing Character of *Boerhaave*. And by this he has done almost as much Service to Physic, as his Predecessors for some Centuries had done Mischief.

It is greatly to be lamented, that our illustrious Author did not think proper to publish his Lectures on his Institutes and Aphorisms, before his Decease. If he had foreseen the fatal Consequences of such an Omission, I believe his Love to Mankind would have prevailed upon him to have done it, and thereby prevented the Mischief his great Name, and the Reputation of his Lectures, may possibly do in the World. That I may explain my Meaning, I must observe, that it is the Misfortune of the *English* to be very little used to converse in *Latin*, tho' perhaps no People in the World understand it better. Add to this, that as we pronounce *Latin* in a different manner from all other Nations, our Ears are not accusom'd to the foreign Accent. Hence Foreigners with Difficulty understand us, and, on the other hand, it is impossible for us to take their Meaning, especially in long Discourses, with that Degree of Exactness, which Subjects of Importance require; and indeed it is no easy Matter to take the entire Sense of long Discourses, tho' deliver'd in the Languages we are best acquainted with. This is the Reason, that many of his Pupils, who have only attended his Lectures for two or three Years, have frequently mistaken his Meaning, and held their own Errors in an equal Degree of Veneration with the genuine Doctrine of their Professor; and have imprudently neglected to set themselves right, by examining the Sources from whence *Boerhaave* himself drew his Treasures; sometimes perhaps, because they imagined the Authority of their Professor render'd it superfluous; and sometimes, because they were Strangers to the Languages in which the best Medicinal Authors wrote; thus either out of Choice or Necessity taking a more easy, tho' less certain Way to Knowledge, than *Boerhaave* either advised, or thought proper to pursue himself.

That this has been really the Case, the spurious Works, attributed to *Boerhaave* by his Scholars, are glaring Evidences; amongst which, his Method of studying Physic, as I think it is called, deserves some Notice, being a crude and injudicious Performance, and in a great many Instances contradictory to the Sentiments of *Boerhaave*, on the Subjects there treated; and, as I remember, it recommends some Authors who never wrote, or even existed. In the same Rank is the *Praxis*

Medica, printed in five Volumes in *Holland*, tho' the Title tells us at *Padua*. In the Preface we are informed, that many of his Auditors took his Lectures in Writing; that these were carefully compar'd, and hence this Work was compiled. Yet, notwithstanding all this Care, there are not many Pages without some enormous Error, nor even Sentences without false *Latin*; so little did they understand either their Professor, or their Subjects.

With respect to his Chymistry, it may be justly said, that his Theory is more philosophical, exact, and full, and his Processes more methodical and regular, than those of any preceding Author on the Subject. It is remarkable, that in this Work he has made many Chymical Operations subservient to the establishing several important Doctrines of the Antients, and to the Confirmation of their Practice. I shall conclude with remarking, that this Work alone would have been sufficient to raise the Character of any other Man; but is, however, that in which *Boerhaave* shines much less than in his Institutes and Aphorisms, the last of which is, perhaps, more useful than any one Book written upon Physic, and has had the Honour of being translated into *Arabic*, as is said, by the *Musli*, and printed at *Constantinople*.

BOETHEMA, *Βοήθημα*. A Remedy.

BOETHEMATICA SEMEIA *Βοήθηματικὰ σημεῖα*, auxiliary Signs in Diseases, are such as give us Notice of a Cure observable in them, (*ἡ δὲ ἐν ὑπομνηστικῇ τῆς ἐν ἀσθενείᾳ τέρψις* *Deegrasias*) *Gal. Def. Med.*

BOF. Quick-lime. *Rulandus*.

BOICININGA, *Johnston*. *Boicinininga*, G. *Pison*. *Dominica Serpentina*, *Nieremb*. In *Portuguese* and *Spanish*, *Cascavel*, or *Tagendor*; in *French*, *Serpent à Sonnettes*; in *English*, the RATTLE-SNAKE.

A Serpent of *Brasil*, four or five Feet long, of the Thickness of a Man's Arm, and of a reddish Colour, inclining to yellow, with small Eyes, a forked Tail, very long and sharp Teeth, and its Tail towards the Extremity furnished with a parallelogramous Substance, two Fingers Breadth or more in Length, and about half a Finger's Breadth in Wideness, consisting, as it were, of small Links combin'd with one another, dry, smooth, shining, and of an Ash-colour inclining to Red. This Substance increases every Year a Link, and makes a Noise like little Rattles, when the Serpent creeps, so as to be heard at a good Distance. It keeps itself in By-paths, and runs after Passengers with such Swiftnefs, that it seems to fly, and is a very violent and dangerous Creature. They say that Travellers, for their Security against it, carry with them a Piece of *Virginian Root* called *Snakeroot*, fasten'd to the End of a Stick; and that when they perceive by the rattling Noise, that the Serpent approaches, they hold forth to it that Root, the Smell of which either kills it, or disables it from advancing any farther.

Its Flesh has the same Virtues as the Viper's in resisting Poison, purifying the Blood, and exciting Sweat. *Lemery des Drogues*.

This seems to be the Rattle-snake now so well known, and so remarkable for its Poison. With respect to this sort of Viper, I find the following Observations in the *Philosophical Transactions*.

The Fat of the Rattle-snake is said to be used by the Physicians of *Mexico* with good Success in the Sciatica, and all Pains of the Limbs, and for dissolving preternatural Tumors.

A present Antidote for this Poison is said to be the Snake-stone, *Pierre de Cobras de Cabelo*, as it is called by the *Portuguese*, and is famous all over the *Indies*; 'tis describ'd by *Garcias ab Horto*, by *Kircher*, and others, particularly by *Redi*, who renders very much suspected the Relations that are commonly had of its great Force and Virtue: but that it does not always fail, some Accounts I have had of Persons relieved by it here in *England* have convinc'd me. One Instance is remarkable, that was told me by an eminent Physician in *London*, of a Person near the Town that was bit by a Viper: His Hand and Arm soon swelled with great Extremity of Pain; but, upon the Application of this Stone for one Night, both were asswaged, and he thought himself well, and took off the Stone, which still firmly adhered. But, not long after, his former Symptoms violently returning, he had recourse to his Antidote, and then suffered it to continue there till it fell off itself, and so was cured. One Trial I formerly made myself in a Patient troubled with the Gout in her Stomach; having removed it thence, it seized her Toe; but she being impatient of the Pain, that I might seem to do something, and to hinder her using abundance of Medicines, which every body was like to advise her to, and might be apt to strike it to her Stomach again, I thought of this: Holding the Stone therefore in my Hand, and without acquainting her, I put it near the Joint where her Pain was most, and, being very near it, I perceived it move out of my Hand, and readily adhere to the Part. Soon after, she acquainted me, that she very sensibly perceived a great Drawing and Tickling all down her Leg and Thigh, and afterwards owned an Abatement of her Pain. In pestilential

peffilential Swellings very probably it may be of Use. Dr. Edward Tyfon.

The Rattle-snake seems to take its Name from the Rattles in its Tail, in which are sometimes twenty of those loose Rings. The more Northerly they travel, these Snakes are less numerous, as well as less venomous; nor, as it is said, are any seen to the North of Merimack River, which is about forty Miles North of Boston. It is constantly affirmed by the Indians, that these Snakes frequently lie coiled at the Bottom of a great Tree, with their Eyes fixed on some Squirrel above in the Tree, which seeming by his Cries, and Leaping about, to be in a Fright, yet at last runs down the Tree, and into the Jaws of the Devourer. The Winter-abode of these Snakes is in the Clefts of inaccessible Rocks, from whence in the Spring they come forth a sunning themselves, at first very feeble, which is their chief Time of destroying them. At this time the Cystis or Gall-bladder in these Snakes is full of an acrid azure-coloured Juice, which they squeeze out into a Glass, but it is so spirituous, that, if the Glass be not immediately stopp'd, it will soon evaporate: This Liquor therefore they mix with a convenient Quantity of powder'd Chalk, or Indian Meal, and use it as a proper Medicine against the venomous Bite of this Snake. Some have named it *Trochisci Connecticutiani*, from the Connecticut Colony. 'Tis observable, when the Summer Heats come on, the Snakes have no longer this azure Liquor in their Gall-bladders, in which there is only found a black thick Sediment of no known Use, at which time they think the forementioned spirituous Juice is carried to, and lodged in their Gums, and so conveyed or thrown by the Hollow of the Teeth into the Wound when they bite, having received another Digestion, and higher Exaltation, by passing through several Strainers and Glands before it arrives at the Gums.

As an Instance of the Virulence of the Liquor, a Traveller, killing one of these Snakes, suffer'd the enraged dying Viper to bite the End of the Switch, with the Lashes of which he had disabled him; and a Fly by chance disturbing one of his Temples as he rode on afterwards, he rubb'd his Temple with the other End of the Switch, which immediately caused his whole Head to swell to a great Excess, the Poison, as he supposes, penetrating the whole Length of the Switch. Another provoking a Rattle-snake to bite the Edge of a broad Ax he had in his Hand, the Colour of the steel'd Part bitten was immediately changed; and at the first Stroke he made with it, in using his Ax, the discolour'd Part broke out, leaving a Gap in his Ax. But to return to the Troches made of the Gall: It is a cordial Sudorific, and so good an Anodyne, that some take three or four Grains of it to compose them to Rest after Travel. 'Tis good in all Fevers, especially the malignant. It is an infallible Remedy for Obstructions incident to Women upon catching Cold in Child-bed. Being taken in a convenient Quantity, twelve Hours before the Fit, it certainly cures a Quartan Ague. The Dose is fourteen Grains, more or less, according to the Circumstances of the Patient, in any Vehicle. Dr. Mather.

The Inhabitants of America have several Remedies for the Sting of a Rattle-snake: Among others, that which is much made use of is a Root they call Blood-root, I suppose so named from the Colour of the Root, and the Juice, which is red like Blood. It grows in great Abundance in the Woods: They bruise the Root, and bind it above the Place that is bit, to prevent the Poison's going further, at the same time scarifying the Place affected. Some of the Root is also boil'd, and the Person poison'd drinks the Water. Paul Dudley, Esq; Phil. Transf. Abr.

The Senekka Rattle-snake Root, taken internally, is said to be a Cure for the Bite of the Snake whose Name it bears. But it is probable, that the common Salad Oil, that is, Oil of Olives, rubb'd well into the Part by a warm Fire, would cure this Bite, as it does that of a Viper.

BOJOBI, *Pison. Jonst.* A Serpent of Brasil, call'd by the Portuguese *Cobre verde*, about an Ell (French) long, and an Inch thick, and of a shining Leek-green Colour; has a wide Mouth, and a black Tongue. It keeps itself among the Stones in Buildings, and does no Harm, unless provoked; but then raises itself on its Tail, and throws itself on the Hand that is next to it. Its Poison is so venomous, that it will hardly yield to the most powerful Remedies. The Medicine chiefly used by the Indian Physicians is the Root of an Herb call'd *Coa-apia*, which is full of Joints, which they bruise well, and cause the Patient to swallow in Water.

The Flesh of this Serpent has much the same Virtues with that of the Viper; and the volatile Salt extracted from it would be more effectual against its Bite, than the *Coa-apia*. Lemery des-Drogués.

BOITIAPO, *Marcg. Jonst.* is a Serpent of Brasil, called by the Portuguese *Cobus de Cipo*. It is seven or eight Feet long, as thick as a Man's Arm, round, and pointed towards the Tail, like a Shoemaker's Awl: It is cover'd with fine, and, as it were, triangular Scales; and is of an olive Colour and yellowish. It lives upon Frogs, and its Bite is dangerous, like that of many other Serpents.

Its Flesh might be used as effectually as that of the Viper for purifying the Blood, and as an Alexipharmac. Lemery des-Drogués.

BOLBIDION, *βολβιδιον*. A small Polypus, a sort of Fish. Hippocrates, *περὶ γυναικ.* Lib. 2. *ἢ δ' ἄρ' ἔστιν βολβιδιον, καὶ βολβιδιον, καὶ σπιδία καὶ σμικρὸν* "If she has a mind to Bread, and Bulbuli, and small Polypuses." Again, in the same Book, for an Inflammation of the Uterus, he advises, in Food, *βολβιδιον καὶ πολυπόδιστον ἐν οἶνῳ καὶ ἐλαίῳ* "Bulbuli and small Polypuses in Wine and Oil." *Poësius*.

BOLBION, *βολβιον*. This, as well as the preceding, is a Diminutive of *βολβος*, and is render'd also *Bulbulus*, a small Bulb. Hippocrates, *Lib. 2. περὶ γυναικ.* advises Bulbuli, with Garlick and Nitre, to be used as a Pessary for a Weakness of the Uterus, not retaining the Semen. He often uses the Bulbulus, or *Bolbion*, in a Pessary for Disorders of that Part, as, in *Lib. 2. περὶ ἐκκυσσεως*, to cleanse the Uterus; and, *Lib. 2. περὶ γυναικ.* the same bruised, with Myrrh and Honey, as an excellent Pessary for the *Flux Uterinus*. Again, *Lib. 2. περὶ γυναικ.* *φύσ.* he advises the Bolbion, bruised in White-wine, and wrapp'd in Wool, to cleanse the Uterus; in order for Conception; and in the same Book, he orders *βόλβιον ἐν ἡσπ. πυρῶν*, "the Bolbion which grows amongst Wheat," to be bruised and macerated in Wine, and, being wrapp'd in Wool, to be applied to a Woman newly brought to Bed. See BULBUS.

BOLBITION, *βολβιτιον*. Galen, in his *Exegesis*, says *Bolbition* is call'd by some *Bombylion*, and is a small Polypus, a sort of Fish. *Poësius*.

BOLBITON, *βολβιτιον*. Cow-dung. It is also call'd *Bolition*, *βόλιον*, as Galen says in his *Exegesis*. Hippocrates, *Lib. 2. περὶ γυναικ.* *φύσ.* for a Dropsy of the Uterus, advises *πυρεῖν ἐν τῷ βολβιτιῳ*, "to foment it with Cow-dung;" and in all his Treatises concerning Women, he frequently prescribes Suffumigations of Cow-dung for Disorders of the Uterus. And Dioscorides, *Lib. 2. Cap. 98.* writes, that the Dung of a Male Bullock represses the Falling-down of the Uterus. It is also called *Bolbitos*, and *Bolitos*, in the Attic Dialect, and by *Hesychius Bolynthon*. *Poësius*.

BOLBONAC. See BULBONAC.

BOLBOS, *βολβος*. Erotian, in Hippocrates, says, *βολβος βόλβανος ὄνομα*, "Bolbos is the Name of an Herb;" but, for *βολβος*, perhaps we should read *βόλβιον*; tho' in *Lib. 7. Epid.* we meet with *βολβὸν χυλὸς*, "the Juice of the Bulbus." See BULBUS.

BOLCHON, *βολχόν*. A Name for Bdellium.

BOLESIS. A Name for Coral. *Rulandus*.

BOLESON. A Balsam. *Johnson*.

BOLETO, Frit. See FRITTA.

BOLETUS. A Mushroom. See AMANITA.

In Dr. Martyn's *Tournefort* I find the following Catalogue of *Boleti*.

Boletus major, pileo fusco, poris albidis. Fungus porofus magnus crassus, ex fusco albicans; J. B. 3. 817. Lib. 40. C. 29.

The Head of this is sometimes ten or eleven Inches in Diameter, *Vaill.*

Boletus major, pileo purpurascens. Fungus porofus magnus crassus purpurascens.

This differs from the former only in Colour.

Boletus major, pileo tuberculis aspero, coloris aurantii, poris albidis. Fungus porofus magnus crassus, tuberculis minimis exasperatus, colore pomi aurantii exiccatis, Vaill. 59.

The Diameter of the Head is from four to six Inches. The Stalk is four or five Inches high, above an Inch thick at the Base, and tapers towards the Top. It is white, and in a manner hairy: This Hair or Down afterwards grows black, and variegates the Stalk.

Boletus major, pileo castanei coloris, poris ex luteo virentibus. Fungus porofus magnus crassus, coloris castanei nunc liquidioris, nunc magis sordidi, Vaill. 59.

The Head is from four to nine Inches in Diameter: Its Substance is white, but it grows red soon after it is cut. It is an Inch thick in its thickest Part. The Top of the Head is a bright chestnut Colour, sometimes of a dirty-white, and sometimes of an amber Colour. The Stalk is white, and sometimes tinged with Yellow. It is five Inches high, and two or three in Diameter towards the Base, especially when the Plant is growing, and tapers towards the Top. It is found about the latter End of August, and Beginning of September. The *Fungus porofus maximus crassus luteus lacer, pediculo longissimo virente*, *Cimel. Reg.* and the *Fungus porofus nostras brachiatus maximus*, *ibid.* are Varieties of this Species, *Vaill.*

I take this to be the same with the *Fungus porofus magnus*, *Raii Hist. 100.* which we often meet with about the latter End of Summer.

Boletus pileo purpurascens, poris flavis. Fungus porofus medius, sordide purpurascens, Vaill. 59.

The Head is about two Inches in Diameter, a little convex. The Stalk is about one Inch and a half high, five Lines thick, and of the same Colour with the Head. Perhaps it is the *Fun-*
gus

gus Italicus, pediculo tumente, pileolo supina parte coloris vini faccum, prona vero luteo, Cimel. Reg. Vaill.

Boletus pileo sordide albo, tuberculis castaneis variegato, poris flavis. Fungus porosus medius, superficie sordide alba, tuberculis castaneis variegata, Vaill. 59.

The Head is hemispherical at first; afterwards it grows flatter. It is two or three Inches high, of a dirty White, near an Inch thick at the Base, and about six Lines at the Top. I take it to be the *Fungus brizzatus madidus*, Raii Supp. 25. Vaill.

Boletus lævis & viscidus, superne coloris fuscis castanei, inferne lutei, Dillen. Cat. Giss. 188. Fungi lutei perniciosi sub pina habitantes, J. B. 3. 816. Lib. 40. C. 24.

The Head of this is from one to three Inches in Diameter: It is a little convex, of the Colour of Ginger-bread, or a reddish Yellow, smooth, and a little shining. This Shining proceeds from a Slime, with which it is usually cover'd, especially whilst it is young. Its Flesh is white. The Pores are of a Lemon or Brimstone-colour; there is a whitish Liquor distils from them, which gathers in Drops. The Stalk is white, an Inch or two long, and a little swell'd something above the Base.

Boletus pileo sordide albo, caule ovali. Fungus porosus, pediculo ovali, pileoli superficie sordidissime alba, Vaill. 60.

The Stalk, Pores, and Head, are all the same Colour; the Flesh of the Head, when broken or cut, is bluish, and stains the Paper of the same Colour. Vaill.

Boletus pileo croceo, caule ovali. Fungus porosus, pediculo ovali, pileoli superficie splendide crocea, Vaill. 60.

The Head is of a dark Saffron-colour, and the Pores of a light one; as is also the upper Part of the Stalk, tho' the lower Part of it is of the same Colour with the Head. The Flesh is of a greenish Yellow, when first cut; but soon changes to a dirty Green. It is the *Fungus Italicus fuscus, pileolo patulo, pediculo tumesciente, & in apice rubro, Cimel. Reg. Vaill.*

Boletus pileo castanei coloris, poris albidis, pediculo ovali. Fungus porosus, pediculo ovali, pileoli superficie castanea. Vaill. 60.

The Stalk is of the same Colour with the Head: The Flesh is white, and does not change Colour when it is cut. Vaill.

Boletus fuscus, pediculo tumesciente. Fungus porosus fuscus, pediculo tumesciente, Vaill. 60.

What is usually understood by the *Boletus*, is the *BOLETUS*, Offic. *Tubera Cervina*, C. B. 376. Park. 1320. Hist. Oxon. 3. 638. *Tubera perniciofa terrestria five cervina*, Sterb. 315. Tab. 32. B. *Tuberum genus quibusdam Cervi Boletus*, J. B. 3. 851. Raii Hist. 1. 111. *Cervi Boletus*, Chab. 591. DEERS-BALLS.

These are digg'd out of the Earth; and the Whole of them are used, which is as large as a Walnut, of an unequal Surface, externally of a cineritious, but internally of a whitish-purple Colour, and of a grateful Taste.

It is rarely used, tho' some recommend it as a powerful *Stimulus* to Veneri, and a Medicine very proper for increasing Milk. Its external Use is recommended in hysteric Disorders, and hard Labours. Dale from Schröder.

BOLISMUS. This Word occurs in *Avicenna*, where it is written, by Mistake, for *BULIMUS*. *Castellus*.

BOLUS. A Bole, or Bolus. The Form of a Medicine.

A *Bolus* is an internal Medicine, soft, coherent, a little thicker than Honey, and whose Quantity is a little Morfel or Mouthful; for which Reason it is by some call'd *Buccella*.

Whatever is fit for internal Use, either by itself, or when mix'd with other Substances, provided it is capable of the above-mention'd Consistence, is a proper Material for the Composition of a *Bolus*, and may be applied to that Purpose: Such are all dry Substances, which operate when exhibited in small Doses, and such as are proper only for forming Powders: These are call'd *Excipienta*, and are not capable alone of forming a *Bolus*.

Soft Substances, more or less thick, Conserves, Electuaries, soft Extracts, Robs, Pulps, soft Confections, thick, native, and factitious Balsams, potable Ointments, and Syrups, are call'd the *Excipientia*; because, when mix'd with the above-named Substances, they constitute the Form of a *Bolus*, which some of the *Excipientia* naturally have of themselves.

Liquid Substances, which are given in smaller Doses, such as liquid Balsams, whether native or factitious, Oils, Spirits, Tinctures, Essences, and Elixirs, being of themselves unfit for the Form of a *Bolus*, are either received into other Ingredients, or receive others into them, before they can become proper for this Purpose.

The Choice of proper Materials for a *Bolus* is regulated by the following Considerations.

A due Cohesion, Softness, and an equable Mixture, are highly commendable, and essential at least to the due Consistence of a *Bolus*.

For this Reason dry Substances, or such as are liquid, are not by themselves proper for this Purpose; but some Ingredients of a soft and glutinous Quality must be interposed, before the due Consistence of a *Bolus* can be produced.

Most soft Substances must also be inspissated by the Addition

of some dry Ingredients, for the Formation of a *Bolus*; yet some of them are of themselves sufficient for this Purpose, such as the thicker Conserves, Electuaries, and Robs. These may therefore be used by way of a simple *Bolus*.

All the Ingredients of a *Bolus* ought to be of such a Nature, as to be capable of being mix'd up, and form'd into an equable Composition.

Acrid Substances, such as are offensive either by their Smell or Taste, and such as are viscid, are more properly exhibited in the Form of a *Bolus*, than in that of Powders; since, in the former Shape, their disagreeable Qualities are much better conceal'd than in the latter; for which Reason the Form of a *Bolus* is the most proper Vehicle for the more strong and drastic Preparations of Mercury.

It is proper to divide pinguious Substances, Balsams, and potable Ointments, by mixing them with Sugar, or some other dry Ingredients, that they may be the more easily swallow'd down, and dissolved in the Stomach.

Alcaline, fix'd, and volatile Salts, and all other Substances which soon become liquid, are very improperly made Ingredients in a *Bolus*, which is intended to be kept for any considerable Time; since, by their Colliquation, the due Consistence of the *Bolus* is lost, and its Virtues destroy'd by their Exhalation.

For this Reason Substances which produce an Effervescence, or easily ferment when mix'd together, are highly improper for the Formation of a *Bolus*, unless the Patient is to use it immediately after it is prepar'd.

The Number of Ingredients in a *Bolus* ought scarce ever to exceed three or four.

The most usual Order observed in prescribing the Ingredients of a *Bolus*, is, first, to specify the Quantity of the *Excipient*; then the Quantity of the *Excipienta*, or dry Ingredients, is to be determin'd; then that of the Liquids; and lastly, if there is any more of the *Excipient* to be added, at the Apothecary's Discretion, that Circumstance is to be mention'd.

The Dose of a *Bolus* may be extended from one Dram to one Dram and an half, or two Drams; but is not rashly to be augmented beyond the last-mention'd Quantity, unless when the Materials of the *Bolus* are of a considerable specific Gravity, or when the Patient can take them without Reluctance or Uneasiness; but the Dose ought scarcely to exceed a Dram, if the Ingredients are light. For this Reason, when the Quantity of the Ingredients must exceed these Bounds, before it prove an effectual Dose, it is better to divide the Mass into several *Boluses*, than to choak and disgust the Patient by one that is unconscionably and extravagantly large; for as Smallness of Bulk is a great Recommendation to a Powder, it is much more so to a *Bolus*; so that, in this respect, we can scarce err, tho' the Quantity of the *Bolus* should scarce exceed a Scruple.

The Number of *Boluses* made at a time, is, for the most part, only one or two, and rarely three or four Doses, unless when they are to be taken at very short Intervals; for, when they are divided by the Apothecary, they readily become too dry, or are melted down, when kept for any considerable time.

The mutual Proportion of the Ingredients is to be determin'd by their Consistence, and their Efficacy; so that the same Proportion is not to be observed promiscuously in the Composition of all *Boluses*.

When soft Substances, each of which is of itself fit to form a *Bolus*, are compounded, the Proportion in which they are to be mix'd must be determin'd by the Quantity of each, which proves an effectual Dose when exhibited by itself, and by the Quantity of the compound *Bolus* which must be a Dose; for, in this Case, the Consistence is not to be consider'd.

When dry Substances are to be incorporated with any *Excipient*, the Dose of them may be half a Dram two Scruples, or at most one Dram; but the Proportion of Excipients must be varied, according as they are of a thicker or thinner Consistence.

The Substances most commonly us'd for *Excipients* are Conserves, Electuaries, Honey, thick Balsams, and potable Ointments; and the Quantity of these to be us'd is from two Scruples to one Dram, or one Dram and an half. When Robs, Pulps, and soft Confections, are us'd as *Excipients*, their Quantity may be from half a Dram to one Dram, or four Scruples.

When Syrups are us'd for this Purpose, as they are more liquid than the above-mention'd *Excipients*, their Quantity may be from one Scruple to half a Dram, or one Dram.

For, when the Quantities of dry Ingredients are the same, the more liquid the *Excipient* is, the less of it is requisite in order to subdue them, or reduce them to the Consistence of a *Bolus*.

Hence 'tis obvious, that, when the Quantity of dry Ingredients is small, 'tis proper to use thick *Excipients*; whereas, when 'tis large, thin *Excipients* must be us'd, lest the Dose of the *Bolus* should be enlarg'd to an unreasonable or improper Bulk.

If to the above-mention'd Ingredients Liquids are to be added, we must not exceed the Quantity of one, two, three, or, at most,

most, four Drops; and, even in this Case, the Quantity of the soft *Excipients* is to be lessen'd in a due Proportion.

On some Occasions, the precise Quantities both of the dry and liquid Ingredients being determin'd and fix'd, the Proportion of the soft *Excipients* is left to the Discretion of the Apothecary, to whom the Physician's Meaning is convey'd by the two significant Letters Q. S. which import a sufficient Quantity. But this Method cannot be us'd, if a small Dose of these Ingredients is capable of considerable Effects: But when the Quantity of dry Ingredients is pretty large, or when the primary *Excipient* is desir'd thick, and in so small a Quantity, that 'tis dubious whether the soft and delicate Consistence of a Bolus can be produc'd by it, there is often a secondary and more liquid *Excipient* added; a sufficient Quantity, for Instance, of some Syrup.

On the contrary, when the too great Softness of the Bolus is dreaded, 'tis customary to add a sufficient Quantity of Sugar, Powder of Liquorice, or some other proper Substance; which Practice is principally us'd in making up pure terebinthinous Ingredients.

The *Subscription* runs thus: *M. F. Bolus*; or *Boli*; No. ij. iij. that is, mix up into a Bolus, or into two or three Boluses. As to the Division of the Doses, when the Ingredients are of a strong and drastic Quality, the Division must be made with the utmost Accuracy and Exactness. Sometimes, for the sake of Ornament, or that the Patient may swallow the Medicine with the less Reluctance, it is added, *Auri Folis aut Nebula obvolvatur*, or *exhibeatur cum Nebula*; that is, Let it be wrapp'd up in Leaf-gold, or a Wafer, or let it be exhibited in a Wafer. The Bolus is generally put into a small Gally-pot, or a Paper; but these are Circumstances too trivial to be mention'd.

The *Signature* must specify the Design of the Bolus, the Dose, the Vehicle, the Time of taking it, and the Regimen to be us'd. Some love a Wafer for a Vehicle, and others choose to have the Bolus previously dissolv'd in some Liquor. It is proper to give some convenient Liquor to be drank after taking the Bolus, if we suspect, that it will be dissolv'd slowly, and with Difficulty, in the Stomach; and this Caution is principally to be observ'd with regard to terebinthinous Substances; and others of a like Nature.

The Use of Boluses is almost universal, either as Evacuants or Alteratives; only we ought carefully to consider, whether the Nature of the Disease, its Seat, its Symptoms, the Constitution of the Patient, Custom, and the Nature of the indicated Relief, do not render such a Formula improper. The Difficulty, or absolute Incapacity, of Deglutition in Quinsies, Ulcers of the Fauces, Apoplexies, Epilepsies, and Syncope, seem to forbid, or, at least, render *Boluses* highly improper. Tho' *Boluses* are design'd for the same Intentions with Powders, yet they are less frequently us'd, because they do not always produce their Effects so soon as could be wish'd. Those who are delighted with Variety, or choose a Bolus rather than Powders, are to be gratify'd with this Form.

For Specimens of *Boluses*, take the following.

An Emetic Bolus, for a full-grown Person.

Take of white Vitriol, twenty-five Grains; Rob of Juniper, a sufficient Quantity: Mix up into a Bolus to be exhibited in a Wafer.

Signature: An Emetic Bolus to be taken in a little Ale, or an Infusion of Green-tea. Let some Draughts of the same Infusion be drank tepid, after every Time of vomiting.

A PURGATIVE BOLUS, to be exhibited in a feverish Restlessness.

Take of the Electuarius Diaprunum of Sybivius, one Dram and an half; and of the Powder of Sena-leaves, one Scruple: Mix up into a Bolus.

An ANTIHYSTERIC BOLUS.

Take of Mithridate, one Dram; of the Troches of Myrrh, half a Scruple; of the distil'd Oil of Amber, two Drops: Mix up into a Bolus, to be wrapt up in Gold-leaf.

Signature: A Sedative Bolus, to be taken in a Glass of Peny-royal Water.

A BALSAMIC BOLUS. See Harris de Morb. Infant. Lib. 2. Observat. 2.

Take of the Turpentine of Chios, two Drams; of Liquorice-powder, a sufficient Quantity: Mix and make two Boluses.

Signature: The Nervous Boluses, one of which is to be taken in the Morning, and the other in the Evening, in the Yolk of a new-laid Egg, drinking after each two Ounces of alexiterial Milk-water.

SALIVATING BOLUSES: See Boerhaave's Mat.

Take of the Conserve of red Roses, half a Dram; of Mercurius Dulcis triturated, nine Grains: Mix up into a Bolus. And two others, exactly the same, but made up separately, are to be deliver'd, put up in different Wafers.

Signature: Aperient Boluses, one of which the Patient is to take every four Hours, having first drank a large Quantity of some proper Pifan.

ASTRINGENT BOLUSES.

Take Rob of the Cornelian-cherry, three Drams; Extract of Tormentil, one Dram; Armenian Bole levigated, two Scruples; Prepar'd Blood-stone, half a Dram; Syrup of Myrtles, a sufficient Quantity: Mix, and make four Boluses.

Signature: The astringent Boluses, one of which is to be taken every three Hours, in a little austere red Wine.

There are many fat Earths us'd in Medicine, which go by the Name of *BOLI*, *Boles*; as the

BOLUS ARMENA, Offic. *Bolus Armena Orientalis*, Mont. Exot. 13. *Bolus Orientalis*, Charlt. Foss. 5. Calc. Mus. 111. *Bolus Armena*, frue *Armeniaca*, Dugd. Ind. 118. *Bolus Orientalis*, quibusdam *Armenia*, Worm: Mus. 11. *Bolus seu Terra Armenia*, Aldrov. Mus. Metall. 269. *Bolus Armenius verus*, Kentm. 7. *Bolus vera quibusdam*. *BOLE-ARMONIA*C.

Dale. It is an earthy Substance, of a pale-yellowish Colour, inclining somewhat to Red. It is ponderous, pinguious, easily friable, and of a styptic Taste. It is digg'd out of the Mines in Turkey, and thence brought to us. It is, at present, very rare with us; for what is found in the Shops, approaching to the Colour of red Okre, is imported from Spain and Normandy, and is thought to be little different from the *Rubrica synopica*.

It is an Alexipharmic, and corrects those Acidities in the Blood which are prejudicial to Health. It is astringent in some Degree, and, for that Reason, us'd in Fluxions of Humours. When apply'd externally, it is of a drying Quality, and induces Cicatrixes on Wounds. *Dale*.

Fracastorius says, that Bole Armoniac given to a Person almost in the Agonies of Death, from the Bite of a Spider, instantly cur'd him.

BOLUS ARMENA ALBA, Mont. Exot. 13. *WHITE ARMENIAN BOLE*. *Dale*.

This Bole is brought from Armenia. Its Virtues are the same with those of the *Bole Armoniac*, but it is not to be met with in our Shops. *Dale*.

BOLUS ARMENA LUTEA, Mont. Exot. 13. *Bolus luteus Theophrasti*, Kentm. 7. *Bolus Armenus naturalis flavus*, Aldrov. Mus. Metall. 270. *An Terra Arabica sigillata sublutea*, Charlt. Foss. 6. *YELLOW ARMENIAN BOLE*.

This Bole adheres to the Tongue, is a strong Astringent, and said to be a powerful Resister of Malignity. *Dale*.

BOLUS BLESENSIS, Ind. Med. 21. *EARTH OF BLOIS*.

This is an Earth of a pale-reddish Colour; but I have never met with any Accounts of its Virtues, or its Use in Medicine. *Dale*.

BOLUS BOHEMICA, Offic. Aldrov. Mus. Metall. 271. *Bolus Bohemicus rubens*, Kentm. 7. *GERMAN BOLE*.

It is an earthy Substance, of the same Colour with the Oriental Bole Armoniac, but somewhat fainter. It has some Veins of a yellowish Colour running thro' it, and is heavy, easily friable, and of an astringent Taste. It is digg'd from the Mines of Bohemia, and thence imported to us.

Its Virtues are the same with those of the Bole Armoniac, and it is much kept in our Shops. *Aldrovandus* informs us, that it is a very efficacious Medicine in all exanthematic Fevers. *Dale*.

BOLUS CANDIDUS, Offic. *Bolus candidus Lignicensis*, seu *Terra sigillata Goltbergensis*, Charlt. Foss. 5. Worm. Mus. 10. *Bolus candidus Lignicensis*, Schw. Foss. 397. *Terra sigillata Lignicensis*, Schrod. 318. Aldrov. Mus. Metall. 265. *Unicornu Minerale*, Schrod. 111. 318. *Axungia Lunæ Chymicis*. *WHITE BOLE*.

This Bole is digg'd from the Earth at Gran in Hungary, and at Goltberg in Liege.

It relieves and mitigates Pains of the Head, strengthens the Brain, and is singularly efficacious in curing Dysenteries, and the Fluor Albus. *Dale*.

BOLUS RUBRA NOSTRAS, Ind. Med. 21. *FRENCH BOLE*.

Dale confesses he knows nothing of this Bole. I take it to be the red French Bole, which is got in many Parts of France. *Pomet* gives the ensuing Account of the French Boles.

"The Bole which we sell is found in several Parts of France, about Blois and Saumur, or Bourgogne, and which is of various Colours, as grey, red, and yellow. The Yellow is the most valuable, because it passes the readiest for Bole of the Levant, and because it fits the Gilders best.

"As these Boles are the dearest, because of the Charge of transporting them to Paris from Blois and Saumur, we prefer that of Baville and other Places about Paris, because the Peasants bring it us at a cheaper Rate than we can buy the other. The best is the cleanest, smoothest, and well-colour'd, of a light-yellowish Red, which, being tasted, seems to melt, like Butter, in the Mouth. Its Thickness is known by sticking to the Tongue. The counterfeit or adulterate Bole is of a sad-deep Red, sandy, and gritty, being, indeed, not of a third Part of the Price. It is very drying " and

"and astringent, good against Fluxes and Gleet. It thickens thin Humours, resists Putrefaction, and expels poisonous Bodies. It is likewise us'd in spitting of Blood, bleeding Wounds, and also to consolidate broken Bones, and strengthen weak Limbs."

BOLUS TOCCAVIENSIS, Offic. Charlt. Foss. 5. Worm. Mus. 2. *Bolus Hungaricus*, Crato. *Bolus Tokaicus*, Schw. 370. *Bolus Pannonicus verus*, Kentm. 7. **TRANSYLVANIAN BOLE**.

This *Bole* has all the Characteristics of the true *Armenian Bole*, and melts in the Mouth like Butter. It is digg'd from the Earth in *Transylvania* near *Tokai*.

It is highly celebrated as an efficacious Medicine in Catarrhs and the Plague. It was first apply'd to medicinal Purposes by *Crato*, who prefers it to the *Armenian Bole* brought from *Turky*. I cannot determine whether it is really different from all the former or not. *Dale*.

BOLUS FABRILIS. The same as *Rubrica Fabrilis*, which see.

BOLUS JUDÆICUS: A Name for the *Althæa*, Marsh-mallows. *Johnson*.

BOMBAX, Offic. *Gossypium sive Xylon*, Ger. 753. Emac. 901. *Gossypium frutescens annuum*, Park. Theat. 1553. *Gossypium frutescens, semine nigro*, C. B. Pin. 430. *Xylon sive Gossypium herbaceum*, J. B. 1. 343. Raii Hist. 2. 1064. Tourn. Inst. 101. Elem. Bot. 84. Boerh. Ind. A. 273. *Gossypium herbaceum, semine albo*, Hist. Oxon. 3. 517. **COTTON-BUSH**. *Dale*.

The Cotton-bush, or Shrub, grows to be a Yard high, or more, spread out into many Branches, with many brittle woody Stalks, on which grow Leaves, divided into five Segments, not much unlike the Leaves of Maple, standing on pretty long Foot-stalks; among these, on the Upper-part of the Branches, grow the Flowers, of a pale-yellow Colour, with a purple Bottom, in Shape like those of Mallows, or the Small Holy-oak, and are succeeded by roundish or oval Capsulæ or Seed-vessels, which, when ripe, open into three usually, and sometimes four Partitions, discovering the white soft Cotton, among which lies dark-brown, longish, round Seed.

Cotton is cultivated in *Greece*, *Turky*, *Sicily*, and *Malta*. It flowers in *June*.

The Seed, which is the only Part us'd, is of a balsamic Nature, us'd in Coughs, Shortness of Breath, and Soreness of the Lungs, causing Expectoration, and freeing them from tough Phlegm. It is also restraining, and good to stop Fluxes of all Sorts. *Miller's Bot. Off.*

In the Shops the Seeds and Wool of this Shrub are us'd. The Wool burn'd, and reduc'd to Powder, stops the Effusion of Blood from Wounds, if put into them. The Seeds are good for Disorders of the Kidneys and Liver, but prejudicial to the Head and Stomach. They are also esteemed excellent for those who are afflicted with a Cough, or Difficulty of breathing. They are good for the Stone, yield a wholesome Nourishment, strengthen the Constitution, and cure the Dysentery; for, by their lenitive Quality, they obtund the acrid and exulcerating Humours. *Casp. Hoffmann. de Medic. offic. L. 2. C. 105*. The Oil expressed from the Seeds removes Spots of the Skin, and cures running Sores of the Head. *Zacut. Lusitan. Prax. Hist. L. 1. C. 2. in Obs.* In *Egypt*, according to *Prosper Alpinus*, they extract a Mucilage from the Seeds, just as they do from those of the Fleabane and Quinces, which is of Use in burning Fevers, and corrosive Coughs. They also restrain all immoderate Fluxes of the Menfes. *Rein. Solenand. Consil. Medic. 8. Sect. 4*. The Inhabitants of *Malta* fatten their Cattle with the Seeds of this Herb, which have a Taste resembling that of an Acorn. See *Henr. Bunting. Itinerar. 8. 8. p. 2. fol. 95*. See also *Pliny, L. 12. C. 10 & 11. Theophrast. de Plantis, L. 9. C. 4. Claud. Salmas. ad Solin. p. 2. 296. and 998. and Erasmi. Francisc. Part. 1. p. 552. Barthol. Zorn. Botanolog.*

BOMBUS. Βόμβος. A Word made to imitate a Sound, by a Figure the Rhetoricians call *Onomatopœia*; a resounding, ringing Noise, proceeding from Blasts which break out of a narrow Passage, and diffuse themselves abroad; but if those Blasts fall into a narrow Passage, and vent themselves, as it were, thro' Chinks, there is heard a Stridor, a grating Noise, or an Hissing. In *Coac. Βόμβος ἐν ὤξει, καὶ ἥχος ἐν ὥσει, θανάσιμος*, "a resounding Noise, and Ringing in the Ears, in acute Difficulties, is mortal."

BOMBYLIUM. Βομβύλιον is expounded in *Galen's* Exegesis by a narrow-mouth'd Cup, or a Cover, so call'd from its ringing Sound. The Word occurs, *Lib. 3. de Morb. καὶ διὰ τὸν γλυκύον καὶ ὕδαρτα προτινεν, μὴ ψυχρὸν, ὁλίγον ἐκ βομβυλίου εὐερόμεν*. "Let the Patient drink a little sweet diluted Wine, not cold, out of a wide-mouth'd Bombylium."

BOMBYX, Offic. *Schrod. 5. 339. Goedart. 1. 112. T. 42. List. Ed. Angl. 41. N. 32. Mar. Eruc. Ort. 1. p. 1. Aldrov. de Insect. 278. Jonf. de Insect. 114. The SILK-WORM*.

This Insect undergoes a strange and surprising Metamorphosis in the several Periods of its Existence. This Animal, or Worm, is call'd *Bombyx* in the Shops, and is produced from

small Eggs, hatched by the genial Heat of the Sun, in the Spring of the Year. It feeds upon Mulberry-leaves till it has arriv'd at a State of Maturity. After this they are usually put into a small Paper-bag, where they wrap themselves up in a silken Case, which, coming from their Mouths, is, without Interruption, carry'd very often round them. This Case is sometimes of a palish, and sometimes of a yellowish Colour. In this Case, or Coat, it remains wrapt up, till it is transform'd into its *Cbrysalis* or *Aurelia*, and appears dead; but, at last, it falls forth from its Coat in the Form of a Butterfly, with four Wings; and after a Copulation, which lasts for three Days, and proves immediately mortal to the Male, the Female lays a considerable Number of Eggs, and dies likewise. The whole Worm, the Silk, and the silken Coat or Covering, are us'd in Medicine.

Silk-worms dry'd, and reduc'd to a Powder, are, by some, apply'd to the Crown of the Head for removing Vertigos and Convulsions. The Silk, and Case or Coat, are of a due Temperament between Heat and Cold, and corroborate and recruit the vital, natural, and animal Spirits. *Dale from Schroder*.

N. B. We must take care not to use the Coat or Case, if it is either stain'd with their Excrements, or if the *Aurelia* or Worm remains dead in it. *Dale*.

Silk yields by Distillation, a very good volatile Spirit and Salt; which Spirit is said to be the *Gutta Goddardiana*, *Goddard's Drops*, formerly so famous.

BOMPOURNICKEL. A Sort of very coarse black Bread, much us'd in *Westphalia*, on which *Hoffman* gives the following Dissertation.

'Tis a Truth not to be call'd in question, that the Bodies of Animals, being incessantly and variously agitated by the Heat and perpetual Motion of their Fluids, do, by that very means, continually lose some of their Parts, and, consequently, stand in need of a seasonable Supply and Reparation of them.

This Supply or Reparation is advantageously made by Aliments, which nourish and support our Bodies, and supply the Place of the wasted eliminated Humours, assuming their Natures, and transforming themselves into Blood and Juices. But, of the several kinds of Aliment, Bread is the principal and most considerable; for, according to *Isidorus*, the Latin Word *Panis*, which signifies Bread, is derived from the Greek Word Πᾶν, which imports as much as the English Expression, *All in all*. 'Tis certain that Bread is, as it were, the Basis of Food, and an universal Aliment, which is highly agreeable to the Constitution, and grateful to the Stomach; and which has not only been daily us'd, but highly approv'd by most Nations of the World, from the very Infancy of Mankind to this present Time; so that it is with good Reason call'd the chief or principal of Aliments: And, indeed, all the farinaceous Grains, and the Bread prepar'd of them, contain Principles more similar to our vital Juices, than any other Substances us'd in Food.

For 'tis certain, that the Fluids of our Bodies are composed of Corpuscles of widely different Figures and Bulks; and that they contain, as we find from Chymical Processes, a Variety of Principles or Elements; Sulphur, for Instance, Oil, volatile Salt, Mucilage, Earth, Water, and other Principles of a like Nature. The like Elements are contain'd in Bread; for, upon Distillation, it yields an oleous, and somewhat acid, Spirit, which, besides other Substances, speedily dissolves Coral, and, by a previous Digestion, produces a reddish Tincture, which is a Medicine of considerable Efficacy. Bread also yields a large Quantity of an inflammable Oil, and a great deal of a black fix'd Earth is found at the Bottom of the Vessel after its Distillation. As for the thick and mucilaginous Substance it contains, it is obvious to our Senses, without the Assistance of Chymistry. That it contains subtil spirituous Parts, of a comforting Quality, is not only proved by the Authority of Sacred Writ, but by the Evidence of Sense; for the very Smell of Bread is refreshing, and Water prepar'd of Bread, especially of the coarser kind, is, by Physicians, highly extoll'd as a Liquor of an analectic and cordial Quality. Its daily Use also proves, that it conveys Strength and Nourishment to the Body. Besides, the Stomach is greatly delighted with this Species of Aliment, on account of its mild and subtil Acid, by whose means the dissolvent Force and Activity of the Menstruum, appropriated for the Maceration and Digestion of Food, is highly increased and augmented.

A great many other Things known to the Antients concerning the Nature, Virtue, and various Kinds of Bread, might on this Occasion be advanced, were they necessary to my present Design. However, on this Subject the Reader may consult *Hippocr. L. 2. de Vict. Rat. Athenæus, L. 3. Cap. 17. & 18. Pollux, L. 7. Cap. 11. and Pliny, L. 18. Cap. 7*.

My present Design is only carefully, but briefly, to inquire into the Nature and Qualities of that coarse Bread used by the Inhabitants of *Westphalia*, which acquir'd the Name of *Bompournickel*, from a French Traveller, that I may rescue this Bread from the Contempt it lies under in the Opinions of many.

This Species of Bread was known long ago to some of the most antient Nations, under the Name of *Panis furfuraceus*, or

or furfuraceous Bread, because it was not thoroughly purged from the Bran, according to *Aulus Gellius*, L. 2. Cap. 9. It was also called *Panis impurus*, impure Bread. See *Hippocrates*, *Athenæus*, L. 3. calls it *Syncomiston*, prepar'd of unsifted Meal. He also called it *Coliphium*, from the Greek Words *Κόλη*, a Member, and *ιστις*, Strength, importing that it convey'd Strength to the Members of the Body. See *Petr. Faber Agonistices* L. 3. Cap. 3. By *Cælius Rhodiginus*, L. 9. C. 16. it is called *Panis cibarius*, and *Panis gregarius*; and by *Terence*, *Panis ater*.

This kind of Bread was always highly esteemed, both for nourishing the Body, and rendering it strong and robust: Hence furfuraceous Bread was among the *Greeks* called *πλουτοτροφόν*, that is, Bread which contains a great deal of Nourishment; whereas that which was made of Flour, or the finest Meal, was called *εμυροτροφόν*, or Bread which yields little Nourishment, according to *Athenæus*, in the above-quoted Book. For this Reason the Wrestlers of old, whose Limbs were of a large and robust Make, and who were full of Flesh and Blood, only used the Coliphium, or coarse Bread, for Dinner, and at Supper Swines' Flesh, not boil'd, but a little roasted by the Fire: They also drank warm Water, not only that they might receive the more Nourishment from their gross and thick Food, but that they might also be the longer sensible of the saturating and filling Quality of it. See *Petrus Faber*, in the above-mention'd Book; as also *Galen de Alimentis*, and *Arrianus*, Lib. 3. *Verrius* in *Pliny* informs us, that the *Roman* People, for three hundred Years, used only the Bran of their Corn. See *Fulvii Ursini Append.* p. 316. For this hard and firm Food generates Humours less subject to Corruption, nourishes much more than that which is soft and fine, resists Hunger more powerfully, and produces Bodies fitter for bearing Hardships and Injuries, and less subject to those Disorders which proceed from a Colliquation of the Blood generally resulting from its excessive Heat.

The Inhabitants of *Westphalia*, who are a hardy and robust Race of People, capable of enduring the greatest Fatigue, and undergoing the severest Hardships, are living Proofs of the salutary Qualities of *Bonpournickel*. 'Tis remarkable that the *Westphalians* are rarely attack'd by acute Fevers, and those Diseases which proceed from an Ebullition of the Humours, and a certain malignant Colliquation of the Blood, and of the Elements or Principles of which it is composed. But the Diseases which rage among them are of a cold and chronic Nature, a Circumstance to be ascrib'd to the Grossness of their Food, and Hardness of their Diet: For, when but a small Quantity of such Aliments as are disposed and prepared for a speedy Corruption is taken, the Humours undergo a slow and less violent Fermentation: Hence an Excess of Heat is prevented by the Cohesion of the viscid Parts. Nor can the Humours of the Body, which have acquir'd a firm and durable Texture, be easily broken and destroy'd by a preternatural and morbose Ferment; and I am actually of Opinion, that the masterly Turn of Genius, the Evenness of Temper, and the happy Judgment of transacting Business, with which the *Westphalians* are peculiarly blessed, as also their Promotions in foreign Countries both in Church and State, preferable to the Natives, are Circumstances to be ascribed partly to their Education, and partly to their Method of living. They are highly qualified for Labour and Industry, to which they are inur'd and habituated from their Infancy. Now, as People, by doing nothing, insensibly learn to do ill, so, by Diligence in the honest Employments of Life, the Seeds of Vice, and the Exorbitance of lawless Passions, are check'd in due Time. And the Method of living used by the *Westphalians* contributes not a little to the Production of this happy Effect. *Aristotle*, Lib. 1. Pol. 3. judiciously observes, that a Diversity of Food and Aliment produces a proportionable Diversity in the Lives and Morals of Men; nor is this asserted without a Reason. Since there is a continual Commerce, and an intimate Union between the Soul and the Body, such as are the State and Motion of what we call the animal Spirits, such also will be the Inclinations, Thoughts, Operations of the Mind, and Morals. But this is a Truth so well known to Physicians, and confirmed by Arguments so strong and irrefragable, that it does not, on this Occasion, stand in need of a farther Illustration.

Nor can it be said, that the gross Food used by the *Westphalians* generates gross Spirits; for, by Labour and Motion, the viscid Particles are sufficiently divided, and, as it were, prepar'd in such a manner, as not only to increase the Bulk of the solid Parts, by a closer Union and Adhesion to the Tubes, but also generates sufficiently firm Spirits, which, as they are not fluctuating and inconstant, render People fit for bearing the most obstinate Labours both of the Body and Mind; and, tho' their Blood is somewhat cold, yet their animal Spirits are of a sufficiently active Quality. It is obvious, that an intestine Spirit, which resides in the Pores of any Fluid, must be confin'd by the Pressure of the thick and rigid Parts, and of

course become less subject to Diffipation; so that the spirituous Parts, being forc'd to the Centre, and render'd stronger by a mutual Union, are possess'd of an uncommon Force and Energy.

But 'tis not to be denied, that this gross Food is less safe and salutary, for such as have the Misfortune of weakly Constitutions, or those who live a quiet and idle Life, or are not accusom'd to Labour. Hence *Hippocrates*, *de Medicina prisca*. justly observes, "That the stronger Aliments, if subdued by Nature, are excellent Nourishers; if not, they produce Pains, and cold Diseases." And *Celsus* informs us, "That the stronger Foods are not easily concocted; but that, when concocted, they nourish more than other Aliments." So that Labour and Motion are absolutely necessary for those who use strong Aliments. Athletic Bodies, and such as are accusom'd to Labour and Exercise, receive a more solid Nourishment than those who are habituated to a calm and idle Life, in whom the Nutrition, and the Fat produc'd by it, are generally suspected of being faulty; for 'tis the Motion and Circulation of the Blood, which by its internal Attrition, and elastic Force, resolves, subdues, deterges, and converts the Particles of the Aliments into the Substance of our Bodies; whereas Rest destroys Nutrition, and generates Obstructions, which prove a fruitful Source of Diseases, and render the Genius slow and fluctuating.

From what has been said, I think it evidently appears, that the *Westphalian Bonpournickel* is of a highly nourishing Quality; and that this firm and strong Species of Aliment, by which both their Bodies and Minds are recruited, may be more safely used, and produce more salutary Effects in these People, who are accusom'd to Labour, than a more delicate Diet can in those who are habituated to Idleness. Besides, if we will but take the Pains to put this Matter to the Test of Reason, many satisfactory Proofs of the Excellency of the *Westphalian* Bread occur; for the Nature and Qualities of this gross furfuraceous Bread, are widely different from those of that which is made of the finest Meal. The coarse *Westphalian* Bread, upon Distillation, yields a very large Quantity of an empyreumatic inflammable Oil. Bread indifferently fine, such as that commonly called *Second Bread*, yields a moderate Quantity of a similar Oil: But Bread of the finest Flour yields a very small Quantity, or rather none at all of it. Besides, Bran itself, upon Distillation, yields a large Quantity of Oil, produced, in my Opinion, from the hard external Husk, which is continually acted upon by the Warmth of the ambient Atmosphere. Now 'tis very well known, that a distill'd Oil is an active Principle, highly agreeable to our Constitutions, suited to the Mass of Blood; a Balsam, as it were, to the Humours, and a faithful Guardian of a due and natural Temperament. The Blood itself, upon Distillation, yields an inflammable Oil; and the more it partakes of this oleaginous Principle, the greater Strength it supplies, and the more effectually it preserves Life and Health. That distill'd Oils are the Repository, and, as it were, the Matrix of a volatile Salt, with which the animal Kingdom abounds, is a Truth sufficiently known to those who have any tolerable Acquaintance with Chymistry.

From what has been said, we may easily see, how much *Bonpournickel* is preferable to other Kinds of Bread. It may justly be called a medicinal Aliment, since, besides that Quality by which it is so friendly to our Constitutions, it is possess'd of another, by which it remarkably restores Strength, corrects a moist Intemperies, dries, defends from Putrefaction, and recruits the spent and dissipated Spirits: For which Reason it may be exhibited as a Medicine, in Cases where Strength is lost, where the Force and due Texture of the Blood is destroy'd, and where a Diffipation of Spirits is dreaded, either in Broth impregnated with Wine, Sugar, and Cinnamon, or in its own distill'd Water of a highly sweet Taste, which is excellent in Loss of Strength, and phthisical and hectic Disorders. I need not, on this Occasion, mention its singular Use, when apply'd externally in Pains of the Head, and in Cases where the Intention is to dissipate stagnating Humours.

Lastly, this coarse Bread is possess'd of a singular Quality not to be found in other Bread, since, notwithstanding the Coarseness of its Texture, it renders the Belly soluble. This Virtue in coarse Bread was long ago observed by *Hippocrates*, who affirms, "That Bread made of unsifted Meal is purgative, whereas that which is purer, is proportionably less so; and that which is purest of all, is so far from operating in this way, that it renders People costive." I am of Opinion, that this purgative Quality is to be ascribed to the rigid Texture and Figure of the Bran, which proves a quick and continual Stimulus to the small intestinal Fibres, to perform their excretory Motion; for, according to *Galen*, Bran is possess'd of a deterfive Quality. Hence we may observe, that Gruels made of coarse Meal are excellently qualified for keeping the Belly soluble.

As for the Medicines prepared of this *Bonpournickel*, the principal and most celebrated is the following Water, which is excellent

excellent for restoring Strength, and recruiting the homogeneous Humidity of the Body in hectic Heats. It is prepared thus :

Take one Pound of the Bread bruised ; of the Juice of Crayfish, half a Pound ; of May Dew, four Pounds ; of Rose-water, four Ounces ; of Nutmegs, half an Ounce ; and of Saffron, one Dram : Let the Whole be distilled together in *Balneo Mariae*, applying a moderate Heat.

Thus a highly cordial Water is yielded, of a fragrant Smell, grateful to the Stomach, and excellently calculated for allaying hectic Heats ; for which Purpose half a Pint of it must be taken daily, either by itself, or with Powder of calcined Hartshorn.

Besides, if a spirituous stomachic Water is desired, this Bread is to be distilled with Rhenish-wine, adding a sufficient Quantity of Nutmegs and Cinnamon. By this Process a Water is yielded which is of singular Service for strengthening the Stomach, when afflicted with an excessive Relaxation, Vomiting, or Loss of Appetite. Besides, the Spirit of this Bread when distilled dry in a Retort, and well purged from its fetid Oil, is a sudorific Medicine agreeable enough to the human Constitution, and highly efficacious in removing Impurities of the Blood. If this Spirit is exposed for some time to the Rays of the Sun, it assumes a reddish Colour. The Virtues and Excellencies of this Spirit are more fully insisted on by *Joh. Tackius in Chrysog. Anim. Hoffman Obs. Chym.*

BON. The Coffee-tree, or *JASMINOIDES*, which see.

BONA, or BOONA, in *Blancard*, is the Bean, or Kidney-bean.

BONASUS. A kind of wild Ox, as high as a Bull, and bigger than a common Ox. His Head and Neck are covered with great yellow Hairs, longer and softer than those of a Horse. His Horns are turned inward, so that they are no great Defence to him ; their Colour is a fine shining Black. The Hair of his Body is ash-coloured Grey, inclining to Red. His Skin is very hard, and Proof against Blows ; and he lows like an Ox. He is found between *Pæonia* and *Media*, and lives among the Mountains. His Flesh is very good Food.

His Horns are aftringent, sudorific, and alexipharmac. *Lemery de Drogues.*

BONATI is explained by *Rulandus vitreari*. I suppose glazed.

Prod.* 2. 38. *Commel. Flor. Mal.* 93. MOLUCCA NUTS, MARSAO, BEZOAR NUTS.

It grows to a Man's Height ; and is a Native of both Indies ; the Parts in Use are the round Beans, which are of an Ash-colour, white on the Inside, extremely bitter, and tasteless.

They are good in Hernias, discuss Flatulencies, ease the Colic, comfort a weak Stomach, provoke the Menses, and expel the Stone. *Dale.*

There is another rarer Species of it barely mentioned by *Ray*, under the Title of *Bonduch Indorum, siliqua minime spinosa*.

BONIFACIA. The same as *Laurus Alexandrina*. See *LAURUS*. *Blancard.*

BONTIA. *Barbados wild Olive vulgo.*

It has a personated Flower, consisting of one Leaf, whose upper Lip is erect, and the under Lip divided into three Parts. From out of the Cup arises the Pointal, fixed like a Nail in the hinder Part of the Flower, which afterwards becomes an oval Fruit, which is soft, and full of Juice, in which is contained one oblong Seed, inclosed in a Nut of the same Form. *Miller's Dict. Vol.* 2.

We find no Medicinal Virtues ascribed to this Plant.

BONUM, ἀγαθόν, καλόν, Good. It signifies in general what a Person ought to chuse, do, or on which he may rely, according to *Galen, Lib. 7. de Hippocr. et Platon. Decr. Cap.* 2.

Bonum may be taken absolutely, or in itself, and comparatively, in which Sense it comprehends a Jeſs Evil. *Galen, C.* 20. in *Epid.* 1. 36. *Castellus.*

BONUS HENRICUS, *Tota bona, Mercurialis*, Offic. *Bonus Henricus*, J. B. 2. 965. *Ger.* 259. *Emac.* 329. *Bonus Henricus, Tota bona*, *Chab.* 303. *Bonus Henricus officinarum*, *Volck.* 67. *Bonus Henricus, falso Mercurialis*, *Pharm. Edengb.* 4. *Blitum Bonus Henricus dictum*, *Raii Hist.* 1. 195. *Blitum perenne Bonus Henricus dictum*, *Synop.* 64. *Blitum perenne, spinachæ facie*, *Hist. Oxon.* 2. 599. *Atriplex Chenopodia, folio triangulo*, *Hort. Monsp.* 29. *Chenopodium folio triangulo*, *El. Bot.* 406. *Tourn. Inst.* 506. *Dill. Cat.* 67. *Buxb.* 70. *Lapathum unctuosum, folio triangulo*, C. B. 115. *Lapathum unctuosum, sive Bonus Henricus*, *Park.* 1226. *Munt. Herb. Brit.* 207. ENGLISH MERCURY. *Dale.*

This Mercury has a thick, yellowish, perennial Root, with several Fibres ; the Leaves grow upon long Foot-stalks of a triangular Shape, like Spinage, of a yellow-green Colour, feeling greasy or unctuous in handling. The Stalks grow to be about a Foot high, with several of the like Leaves growing on them ; and on their Tops Spikes of small herbaceous Flowers, inclosing little, round, black, shining Seed. It grows in waste Places, and among Rubbish ; and flowers in Spring.

This Herb is of a detergent cleansing Quality. The young Shoots, before they come to Seed, boiled as Spinage or Asparagus, are pleasant to the Palate, cooling, soluble, and good for the Scurvy, and provoke Urine ; outwardly it is much used in Clysters, and a Cataplasm of the Leaves helps Pains of the Gout.

The only Official Preparation is the *Mel Mercuriale*, which is thus made :

Take of the Juice of Mercury, three Pounds ; of Honey, two Pounds : Let them be depurated, and boiled up together, to the Consistence of Honey.

This is seldom used, except in Clysters.

BOOPS, *Boax, Box, βῶξ, βίαξ, βιαξ*. The Name of a Fish that lives near the Shore. Its Flesh is reckon'd among Meats easy of Digestion, and is advised to sick Persons. It is described by *Aldrovandus, Lib. 2. de Pisc.*

BOOS *thalassiu, βοῦς θαλασσίς*, from *θάλασσα*, the Sea, the Genitive of *βῆς θαλάσσιος*, the Sea-cow. The Words are in *Galen's Exegetis on Hippocrates*, which he expounds by *σελαχάδης ἐστὶν ὁ ἰχθύς ἑτερος*, "this is a cartilaginous Fish." This Sort of Fishes *Pliny, Lib. 9. Cap.* 24. calls *plani*, and amongst them he reckons the Sea-cow ; and so does *Aristotle, Lib. 5. Hist. Anim. Cap.* 5. and *Lib. 6. Cap.* 12. who, as *Pliny* says, calls all those Kinds *σελάχη*, "cartilaginous," which are distinguished from others by having a Cartilage instead of a Spina, or Chine-bone of the Back. *Foësius.*

BORACO, *Capistrum Auri*, "the Bridle of Gold." *Rulandus.* See *Salmaſtus's* Remark on this Name under BORAX.

BORADES, Filings. *Rulandus.*

BORAGO, Offic. *Borrage*, *Park. Parad.* 249. *Chab.* 515. *Borrage hortensis*, or Garden Borage, *Ger.* 653. *Emac.* 797. *Raii Synop.* 3. 228. *Hist. Oxon.* 3. 437. *Borrage floribus cæruleis*, J. B. 3. 574. *Touſſn. Inst.* 133. *Boerh. Ind. A.* 188. *Borrage floribus cæruleis & albis*, *Raii Hist.* 1. 493. *Buglossum latifolium, Borrage*, C. B. *Pin.* 256. BORRAGE. *Dale.*

The Root of Borage is thick, whitish, and but little branched ; from which spring several large, long, and roundish green Leaves, wrinkled, rough, and even prickly in handling. The Stalk likewise is rough and prickly, beset with smaller Leaves, bearing many Flowers at the Top, which are of one single Leaf cut into five Segments, laid open like a Star, of a fine blue Colour, with a black Umbo in the Middle, each of which is succeeded by four brown angular Seeds, growing in a round Calyx. It grows in Gardens, but is found wild in divers Places near Houses, and upon Walls ; and flowers in June. The Leaves and Flowers are used.

The Leaves are accounted Cordial, good to comfort the Heart, and drive away Faintness and Melancholy ; and to that Purpose, the Tops are frequently put into Wine, and Cool-tankards. They are likewise Alexipharmac, and good in malignant Fevers.

The Flowers are one of the four Cordial Flowers. The only Official Preparation is the Conserve of the Flowers. *Miller's Bot. Off.*

BORAX. A kind of Salt used in mechanic Arts and Medicine. It is thus distinguished :

Borax, Chrysocolla factitia, santerna Plinii & Tincar, Offic. *Borax*, *Charlt. Foss.* 9. *Dougl. Ind.* 18. *Nitrum unde Borax coquitur*, *Aldroy. Mus. Metall.* 324. *Nitrum factitium, Arabice Borax*, *Worm.* 21. *Nitrum nativum aliorum fossilium modo in terra repertum durum, & spissum, ut Lapidi non abs re assimilari possit. Tincar est Arabum, ex quo Chrysocolla Græcorum, Borax eorundem Arabum, Venetiis conficitur*, *Calc.* *Mus.*

Mus. 162. *Nitrum nativum scissile durum, ex quo Venetiis Borax coquitur*, Kentm. *Baurach*, Mayern. Syntag. 1. BORACE. Dale.

The best Chryfocolla is what comes from *Armenia*, and is of a lively Leek-green. The next in Goodness is the *Macedonian*, and after this the *Cyprian*, of which Kind the pure is to be preferred; what has gathered Dirt and Stones is to be rejected.

The Manner of washing the Chryfocolla is thus: First, they break it, and then put it into a Mortar, where, pouring in Water, they rub the Chryfocolla well with their flat Hand against the Pestle; after this they let it alone to subside, and then strain it off. This done, they pour fresh Water to it, and work it as before, repeating the Operation till the Chryfocolla comes out pure and unmixed; then they dry it in the Sun, and so lay it up for Use.

When they have a Mind to burn it, they do it in the following manner: Having pounded a sufficient Quantity, they set it in a Pot upon the Coals; and proceed as has been directed in other Cases.

Chryfocolla exterges the Marks of Scars, and checks Excrescences; it is of a cleansing, astrigent, and heating Quality; and is a gentle Septic, with some Degree of Mordacity. It is reckon'd among those things which excite Vomiting, and endanger Life. *Dioscorides*, Lib. 5. Cap. 104.

Chryfocolla is a liquid Substance, which runs through a Vein of Gold, and is condensed by the Cold of the Winter to the Hardness of a Pumice-stone. The best is found in the Copper Mines, and the next in Goodness in the Silver Mines; they meet with it also in the Lead Mines, and a baser Sort in the Gold Mines. They have also a way of making Chryfocolla artificially in all these Metals, though much inferior to what grows naturally, by introducing into the Vein a gentle Current of Water during all the Winter, till the Month of June, which, in that and the next Month, drying up, leaves behind it the Chryfocolla, which may be understood, from this manner of Production, to be no other than a putrid Vein. The native Chryfocolla is far different from this with respect to Hardness; they call it *Lutea*, though they dye it also with an Herb of that Name. It is of the Nature of Wool or Flax to imbibe any Juice. They pound it in a Mortar, then pass it through a fine Sieve; after this they grind it; and being thus reduced smaller, they pass it through the Sieve again; what will not go through is pounded over again in the Mortar, and afterwards ground in the Mill. The Powder is always disposed into small Vessels [catinos], and macerated in Vinegar, to take off all Hardness; then pounded over again; and afterwards washed in Pans, and so dried. After this they stain it with plumous Alum, and the Herb *Lutea* before-mentioned; and thus it is painted, before it paints. It matters much how bibulous and receptive it is; for if it does not immediately take the Colour, they add to it Schytanum and Turbystum, which are the Names of Drugs that dispose things to receive Colours. When the Painters have stained it, they call it *Orobitis*, and make two Sorts of it; the Yellow [Lutea], which is kept for a Paint; and the Liquid, resulting from a Diffolution of the Globules by Sweat; both these Kinds are made in *Cyprus*.

The most valuable Chryfocolla is the *Armenian*, next to that the *Macedonian*, but the largest comes from *Spain*. The utmost that can be said in its Commendation is, that it very nearly represents the Colour of a lively Corn-green. The Emperor *Nero*, in the Time of the public Shews, ordered the Area of the Circle to be strew'd with Chryfocolla, then enter'd himself, habited in the same Colour, and after introducing a Rabble of Mechanics, entertain'd them with his Dexterity in driving a Chariot. They make three Kinds of Chryfocolla; the rough, which is valued at seven Libræ; the middle Sort, valued at five Denarii; and the *Attrita*, called also the herbaceous, at thirteen Denarii.

The Use of Chryfocolla in Medicine is to cleanse Wounds, being mixed with Wax and Oil: As it is dry of itself, so it dries and contracts. It is prescribed also in the Quinsy and Orthopnea, being mixed with Honey. It provokes Vomiting, and is an Ingredient in Collyria for Cicatrices of the Eyes, and in green Plaisters for mitigating Pains, and inducing a Cicatrix. Physicians call the Chryfocolla, except the *Orobitis*, *Acesis*. The Goldsmiths lay Claim to the Chryfocolla for soldering Gold, from which Use it takes its Name, [*χρυός*, Gold, and *κόλλα*, Glue, Solder] and is so called by all who use it for the like Purpose. It is temper'd with *Cyprian* Verdegrise, and the Urine of a Boy, with an Addition of Nitre; they pound it with *Cyprian* Copper Pestles in *Cyprian* Mortars; we call it *Santerna*. This makes a Solder for that Gold which they call the *Silverish*, which is known by its acquiring a Brightness by an Addition of *Santerna*. But what they call the *Copperish*, on the contrary, contracts itself, and looks dull, and is difficult to be solder'd. For this Kind they make a Solder, consisting of Gold, and a seventh Part of Silver, added to the before-mentioned, and pounded together. *Pliny*, Lib. 33. Cap. 5.

Some Sorts of Chryfocolla are found among Metals, and these

VOL. I.

only are by some accounted proper Chryfocolla. But there is a factitious Sort, which is prepared by pounding them with Boy's Urine in a Mortar of red Copper, with a Pestle of the same Metal, in the Heat of the burning Sun. This is more medicinal than the native Kinds, and makes an excellent Remedy for malignant Ulcers, either by itself, or mixed with proper Ingredients. Burning of it will diminish its pungent Quality. *P. Aegineta*, Lib. 7. Cap. 3. *Aetius*, Tetr. 1. Serm. 2. Cap. 81.

Borax is a barbarous Word Latinized, and now every-where used instead of Chryfocolla. The later Greeks also call it *βοράχιον*, (*Borachion*) as *Myrepsus*, in the Ointment *δια νιρίων*, "of Citrons," Number forty-two, where one of the Ingredients is a Quantity *λίβς βοράχιν*, "of the Borachian Stone," where you see that Chryfocolla is called a Stone. But *Dioscorides* makes it a Property of the best Chryfocolla to be without Stones; and so the best Stone must not be at all stony, which is absurd. But I have often wonder'd how both Greeks and Latins of the later Ages came to use the Words *βοράχ* and *βοράχιον*, instead of Chryfocolla. They seem to have received them from none but the *Arabians*; and yet these are no *Arabic* Words. Therefore a great Man happens to be mistaken in his Notes upon *Garcias*, Cap. 35. Lib. 1. where he observes that *Borax* is a corrupt Word, and that we ought to say *Baurac*. This *Baurac* is indeed an *Arabic* Term, but never used for Chryfocolla, but for *Nitrum*, or *Aphronitrum*; it is *Avicenna's* Word for *Nitrum*, for he calls *Aphronitrum*, *Zebed Baurac*, that is, *Spuma Nitri*. The *Arabians* sometimes also use the Greek Word *Nitron*, but Chryfocolla they call *Tincar*. In a very antient Copy of *Dioscorides*, *χρυσοκόλλα* (*Chryfocolla*) is expounded, by the *Arabian* Glosser, *Tincar va Lezac Alzeheb*, "Tincar, or the Solder or Consolidation of Gold." In the latter Explication the Greek Word *χρυσοκόλλα* is expressed, being no other than that by which Gold is solder'd. But *Zebed* is put for *Deheb*, for this is *Avicenna's* Word for Chryfocolla, as *Lezac Aldeheb*. This is the *Chaldaic* Name for Gold; for they also say *דָּהָב*, *Dahab*, instead of the Hebrew *זָהָב*, *Zahab*, Gold. *Brassavolus*, and others, observe, that Chryfocolla is called by the *Arabians* *Capistrum Auri*, "the Bridle of Gold." They were led into this Mistake by the old Interpreter, who on the Word *Tincar*, in *Avicenna*, has these Words, *et dicitur Capistrum Auri*, "and it is called the Bridle of Gold." In the *Arabic* it is, "the Consolidation or Soldering of Gold." *Avicenna* uses the Verb every-where as signifying to conglutinate and conjoin separate Parts, in the same Sense as the Greeks use *συγκολλᾶν* and *κολλᾶν* whence *κολλήματα φάρμακα*, "conglutinating Medicines." But the Letters of the Verb, with but one Apex more, signify *frænare*, "to bridle;" whence is deriv'd the verbal Noun, signifying *Frænum*, *Capistrum*, "a Bridle or Halter." This deceived the old Interpreter, who mistook it for the other; and indeed it would be absurd to call Chryfocolla, which is the Cause of the Cohesion and Conglutination of Gold to Gold, the Bridle of Gold.

The *Arabians* seem to acknowledge some Relation between the Chryfocolla and Nitre, that is, *Baurac*; for *Serapion*, in his Chapter of Chryfocolla, Cap. 413. writes, that the *Tincar* was a kind of Salt, and had some Taste of Nitre, that is, of *Baurac*. Also in his Chapter of Nitre, speaking according to the Opinion of *Rhasis*, he says, there is a kind of *Nitrum*, or *Aphronitrum*, whence is the *Tincar*, that is, the Chryfocolla. However it be, I do not in the least doubt, but from this *Arabic* Word *Baurac*, or *Borac*, which is Nitre, the *Barbarians* form'd their *Borax* to signify Chryfocolla. Thus from the *Arabian* *Sandarac* we know they made their *Sandarax*, and *βερνίκιν* (*Bernice*) they chang'd to *Vernix*, though to quite a different Sense from what the Greeks put upon their *Bernice*.

That the *Arabians* will have some Resemblance between the Chryfocolla, commonly called *Borax*, and Nitre, which they call *Baurac*, must perhaps be understood of that factitious kind of Chryfocolla, which is commonly made of plumous Alum and Sal Ammoniac; and therefore *Serapion* reckons the Chryfocolla among the kinds of Salt.

Borax, in *Albertus Magnus*, is also the Name of a Stone found in the Head of a Toad; but no Credit is to be given to that Author. *Salmasius de Homonym. Hyl. latr.* Cap. 121.

Aristotle, in his Book *περί θαυμασ. ἀνυσμάτων*, speaks of *Demonesus*, an Island over-against *Chalcedon*, which produced Chryfocolla, the finest Sort of which was valued at its Weight in Gold, being a Remedy for the Eyes. *Idem*, *Pliniana Exercitationes*.

Mr. Geoffroy gives the following Account of *Borax*.

Borax is a Salt, whose Composition, whether natural or artificial, is but little known. Natural History, as well antient as modern, affords us but little Light or Information concerning this strange Salt; and from what we can learn of it from thence, we are not sufficiently instructed to conclude, that it

is the true Chrysocola of the Antients, though the *Spaniards*, who work in the Mines of *Chili*, the *Venetians*, and other Moderns, still give it that Name, which they found in antient Natural History.

Pliny, speaking of the Chrysocola of his Time, divides it into two Kinds; the native, which was taken out of the Mines of Copper; and the factitious, which was made by stirring and beating the Urine of young Children in Mortars of Copper. See above.

Paul Herman, in his *Materia Medica*, *Straßbourg* 1706. says, that they make Borax in the *East-Indies* of a nitrous Earth, which, after they have calcin'd, and reduced it to Powder, they boil and make thereof a strong Lixivium; this they afterwards expose to the Air, in order to make it run into Crystals; that this Salt never comes to a greater Perfection in that Country; and that it is in the Places whither it is transported that they purify it.

By these two Descriptions, and especially *Pliny's*, it appears, that we are at a Loss for the true Borax at present; for, in the Essays which I made on the Solution of this Salt in Water without Addition, I could never find a single Atom of Copper, whereas there ought to have been a considerable Quantity, had it been the Chrysocola of *Pliny*.

Nor had I any more Reason, from what I could discover, to think that it might be made of a nitrous Earth, taken in the Sense, and according to the Properties of our Nitre at present, because it crystallized in a different manner, and fused upon Coal. But if *M. Herman*, by his *Indian Nitre*, means the Nitre of *Agra*, and some other Places in the *East-Indies*, which is a Natrum, and consequently a strong Alkali, Borax would be an alkaline Salt of much greater Penetration, and of a much more acrimonious Taste than we find it, unless they have a way in making this Salt, to add to the Natron some sweetening Substance to take off the Acrimony, and so make an imperfect Sal Salsum, in which the Alkali is predominant.

My late Brother, in the Lectures which he read at the Royal College upon the *Materia Medica*, and after the Perusal of some Memoirs of a German Traveller called *M. Narglin*, a good Naturalist, who had made many Essays upon that Salt, both in the *Indies*, and at *Venice*, where it was formerly purified, tells us, "That Borax was produced in several Parts of the *East-Indies*, but most plentifully in the Dominions of the Great Mogul, and in *Persia*; that, in several Places of those two Countries, there flow'd gently from different Mines, but principally from those of Copper, a salt Water, muddy and greenish, which was carefully preserved; that, after it was evaporated to a certain Consistence, they poured it into Pits sunk in the Earth, and lined with a Paste composed of the Mud deposited from the same mineral Sources, and the Fat of Animals; that they laid over these Pits a Cover of a convenient Thickness, made of the same Paste; that at the End of some Months they open'd them, where they would find the Water partly evaporated, and the Salt of the Borax crystallized; that they took these Crystals out of that fat Mud, with which they were still mix'd or cover'd, and in that Condition they were brought to us from the *Indies*."

Our Merchants import Borax also from *China*, where it costs little; which makes it probable, that this kind of Salt is natural to that Country, or at least very easy to make.

These different Boraxes are at present refined in *Holland*; but the way of doing it is not a Secret known only to the *Dutch*, for there is a private Gentleman in the *Fauxbourg St. Antoine*, who did refine it, and deliver it to the Merchants as fine and as pure as that of *Holland*. In this State of perfect Purification it is transparent like Rock-crystal.

While it is rough, or in the same State in which it was imported from the *Indies*, its Crystals are commonly of the Bigness of Hazel-nuts, of a greenish Colour, dirty, and obscure, like the Lare-stone of *China*, or of a palish Green like the Jade [a sort of precious Stone]. They are full of Impurities, and mix'd with Earth, and bedaub'd with a fat Substance, which is perhaps that of the Paste spoken of before, or some other Fat with which they were cover'd, in order to prevent their running into a Calx, or being reduced to a Powder during their Carriage in these hot Countries. For we know, that Borax is easily calcin'd in the Air, as soon as it has been washed in cold Water, and cleared of its unctuous Envelopment, which whitens the Water, and dissolves in it like Soap.

The Crystals of this Salt have the Figure of an oblique Prism, with six Faces, whose Base has six Sides, of which those opposite to each other are equal and parallel. The greatest Diameter or Length of the Base is almost double, and sometimes more than double its Breadth. What is singular in these Crystals is, that if we consider the two opposite Planes, which may reciprocally serve for a Base, we shall perceive a small Side of that Plane flatten'd throughout its whole Length; and sometimes also the acute adjacent Angle, and the two Sides, one in each Plane, thus flatten'd, are so situated, as to be diametrically opposite. Though this be not exactly true in all these Crystals, we may yet per-

ceive, that they for the most part resemble that Figure. The greatest Diameter of the Base of the largest that I could find was about ten or twelve Lines; and the least Diameter, or what measures the Thickness, five or six Lines. The Length is not always proportion'd to the Greatness of the Base; for one, the greatest Diameter of whose Base is but eight Lines, shall be thirteen or fourteen Lines in Height, whereas another, the greatest Diameter of whose Base is twelve Lines, shall have but ten Lines of Height.

There are some Crystals which come very short of that Size; and even some which are no bigger than Grains of Millet.

As it is very probable, that this Salt was form'd in a troubled or muddy Liquor; accordingly we find in dissolving it a great deal of gross Earth, or Sand; and its greenish Colour disappears, if it be crystallized anew.

This is all that I have to say concerning the external Form and Figure of Borax; as to its internal Nature and Properties, which has been the Object of the Inquiries of the most Part of the Chymists of *Europe*, I can speak no more than by Conjecture. *Becher* seems to have known the Composition of this Salt, if he did not speak at random in his *Physica Subterranea*, and his *Alphabetum Minerale*, where he says, "That the universal Acid, in dissolving a Stone, or fusible Earth, forms Borax; as it forms Alum, when it meets with an Earth fit to make Lime."

We shall, perhaps, one Day or other, discover Borax in Substances where we never suspected it could have been, as we have found *Glauber's* Salt, and vitriolated Tartar, in mineral Waters, Plants, and other natural compounded Bodies.

M. Homberg believ'd, that Borax was a mineral urinous Salt. *M. Lemery* the elder thought it had the Qualities of a neutral Salt, which neither fermented with Acids nor Alkalies; and, in the last Place, *M. Lemery* defin'd it to be a Sal Alkali, because it precipitates the metallic Earth of Vitriols, and the Earth of Alum, almost as readily as Salt of Tartar does it. He has shewn also, that Borax is sublimed not only with a vitriolic Acid, but with other mineral Acids, and with white Vitriol. *Memoires de l'Acad. Roy. des Scienc.* 1732.

The distinguishing Properties of Borax are principally these:

1. Its Form and Appearance, as brought to us from the *East-Indies*, which is that of dirty Lumps, or a coarse, saline, and particularly fetid Substance, mixed with much unctuous, earthy, and stony Matter; and in this State it is commonly called Tincal, or Tincar.

2. Its pure and entire Crystals, when refined, being octagonal Prisms very finely cut, though seldom obtained perfect in the ordinary way of refining it.

3. Its particular Taste, not easy to be described, as being sweetish, sharpish, and somewhat urinous or lixivious.

4. Its Property of folding Metals, or making them easily unite, or take hold of each other, more particularly the Parts of Gold.

5. Its making an excellent Flux for Metals and certain Ores, and, by being melted with a proper Proportion of Sand or Flint, turning, in a very short time, to a hard Glass, capable of cutting common Glass almost like a Diamond.

6. Its extremely vitrescible Nature, so as by itself, with a moderate Heat, and in a few Minutes time, to become true and permanent Glass.

The Use of Borax in Medicine is that of an incisive and aperient Salt, by virtue of which it is effectual against Diseases which proceed from an Inspissation of the Humours, and Obstructions thence arising, acting at the same time against the Acid, without exciting any Motion. The Dose is an entire Dram. It is thought by some to have a specific, emmenagogical, and expulsive Virtue, which may probably be derived from the aforesaid incisive, deobstruent, and aperitive Qualities. However, its Stimulus does not seem strong enough to be depended upon for present Relief in a difficult Birth, unless it be join'd with some other Ingredients, that are of more Efficacy by their volatile Stimulus. For this Reason Borax is commonly given in Powder mixed with Saffron, Myrrh, Oil of Cinnamon, Castor, the volatile Salt of Amber, and other Powders of known Efficacy, in promoting the Birth, and facilitating Delivery. Some advise a few Grains of it to be taken in a poach'd Egg, as a Provocative to Venery, especially to those whom poach'd Eggs alone have a good Effect upon.

Borax calcin'd is reckon'd of specific Virtue in Fluxes of the Belly, or the Semen, because it is a sort of styptic Earth. The Dose is from a Scruple to half a Dram, in Conserve of Roses, either alone, or with other suitable Ingredients, for Instance, the Bone of the Cuttlefish, or toasted Nutmeg.

Outwardly it is apply'd, though but seldom, to consume carnos and spongy Excrescences in sordid Ulcers; it is recommended also for the Itch, and in Cosmetics. The Usefulness of Borax in such Cases may reasonably be expected from its saline, incisive, and resolving Qualities, which cause it to be received into the Unguentum Citreum, which is recommended for making

making the Skin smooth, and free from Asperities. Its saponaceous, absterfive Virtue, for the Purposes aforesaid, may perhaps more justly be expected from Borax in its crude State, as it is sold in India; tho', according to *Garcias*, it is seldom used by the Indian Physicians, unless for the Itch. The *Pulvis Diaboracis Mynsichti* has Borax for its Basis, and stimulating Aromatics and Absorbents for Accessories. The Dose is to a Dram for Women in Labour, to facilitate the Birth, and to expel the Secundines, and dead Foetus.

As Examples of the Methods of prescribing Borax, I shall give the *Pulvis Emmenagogus* of *Fuller*, and the *Pulvis Diaboracis* of *Mynsicht*.

PULVIS EMMENAGOGUS, *Fulleri*.

Take of Venetian Borax, fifteen Grains; Myrrh, twelve Grains; Saffron, three Grains; Oil of Cloves, one Drop: Mix together, and make a Powder.

This is to be taken twice a Day, and is recommended for promoting the Menfes.

PULVIS DIABORACIS, *Mynsichti*.

Take of Venetian Borax, an Ounce and a half; Cassia Ligna, and Oriental Saffron, each three Drams; Savin-wood, white Amber prepared, each a Dram and a half; Bone of a Stag's Heart; Mistleto, Flowers of the Wall-flower, each a Dram: Mix, and make a Powder. The Cassia Ligna, Savin-wood, Mistleto, the Bone of a Stag's Heart, the Saffron, and Flowers dried, are to be powder'd together; and so are the Amber and Borax; and then all are to be mix'd together.

It is recommended for promoting Delivery, and expelling the After-birth; and is said to be a good Emmenagogue.

BORBONICUS, *Borbonensis*. A patronymic Epithet of some hot Springs, commonly call'd the Waters of *Bourbon*. *Castellus*.

BORBORODES, *βορβορῶδες*, muddy, dirty, earthy, feculent. *βορβορῶδες πύον*, is dirty, feculent Pus, *Hip. Prognostic.* and *Aph. 44: Lib. 7.* and *Coac. βορβορῶδες ὀσμῆς* are "muddy, earthy Smells," *Lib. πρὸς γυναικῶν. βορβορῶδες ὕδωρ* are "muddy, feculent Urines." *Galen. Comment. ad Aph. 69. Lib. 4.*

BORBORYGMUS, *βορβορυγμός*. A rumbling Noise, excited by Wind, mix'd with some Degree of Humidity. *Galen*, in his Comment on the seventy-third Aphorism of *Book 4.* says that *Borborygmus* is the Noise of a Flatus, not very loud, nor long, with a moderate Degree of Humidity, descending to the inferior Parts. And, *Lib. 3. Symptom. Caus. Cap. 7.* "a *Borborygmus* is a murmuring Sound, excited by Humidities contain'd in the Intestines, and is the Fore-runner of a humid Excretion: So Tumors about the Præcordia terminate in a " *Borborygmus*, or Rumbling; the Flatulencies, together with " the Excrements and Urine, discharging themselves principally by Stool; for such is not barely a Sign of a Flatus, but " that it is mix'd with some Humour, or more solid Body." *βορβορυγμός γένεσθαι ἐν ὑποχονδρίῳ* "A Rumbling in the " *Hypochondria*," *Coac. βορβορίζειν*, and *διαβορβορίζειν*, are spoken of the *κοιλίᾳ*, "Belly," when it rumbles, and is irritated to Excretion, *Lib. de Rat. Vict. in Morb. acut. διαβορβορίζουσα κοιλίᾳ κατὰς ἡβαστάσεις* "The Belly rumbling, with "vain Efforts to ease itself," *Prorrh. διαβορβορίζουσα ὑποχονδρία μέλαινα* "The Hypochondria rumbling, and "elevated, *Aph. 73. Lib. 4.* *ὑπερβορβορίζειν* is also used, as, *κοιλίᾳ ὑπερβορβορίζουσα φύσιν*, "the Belly rumbling with Flatulencies," *Arctæus, Lib. 2. Cap. 6. de Causis & Signis acut. Morb. οἱ ἐν πλοῖσιν ὑπερβορβορίζουσιν* "Who have a Rumbling in them when they drink," *Coac.* This sort of Noise is like what is produced by treading in Mire, *βέβροθ*, whence it takes its Name.

BOREAS, *Boreales Venti*. The Northern Winds are of a cold Temperament, and therefore the most wholesome of all Winds, especially to Bodies of a hot Complexion, and well cloathed with Flesh. *Actius, Tetrab. 1. Serm. 3. Cap. 163.*

It is observed, that the North and East Winds bring with them the universal Acid of the Air in great Abundance: Hence they might reasonably be expected to be cold, *a priori*, as we in Effect find they are. In consequence of this Cold, all Tendency to an alkaline Putrefaction, and a Dissolution of the Blood, is destroy'd; that is, all Contagion, in some Degree at least; which the South Winds, as productive of Heat, increase and promote.

Hence we may readily determine, what sorts of Diseases the North Wind is likely, in general, to produce; which are such as depend upon an increased Rigidity of the Fibres, and a Viscidity of the Juices, the Consequences of Cold. And, in Fact, we find in these Northern Climates, most Fevers, those which happen during Winter more especially, are accompanied with a Siziness of the Blood; whereas very hot Countries are more

subject to Fevers attended with a Dissolution of the Juices, that is, pestilential Disorders.

BORIDIA. A sort of salt Meat, prepared of a kind of small Fish, and eaten raw. This, with other Pickles of the like Kind, are hurtful to the Stomach, hard of Digestion, and loosen the Belly. *Oribasius* from *Xenocrates, Med. Coll. Lib. 2. Cap. 58. ad finem.*

BORITIS. The Philosopher's Stone, which melts the Copper of the wife Men, and renders it fluid like Water.

BORIZA. The same as *LUNARIA*, which see.

BOROMETZ. See *AGNUS SCYTHICUS*. See *AGNUS*.

BOROS, *βορρς*. Voracious, edacious. Hence *ὕδωρ βορρς*, voracious Water; that is, Water which excites a good Appetite, *Aph. 18. Lib. 6. Epid. Sect. 4. Galen* says, "All the Greeks, in "our Part of Asia, still call great Eaters by the common Name "of *Bori*." *βορρς*, in the Ionic Dialect, for *βορρς*, signifies Food, *Lib. 1. πρὸς γυναικῶν. βορρς*, in *Hesychius*, is expounded by *βρῶσις, σίτησις, τροφή*, "Meat, Food, Aliment."

Castellus, by an egregious Blunder, calls this *Borrhus*, *βορρς*.

BOROZAIL, or the Zail of the Ethiopians. A Disease epidemic in the Countries about the River *Senega*. It principally infects the Pudenda, but is different from the *Lues Venerea*. This owes its Rise to immoderate Venery, to which they are very subject. This Distemper, in the Men, is call'd *Asab*; in the Women, *Affabatus*. *Blancard.*

BORSELLA. An Instrument belonging to the Glassmakers, by which they contract or extend their Glass Vessels, as they see Occasion. *Castellus*.

BOS, *Offic. Schrod. 5. 269. Schw. Quad. 63. Aldrov. de Quad. Biful. 13. Gefn. de Quad. 25. Bos domesticus, Jonf. de Quad. 26. Charlt. Exer. 8. Raii Synop. A. 70. Mas Taurus. THE BULL. Dale.*

But *Bos* properly signifies a Cow, Bullock, Heifer, or any thing of the Neat Kind.

Black Cattle, or Kine, as well as other Animals which feed on high Grass and Herbs, during Winter, and the Beginning of Spring, are lean, and of bad Juice; but as the Summer comes forward, and the Grass grows, they visibly increase in Flesh, and become of better Juice. But Animals which can eat tender Herbs, and short Grass, are best in the Beginning and Middle of Spring: Such are Sheep. The Beginning and Middle of Summer agree best with Goats, and their Flesh is most wholesome when they can browse on the tender Shoots of all manner of Shrubs.

Beef affords a good deal of Nourishment, and what is not easily dissipated, but generates too thick a Blood. And if a Person be naturally of a melancholy Temperament, a plentiful feeding on Beef will bring upon him some melancholy Disorder. As much as Beef surpasses Swines Flesh in Solidity, so much does this latter exceed the other in Sliminess of Substance, and yet is much easier of Concoction. *Oribasius, Med. Coll. Lib. 2. Cap. 28.*

In a Resolution of the Stomach, by which it becomes incapable of retaining the Food, Meats of a cold Quality, and such as are difficult of Concoction, rather than easy to be corrupted, are to be prefer'd; for which Reason many Persons digest Beef, who can digest nothing else. *Celsus, Lib. 4. Cap. 5.*

The same Author advises Eating of a Bullock's Spleen, to those who labour under a Hardness and Swelling of that Part, *Lib. 4. Cap. 9.*

The Marrow of young Bulls is reckon'd, by *Oribasius*, next in Goodness to that of Stags; that of Bulls and Goats, he says, is more drying and acrimonious, and therefore not so fit as the others for dissolving a scirrhus Tumor or Hardness. *De Virtut. Simpl. Lib. 2. Cap. 1.*

The Fat of Beef is reckon'd among Sudorifics, by the same Author from *Zopyrus, Med. Coll. Lib. 14. Cap. 56.*

The Dung of Bulls, like their Food, has but little Variation: It is of a drying Quality, and is also an Attractive. A Physician, of no mean Skill in his Profession, used to cover up his Hypodermal Patients with Cow-dung, and then expose them to the Sun, and by that means did much Good. He chose the Dung in the Spring-time, when it was moist, and the Cows were at Grass: This he dried, and laid aside for Use. He applied the same, by way of Cataplasm, to strumous and all other hard Swellings. *Actius, Tetrab. 1. Serm. 2. Cap. 115.*

With respect to the Ox-kind as an Aliment, it must be consider'd, that Animals of this Species live on Grass and Water only; and that their habitual Exercise is very little, most of their Time being employ'd in Eating, Sleeping, and chewing the Cud; unless when they are imprudently put upon hard Labour, as is the Custom in some Countries. Hence their Flesh is not render'd too hard by their habitual Exercise; nor are their Salts highly exalted either by their Food or Motion. It must therefore be a very good Aliment, under proper Management, when taken in due Quantities, and in proportion to the Exercise used by the Person who eats it.

But the English generally take care to abuse the Gifts of Providence, in regard to this salutary Food; and with much Pains contrive

contrive to convert Beef, of itself a very nourishing and strengthening Aliment, into a Poison, rendering it hard, and, in Consequence of that, indigestible, by laying it in Salt for many Days before they dress it; not to mention, that it is even then frequently swallow'd half raw. The digestive Organs, therefore, not being able to dissolve this indurated Aliment, and convert it into good Chyle, many Particles, too large to circulate thro' the minute Vessels of the Body, must stagnate in different Parts, and particularly in the Glands. Hence that Distemper which we call the Scurvy, the Source of innumerable Disorders, both acute and chronical; to which Sailors, on account of their salt Diet, are particularly subject.

It is owing to this Error, more than to our Climate, that the *English* are remarkable for being melancholy and dejected, especially in a rainy or cloudy Day, when the Atmosphere is light, and the Elasticity of the Air diminish'd; for on these Occasions it is, that they appear gloomy and unfociable, and are much inclined to find out a retired Place, where they may, without Disturbance, put an End to their Lives: A Custom too frequent amongst us, and which is peculiar to our own Country; for Self-murder is scarcely ever heard of abroad.

The *French*, with respect to their manner of Diet, are more prudent than we. They boil their Beef well, unsalted, and make of it large Quantities of Soup and Bouillies; adding to them a large Quantity of Vegetables, and Salt as they like it; by which they avoid the Inconveniencies and Disorders we voluntarily run into. Hence they are perpetually gay, and full of Spirits; and hence the Scurvy, and its Consequences, are known in *France* to none but the Sailors.

Beef, according to *Hippocrates, de Diata, Lib. 2.* is a strong Food, and binds the Belly, and is of difficult Concoction, because the Animal abounds with thick Blood, and its Flesh is heavy. In another Place, which is his Book *de Rat. Viſſ.* he says, that atrabilious Affections are exasperated by eating of Beef; for its Nature is insuperable, and it is not to be digested by every Stomach; but it is best qualified for Concoction and Distribution when thoroughly boil'd, after it has been hung up for a good while.

Simeon Sethi, giving us the Opinion of the Antients, writes, that Beef affords very firm Nourishment, and that the Blood generated of it is immoderately thick; for which Reason, in melancholy Constitutions, it causes various Diseases of the same Kind. It is also very heavy of Digestion and Distribution; but, if well concocted, is abundantly nutritive. If compared with Mutton, it is of a cold Nature, and generates melancholy Blood; but Broth made of it stops a Flux of the Belly proceeding from yellow Bile. If any one desires, or is compell'd, to feed on it, let him, if he be apprehensive of any Harm from it, eat it corrected with Vinegar, Garlick, and Rue; but it only proves of bad Juice in the before-mention'd Cases, and is a Remedy for a hot Stomach, and to those who use much and continual Exercise.

From the Premises we learn, that Beef is better for strong than weak Persons; for those who use Exercise, than the Sedentary; for those who are in the Vigour of their Age, than for Children or aged Persons; and in the cold Seasons of the Year, than in the hot. We see the Reason also, why Beef is call'd the Food of Heroes in *Nonnius*; and why its Broth is good to stop a Looseness, that is, when the Disease requires a Remedy of a glutinous Nature, that tempers Acrimony, and is a Vulnerary; and lastly, why it is hurtful to those who are of a melancholy Habit of Body, if they feed too freely on it. If it be eaten, then, by those who use much Exercise, and with Moderation, it will verify what *Celsus* says of it, *Lib. 2. Cap. 24.* which is, that it is good for the Stomach.

The Flesh of Bulls is inferior to that of Oxen in Wholesomeness; unless the Ox has been much inur'd to Labour, and his Flesh by that means render'd dry and hard. The Flesh of Oxen is also prefer'd to that of Cows.

The Smell of the Hide, but especially old Leather made of it, burnt or singed, is commended for the Hysteric Passion. The Tallow is of Service, where-ever Emollients are required. The Axungia, which is melted from the Hoofs, is more penetrating and emollient, because of finer Parts; but the Marrow exerts its emollient Virtue where-ever it is applied. That the Bones, calcin'd and pulveriz'd, are said to strengthen the Bowels, to stop a Looseness, and to be effectual against Worms and the Epilepsy, used either internally, or in Ointments or Plaisters, must be understood of such Cases where the Disorder proceeds from an Excess of Humidity, or an Acid, and is to be subdued by Driers and Absorbents. Some commend the Scrapings of a Bull's Horn, taken at the Time of his Coition, for the Epilepsy and Impotence; but, supposing it easy to be obtain'd at such a Juncture, it can no otherwise be effectual to these Purposes than as an Anti-acid, which acts by its volatile alkaline Salt. The Horns are also commended as proper for Suffumigation in pestilential Times; but I much question whether the inspir'd Fume, being of an alkaline Nature, would not more dispose the Humours to Putrefaction. The Hoofs have an antepileptic Virtue, with the Limitations aforesaid: Being

fried, and so taken, they may be of some Service in a Dysentery, where an alkaline, anti-acid, glutinous Faculty is requir'd. The *Talus* of a Cow pulveriz'd, and drank in Wine, is commended by *Foreſtus*, as a Specific against Worms in the Intestines. The *Membrum genitale*, or Pizzle of a Bull, pulveriz'd, or else a Decoction of the same, is reported to create a Desire of Coition in Men, but an Abhorrence of the same in Women; but Reason does not comprehend these Contrarieties, nor Experience attest them. There is a Stone sometimes found in the Gall-bladder of this Animal, which is call'd *Bezoar Bovinus*, and *Alcheron Lapis*, by the *Portuguese Mesang de Vaca*; and by the *Arabians Haraczi*, which is said by some to have an alexipharmac and antepileptic Virtue. But this Stone is not to be confounded with the *Bulithum*, or Ball, which is sometimes found in the Stomach, and sometimes in the Intestines of this Animal: These are usually call'd also *Tephi Bovini*, and consist of Hairs, which it gets off, by Licking, from its Body, and swallows; where by degrees they concrete into a Ball, which is commonly of the Colour of the Animal's Hair. *Sir Hans Sloane*, in his History of *Jamaica*, says, that some give half a Dram of it in Powder as an Astringent. These Balls have sometimes a shining Cruſt over them, in which respect they imitate the true Bezoar-stone. The Gall is fully treated on under the Article *BILIS*. The Spleen is not only commended in Decoctions, but for external Uses, in Affections of the Spleen, as Hardness, Inflammation, Pain, and Tumor. *Paracelsus*, as *Etmuller* writes, has a remarkable Experiment of the Virtue of this Part, which he chopp'd into small Bits, and boil'd in Water, for a Suppression of the Menſes, and a Cachexy proceeding from it. Reason does not comprehend this, but must yield to Experience. *Etmuller* goes on to tell us, that the Essence prepar'd with Spirit of Baum is commended in Obstructions of the Menſes, and a Cachexy thence proceeding. It may also conveniently be mix'd with liquid Essence of Steel, that it may be more appropriated to such Cases, and more especially to the internal Parts, and principally to the Opening of the Obstructions and Oppilations of the Mesentery. *D. Michaeli* had some compound Essence of Ox's Spleen mix'd with Essence of Steel, which he used in a Suppression of the Menſes, attended with Pain. Some commend it to provoke an Appetite. The Spleen of an Ox, distil'd with Spirit of Wine, is recommended for all Infirmities of the Stomach. Thus far *Etmuller*; but the Virtue of this distil'd Liquor, I should think, were owing to the Spirit of Wine, and that of the Essence to the other Ingredient, rather than to any thing proceeding from the Spleen of the Ox. In the *Berlin Dispensatory* there is a Medicine intitled, *Essentia Splenis Bovini*, which is extracted from the Spleen of a young Bull castrated, by means of Spirit of Wine, or of Baum, after it has been cut into thin Slices, and macerated for some Days in Spirit of Wine, saturated with Myrrh, or the Powder of Angelica, and then dried in the open Air.

The Liver of an Ox, dried and pulveriz'd, is commended as good in Fluxes of the Belly, and Hemorrhages. If it be serviceable in this Case, it acts as an absorbing, alkaline Powder; but then the Liver of other Animals will have the same Effect. It is said to be conducive in curing Infirmities of the Liver, if a Decoction be made of it, and other hepatic Plants; but I attribute such Effects to those Plants alone.

The Dung of an Ox is deservedly commended for its discutive Virtue in external Applications. Hence it is used recent, by way of Cataplasm, in Inflammations, particularly the Gout, as an approved Anodyne. Some mix with it Earth-worms, and apply it to the Abdomen, in order to cure the Colic, and discuss Flatulencies; as also in the Aſcites, to repress the Tumor, and discuss the Water; for, next to human Dung, that of an Ox is reckon'd the best for this Purpose. *Etmuller* says it is very effectually applied to cedematous Tumors: It is also commended against a Suppression of Urine, if applied to the Pecten, and the Region of the Pubes. The common People give the express'd Juice in Pains of the Colic; and *Etmuller* asserts, from certain Experience, that it is not only a present Remedy in the Colic, but also in the Pleurisy; that of this Dung, in the same manner as of human Dung, by repeated Digestion and Sublimation, may be prepar'd the *Zibethum Occidentale*, so call'd by *Paracelsus*, because it exhales a sweet Smell like Civet. *Dioscorides, Lib. 2. Cap. 73.* says, that the Dung of an Ox that grazes, applied recent, mitigates the Inflammation of Wounds. It is wrapp'd, he says, in Leaves, and heated in hot Ashes, and then applied to the Place; that a Fomentation of it asswages the Pain of the Sciatica; that it discusses Hardnesses, Pain, and Strumæ, being anointed with it, infused in Vinegar; and that a Suffumigation of the Dung of the Male of this Species represses the Falling-down of the Uterus; and that the Smell of it, when kindled, drives away Gnats. On these Passages, *Matthiolus* remarks: "We are to consider, that all Medicines of this Kind are accommodated to the hard Bodies of Rustics, such as Diggers, Mowers, and such as are inur'd to Work which requires bodily Strength; to such as these, when affected with scirrhus Tumors, it is applied by way of Cataplasm, with Vinegar." *Valescus de Tarranta*

ranta assures us, that the Dung of an Ox (or a Horse) is of excellent Use in a Gangrene, to preserve the sound Parts from Corruption: And, after him, *Sylvius* and *Barbette*, as they say, made use of the same Remedy, which they kept as a great Secret. But it is really a sordid Medicine, hardly worthy of a Physician, and to be left to the poor Commonalty, rather than to be recommended to the Rich and Noble, according to *Heister*, *Chir. p. 323*.

Cow's Urine, internally used, *Etmuller* says, cures the Gout, if it be taken in the Month of May, and the Feet are bathed a while in it, and, after that, the *Norimberg* Plaister is applied to them. *Dioscorides* says, that a Bull's Urine, with Myrrh, instil'd into the Ears, eases Pains thereof. *Helmont* proposes, as an approved Remedy for the Stone, the Liquor that usually fills the Bladder of the Fœtus in a Cow, drank every Morning, to the Quantity of about two Ounces, in a like Proportion of White-wine.

The Blood of a Bull, fresh-drawn, is reckon'd poisonous, by causing a Difficulty of Breathing, and Suffocation; but *Matthiæus* on *Dioscorides* observes, that, except it be drank in great Quantities, and hot as it comes from the Veins, before it concretes, it does little or no Harm. This poisonous Quality is not, however, confirm'd by later Experiments. But the Blood of Oxen and Bulls is commended, as internally used, for the Dysentery, an Excess of the Menfes, and other internal Hemorrhages; and, for Spitting of Blood, it is prescribed to be taken in Vinegar. Externally it is effectual in discharging and mollifying Tumors, and clearing the Face of Spots and Blemishes. *Etmuller* says, the Blood is hardly used, but in case of an Atrophy of the Limbs and Joints, after great Wounds receiv'd; and for Weakness and Pains in the Members and Joints, which, being thrust into the fresh Blood of an Ox, or a Dog newly kill'd, will be wonderfully refresh'd thereby, and render'd more pliable; and fit for Motion. The Blood of an Ox then, externally applied, has these Virtues in common with the Blood of other Animals; which Virtues are derived from its saponaceous Nature, whereby it is a Dissolvent and Aperient, its native Heat promoting its Operation. Internally taken, it is hurtful, by its natural Property, which causes it to congregate in the Stomach, and renders it insuperable by the vital Powers. *Helmont* says, that the Blood of a Bull is Poison, but not that of an Ox or Cow; and assigns as a Cause the Fury of the Bull, dying with an eager Desire of Revenge, which impresses a Mark of Vengeance, and a powerful Signature, on the Blood. *Guainerius* says, that not only the Blood of a Bull, but that of an old Ox, is poisonous. *Kiegar*.

BOSA. An Egyptian Word for a Mass, prepar'd of the Meal of Darnel, Hempseed, and Water, of the same inebriating Virtue as the *Assis*, which see.

BOSCADES, *βουσκάδες*. An Epithet for Pigeons which build in Towers, which some use to erect in the Fields. They are otherwise call'd *Agrestes*, wild, to distinguish them from the Domestic, *ἡ νοτίστικος*, *Galen, Lib. 2. de C. M. S. G. Cap. 10.* *Βουσκάς* is also a kind of dry Pitch, of a tenacious Quality, like Bird-lime. *Gorraeus*.

BOSCI SALVIA. A kind of Sage which takes its Name from *Boscum*, or *Boscus*, a Wood, the Places where it grows. *Blancard*.

BOSMOROS, or **BOSPOROS**, from *βρωσ*, to feed, and *πόρος*, a Portion or Division. A kind of Corn so call'd, because it is divided by the Teeth of the Mill, or by the Stone; or because it is separated from the Chaff by the Treading of the Oxen, it may derive its Name from *βῆς*, *Dorice*, *βῆς*, an Ox; or, again, from *βῆς* and *πείω*, to pass over. *Blancard*.

BOTAMUM. Wash'd Lead. *Rulandus*.

BOTANE, *βόταν*. An Herb; whence is derived

BOTANY. The Science relating to Herbs and Plants, for which the Antients have no Name, as it was not in their Days erected into a regular Science.

Before I proceed to the History of Botany, it will be convenient to give an Explication of the Botanical Terms commonly us'd, which will save the Reader the Trouble of turning to a Multitude of Articles, in order to understand what will afterwards be said.

A

ACAULIS & ACAULOS, without a Stalk; that is, when the Flower of a Plant grows close to the Ground, having no visible Stalk, as in the Carline-thistle.

ACINUS & ACINI, are the Berries or Fruit of the Elder, Privet, Ivy, &c.

AGARICUS. See this Word in the Letter A.

ALA is the Sinus of a Stalk, which the Leaf or Pedicle makes with the Stalk or Branches, from whence a new Offspring uses to put forth.

ALCYONIUM. See this Word in the Letter A.

ALGA. The *Alga* is a Species of Plant that grows in Water, with fine oblong grassy Leaves, and more perfect Seed than that of the Fucus; for its Vessels, when come to Maturity, gape, and let fall the Seed, as it happens in more perfect Plants.

AMENTACEOUS FLOWERS are such as have an Aggregate of Summits hanging down in form of a Rope or Cat's Tail; as

the Male Flowers of the Mulberry, the Hazel, Walnut, and Oak. These are also call'd *Iuli*, and, in English, *Katkins*.

APETALOUS FLOWERS. See *FLOS*.

APICES, *Summits*, are those Bodies which hang upon the Chives, or Threads, which generally surround the Pointals of Flowers, and contain the prolific Powder, which is analogous to the Male Sperm in Animals.

ARBOR, a Tree, is defin'd to be a woody Plant of the largest Growth, whose Trunk is perennial and single, and divided into many large Branches, which are again divided into smaller Twigs, on which the Leaves, Flowers, and Fruits, are produc'd.

ARISTA is that sharp-pointed Needle which stands out from the Husk, or Covering of the Grain of Corn or Grass, and is call'd *Awn*, or *Beard*.

ARTICULATION is the Connexion of Parts that consist of Joints or Knees, such as the Pods of Birdsfoot, or French Honeysuckle, which, when ripe, divide into so many Parts as there are Knees or Joints.

AXIS is a taper Column placed in the Centre of some Flowers or Katkins, about which the other Parts are dispos'd.

B

BACCA, a Berry, a roundish Fruit, for the most part soft, containing one or more Seeds in a pulpy Substance.

BALAUSTIUM is the Cup of the Flower of the wild Pomegranate.

BARBULÆ are the Half-florets of compound Flowers.

BIVALVE: The Pods or Husks of Plants, which open lengthways in two Parts, like the Shell of a Muscle, are term'd *Bivalve*.

BRACHIA are the Division of the large Branches of Trees from the Trunk.

BRYUM. The *Bryum*, or *Bryon*, is a fertile kind of Moss, which differs from the *Polytrichum* by its smooth Calyptra, and from the *Hypnum* principally with respect to the Original of its Pedicles, which proceed from the Tops of the Stalks and Branches, or from the Radicles and annual Shoots, which, the former Year, were the Tops of the Stalks, and have not their lower Part inclosed in a squamous Sheath, like those of the *Hypnum*. Add to these Characters, that its Stalks are, for the most part, erect, and less branch'd than those of the *Hypnum*, and not trailing and creeping. The Calyptræ are situated sometimes perpendicularly, sometimes obliquely in the Head, and the Seed-vessels, usually part transversely, sometimes with an even, sometimes with an indented Margin.

BULBUS. Bulbous Roots are such as consist either of several Coats involving one another, or of several Scales lying one over another. The first of these is call'd a tunicated Root, (of this Sort is the Onion and Tulip) and the last is call'd a squamous (that is, a scaly) Root; of which sort is the Lily and Martagon.

BYSSUS. The *Byssus* is the lowest, and a barren kind of Moss, consisting of a very thin, and, to the naked Eye, imperceptible sort of Wool, which is produc'd from various Substances, appearing sometimes like a very fine Powder, sometimes like Down, and frequently lasts for a considerable time, in which respect it differs from the *Fungus*, as it does also in having no Head, or any other Resemblance to the rest of the *Fungi*.

C

CALYPTRA is the thin Involucrum or Cover of some Seeds.

CALYPTRA, a thin Cup, which covers the Heads of some of the Mosses.

CALYX, or Empalement, is generally understood to mean those less tender Leaves, which cover the other Parts of the Flower.

CAPILLAMENTS in Flowers are generally understood to mean the Chives which support the *Apices*.

CAPITELLUM, the Head or Seed-vessels, frequently applied to Mosses.

CAPITULUM is the Head or Top of any Plant.

CAPSULA is the short Pod or Husk of a Plant, containing the Seed.

CARINA is the concave Petal or Segment of a Butterfly-flower, which resembles the Keel or lower Part of a Boat.

CAUDA, the Tail of a Leaf, is a Production of the middle Rib, and connects the Leaf with the Stalk, after the manner of a Pedicle; when the middle Rib has an Appendix of the Leaf running along it, it is often call'd a wing'd Leaf.

CAUDEX is the Trunk of a Tree.

CAULIS is a Part of a Plant receiving the Nourishment from the Root, and conveying it into the other Parts with which it is cloath'd, not having one Side distinguishable from the other. The Stalk of a Tree is call'd the Trunk, and in Corn and Grass it is call'd the Blade.

CAULIS PROCUMBENS, a procumbent or trailing Stalk, is that which lies on the Ground without emitting Roots.

CAULIS REPENS, a creeping Stalk, is that which lies on the Ground, and propagates itself by emitting Roots, as the Ivy and Strawberry.

CAULIS SCANDENS, a climbing Stalk, is that which climbs by the Help of Tendrils, as the Vine and Briony.

CAULIS VOLUBILIS, a twining Stalk, is that which twists about any Prop without the Help of Tendrils, as the Hop, Kidney-bean, &c.

CIRRI are the little Fibres of the Roots of Plants.

CLAVICULUS, or *Capreolus*, (that is, Tendrils) is a Part of a Stalk, curling and laying hold on any adjacent Body, and is always produc'd at a Joint. These are also call'd *Claspers*.

COMA is the Top of a Branch or Flower.

CONSERVA. The *Conserva* is a barren kind of *Moss*, destitute of little flowery Heads, and even of those Boffes and Tubercles, which some other Kinds are furnish'd with instead of them, and consisting only of round, smooth, and uniform Leaves, or rather little Stalks, divided into fine Capillaments.

CONUS, a Cone, is the Fruit of the Pine, Fir, and Cedar.

CORYMBUS signifies a Cluster of Flowers or Fruit standing on Pedicles, which are disposed in such a manner as to form a Sphere; of this sort is the Ivy.

CRENA, or crenated Leaves, are such as are cut about the Edges into several obtuse Segments.

CUBITUS, a Cubit, that is, a Foot and a half; so the Stalks of Plants are term'd *Cubitalis*, *Bicubitalis*, &c. according to their Height.

CULMUS is the Stalk or Blade of Corn.

CYLINDRUS, that is, Cylinder; the Fruit of Plants are term'd Cylindrical, when they resemble a Column.

CYTINUS is generally understood to mean the Flowers of the true Pomegranate; but, by some Writers, the Cups of Flowers, which expand after the same manner, are term'd *Cytiniformes*.

D

DENTICULATUS, that is, indented; those Leaves of Plants which are cut about the Edges into several Segments, more acute than the crenated Leaves, are term'd denticulated.

DIGITATED LEAVES are compound Leaves divided into several Parts, all of which meet together at the Tail, in form of a Hand.

DISCUS, the Disk, is an Aggregate of Florets, forming, as it were, a plain Surface.

DISSEPIMENTUM is the thin Septum which divides the several Cells in the Fruit of Plants.

E

ECHINUS; those Plants, or Parts of Plants, which are beset very closely with Spines, like a Hedgehog, are term'd echinated.

EMARGINATUS; those Leaves of Plants which are hollow'd at their Extremities, so as to form a Heart, are call'd Emarginated Leaves.

EMBRYO is the tender Fœtus of the Plant.

ESCHARA. The *Eschara* is a stony kind of Plant, somewhat resembling a Web in its Contexture.

F

FIMBRIA, Fringe; those Parts of Plants or Flowers, whose Borders end in small Threads resembling fring'd Linen, are term'd fimbriated.

FISTULOUS PLANTS are such whose Stalks are hollow like a Pipe.

FLOS, that is, a Flower, is the Organs of Generation of both Sexes, adhering to a common Placenta, together with their common Coverings, or of either Sex separately, with its proper Coverings, if it have any.

The Flowers of Plants are distinguish'd by Botanists in the following manner.

FLOS AMENTACEUS, Amentaceous Flowers; these are such as are term'd Katkins.

FLOS APETALUS, Flowers without Petals; these are such as have no other Covering to the Parts of Generation but the Calyx.

FLOS CAMPANIFORMIS is such a Flower as is shap'd like a Bell. Those Flowers whose Edges spread very wide, are term'd open bell-shap'd Flowers; but those which are much less spread, are call'd tubulous bell-shap'd Flowers.

FLOS CARYOPHYLLEUS is such a Flower as is shap'd like a Clove-gilliflower.

FLOS COMPOSITUS is a compound Flower, which is compos'd either of Florets or Semiflorets, or of both together. Of this kind is the Blue-bottle, Knapweed, and many others.

FLOS CRUCIFORMIS, a cross-shap'd Flower, which is compos'd of four Petals, plac'd in form of a Cross. Of this sort are the Cabbage, Mustard, and Wall-flower.

FLOS FLOSCULOSUS, a flosculous Flower, is that which is compos'd of several Florets, included in one common Cup.

FLOS INFUNDIBULIFORMIS, a funnel-shap'd Flower, is that which is shap'd like a Funnel. Of this kind is the Primrose, lesser Centaury, and many others.

FLOS LABIATUS, a Lip-shap'd Flower. This is an irregular monopetalous Flower, divided commonly into two Lips; the upper Lip is call'd the Crest, and the under one the Beard. Sometimes the Crest is wanting, and then the Style and Chives supply its Place. This is by some call'd an unilabiated Flower.

FLOS LILIACEUS, a Lily-shap'd Flower, is generally compos'd of six Petals, which resemble those of the Lily. Of this sort are the Tulip and Asphodel.

FLOS MONOPETALUS, a Flower compos'd of one Leaf. All those Flowers whose Petals are join'd at the Bottom, so that they fall off entire, are term'd monopetalous Flowers.

FLOS MONOPETALUS ANOMALUS, an irregular Flower, consisting of one Leaf.

FLOS PAPILIONACEUS, a papilionaceous or pea-bloom Flower, is one which, in some measure, resembles a Butterfly with its Wings expanded. It always consists of these four Parts; the Standard, (or *Vexillum*) which is a large erect Segment or Petal; the two Wings, (*Alae*) which compose the Sides; and the Keel, (*Carina*) which is a concave Petal or Segment, resembling the Keel of a Boat; this is sometimes entire, and, at other times, it consists of two Petals or Segments, adhering pretty close together. Of this sort are the Bean, Pea, and Vetch, &c.

FLOS PERSONATUS, a personated Flower, that is, an irregular monopetalous Flower, whose upper Part resembles the Beaks of Fowls. Of this kind are the Snap-dragon, Toad-flax, and others.

FLOS PETALODES, a petalous Flower, that is, a Flower whose Organs of Generation are surrounded with Leaves or Petals.

FLOS POLYPETALUS, a polypetalous Flower, that is, a Flower compos'd of several Leaves or Petals. When these agree in Figure and Position, it is call'd a regular polypetalous Flower; but when the Petals do not agree in Figure and Position, it is call'd an irregular polypetalous Flower.

FLOS RADIATUS, a radiated Flower, consists of two Parts; the Disk, which is an Aggregate of Florets forming a plain Surface, and the Rays, which are several Semiflorets set round the Disk, in form of a Star. These are call'd radiated discous Flowers; but those which have no such Rays, are call'd naked discous Flowers.

FLOS ROSACEUS, a rose-shap'd Flower, that is, a Flower consisting of four or more Petals, which are plac'd circularly in form of a Rose.

FLOS ROTATUS, a Flower in the Form of a Wheel. Such are those of Borrage, Anagallis, and Willow-weed.

FLOS SCORPIOIDES, that is, when the Flowers are rang'd on one Side of the Pedicle, which twists at the Top in form of a Scorpion's Tail. Of this sort is the Heliotropium.

FLOS SEMIFLOSCULOSUS, a semiflosculous Flower; this is compos'd of several Semiflorets, included in one common Calyx.

FLOS SPICATUS, a spik'd Flower, is that whose Flowers are set thick on the Pedicle, in such a manner as to form an acute Cone.

FLOS STAMINEUS, a stamineous Flower, is that which is compos'd of many Chives included in a Calyx, having no Petals. Of this sort is the Bistort and Sparganium.

FLOS STERILIS, barren Flowers; these have no Embryo adhering to them; so are call'd Male Flowers, and False Flowers. Of this kind are the Melon and Gourd.

FLOS VERTICILLATUS, that is, a whorle-shap'd Flower. These Flowers grow closely united, surrounding the Stalk at the several Joints.

FLOS UMBELLATUS, an umbellated Flower, is, when the Extremity of the Stalk or Branch is divided into several Pedicles or Rays, beginning from the same Point, and opening in such a manner as to form a kind of inverted Cone, like an Umbrella. When the Pedicles, into which the Stalk is divided, are subdivided into others of the same Form, upon which the Flowers are disposed, the first Order is call'd Rays, the second Pedicles. That Umbel which consists of Pedicles only, is call'd a single Umbel; that which is compos'd both of Rays and Pedicles, is call'd a compound Umbel.

FLOS URCEOLATUS, or Pitcher-shap'd Flower. Of this sort are the Arbutus and Whortle-berry.

FOLIUM, a Leaf, is a Part of a Plant, extended into Length and Breadth in such a manner as to have one Side distinguishable from the other. This is call'd in *Latin* *Folium*, to distinguish it from the Leaf of a Flower, which is call'd *Petalum*.

FOLIUM ALATUM, a wing'd Leaf, is, as it were, compos'd of several pinnated Leaves.

FOLIUM ANGULATUM, an angular Leaf, is that whose Margin is cut into several Angles.

FOLIUM AURICULATUM, an ear'd Leaf, is that whose Base, next the Pedicle, is indented, somewhat resembling an Ear.

FOLIUM COMPOSITUM, a compound Leaf, is that which is divided into several Parts, each resembling a simple Leaf.

FOLIUM CRENATUM, a crenated Leaf, is that which is cut about the Edges into several obtuse Segments.

FOLIUM DIGITATUM, a digitated Leaf, is a compound Leaf, divided into several Parts, all of which meet together at the Tail, so as to resemble a Hand.

FOLIUM HEPTAFOLIATUM, a heptafoliated Leaf, is a digitated Leaf, consisting of seven Fingers.

FOLIUM INTEGRUM, an entire Leaf, is that which has no Division on the Edges.

FOLIUM LACINIATUM, a jagged Leaf, is that which is cut about the Edges into several deep Portions, in an irregular manner.

FOLIUM PENNATUM, a pennated Leaf, is a compound Leaf divided into several Parts, each of which is call'd a Lobe, plac'd along the middle Rib, either alternately, or by Pairs. When the middle Rib is terminated by an odd Lobe, it is call'd an unequal pennated Leaf; and when it is not terminated by an odd Lobe, it is term'd an equal pennated Leaf. When the Lobes are all nearly of the same Form and Bigness, it is call'd an uniform pennated Leaf; when they are not so, it is term'd difform.

FOLIUM QUINQUEFOLIATUM, a quinquefoliated Leaf, is a digitated Leaf consisting of five Fingers.

FOLIUM RAMOSUM, a ramose Leaf, is that which is still farther divided than the wing'd Leaf, as is the common or Female Fern.

FOLIUM SAGITTATUM, a Spear-shap'd Leaf, is that which ends in three sharp Angles, resembling a Dart.

FOLIUM SIMPLEX, a simple Leaf, is that which is not divided to the Middle.

FOLIUM SINUATUM, a sinuated Leaf, is that which is cut about the Edges into several acute Segments, like the Teeth of a Saw.

FOLIUM TRIFOLIATUM, a trifoliated Leaf, is a digitated Leaf, consisting of three Fingers.

FOLIUM TRILOBATUM, a trilobated Leaf, consists of three obtuse Lobes, which are not divided to the Bottom.

FOLIUM UMBILICATUM, an umbilicated Leaf, is that which has the Pedicle fasten'd to the Backside of a Leaf, so that, on the upper Side of the Leaf, there is a small Cavity form'd like a Navel.

FOLLICULUS is a leafy membranaceous Sheath or Covering, which surrounds the Fruit or Seed; as the Winter-cherry.

FONTINALIS. The *Fontinalis* is a sort of Moss distinguish'd by its close uniform Heads, supported by none, or very short Pedicles, and, when come to Maturity, opening transversely in the upper Part, and discharging a Capitellum.

FORNICATUS, or fornicated Petals, are such Flower-leaves as are arch'd after the manner of the Galea, or Crest, of the Clary, and Sage.

FRUCTUS, a Fruit. By the Word Fruit is to be understood the Seeds of all Plants, with their Covering.

FRUCTUS UMBILICATUS, an umbilicated Fruit, is that which had the other Parts of the Flower growing on its Top when it was an Ovary. They usually form a Cavity, which is known by the Name of the *Umbilicus*, or Navel; as in the Medlar, Rose, and Pomegranate.

FRUTEX, a Shrub, is a Plant with many woody perennial Trunks, such as Roses, Syringa's, and Spanish-broom, which divide into several Stems near the Ground; but the Word is frequently us'd by Gardeners for all woody Plants of low Growth.

FUCOIDES. The *Fucoides* is a Species of Plant which grows in Waters, and is of a middle Nature between the *Conserua*, *Corallina*, and *Fucus*. It is often finely divided, and of a more tender Substance than the *Fucus*, and not distinguish'd by Nodes, and Joints like the *Conserua* and *Corallina*.

FUCUS. The *Fucus* is a Species of Plant growing in Water, whose Leaves and Stalks are of various Figures. It is, for the most part, of a viscid and coriaceous Substance, and is furnish'd with Vessels on both Sides, which admit the Air, being form'd to assist its Floating. Its Extremities are often set with Tubercles, which seem to contain something of a seminal Nature.

FUNGOIDES. A *Fungoides* is a Species of *Fungus* without a Head or Cap, whose Pedicles or Stalks are of various Shapes and Divisions. As to its Substance, it consists of an uniform Matter, which is undivided into Lamellæ, or by Pores.

FUNGUS. A *Fungus* is the lowest, and a very imperfect Genus of Plants, having neither Seed nor Flower, as far as can hitherto be observ'd, and remarkably differing from other Plants, in that it has not an herbaceous Colour, nor Leaf, properly speaking, nor any thing else analogous in its Contexture. Most of them spring up in a very short time, and are as soon dissolv'd into the putrid Matter whence they arose.

G

GENICULUM, a Knot; such Roots and Pods of Plants are said to be geniculated, as are divided into Joints.

GLUMA is the Husk or Chaff of Corn.

H

HABITUS PLANTÆ is the outward Appearance of Plants, or what they call the *Port*.

HERBA, an Herb. By an Herb is meant all such Plants whose Stalks die to the Ground every Year. Those whose Roots do not continue longer than one Year, are term'd annual

Plants; those whose Roots continue two Years, are term'd biennial Plants; and those whose Roots continue many Years, are term'd perennial Plants.

HYPNUM. The *Hypnum* is a fertile kind of Moss, furnish'd with uniform calyptrated Heads (*Capitulis*); the Calyptræ, for the most part, being situated obliquely on them. The Capitella fall off transversely, sometimes with an even, and sometimes with an indented Margin. The Pedicles, which, for the most part, are pretty long, proceed from the Sinuses of the Leaves, and shoot along by the little Stalks and Branches, and have their lowest Part inclosed in a squamous Sheath, which is different from the Leaves. To these Characters we may add, that the Stalks are, for the most part, set at a wider Distance, and more branch'd, than in the *Bryon*.

I

IMBRICATUS. The Leaves or Scales of Plants are said to be imbricated, when they are disposed so as to lie one on the Edge of the other, after the manner of Tiles on a House.

INTERNODIUM is that Part of the Stalks of Plants between the Knots or Joints.

IULUS is a Katkin.

L

LANUGO, Down. The Seeds of Plants which have a downy Substance fasten'd to them, which serves as Wings to transport them, are term'd lanuginous, as the Thistle: These are also call'd pappous.

LICHEN. The *Lichen* is a floriferous as well as feminiferous kind of Moss, whose flowery little Heads are furnish'd with many Grains, and are variously shaped, producing, as they ripen, several little monopetalous Flowers. The Seeds, which are small, flat, and orbicular, are contain'd in some peculiar open Capsules, resting upon the Plane of the Leaves; and are sometimes found in the same Plant that bears the little Heads, sometimes in other Plants of the same Species. Besides these flowery little Heads, there are observed in some Species some umbellated Heads of different Figures, which produce neither Flower nor Seed, as other Plants of the same Species usually do. The Pedicles of both Species are, for the most part, naked, and proceed from no Vagina. Tho' these Characters are very evident, yet, the more easily to distinguish it from the rest of the Tribe of the Mosses, we may add, that the Leaves are of an herbaceous Consistence, and of an indeterminate Figure, widely spreading, and running out into numerous Roots from their back Part.

LICHENASTRUM. The *Lichenastrum* is a fertile, or a remarkably floriferous, kind of Moss, with Heads supported by pretty long Pedicles; which Heads, as they ripen, usually cleave into four equal Parts, as far as the Base, and resemble a cruciform Flower, and discharge a very fine Dust, which answers to the fine Flour of the Apices in the most perfect Flowers: This Dust cannot be denied to be of the same Service in the rest of the Mosses, since the Dust of their Heads appears to be exactly of the same Figure and Contexture, if examined with a Microscope. The Heads of the *Lichenastrum* are simple and naked, each standing on its own Pedicle, which is longer or shorter, and proceeds from a Vagina or Sheath, sometimes simple, sometimes bivalve, and sometimes divided at the Top into several Parts, by which Character it is very clearly distinguish'd from the *Lichen*.

LICHENOIDES. The *Lichenoides* is distinguish'd from the *Conserua* and *Ulua*, by its Bosses and Tubercles; and from the *Lichen*, *Lichenastrum*, and others, by the same, and its being destitute of little flowery Heads, and consisting of a middle Substance between the *Fungi* and *Mosses*; whence many of its Species are usually call'd *Musco-fungi*.

The *Lichenoides* are divided into,

I. The Cauliferous, or Stock-bearing, which are subdivided into,

1. The capillaceous, not tubulous, and scutellated, that is, with Eminences like little Targets, from *Scutella*, a little Target or Buckler.

2. The coralliform, for the most part, set with Tubercles; and of this Sort there are (1.) the solid, and not tubulous; (2.) the tubulous.

3. The pyxidated, that is, hollow'd in form of a Box, in Latin *pyxis*.

4. The fungiform, or those resembling a *Fungus*.

II. The *Lichenoides* without Stalks, subdivided into

1. The purely crustaceous.

2. Those with a leafy, scutellated Crust, or scutellated Leaves, closely adhering one to another; and these are either (1.) of a Jelly-like Substance; or (2.) of a harder and juiceless Consistence.

3. Those with Leaves more at Liberty, and not growing so close to one another; and these are either (1.) with Leaves scutellated and tuberculated, or (2.) peltated.

LITHOPHYTON. A *Lithophyte* is a Species of Plant, of horny sort of a Substance, and of a middle Nature, between Wood

Wood and Stone. There usually adheres to it a Bark, which consists of a Contexture of Fibres, or resembles Tartar. *Boerhaave* calls these *Keratophyti*.

LOCULAMENTA are the Cells in the Fruit of Plants, where the Seeds are lodged, which are divided by small Partitions.

LOCUSTA is the outer Covering of the Flower and Grain of Corn, which incloses the Chaff.

LYCOPODIODES. The *Lycopodioides* differs from the *Lycopodium*, in the same respect as the *Selaginoides* differs from the *Selago*.

LYCOPODIUM. The *Lycopodium* is a fertile kind of Moss, destitute, as well as the *Selago*, of Pedicles and Capitella: But it differs from the *Selago*, in that its Heads, or Capsules, grow not scatter'd in the Sinuses of the Leaves, but are collected into a Club; for each Scale covers a Kidney-shaped and bivalve Capsule, which loses no Part of itself when ripe.

M

MALLEOLUS, Mallet. The Cuttings of Vines, which are taken with Joints of the old Wood to their Bottom, so as to resemble a little Mallet, are term'd *Malleoli*; which Cuttings more certainly take Root than any other; and always make better Plants.

MARGINATUS, border'd. The Seeds of Plants which have a thin leafy Border round them, are said to be marginated; as those of the Stock-gilly-flower, Honeysy, and others.

MINIUM. The *Minium* is a fertile kind of Moss, furnish'd with little flowery Heads, or feminal ones, if they may be so esteem'd, which are of two Sorts; for some of them are naked and dusty, having neither Capsule nor Cover, nor so much as surrounded with a Membrane; but others are observed to be like the rest of the floriferous kinds of Moss, particularly the *Hypna* and the *Brya*; and the different Manner of flowering is what distinguishes this Kind from all the rest. There is usually a Variety in the little Heads, sometimes in the same, sometimes in different Plants; and the Pedicles which support membranaceous Heads, are pretty long and bare; but those which have their Heads naked are observed to be much shorter than the others, and surrounded with very small Leaves.

MUCRO, a sharp Point. Those Leaves or Fruits of Plants, which are terminated in a sharp Point, are termed mucronated.

MULTICAPSULAR PLANTS are such as have several Pods of Seeds succeeding each Flower, as the Celandine, Columbine, and others.

N

NUCLEUS, a Kernel, is that Part of the Fruit which is inclosed in a hard Shell, as the Kernel of the Almond and Apricock.

O

OSSICULUM, a Shell, is the hard stony Covering of Seeds.

P

PANICULA, a Panicle, is a Stalk diffused into several Pedicles, sustaining the Flowers or Fruits; of this Sort are the Oat, Millet, and others.

PAPPUS, Down. See LANUGO.

PEDICULUS, a Pedicle, is that Part of a Stalk which immediately sustains a Leaf, a Flower, or a Fruit, and in *English* is call'd Foot-stalk.

PETALA, Petals, are the tender fine-colour'd Leaves, which are generally the most conspicuous Parts of a Flower; so those Flowers which consist of one Leaf, are call'd monopetalous Flowers; those of two Leaves are call'd bipetalous; those of three Leaves, tripetalous; those of four Leaves, tetrapetalous; those of five Leaves, pentapetalous; those of six Leaves, hexapetalous; and those of a greater Number of Leaves, are term'd polypetalous.

PEZIZA. The *Peziza* is a Species of *Fungus*, sometimes without Pedicles, and sometimes with them, having its Edges divided in such a manner as to form a remarkable Cavity between them. It is of an uniform Substance, like the *Fungoides*, and neither distinguish'd by Lamellæ nor Pores.

PISTILLUM, Pointal or Style, is that Column which occupies the Centre of the Flower, rising on the Top of the Embryo, and is generally surrounded with the Chives. These differ greatly in their Form; for in some Flowers they are roundish, in others triangular, oval, or square.

PLACENTA is that Part of the Pod or Husk of a Plant to which the Seeds are fasten'd, and by which they are nourish'd till they are ripe.

PLANTA, a Plant, is an organical Body, destitute of Sense, and spontaneous Motion, adhering to another Body in such a manner, as to draw from it its Nourishment, propagating itself by Seed. Under this generical Name are included Trees, Shrubs, Under-shrubs, and Herbs.

POLYPETALOUS, many Leaves. Those Plants are term'd polypetalous, whose Flowers are composed of several Leaves.

POLYTRICHUM. The *Polytrichum* is a fertile kind of Moss, whose Capitellum commonly quits the Plant transversely, with an even Margin; and is cover'd with an upright and villous Calyptra, with a Capitellum; by which Character it is distinguish'd from the *Bryon*. From the *Hypnum*, besides the Difference of the Calyptra, it is distinguish'd by its erect and less branch'd Stalks, which, from their Tops, or from annual Shoots, produce naked Pedicles, not having their lowest Part inclosed in a squamous Sheath.

POMUM, an Apple, is generally understood to be any fleshy Vessel, containing more Seeds than one; so that all Plants which produce such Fruit are term'd pomiferous, that is, Apple-bearing.

PRUNUM, a Plum, is a fleshy Vessel, inclosing a hard brittle Shell, in which are one or two Seeds; so that all Plants which produce such Fruit are term'd pruniferous, that is, Plum-bearing.

PULPA, Pulp, is the soft Part of Fruits which surrounds the Seeds, as in the Tamarind and Cassia.

PYRAMIDATUS, pyramidal. Those Flowers or Fruits which grow in form of a Pyramid, are term'd pyramidal.

R

RACEMUS, a Cluster, is a Stalk divided or branch'd into several Pedicles, sustaining the Flowers or Fruits thick set together (as in the Vine and Currant): The first of these Conditions distinguishes it from a Spike, the last from a Panicle.

RADIX, a Root, is that Part of a Plant by which it naturally receives its Nourishment. These are of different Forms and Contextures, some of them being fibrous, others fleshy or woody.

RADIX ASPHODELI, an Asphodel-root, is that which is composed of several oblong fleshy Knobs; of this Kind are the Kingspear and Day-lily.

RADIX BULBOSA, a bulbous Root, is that which consists of several Coats, involving one another, or of several Scales lying one over another. The first of these is call'd a tunicated Root; of this Sort are the Onion, Tulip, and Hyacinth (from whence the *French* call all these Sorts of Roots Onions); the last is call'd a squamous (or scaly) Root; of this Sort are the Lily and Martagon.

RADIX FIBROSA, a fibrous Root, is that which consists only of small Fibres like Hairs; of this Sort are Grass and Corn.

RADIX GRANULOSA, a granulous Root, is a kind of grumous Root, consisting of many small fleshy Knobs, resembling Grains of Corn; of this Kind is the white Saxifrage.

RADIX GRUMOSA, a grumous Root, is that which consists of many oblong fleshy Knobs, joined to one Centre at the Top; of this Sort is the Ranunculus.

RADIX PALMATA, a handed Root, is a tuberous Root, divided as it were into several Fingers, so as to resemble a Hand; of this Sort is the handed Orchis.

RADIX TESTICULATA, a testiculated Root, is a double tuberous Root; for it consists of two Knobs, resembling a Pair of Testicles: Of this Sort are some of the Orchis Species.

RADIX TUBEROSA, a tuberous Root, is that which consists of an uniform fleshy Substance, and is generally of a roundish Figure: Of this Sort is the Sowbread.

RAMUS, a Branch, is the Division of a Stalk; in Trees it is often call'd a Bough.

S

SELAGINOIDES. The *Selaginoides* is a kind of Moss, which agrees with the *Selago* in all respects, except its Heads, which consist of three or four Grains, and, when ripe, open, as it were, into as many Capsules: Of this there is but one Species hitherto known in *England*.

SELAGO. The *Selago* is a fertile kind of Moss, destitute of Pedicles and Capitella; for the Heads are situated in the Sinuses of the Leaves, being bivalve, and shaped like a Kidney; or, when ripe, cleave in two lengthwise, and discharge a mealy Substance, without letting go any Part of the Capitellum.

SEMEN, a Seed, is that Part of a Plant which is committed to the Earth, in order to obtain a Plant of the like Kind with its Parent Plant, which produced it.

SEMEN also signifies a Body perfected by the mutual Operation of both Sexes, containing the Rudiment of such Plant as that from which it was taken; so may properly be judged to be analogous to the Egg of an oviparous Animal.

SEMEN NUDUM, a naked Seed, is that which has no Covering, beside the Empalement, remaining upon it, till the time of Vegetation.

SEMEN PAPPOSUM, a downy Seed, is that which has a downy Substance, like Wool, fasten'd to it, by which it is transported in the Air to a great Distance from the Parent Plant.

SILIQUEA, a Pod, is a long, flat, or round membranaceous Vessel, containing one or two Rows of Seeds.

SPHAGNUM. The *Sphagnum* is a fertile kind of Moss, whose Heads are furnish'd with a Capitellum, in Shape like those of the Hypnum, Polytrichum, and Bryum; but differing from them in that they are bare; and without Calyptrae, and commonly stand on none, or but very short Pedicles; whence they were heretofore call'd *Musci apocarpi*.

SPICA, a Spike, is a Part of a Stalk, thick-set with Flowers or Fruit, in such a manner as to form an acute Cone.

SPONGIA, a *Sponge*, is somewhat like a *Fungus*, being a Plant that grows in the Water, thick, of a soft; and, as it were, woolly Substance, full of little Perforations, elastic, and easily imbibing and retaining Water, or any other Moisture.

STAMINA, or Chives, are those slender Threads which encompass the Style in the Centre of Flowers, and support the Apices or Summits which contain the Male Dust.

STOLONES, Suckers, are such Shoots of Plants as arise from the Root, and may be taken off, with Fibres to them, so as to propagate the Species thereby: Of this Sort are the Filbert and Fig.

STRIÆ, Channels. Those Parts of Plants which have small longitudinal Furrows running along them, are termed striated.

STROBYLUS is the Cone or Fruit of the Pine-tree.

SUFFRUTEX, Under-shrub, is a woody Plant, not gemmiferous: Of this Sort are Thyme, Sage, and Lavender.

T

TALEA, Cuttings, are such Parts of a Branch as, when cut off from the Tree, will take Root, if they are planted in the Ground.

THYRSUS, a Thyrs, differs from a Spike in having the Flowers or Fruits set more loosely on it, so that there are Spaces visibly between them.

TOMENTUM, Flocks, is when the Leaves or Stalks of Plants are cover'd with a thick Down, as in Mullein.

TRACHÆÆ are the Air-vessels in Plants.

TURIONES, Buds, are the future Shoots of Plants, which, being inoculated into a proper Stock, will produce a Tree of the same Kind with its Parent Plant, from which it was taken.

V

VAGINA, or **THECA,** is the Sheath or Covering of a Bud.

VALVÆ, Valves, the Sides of the Pod or Seed-vessel, which, when they open lengthways in two Parts, like Muscles, Cockles, and such kinds of Shell-fish, are term'd bivalve Pods, as in the Stock-gilly-flower.

VERTICILLUM. See **FLOS VERTICILLATUS.**

VEXILLUM, or *Standard.* See **FLOS PAPILIONACEUS.**

VIMEN is the flexible Shoot of a Tree.

VITICULÆ, Runners, are the slender Shoots of Plants, which trail on the Ground, and emit Roots at their Joints, so as to propagate; as in Strawberries and Cinquefoil.

ULVA. The *Ulva* is a barren kind of Moss, which differs from the *Conserua*, in that it consists of plain and very thin Leaves, which are sometimes wide, sometimes narrow, and sometimes tubulous.

UMBELLA. See **FLOS UMBELLATUS.**

UMBILICUS. See **FRUCTUS UMBILICATUS.**

Tho' Botany, as a Science, may to some appear a Study too flat and dull for what we commonly call an exalted and refined Genius; yet, if we cast our Eyes back on the earlier Ages, and trace this Branch of Learning down to our own Times, we shall find, that it has been cultivated by those of the brightest Parts, and care'd by Men of great Distinction. As a Proof of this, I shall first mention *Solomon*, that venerable Eastern Sage, so famed for his Wisdom, that his very Name is become another Term for a wise and knowing Man. This Prince, tho' born to a Throne, and destin'd to rule over a powerful People, was yet so captivated with the Charms of Botany, and so strongly addicted to the Study of Plants and Herbs, that he is in Scripture said to have known them all, from the Cedar of Lebanon to the Hyssop that grows upon the Wall; and he himself, in the Book of *Wisdom*, informs us, that he was skill'd in the Differences of Plants, and the Properties of Roots. *Josephus*, also, that celebrated Jewish Historian, makes mention of *Solomon's* Skill in Botany, and gives us almost the same Account with that laid down in the Sacred Records. But however knowing *Solomon* might be in this respect, yet 'tis certain, we are at present no competent Judges, how far his Knowledge might have reach'd, and consequently cannot determine positively with regard to the State of Botany in his time. He began to reign in the Year of the World two thousand one hundred and twenty-nine, that is about an hundred and seventy Years after the Siege of *Troy*, and is said to be the first Botanist mention'd by any Records now extant.

But as 'tis an unpleasant Thing to grope, if I may so speak, in the dark, and a criminal Thing to advance imaginary Facts for historical Truth, we shall pass the State of Botany during

the Ages which intervened betwixt *Solomon* and *Hippocrates*, the great Founder of Physic.

This Physician was, according to most Historians and Chronologers, born in the Island of *Cos*, in the first Year of the eightieth Olympiad, that is; about four hundred and fifty-nine Years before Christ. Some maintain, that he died in the eighty-fifth, others in the ninetieth, others in the hundred and fourth, and others in the hundred and ninth Year of his Age. So that according to these different Accounts he must have died, either three hundred and seventy-four; or three hundred and sixty-nine; or three hundred and fifty-five, or three hundred and fifty Years before Christ. As in this Physician's Days it was customary for those who were cured of Diseases to fix up in the Temple of *Æsculapius* an Account of their Disorders, and the Medicines by which they had been removed; that the same Remedies might afterwards be used in parallel Cases; he is said to have wrote out these Accounts, and, according to *Varro*, constituted by their means what we call *Clinical Medicine*; after the Temple was burnt; for this Reason we find the Writings of *Hippocrates* interspersed with the Names of the Plants most known to the Greeks; and Accounts of their Uses and Virtues. But he would have done a further Service to Botany, and still more effectually consulted the Health and Welfare of Posterity, if he had given us Descriptions of them. But he has only mention'd the Names and Virtues of about two hundred and thirty-four, leaving their Descriptions to *Cratevas*, the most celebrated Botanist of his Time; whilst he himself was wholly employed in curing the Sick.

This *Cratevas* or *Crateias*, was Cotemporary with *Hippocrates*, and so skilful a Botanist, that this divine Physician styled him *ἀρχεβοτάνος*, the Prince or Chief of Botanists; and publicly professed, that he admir'd his Skill and Knowledge of Plants and Herbs. This *Cratevas*, and *Andreas Medicus*, who are thought to have been the most skilful Botanists in the Times in which they liv'd, are yet charg'd by *Dioscorides* with having left many useful Roots and Herbs imperfectly describ'd. But, however imperfect the Works of *Cratevas* may have been, yet 'tis certain, Botany has in After-ages sustain'd a considerable Loss for want of them; since in all Probability he described the Plants mention'd by *Hippocrates*. Whether this Conjecture be well founded, they who have an Opportunity of looking into the Fragments of *Cratevas* still preserv'd in the Imperial Library, are best able to judge.

The next Botanist of any Note who appear'd was *Theophrastus*, the Son of *Melantus* a Fuller of Cloth. This Author justly deserves the highest Encomiums for his History of Plants, and his Treatise intitled, *ὑποκρίων ἀντίον βιβλία η',* or eight Books concerning the Causes of Plants, of which the first six have only reach'd our Hands. He was first called *Tytramo*, according to *Diogenes Laertius*; but was afterwards called *Theophrastus* by *Aristotle*, on account of his uncommon Eloquence. He is said to have had two thousand Disciples at one time, a Circumstance which sufficiently proves the Reputation he had acquir'd. He was born at *Ereus* in the Island of *Lesbos*, and studied under *Leucippus*, *Plato*, and *Aristotle*; whom he succeeded in the hundred and fourteenth Olympiad, in the Beginning of the Reign of *Ptolemy* the Son of *Lagus*, under whom *Herophilus* flourish'd. Tho' *Theophrastus* lived till he was eighty-five Years of Age, he is said to have found Fault with Providence for giving a longer Life to Deer and Ravens, than to the human Species; since Men, if their Lives were longer, might acquire greater Degrees of Knowledge, and become more perfect than they really are when they come to die.

The Romans, tho' in other respects a polite and learned People, were nevertheless Strangers to Botany till *Pompey* conquer'd *Mithridates*, the most powerful, and at the same time the most knowing King then in the World. This Prince is reported to have drunk poisonous Draughts every Day, in order to render himself proof against Poison; and indeed so curious he was with regard to Medicinal Subjects in general, that he collected all the Observations of this Nature he possibly could, which, falling into *Pompey's* Hands, were by his Order translated into Latin by one *Lenæus*, a skilful Grammarians, and a freed Man of his own: Till this Time, according to *Pliny*, the Romans were entire Strangers to Botany; and even after this Science was known in *Rome*, it was not universally cultivated, for *Marcus Cato* alone is said to have apply'd to it. Nor after him do we read of any Botanist among the Romans, till *Caius Valgius* publish'd a very imperfect Work of this kind, dedicated to *Augustus*. After *Valgius*, appear'd *Marcus Terentius Varro*, about twenty-five Years before the Birth of Christ. This Roman, however skilful in Botany, wrote nothing on the Subject till the eighty-first Year of his Age. He has wrote three Books *de Re Rustica*, which make a Part of that valuable Collection which goes under the Name of *Rei Rusticæ Scriptores*.

Much about the same time lived a considerable Number of Physicians well versed in Botany. Of these the most celebrated are *Antonius Musa*, and *Euphorbus*, the former of whom saved the Life of *Augustus*, and wrote a Treatise on Botany, dedicated to *Marcus Agrippa*; which Work has been revised by *Gabriel Humbelbergius*, of *Ravensburg* in *Germany*, and printed at *Zurich*, together with *Apuleius's* *Treatise de Medicaminibus Herbarum*.

The next Roman Botanist who appeared was *Emilius Macer*, who was born at *Verona*, and died in *Asia*, whither he had gone to fight. As this Author had a Turn for Poetry, he clothed Botany in Numbers so agreeable and soft, as to deserve the Approbation of *Ovid*. See *ÆMILIUS MACER*.

Next appear'd *Julius Bassus*, and *Sextius Niger*, who, tho' both Romans, yet wrote in *Greek* concerning Plants. These Authors have but little Regard paid them by *Dioscorides*, a little before whose Age, or that of *Pliny*, *Salmasius* thinks they liv'd.

But hitherto Botany seems only to have been, as it were, in its Infancy, till *Dioscorides* arose, who, by his Industry and Diligence, surpassed all who had gone before him. He was born at *Anazarba*, a City of *Cilicia*, afterwards called *Cæsarea Augusta*. He is commonly distinguished from the others of his Name by the Epithet *Pedanius*, which *Photius* without any Reason supposes to be bestowed on him from his Country. In some Manuscripts the Epithet is read *Pedanius*, and 'tis pretended, that *Dioscorides* receiv'd that Part of his Name from the *Pedanian* Family, as other Foreigners did from the Roman Families into which they married. But *Lambecius* was probably in the Right, when he supposed, that this Epithet was bestowed on him, because he was the Son of one *Pedanius* or *Pedanius*, as that Author would have it.

From the Works of *Dioscorides* it plainly appears, that he was contemporary with *Licinius Bassus*, who in Conjunction with *Crassus Frugi* had been Consul under *Nero*. But the Time in which he flourish'd is a Point so much controverted, and so little capable of being fix'd, that it would be a Task both tedious and useless to attempt it. In his Works he has mention'd about six hundred Plants, four hundred and ten of which he has either describ'd or compar'd with such as were better and more universally known, but of the rest he has only given us the Names and Virtues.

Soon after *Dioscorides* appear'd *Lucius Junius Moderatus Columella*. He was born at *Cadix* in *Andalusia*, and the Time in which he liv'd may be determin'd from his having been contemporary with the *Senecas*, and his quoting *Lucius* the Philosopher as then alive. Other memorable Incidents concur to render us sufficiently certain as to the Time in which he flourish'd; for he was the intimate Acquaintance of *Gallio*, and wrote his Work after the Consulship of *Lucius Volusus*. We have only thirteen Books of his *de Re Rustica*, and one *de Arboribus*, tho' *Cassiodorus* attributes sixteen to him. In the first Chapter of his first Book he enumerates not only the Roman, but also the other foreign Authors who had wrote upon Agriculture before him. The delicate and polite Turn of his Language, together with his Learning, and the Force of his Genius, justly calls for our Admiration. In his Poem intituled *Hortulus*, the Numbers are soft, harmonious, and unswelled with that unmeaning Pomp of Words, which is the Reproach of Language, and the common Bane of the ill-form'd and luxuriant Genius. But, among all the Romans, none seems to have made more surprising Advances in Botany than *Plinius Secundus*. In his History of the World, which he dedicated to the Emperor *Vespasian*, or, according to others, to *Titus*, he treats of Plants in an historical, philosophical, medicinal, rural, and magical Light. This, according to *Gesner*, is his Design from the twelfth to the twenty-seventh Book. His Work consists in all of thirty-seven Books, which contain a great Part of the Writings of *Dioscorides*, whom he no-where quotes, having in all Probability used the very same Authors, from whom that Author had made his Collections. He also translated several Things from *Theophrastus's* History of Plants, and is thought to have been no very happy Translator, however bright his Genius might be in other respects. The precise Time in which he liv'd is much disputed: However, 'tis, I think, generally agreed, that he flourish'd pretty near the Time of *Dioscorides*. He is by some censur'd as wanting some of the Qualifications most necessary for producing a Botanist, whilst others are so blindly devoted to his Character, as to believe him infallible.

The next of the Romans who distinguished himself in this Way, was the illustrious *Palladius Rutilius Taurus Æmilianus*, tho' he is more properly to be class'd among the *Geoponici*, *Cato*, *Varro*, and *Columella*. He wrote fourteen Books *de Re Rustica*. According to *Ludovicus Vives*, he wrote in a pure and elegant Style, except that some Words and Phrases are peculiar to the Time in which he lived. *Johannes Jucundus* of *Verona*, in *Pref. Lib. de Re Rustica*, gives him an ample, and at the same time a just Character in the following Words. "When, says he, amongst other Books of Agriculture, I

" read the Works of *Cato*, *Varro*, *Columella*, and *Palladius*, " I could not help being charm'd with the delightful Study; " for I imagin'd I was transported to the Country, placed in " some agreeable Village, and leading the calm and blissful " Life of *Marcus Curius*, and *Lucius Quintius Cincinnatus*; " the former of whom, after having triumph'd over the *Samnites*, the *Sabines*, and *Pyrrhus*, retir'd to the Country to " spend the Remains of a glorious Life, where, having a large " Quantity of Gold brought him by the *Samnites*, he bravely " refused the magnificent Present, and told them, his " Grandeur did not consist in the actual Possession of Gold, but " in ruling over those who possessed it." And the other, being created Dictator, was honourably invited to leave the Country, and take his Place in the Senate.

From these Accounts 'tis plain, that the Diligence and Industry of the Romans were more employ'd in cultivating Agriculture than Botany; in which they were surpassed by the Greeks, amongst whom the most considerable, who apply'd to the Study of natural Things, was *Claudius Galenus*, who, next to *Hippocrates*, was justly accounted the greatest Ornament of ancient Medicine. He was born at *Pergamus*, a most flourishing City of *Asia*, about the Year of Christ 133. under the Reign of the Emperor *Adrian*; and flourish'd under *Antonius Pius*, *Marcus Aurelius*, *Antoninus*, *Commodus*, *Pertinax*, *Didius Julianus*, and *Septimius Severus*. He died under the Reign of *Caracalla*, after having lived, according to *Suidas*, seventy, according to *Laertius*, eighty-seven, according to others, ninety-eight, or an hundred and five Years. He was a curious and indefatigable Inquirer into the Virtues and Qualities of natural Bodies, with which View he undertook several Voyages. He went, for Instance, into *Palestine*, in order to get acquainted with the *Opobalsamum* and *Bitumen*; he sailed into the Island of *Lemnos*, that he might discover whether the Accounts he had receiv'd of the *Lemnian* Earth were true or false. He visited *Cyprus*, in order to take a View of the celebrated Mines of that Country. He also travelled into *Cilicia*, *Phœnicia*, *Crete*, *Egypt*, and several other Countries, to enrich his Mind with a proper Store of useful Observations. He has treated of the Virtues of about four hundred and forty Plants, in the sixth, seventh, and eighth Books of his Treatise, *de Simplicium Medicamentorum Facultatibus*, besides many more, which he has casually describ'd on different Occasions.

I now proceed to those who after *Galen's* Time apply'd themselves to the *Materia Medica*. The first of these who distinguished himself was *Oribasius* of *Sardis*, tho' *Cniringius* endeavours to prove, that he was a Native of *Pergamus*: This Author was contemporary with *Julian* the Apostate, whose Favour he had so effectually gain'd, as to be appointed Quæstor of *Constantinople* by him. He wrote many Things concerning simple and compound Medicines; but stole most of his Works from *Galen*, except some foolish and trifling Things he has added of his own.

Next appear'd *Aetius*, distinguish'd by the Epithet *Amidenus*, because born at *Amida*, a City of *Mesopotamia*. He has written pretty much in the same manner with *Oribasius*, since like him he has borrow'd a great many Things from other Authors. *Castellanus* seems to give him a favourable Character, when he affirms, that in his Works we have *Galen* contracted, *Oribasius* explain'd, and *Paulus Ægineta* enlarg'd. This Author flourish'd in the Year of Christ three hundred and fifty, or, according to others, four hundred and fifty-five, which was more early than *Paulus Ægineta*. See *ÆTIUS*.

Alexander Trallianus, so called from *Tralles*, a City of *Lydia* in the lesser *Asia*. He has several Things relating to Herbs, principally borrow'd from his Predecessors. See *ALEXANDER*.

After *Trallian* appear'd *Paulus Ægineta*. This Author copies pretty exactly *Dioscorides* and *Galen*, with respect to Plants. See *ÆGINETA*.

But *Gesner*, tho' a severe Censurer of these three Authors, yet seems to have entertain'd more favourable Notions of the Arabian Physicians than the rest of his Contemporaries; for the *Materia Medica*, during many Years cultivated only by the Greeks, was at last so considerably enriched by the Arabians, that a great part of the Medicines now in Use are to be ascribed to them. They receiv'd Botany, as well as all the other Branches of Physic, from the Greeks, especially after the Califs ordered the Productions of the Greek Authors to be translated into the Persian Language. The first who applied to the Sciences among them, was the second Calif *Abu-Jaafar Almanzor*, who was created Calif in the Year of Christ seven hundred fifty-four. But the Empire at last falling into the Hands of the seventh Calif *Abdalla Almamunem*, in the Year of Christ eight hundred and thirty-one, he interceded with the Greek Emperors to send him all the philosophical Works they possibly could; which Favour when they had granted him, he sought out for learned Interpreters, and order'd them to be faithfully translated. Then Learning began to flourish, and all the Branches of Medicine were cultivated with uncommon Care and Industry.

But

But of all the *Arabians*, none was more successful in carrying on this Design than *Serapio*, who collected and digested all the *Greek* and *Arabian* Authors who had wrote on *Simples* before his Time. The greater Part of this Work consists not only of the Materials, but also of the very Words, of *Dioscorides* and *Galen*; but yet it contains a great Number of *Simples* not taken from the antient *Greeks*. Some of these are at present known, whilst we are entire Strangers to the rest. According to *Wolfgangus Justus*, he flourish'd in the Year one thousand and sixty-six.

Next appear'd *Razis* or *Razy*, or *Arrazy*, which Name he receiv'd from *Rei*, the City of *Persia* in which he was born; for his original Name was *Aboubieri Mouhammad*. He is by some quoted under the Name of *Almansor*, and his Book called *Almansor* or *Manfor*. His Book is, as it were, an Abstract of thirty other Volumes, which he called *Al hhaouy*, which in the *Arabian* Language signifies *Containing*, because it was thought to contain uncommon Treasures of useful Knowledge. He likewise published *Aljanja*, which was an immense Collection of Things relating to *Physic*; and some Treatises concerning the Parts of the human Body. He flourish'd, according to *Wolfgangus Justus*, in one thousand and seventy, or one thousand and eighty-five.

Next appeared *Avicenna*, by some called *Avicenna*; or *Abensina*, or *Ben Sina*, or *Abuali Ibn Tinsa*. His second Book treats of all kinds of Medicines in general. In this Work he quotes *Galen*, *Dioscorides*, and a few *Arabian* Authors. See *AVICENNA*.

Actuarius, who lived about this Time, or perhaps a little later, has not much contributed to the Improvement of the Knowledge of Plants; all that he says concerning them being taken from others. See *ACTUARIUS*.

Next appeared *Johannes Mesues Damascenus*, the Son of *Abdela* King of *Damascus*. He acquir'd an uncommon Fame for his having been the Inventor of many of the Medicines which we daily use with Success. He flourish'd in the Year of Christ one thousand one hundred and fifty-eight.

Averrhoes about the same Time distinguished himself by the Improvements he made in the *Materia Medica*. This Physician collected an Account of the most remarkable Plants from *Galen's* Books of simple Medicines, and reduced them to the Order of the *Greek* Alphabet, as *Gesner* observes.

Next appeared *Baitar*, by others called *Ibnu El Baitar*, as also *Abenbaitar*, or, as others write it, *Ebenbaitar*. He was born at *Malaga*, in the Year of Christ one thousand two hundred and sixteen.

It must be confessed, that Botany is much indebted to the *Arabians*, who, tho' they borrow'd much from the *Greeks*, have enriched the *Materia Medica* with many Plants unknown to their Masters, among which are most of the milder Cathartics.

After the Time of these *Arabians*, a shameful and almost universal Ignorance prevailed, and the Monuments of Learning handed down from former Times were, excepting a very few, buried in Oblivion. The barbarous and ill-form'd Taste which reigned in these Days, is sufficiently prov'd by the Works of *Nicolaus Myrepsus* of *Alexandria*. We cannot precisely fix the Time in which he liv'd; yet, according to *Fuchsius*, he was among the later *Greek* Writers, since he quotes *Actuarius* and *Mesue*, who lived in the Year of Christ one thousand one hundred and fifty-five. His Style is uncorrect, and his Works abound with barbarous, and ill-chosen Words.

In the Year one thousand one hundred and eighty, appear'd *Hildegardis*, Abbot of *St. Rupert's* Monastery in *Mentz*, and one of the *Benedictine* Order. He enriched several Parts of Natural Knowledge, and among the rest Botany; but writes in a very barbarous Style, and has many Things which are not only trifling, but also superstitious, and repugnant to Truth and common Sense.

Next appear'd *Johannes Platerius* of *Salerno*. He flourish'd in the Year of Christ one thousand three hundred. As the Reader will be best able to judge both of his Design, and of his Style, from some of his own Words, I shall insert the following Passage of his Preface.

"In Tractatione, says he, uniuscujusq; Medicinæ simplicis
"Complexio rerum primo est intendenda, consequenter utrum
"sit Arbor, an Frutex; Herba, Radix, an Flos, an Semen,
"an Folium, an Lapis, an Succus, an aliquid aliud: Post-
"modum quot sunt ipsius Maneries, & qualiter fiant, & in
"quo loco inveniantur. Quæ etiam Maneries sit melior,
"qualiter sophisticantur, & sophisticatæ cognoscantur."

Much about the same Time *Matthæus Sylvaticus*, of *Mantua*, compil'd a Volume of the *Pandecks* of Medicine, and dedicated it to *Robert* King of *Sicily*; but this is a Work of so little Value, with respect to Botany, that we shall not spend Time in giving any Account of it. Its Author liv'd in 1336. Nor is a much greater Regard due to the Productions of *Arnaldus de Villa Nova*, who died in the Year 1412. or those of *Jacobus de*

Dondis, of *Pavia*; or of *Petrus Crescentiensis*, a Senator of *Bononia*, who wrote in the Year 1473.

Soon after appear'd *Johannes Cuba*, *Quiricus de Augustis de Thertona*, *Johannes de Bosco* of *Alexandria*, and *Paulus Suardus* of *Milan*; but the Works of these Authors are so obscure, and full of Blunders, that they scarce deserve our Consideration.

About this time *Avicenna* was first read in the Schools. Then *Razis*, especially his ninth Book to *Almanzor*. Numbers of the later practical Physicians were also study'd, whilst the *Greeks* were entirely neglected, and forgot so much, that the Names of *Hippocrates* and *Galen* were lost, or rather chang'd into those of *Hippocras* and *Galienu*s.

Thus, for about four Centuries, Barbarity and Ignorance had almost put an End to the Sciences, and banish'd Learning from the World, till at last, about the End of the fifteenth Century; propitious Heaven rais'd up some great Men, who rescu'd the Authors of Worth and Note from the shameful Oblivion in which they had been bury'd. At this happy Conjunction, Botany had the same good Luck with other Parts of Learning; for *Theoderus Gaza* restored *Theophrastus*, and translated his Works into *Latin*, in which he is thought to have succeeded very well. He died in *Rome* in the Year 1478.

After him appear'd *Hermolaus Barbarus*, a *Venetian* Nobleman. He was born in the Year 1454. He corrected *Pliny's* Natural History, and translated *Dioscorides* into pure and beautiful *Latin*; but he is thought to have receded too much from the Meaning of the Original, that he might imitate the Style of *Pliny*. *Fuchsius* commends him for the reasonable Aid he gave to Botany and *Physic*, and the Pains he was at in improving and enriching them, tho' he was himself no Physician.

Soon after arose *Johannes Ruellius*, born at *Soissons* in *France*, and a Man of uncommon Learning. He seems to have trod in the Footsteps of *Hermolaus Barbarus*, and pursued the same Design of banishing and exploding the Jargon of *Avicenna*, and some other *Arabians*, that we might draw our Knowledge of Plants from *Dioscorides* himself. He cultivated Botany with greater Care than any of his Contemporaries, and collected all the useful Observations which *Theophrastus*, *Pliny*, and *Galen*, had made concerning Plants.

He was soon after succeeded by *Marcellus Virgilius*, a *Florentine*, who, tho' not a Physician by Profession; nor, perhaps, very skilful in Botany, is, nevertheless, to be commended for his Industry in correcting, and restoring to their antient Splendor, some Pages of *Dioscorides*, which had been wretchedly mangled and corrupted.

Marcellus was succeeded by *Joannes Manardus* of *Ferrara*, a celebrated Physician. In his Epistles there are many Things which illustrate *Dioscorides*, especially in the eighth Book, where he corrects *Marcellus's* Version in many Places, and defends the Interpretations of *Ruellius* and *Hermolaus Barbarus*. He also wrote Annotations on the *Medicamenta Simplicia* of *Joannes Mesue*, in which, if we may believe his own Word, many obscure things are made plain, those that were formerly too concise enlarg'd, such as were lost restor'd, and such as were erroneous corrected.

In the same Age appear'd a great Number of Interpreters, Critics, and Restorers of *Theophrastus*, *Dioscorides*, and *Pliny*. Amongst the rest, *Nicolaus Leoniceus*, in his Work *de Plinii & aliorum in Re Medica Erroribus*, delivers many things of great Importance with respect to the Knowledge of Plants. He was born at *Vincentia* in the Year 1428. and died at *Ferrara*; (where he had taught for sixty Years) in 1524. after he was ninety-six Years of Age. When he was ask'd what medicinal Secret he us'd, in order to preserve so uncommon a Vigour both of Mind and Body, and elude the Attacks of old Age, since he us'd no peculiar Diet which could account for such happy Effects, he made this noble Reply: "I easily preserve my Mind
"lively, by a Reflection on the perpetual Innocence of my
"Life; and my Body sound and healthful, by a cheerful Frugality." According to *Scaliger*, this Author was, from his Infancy, afflicted with violent epileptic Fits, till the thirtieth Year of his Age; after which this formidable Disease left him, and he enjoy'd the perfect Use of all his Limbs and Senses, without the Suspicion, much less the Shock, of a Disease, till he was ninety-six Years of Age. If this Circumstance is true, he was singularly indebted to his Temperance; for, according to *Paulus Jovius*, he was highly abstemious in every respect. He first translated *Galen's* Works from the *Greek* to the *Latin* Language, and illustrated them with Commentaries.

In 1534. appear'd *Antonius Musa Brasavolus* of *Ferrara*. He publish'd an Examination of all the Simple Medicines used in the Shops, in which Work he often treats of Plants. He also wrote Commentaries upon the Aphorisms of *Hippocrates*, and compil'd a large Index to all the Works of *Galen*.

Brasavolus was succeeded by *Otho Brunfelsius*, who was born at *Mentz* in *Germany*. He was first a *Carthusian* Monk, then a Schoolmaster for nine Years, and, last of all, a Physician. He was a Man of singular Learning, and attempted to restore and illustrate Botany, both in the *Latin* and *German* Languages. Tho', in his Works, many things are imperfect,

tho' the Descriptions do not correspond to the Draughts, and tho' he often calls Herbs by their wrong Names, yet he was the first who restor'd the true way of drawing Herbs in Germany. He was at last call'd to Bern in Switzerland, where he practis'd with such Success as to acquire an uncommon Reputation; but he died about a Year and an half after he had settled there, in the Year 1534.

Bruchfelsius was succeeded in his Design of restoring and enriching Botany, by *Euricius Cordus*, born at Hesse in Germany. He practis'd and taught Medicine at Erford, Marburg, and Bremen. Besides his Skill in Poetry, and other fine Accomplishments, he was a Man of untainted Morals, and singular Industry. How much he has contributed to the Improvement of Botany, may be judg'd from his *Botanologicon, seu Colloquium de variis Herbis*. He died in the Year 1538.

Nor are we to pass over in Silence *Gualterus Hormenius Riffus*, Professor at Strasburg, and *Joannes Lonicerus*, Professor at Marburg; the former of whom has follow'd *Ruellius*, and the other *Marcellus*, in interpreting *Dioscorides*. *Gesner* gives both these Authors such a wretched Character, as would induce one to neglect their Productions, as worthless and insipid Jargon.

But the greatest Illustrator of *Dioscorides*, and the most happy Discoverer of Plants before unknown, was *Valerius Cordus*. He was born in Hesse in the Year 1515, and died at Rome 1544, in the twenty-ninth Year of his Age. He was more industrious in enriching Botany than many of those who had gone before him. Besides his exquisite Annotations on *Dioscorides*, he compil'd an History of Plants, in four Books; but as he died before that Work was completed, all his Descriptions are not equally exact and just.

In 1550, appear'd *Amatus Lusitanus*, who is by some call'd *Joannes Rodericus Lusitanus*, and *Joannes Rodericus Castellialbi*. He wrote Illustrations upon *Dioscorides*, in which he often talks of things to which he was an entire Stranger.

But *Andreas Lacuna*, of Segovia, is an Author far preferable to *Amatus Lusitanus*. He was chief Physician to *Julius* the Third. In the Spanish Language he wrote Commentaries and Annotations on *Dioscorides*, but is severely censur'd for being a Plagiarist by *Matthioli*. He also translated that Work concerning Plants, ascrib'd to *Aristotle*. He died in the Year 1552.

Hieronymus Bockius, call'd commonly *Bock*. He is known by the Name *Tragus*, and was born at *Hiedspach*, a Village of *Bretta*, near the City of *Spire*. He liv'd for some Years at *Deuxponts*, where he adorned the Gardens of Duke *Lewis*, Palatine of the Rhine, with a Variety of Herbs formerly unknown in it. He compos'd a History of Herbs at *Saarbruck*, and died in 1554.

Next appear'd *Joannes*, or *Janus Haynbut*, or *Hagenbut*, who was call'd *Cornarius*, tho' *Hagenbut* signifies the Fruit of the Dog-rose. He was born at *Zuwick*, a City of *Misnia*, in the Year 1500. He translated *Dioscorides*, and added Figures to each Chapter. Tho' in this Work he does not discover a more extensive Knowledge in Botany than some who had gone before him, yet he re-establishes the genuine Readings in numberless Places. He had for an Antagonist *Leonardus Fuchsius*, who finds fault with a great many Passages in his Translation. He died in 1558.

Next appear'd *Jacobus Goupylus* of *Peictiers*. He was Doctor of Physic at *Paris*, and very skilful in the Greek and Latin Languages. He gave some very short, but, at the same time, very useful Amendments of *Dioscorides*. He diligently and judiciously revis'd *Trallian*, *Aetnarius*, and some others. He died in the Year 1560.

At *Wemding*, in the Country of the *Grisons*, was born *Leonardus Fuchsius*, in the Year 1501. He was a Man of uncommon Application, and a diligent Inquirer into the Plants of Germany, five hundred and ten of which he represented in large Figures, to the no small Improvement of Botany. But he was so foolishly attach'd to *Dioscorides*, that he endeavour'd to accommodate *Dioscorides*'s Descriptions to the German Plants; which made him sometimes affirm, that things were clearer than the Light, when they were, at the same time, involved in the greatest Darkness and Obscurity. He died at *Tubingen* in the Year 1566.

The same Year deprived the World of *Gulielmus Rondeletius*, a celebrated Physician, born at *Montpelier*. He was indefatigably laborious in discovering and finding out Simples, and their Virtues. He wrote Commentaries upon several Parts of *Dioscorides*, which were much esteem'd by the Botanists who liv'd at the same time with himself. He died in 1566.

William Turner, an English Physician of singular Learning, in 1551, publish'd an History of Plants in English; in which Work he has, for the most part, publish'd the Figures of *Fuchsius*, and given the Names of the Plants in Latin, Greek, English, German, and French, in an alphabetical Order.

Nor ought we to forget *Lucas Ghini* of *Forli*, a Physician of an excellent Genius, and uncommon Learning. He profess'd the *Materia Medica* at *Pisa* for several Years with universal Approbation; and tho' he publish'd nothing himself, yet he

was either the Master, or the intimate Acquaintance, of those celebrated Men, *Cesalpinus*, *Anguillara*, *Marantha*, *Matthioli*, and some others, to whom he not only sent Plants, but openly deliver'd his Opinion of them; by which means he contributed considerably to the Illustration of former Authors, and the Improvement of Botany.

Petrus Andreas Matthioli was born at *Sienna*, a celebrated City of *Tuscany*. *Thuanus* gives him a very great Character for a skilful Botanist. But however well acquainted *Matthioli* might have been with the Writings of the Antients, yet he was so ignorant of the common Plants, that of the whole nine hundred he has treated of, he has scarce given an accurate Description of one. He died of the Plague at *Trent* in the Year 1577.

Bartholomæus Maranta, a Physician of *Venussum*, compos'd three Books on the Method of knowing simple Medicines, which are highly useful for understanding many Passages of *Dioscorides*. He died in the Year 1554.

Adamus Lonicerus was born at *Marburg* in *Hesse* in 1528. He was a learned Physician, and a skilful Botanist, as is obvious from his *Botanicon*, his *Historia Plantarum*, and his *Herbarium*, publish'd in the German Language. But *John Bauhine* seems to have judg'd rightly of *Lonicerus*, when he affirms, that he collected his Botanical Works from *Tragus*.

Nor at this time were there wanting Men of Learning, who either went to both *Indies* themselves, in order to discover the Spices and Plants produc'd in them, or treated largely of them after they were brought into Europe. Amongst these were *Garcias ab Horto*, *Christophorus a Costa*, *Nicolaus Monardes*, *Gonsalvus Ferdinandus Oviedo*, *Franciscus Lopez de Gomara*, *Johannes Fragosus*, *Hugo Linschotanius*, *Johannes Leirius*, *Franciscus Hernandez*, *Franciscus Ximenez*, *Josephus a Costa*, and, nearer our own Times, *Jacobus Bontius*, of *Rotterdam*, *Gulielmus Piso*, a Physician of *Amsterdam*, *Georgius Marcgravius*, of *Liebstad*, and some others.

Among those who have more particularly applied themselves to the Knowledge of Plants, was *Jacobus Dalecampius*, who was born at *Cadom*. He practis'd Physic at *Lyons*, with universal Reputation. He was the first of the Moderns who undertook to write an universal History of Plants; but being involved in a Multiplicity of Business, he did not live to finish it. This Task was, by *Revillius*, a Printer at *Lyons*, committed to one *Molinaus*, a learned Physician, who finish'd the Design, and publish'd it under the Title of *Historia Lugdunensis*. *Dalecampius* died in the Year 1537.

Jacobus Theodorus Tabernamontanus is, according to *Conringius*, justly preferable to his Master *Tragus*; since, in Imitation of him, he advanced many things new concerning the Virtues of Plants; but 'tis to be lamented, that he only finish'd the first Part of his Work, since the second and third, done by another Hand, however excellent, are yet short of the Judgment and Skill of *Tabernamontanus* himself. In his Practice, abstracting from the Theriaca and the Mithridate, he us'd very few exotic Substances, contenting himself with the Simples of his own Country. Besides his discovering some Plants formerly unknown, he has wrote very well concerning the Virtues of those which were commonly known. He was call'd *Tabernamontanus* from the Place where he was born, which is *Bergzabern*, a Town in the Territories of the Prince of *Deuxponts*. He died at *Heidelberg* in the Year 1590.

This Author originally practis'd Pharmacy at *Kronweissenberg*.

Some of the Figures of *Tabernamontanus*, and also of *Lobelius*, were taken by *John Gerard*, an Englishman, born at *Nantwich* in *Cheshire*. Nor did he add any Figures of his own, except sixteen, in the whole History of Plants which he publish'd in English. He had little or no Knowledge of the Languages. The greater Part of his Work is nothing but the *Pemptades* of *Dodonæus*, turned into English by one Doctor *Priest*, which *Gerard* took without any Alteration. To conceal this, he changes the Method of *Dodonæus* into that of *Lobelius*, beginning with Grasses and Graminifolious Plants. To this Translation of *Dodonæus* he has added some Plants from *Clusius*, and others from the *Adversaria* of *Pena* and *Lobelius*, having only given about fourteen of his own. He has confounded and unskilfully transpos'd the Figures of *Tabernamontanus*. He flourish'd about the Year 1597.

Joachim Camerarius, born at *Norimberg* in the Year 1534, acquired a far greater Reputation than *Gerard*. He is by some celebrated as a Man of profound Learning, and a skilful Botanist. He was so fond of promoting Natural History and Botany, that he purchas'd of *Wolffius* the *Bibliotheca Herbaria*, and the Botanical Works which were left him by *Gesner* in his last Will. However, he is not much extoll'd by *Tournefort*, who says of him, "That if we were to judge of him from what he publish'd during his Life, we should find his Skill in Botany far inferior to the Reputation he acquired on that account." He died in the Year 1598.

With *Camerarius* we may join *Janus Antonius Saracenus*, of *Lyons*, who flourish'd about 1598. By his Care and Diligence he

he restor'd the Works of *Dioscorides* to their primitive Dignity; for he preserves the Sense of *Dioscorides*, without receding from the Purity of *Pliny's* Diction.

Petrus Bellonius, of *Mans*, was a Man of incredible Industry and Application, as appears from his Works publish'd partly in the *Latin*, and partly in the *French* Languages. He has written concerning coniferous Trees and Evergreens. He has also given us Commentaries on *Dioscorides*, and a Book concerning Agriculture. He likewise designed some other Works; but Death prevented him.

Leonardus Rauwolfius was born at *Mechlin* in 1517. He travell'd thro' *Syria*, *Judea*, *Arabia*, *Mesopotamia*, *Babylon*, *Affyria*, and *Armenia*, from which Countries he brought back into *Germany*, with him, many Herbs, Shrubs, Plants, and other things of the like Nature. He wrote a Book, which he calls *Hodæporicon*, or Travels into *Syria*, *Judea*, *Arabia*, *Mesopotamia*, *Babylon*, *Affyria*, and *Armenia*, which he divided into six Parts, and which contain many curious things relating to the *Materia Medica*. He flourish'd about the Year 1583.

The World is considerably indebted to the Lucubrations of *Rembertus Dodonæus*, who was born at *Mechlin*, in *Brabant*, 1517. His History of Plants is recommended not only by the Elegance of the Figures, but also the Richness and Variety of the Matter. By his Learning he acquired such a Reputation, that he was invited to the University of *Leyden*, where he profess'd Physic with great Applause, and died in 1585. in the sixty-eighth Year of his Age.

Carolus Clusius was singularly fond of Botany. He became enamour'd with this Science when he was at *Montpelier*, where he lodg'd with the celebrated *Rondeletius*, as *Boissard* informs us. He was born at *Arras*, in the *French Netherlands*, in the Year 1526. His Reputation soon procur'd him an Invitation from the Professors of the University of *Leyden*, which having accepted, he there revis'd all his Writings, put the last Hand to them, and digested them into two Volumes; the former of which contains one thousand one hundred and thirty-three Figures of Plants; the other, besides Fruits, and exotic Animals, contains the Representations of forty-five Plants discover'd by himself. He died, much regretted, at *Leyden*, in the Year 1609. in the eighty-fourth Year of his Age.

Matthias Lobelius, of *Lisle*, was far inferior to *Clusius*, and less exact in describing his Plants, as appears from his *Adversaria*, and his Observations and Illustrations of Plants, in which, where Figures are wanting, he is scarcely intelligible. In assigning the Places where Plants grow, he trusts too much to his Memory; for, as *Mr. Ray* justly observes, he takes many Plants to be the natural Product of *England*, which were never seen to grow spontaneously in it, and which, perhaps, were never seen any-where in the World. *Lobelius*, relying on the Assistance of *Petrus Pena*, a Native of *Provence* in *France*, and a Man of great Learning, publish'd a Description of the rare Plants of *Languedoc*, in a harsh and uncouth Style.

I now come to *John* and *Caspar Baubine*, two Brothers, who have acquir'd such an uncommon Fame for their Skill in Botany, that the smallest Herb is hardly mention'd without, at the same time, mentioning the Name affix'd to it by them. They were born at *Basil*, but their Father was a Native of *France*. Notwithstanding the Learning and Industry of these two Brothers, they seem to have undertaken a Task to which they were by no means equal; for each of them propos'd to write an universal History of Plants. But as *Gesner*, in one of his Epistles to *Fuchsius*, well observes, one Man is not at all sufficient for carrying on so extensive a Design, since there are numberless Species of Plants, each of which a single Man must be an entire Stranger to, on account of the Diversity of Climates. But if different Men, in different Climates, would oblige the World with their Observations, there is a Possibility of an universal History of this kind being some time or other produc'd by a masterly Hand. Tho' it were to be wish'd, that a Work of this Nature should appear in our own Age, yet we have no Reason to expect it; because, from the Descriptions of the Plants already known, we can neither infallibly discover their Species, nor reduce them to their proper Genuses; and from this Source have arisen almost all the Errors of the universal Histories of this Nature, which have hitherto appear'd. But, to return to the *Baubines*: No more useful Work of the kind has appear'd than the *Pinax*, nor was it possible to render it much more perfect at the time in which it was written. Among the six hundred Plants describ'd by *Caspar* in the *Prodromus Theatri Botanici*, many were receiv'd dry and imperfect from his Friends and Acquaintances. His Brother *John*, tho' he us'd the same Practice, yet gave his Descriptions far more natural and accurate. But the great Fault of these two Authors seems to consist in their having neglected to establish the Genuses of Plants, than which nothing is more requisite to such a History. *John* died at *Mont Beillard* in 1614. and *Caspar* at *Basil* in 1624. in the sixty-fourth Year of his Age.

Nor ought we, on this Occasion, to forget the *Hortus Floridus* of *Crispinus Passæus*, publish'd in 1614. in which there are three hundred and twenty-five Figures accurately delineated, and divided according to the Seasons of the Year; nor the Works

of *Emanuel Sweertius*, a Native of *Sevensberg* in *Holland*; nor the *Florilegia* of *Theodorus de Bry*; nor the Description of the Herbs growing on Mount *Baldo*, publish'd by *Johannes Pona*, an Apothecary of *Verona*; nor the History of the Plants of *Cannada*, publish'd by *Jacobus Cornuti*, a Physician of *Paris*.

After the *Baubines* appear'd *John Parkinson*, a Native of *London*, and Apothecary to the King, who attempted to give an universal History of Plants in the *English* Language; for in his *Paradisus Terrestris*, publish'd in 1629. he gives the History of Flowers at great Length; and, in his *Theatrum Botanicum*, he has comprehended more Species of Plants, than were to be found in any History of Plants publish'd before his Time. For the most part, he follow'd *Caspar Baubine*; and added several Species from *Alpinus*, *Cornuti*, and some others. But tho' he trod in the Steps of the best Authors, who had gone before him, yet, thro' Forgetfulness or Haste, he has omitted many Things, and sometimes repeated his Descriptions of one and the same Herb.

As Kings and Princes have contributed to the Advancement of other Sciences, so have they not been wanting to the Improvement of Botany; for the Herbs of *Greece*, and the *Eastern* Countries, have been rendered as famous by the Notice which Kings have taken of them, as by their own Virtues. *Juba*, King of *Mauritania*, is as memorable for his diligent Study of Plants, as for his being cloath'd with Royalty, and swaying the Sceptre over a warlike People: And, according to *Galen*, *Mithridates* and *Attalus* were acquainted with the Virtues of almost all the Simples which resist Poison, the Qualities of which they tried upon such Criminals as were condemn'd to Death.

Nor were the *Roman* Emperors less Admirers of Botany, or less careful in advancing it; for the Botanists kept by *Cæsar* in *Arabia*, *Lybia*, *Sicily*, and *Crete*, transmitted Baskets of Flowers not only to *Cæsar* himself, but almost to all the *Roman* People. And *Evax*, a certain King of the *Arabians*, is said to have written to *Nero* concerning the Virtues of Simples.

But, to come near our own Times, *Philip* the Second, of *Spain*, as we are told by *Josephus Acosta*, sent his chief Physician, *Franciscus Hernandez*, into *America*, with a View to discover new Plants, and more accurately describe those already known.

Among the public Gardens, in which Herbs are demonstrated by Professors, that of *Padua* is the oldest. *Franciscus Bonafidius*, a Physician of *Padua*, at whose Persuasion the Design was set on Foot, first explain'd the Simples in this Garden from the Year 1533. to 1549. when, being weaken'd with Age, and losing his Sight, he resign'd his Place.

He was succeeded in this Office by *Gabriel Fallopius*, of *Modena*, whose Character, both as a Surgeon and a Botanist, is well enough known. He was succeeded by *Bernardinus Trivisanus* in 1563.

In 1561. *Melchior Guilandinus* was chosen Keeper of the *Paduan* Garden. He was born at *Comingsberg* in *Prussia*, and made uncommon Advances in Medicinal Learning, but more especially in Botany: He took Notice of an hundred Errors in the *Herbarium* of *Matthioli*; and, after having acquired an uncommon Character for Learning, died at *Padua* in 1589.

His Place was given to *Jacobus Antonius Cortusius*, in the Year 1590. who, tho' no profess'd Physician, was yet the most skilful Botanist of the Times in which he lived. He died in 1593. without publishing any thing, except a Catalogue of the Plants in the *Paduan* Garden.

The same Year *Prosper Alpinus*, born at *Marosfica*, a Town at the Foot of the *Vicentian* Mountains, in the *Venetian* Territories, was chosen to read Lectures on Simples in the Schools, and shew them in the Garden. He went into *Egypt* in the Year 1580. with *Georgius Amius*, a *Venetian*, in order to take care of the Health of the *Venetians* who resided there. He was called thence to *Genoa* in 1586. by *Joannes Andreas Aureas*, Admiral of the *Spanish* Fleet, in order to prescribe for him. Thence he went to *Padua*, and enter'd upon the Explication of Simples. He was a Man of an universal Genius, and uncommon Learning. The Plants he himself had seen in *Egypt*, as also those sent him from *Crete*, and other Parts, by *Hieronymus Capellus*, and *Nicolaus Contarenius*, are imperfectly described by him, and as imperfectly delineated, as appears not only from his Treatise *de Plantis Egyptiis*, but also from his Books *de Plantis Exoticis*, publish'd by his Son *Alpinus* in 1628. *Prosper*, the Father, died at *Padua* in 1617.

The following Year *Jacobus Zabarella* was chosen to give Lectures on Simples; and *Johannes Prevotius*, a Native of *Basil* in *Switzerland*, to shew them in the Garden; but the latter was carried off by the Plague in 1630. The following Year an Offer of his Place was made to *Joannes Rhodius*, a *Dane*, but he refused it; and in 1633. it was given by the Senate to *Alpinus Alpinus*, the Son of *Prosper*, who enjoy'd it till 1637. when he died of a Consumption. Next Year he was succeeded by *Joannes Vesslingius*, of *Minden*, whose Character, both as an Anatomist and a Botanist, is too well known not to procure him the Esteem he justly deserves. He was a Knight of the *Holy Sepulchre*, and died of a malignant Fever in 1649. He had for his Successor, in Office, *Georgius a Turre*, who is justly celebrated for his Skill in Botany. His Successor, the illustrious

Abbot *Felix Fiali*, was no less a Glory to his Country, and the University of *Padua*.

Encouraged by the Example of the *Paduans*, *Cosmo* of *Medicis*, the Great Duke of *Tuscany*, formed a Garden for the same Purpose at *Pisa*; the Care of which he committed to *Andreas Casalpini*. We must not here forget the *Farnesian*, the *Barberinian*, the *Ludovician*, the *Borghesian*, the *Aldobrandinian*, and the *Estensian* Gardens in *Italy*. The *Bononian* Garden has been singularly enrich'd by *Jacobus Zanoni*, and *Laelius Triumphetti*; and that at *Rome* by the skilful Botanist *Joannes Baptista Triumphetti*.

Nor let us imagine, that in this Particular we were outdone by the celebrated Gardens of the *Hesperides*, or those of *Babylon*, or by that of *Adonis*, *Alcinous*, *Epicurus*, or *Theophrastus*; for if we take a View of the Gardens of *Holland* and *England*, we shall find them equal, if not preferable, to the most celebrated among the Antients; since those of *Leyden* and *Amsterdam* contain whatever the *Indies* and *Africa* produce: And those of *London* and *Oxford*, the last of which has of late been greatly improved by Dr. *Dillenius*, thro' the Munificence of Dr. *Sherard*, contain whatever *Jamaica* and *Virginia* afford. And those of *Hampton*, Bishop *Compton's* at *Fulham* (now neglected), and that at *Chelsea*, are furnish'd with almost whatever is to be found in the whole World. The Gardens of Mr. *Beaumont* in *Holland*, in which there is *Euphorbium*, brought from *Africa* at the Proprietors Charges, is no less famous than that of *Juba*, and will for ever be signaliz'd by the Catalogue of its Plants, publish'd by the learned *Hagelaerus*.

Nor have the Kings of *France* been wanting in this Particular; for *Francis* the First was not only an Admirer of Botany himself, but also a great Encourager of every Plan that could improve and advance it. *Henry* the Fourth also, King of *France* and *Navarre*, form'd a Garden for the Culture of rare Plants, and gave the Care of it to that skilful Botanist *Joannes Robinus*. But *Lewis* the Thirteenth, in 1626. form'd a still larger, and more noble Garden, in the Suburbs of *St. Victor's* at *Paris*, by the Persuasion of *Heroard* his chief Physician, and *Guido Broisius* his Physician in Ordinary, and who, being created Governor of the Garden, appointed the Plants to be demonstrated by *Vespasianus Robinus*, that diligent Botanist; who, besides the Species of the *Lingua Cervina*, the Names of which are mentioned in the Catalogue of Plants contain'd in the Royal Gardens, first brought into *France* the *Filix Baccifera*, the *Adiantum Americanum*, the *Geranium Triste*, the *Origanum Fistulosum*, the *Asarum Canadense*, the *Acacia Americana*, and other curious Plants, with which *Cornuti*, a Physician of *Paris*, has adorn'd his History of Plants. At last, *Lewis* the Fourteenth gave the Charge of his Gardens to the illustrious *Guido Cressentius Fagon*; who, at his own Expence, soon enrich'd the Royal Garden with Store of curious Plants, which he cull'd, with his own Hands, in different Parts of the World: So that it is no Wonder, if the Royal Garden at *Paris* surpasses most others in the World for the immense Number of Plants it contains. Mr. *Fagon*, being call'd to the Court, put *Armandus de Mauvillain*, a Physician of *Paris*, into his Place; and in the Year 1683. *Mauvillain* was succeeded by *Tournefort*, a brief Sketch of whose Life I shall give; since he seems to have carried Botany to a higher Degree of Perfection, than any of the Authors I have hitherto mention'd.

Besides the Royal Garden at *Paris*, *France* is blest'd with another at *Montpelier*, instituted by *Henry* the Fourth, about the Year 1598. the Care of which has successively been committed to the most distinguish'd Botanists; such as *Petrus Richierius de Belleval*, *Joannes Richerius de Belleval*, *Michael Chycoineau*, *Petrus Magnol*, *Franciscus Chycoineau*, and *Nicolaus Fabricius Peireskii*, who, by a matchless Diligence, transplanted the *Myrtus latifolia flore pleno* from the woody Places between *Toulon* and *Marseilles*; the *Jasminus Indicus flavus odoratissimus* from *China*; the *Papyrus* from *Sais*, a Town of *Egypt*; the *Lisa* from *Mecca*; and some uncommon Vines from *Tunis*, *Smyrna*, *Sidon*, *Damascus*, *New France*, and other Parts.

The Gardens of *Gasto Borbonius*, Duke of *Orleans*, are also a noble and entertaining Scene for a Botanist, since it is enrich'd with Store of curious Plants. But among all the botanic Scenes the World ever saw, the most glorious and magnificent is that incredible Treasure of Plants, done in their native Colours, as large as the Life, and kept in the Repository of *Lewis* the Fourteenth. This Garden dreads neither the Cankerworm, the Locust, nor the Caterpillar; but blooms with all the Verdure of an eternal Spring, and bids a Defiance at once to the nipping Colds of the Winter, and the scorching Heats of the Summer.

LIFE of TOURNEFORT.

When we observe any Man distinguish'd by a superior Knowledge, or Skill of any Kind, it is natural for the Mind to be solicitous and inquisitive about the several Circumstances which have concurr'd to render him thus conspicuous. When, for Example, we hear of *Alexander's* Skill in all the Arts of War

and Conquest; when we view the brave and heroic Actions of *Cæsar*, *Scipio*, and *Hannibal*; when we reflect on the extensive Knowledge, the deep Researches, the accurate Deductions, and important Discoveries, of the incomparable Sir *Isaac Newton*; our Minds are indeed struck with certain Ideas of Grandeur and Surprise; but a secret Dissatisfaction is still lodged in the Breast, and the labouring Soul remains, as it were, on the Rack, till we know something more about the Men, and have discovered their Turns of Mind, and the several Steps by which they have gradually advanced to Honour, and paved their Way to immortal Glory. Now, as Mr. *Tournefort* is universally allow'd to have carried Botany to a higher Degree of Perfection than any who went before him, by enriching it with numberless Discoveries, advancing it into a Science, giving it an Air of Accuracy, which it formerly wanted, and smoothing all its Difficulties; it must, of course, be an uncommon Satisfaction to become acquainted with the Education, the Genius, the Disposition, and Studies of this celebrated Botanist.

Joseph Pitton de Tournefort, then, was born at *Aix* in *Provence*, on the Fifth of June, 1656. He was the Son of *Peter Pitton de Tournefort*, and *Aimare de Fagone*, the Descendant of a Family of Note in *Paris*.

Their Son *Joseph* was put to the *Jesuits* College in *Aix*, with a View to learn *Latin*, as the other Scholars did. But, as soon as he saw any Plants, the Bent of his Genius discover'd the future Botanist; for he was anxious and uneasy, till he found out their Names: He carefully remark'd their Differences, and sometimes neglected to attend his Class, in order to discover Herbs, and study Nature in the Fields, instead of the Language of the antient *Romans* in the Schools. And as it is no uncommon thing to see some People excel in an Art, by the mere Force of Genius, without the Assistance of a Master, this young Botanist had, by his own Industry, acquir'd a Knowledge of all the Plants produced about the Village where he was born.

When he enter'd upon his Philosophical Studies, he discover'd no great Relish for what was taught him. In Disquisitions of this Kind, instead of Nature, with whose Contemplation he was so highly charm'd, he found only vague and abstracted Ideas, which decoy and amuse the Mind, without enriching it with any thing that is solid and satisfactory. During this Period of his Education, he accidentally found the Philosophy of *Descartes* in his Father's Study, and soon discover'd it to be the very Thing he wanted. Tho' he could only read the Productions of this Author privately, and, as it were, by Stealth, yet he read them with Care and Accuracy; and the Father, who violently opposed to useful a Study, afforded him, without being sensible of it, the Advantages of a fine Education.

As he destin'd his young Son, for the Church, he made him apply to the Study of Theology, and for that Purpose enter'd him in a Seminary. But in his Breast Botany could not endure a Rival, and the Bent of Nature was too powerful to be balanced by any Views, or overcome by any Byas.

Notwithstanding the Intentions of the Father, the Son must necessarily see Plants; and for this End he retired to prosecute his darling Study, either to a curious Garden belonging to an Apothecary of *Aix*, or to the neighbouring Fields, or to the Summits of Rocks, which had been inaccessible to others, fir'd with a less ardent Desire of Knowledge than he. Either by Stratagem or Presents he found Access to the most close and conceal'd Places, where he suspected there were Plants not to be found elsewhere; and when these Means fail'd, so undaunted was his Resolution, that he would make his Way into them in an unlawful and clandestine manner, rather than not satisfy his Curiosity; and, indeed, for an Attempt of this Kind, he once ran a Risque of being stoned to Death by the Country-people, who took him for a Robber. But what Hardships will not a Mind, actuated with an ardent and insatiable Desire of Knowledge, undergo for Satisfaction?

Mr. *Tournefort* was almost as fond of Anatomy and Chymistry as he was of Botany; and at last Physic and Medicine so engross'd his Affections, as to gain a thorough Victory over his Inclinations to Theology, which he now resolv'd to drop. In this Resolution he was encouraged by an Uncle on his Father's Side, who was a Physician of great Skill and Reputation. Soon after, the Death of his Father in the Year 1677. left him at his own Disposal, and Master of his own Inclinations.

He quickly improv'd this Revolution made in his Fortune by his Father's Death; for, in the Year 1678. he carefully ranged the Mountains of *Dauphiny* and *Savoy*, from which he return'd with a large Quantity of beautiful dry Plants, which were the Beginnings of his celebrated Collection of Herbs.

Botany is not an unactive and sedentary Science, which, like Geometry or History, may be acquir'd by a recluse and solitary Application within the narrow Precincts of a Closet; or which, like Chymistry, Anatomy, and Astronomy, demands only such Operations as may be perform'd without a great deal of Exercise, Toil, and Fatigue. The Botanist must wander thro' Mountains and Valleys, range the gloomy Forests, climb the steepest Rocks, and expose his Life on the Brinks of hideous Precipices, in Quest of Knowledge. The only Books capa-

ble. of instructing us thoroughly in this Science, are, with a rich and liberal Hand, scatter'd up and down the whole Surface of our Globe. But Resolution and Patience, Industry, and Contempt of Danger, are necessary to collect and gather them. This is the Reason why so few excel in this Science: That Degree of Ardor which is capable of rendering a Man skill'd in other Branches of Literature, is by no means sufficient for forming a complete Botanist; who, besides the insurmountable Ardour of his Soul, must have an uncommon Strength of Body, and Soundness of Constitution, to bear him up under the Toils and Fatigues he must necessarily undergo. Now, Mr. *Tournefort* had a brisk laborious Turn of Mind, a robust Constitution, and a large Fund of natural Gaiety in his Temper, to support him under his painful Researches; so that both the Make of his Body, and the Turn of his Mind, joined their united Force to qualify him for a Botanist.

In the Year 1679. he went from *Aix* to *Montpelier*, where he perfected himself in Anatomy and Physic. The Garden of Plants established in that City by *Henry IV.* rich as it was, could not satisfy his unbounded Curiosity. He ransack'd all the Tracts of Ground within more than ten Leagues of *Montpelier*; and, as a Recompence for his Labour, found Plants unknown and unheard of by the Inhabitants of the Country themselves. But as he thought himself still confin'd within too narrow Bounds, he quitted *Montpelier*, and went to *Barcelona*, in the Month of April 1681. He proceeded as far as *St. John*, in the Mountains of *Catalonia*, where he was follow'd about from one Place to another by the Physicians and young Students of Medicine, to whom he describ'd the several Plants which occur'd; and one would have thought, that in this he resembled the ancient *Gymnosophists*, who led their Disciples into the Deserts, in order to instruct them.

The *Pyrenean* Mountains, which were now not far off, could not fail tempting him to make them a Visit; and before he undertook this Expedition, he knew that in these forbidding Solitudes he should have no other Sustenance than what the most austere Hermits are accusom'd to; and that the miserable Inhabitants, who could supply him with it, were not more numerous than the Robbers, to whose Violence he was sure to be exposed. Accordingly he was several times robb'd by the *Spanish* Miquelets. In order to prevent the like Misfortunes for the future, he bethought himself of a happy Expedient; for he inclosed his Money in some Bread, which was so black and hard, that the *Spanish* Robbers, undoubtedly the greediest in the World, did not think it a Prize worth the taking. The unconquerable Force of his Inclinations surmounted all Difficulties; and the dreadful and almost inaccessible Rocks, which surrounded him on every Side, had to him transform'd themselves into a magnificent and well stor'd Library, where he passed the Time with Pleasure, and fully satisfied the Ardour of his Soul. One Day a ruinous Cottage, in which he had the Misfortune to lodge, fell all on a sudden; and Mr. *Tournefort*, being buried under its Ruins for two Hours, had undoubtedly perish'd, had not a seasonable Relief been afforded him. But this Accident, which of itself would have struck Terror into the Bravest, did not interrupt the Course of his painful Inquiries, nor fright him from a Scene in other respects so agreeable to him.

At last, in 1681. he return'd to *Montpelier*, and thence to *Aix*, the Place of his Nativity, where he ranged in his Repository of Herbs all the Plants he had collected about *Provence*, *Languedoc*, *Dauphiné*, and *Catalonia*, and those less known produc'd by the *Alps* and *Pyrenean* Mountains; and whatever People, whose Minds and Studies are turned another way, may think, the Pleasure of seeing such a large Number of Plants, entire, well preserved, and disposed in a beautiful Order in large Paper Books, was a sufficient Recompence for the Toil and Pains they had cost him.

The Fame of Mr. *Tournefort*'s extensive Skill in Botany had by this time reach'd the Ears of Mr. *Fagon*, who was himself a curious Botanist, and first Physician to the Queen; and, as he had receiv'd a very advantageous Character of *Tournefort* from all Quarters, he conceived a Design of alluring him to *Paris*, the general Rendezvous of all the Literati of *France*. For this Purpose he apply'd to *Madam de Venelle*, who was second Governess to the Daughters of the Royal Family, and who was intimately acquainted with Mr. *Tournefort*, and his Relations. Accordingly, this Lady, prevailing on him to come to *Paris* in 1683. presented him to Mr. *Fagon*, who, before that Year was expir'd, procured him the Place of Professor of Botany in the Royal Garden of Plants established at *Paris* by *Louis XIII.* for the Instruction of the young Students of Physic.

This Employment did not hinder him from undertaking several other Voyages; for he went back to *Spain*, and thence to *Portugal*, where he saw new Plants, but found no Botanists. When he was in *Andalusia*, a Country fertile in Silk-worms, he endeavour'd to find out the Truth of the Reports so long ago handed down to us, concerning the Amours between the Male and Female of these Insects; but he could discover no-

thing certain with regard to this Particular; and these Amours, if real, are hitherto mysterious. He travelled also into *Holland* and *England*, where he had an Opportunity of seeing Plants he had never seen before, and conversing with some of the greatest Botanists of the Age, whose Esteem and Friendship he easily gained. As a Proof of this, no other Circumstance is necessary to be mentioned, than his being solicited by friendly and importunate Letters from Mr. *Herman*, the celebrated Professor of Botany at *Leiden*, to accept of his Place, which, as he was too old and infirm, he offer'd to resign in favour of Mr. *Tournefort*. This Gentleman's Zeal for the Interest of Botany made him choose *Tournefort* for his Successor, tho' he was not only a Foreigner, but belonged to a Nation then engaged in an open War with his own Country. Mr. *Herman* promised him four thousand *Liures* in the Name of the States-General, and gave him Reason to think, that his Salary would be augmented, when his Merit came to be better known. But tho' the Income affixed to his Place in the Royal Garden was very moderate, yet the Love of his Country prevailed upon him to reject so fair and advantageous an Offer. He also gave his Friends an additional Reason for his Refusal of this Place, which was, that the Sciences were at least in as flourishing a State at *Paris*, as in any other Part of the World; for the native Country of a genuine and unfeign'd Virtuoso would be but a dull and uncomfortable Scene to him, if the Sciences did not thrive and prosper in it.

His Country did not prove ungrateful for the Love he had shewn her in rejecting Preferment in a distant Nation, for, in the Year 1691. the Academy of Sciences being put under the Inspection of the *Abbé Bignon*, that Gentleman exerted his Authority, two Months after he was vested with it, by taking into the Society Mr. *Tournefort*, and Mr. *Hamborg*, neither of whom he was personally acquainted with, tho' he was no Stranger to the Fame and Reputation they justly acquir'd.

In 1694. Mr. *Tournefort*'s *Elements of Botany*, or the Method of knowing Plants, was printed at the *Leure*, in three Octavo Volumes. This Work, tho' generally approv'd, found some very powerful Opposers; for its Author was attack'd upon some Points by Mr. *Ray*, a celebrated Botanist in *England*. And in 1697. Mr. *Tournefort* answered the Charge in a *Latin* Dissertation address'd to Mr. *Sherrard*, another *English* Gentleman, who was a skilful Botanist. The Dispute on both Sides was manag'd not only without Bitterness, but even with a certain graceful Air of Decorum and Politeness, which bespeak Candour, and a Love of Truth. It may possibly be said, that the Subject was not of sufficient Moment to ruffle their Spirits, or inflame their Passions, since the Question in Dispute was only, whether the Flowers and the Fruits of Plants were sufficient to establish their Genuses; and whether certain Plants were of one Genus, or another. But this Circumstance does not at all detract from the Merit of these two Disputants, since 'tis natural for Men, especially of Learning, to become enrag'd at each other, on account of the most arrant Trifles in the World. Mr. *Tournefort*, in a Work posterior to the Date of this Dispute, passes very high Encomiums on Mr. *Ray* and his System; an exalted Instance of a candid and generous Soul!

Mr. *Tournefort* was created Doctor of Physic, of the Faculty of *Paris*; and in 1698. he published his *History of the Plants which grow about Paris, together with an Account of their Use in Medicine*. Now we cannot readily suppose, that the Man who had made his Way to the Summits of the *Alps* and *Pyrenean* Mountains, in Quest of Plants, could be a careless Observer of those produced about *Paris*, where he had resided so long. Botany would only be an Amusement to the Mind, if it had no Relation to Medicine; but Mr. *Tournefort* has in this Work shewn the Subserviency of the former to the latter.

We may also reckon among the Works of *Tournefort*, a Book, or at least a Part of a Book, which yet was not printed by his Orders, intituled *Schola Botanica, sive Catalogus Plantarum, quas ab aliquot annis in Horto Regio Parisiensi, studiosis indigitavit Vir clarissimus Josephus Pitton de Tournefort Doctor Medicus; ut & Pauli Hermannii Paradisi Batavi Prodromus, &c. Amstelædami, 1699.* One Mr. *Simon Wharton*, an *English* Gentleman, who had studied Botany for three Years in the Royal Garden under Mr. *Tournefort*, made this Catalogue of the Plants he had there an Opportunity of seeing.

As the *Elements of Botany* had met with as favourable a Reception as the Author himself could have desired, in the Year 1700. for the sake of Foreigners he gave a *Latin* Translation of it considerably enlarg'd, under the Title of *Institutiones Rei Herbariae*, in three Quarto Volumes; the first of which contains the Names of the Plants distributed according to his own System, and the other two their Figures very accurately engraved. To this Work he has prefixed a large Preface or Introduction to Botany, containing the Principles of his own System, ingeniously and solidly establish'd, and a History of Botany and Botanists collected with uncommon Care,

Care, and written with an agreeable Spirit. We may easily suppose, that he employ'd himself with Pleasure on every Object that had the least relation to Botany, his darling Study.

But his Curiosity was not entirely confin'd to Plants and Herbs; for he was almost equally fond of all other natural Rarities, such as figur'd Stones, uncommon Marcasites, extraordinary Petrifications, and Crystallizations, and Shells of all Kinds. 'Tis true, he look'd upon Stones to be Plants which vegetated, and had their respective Seeds; he was also pretty much inclin'd to extend this System to Metals, and seem'd inclin'd to transform every Object into the Nature of Vegetables, the Contemplation of which afforded him so ecstatic and superlative a Delight. He also collected the Garments, the Arms and Instruments of distant Nations, another Species of Curiosities; which, tho' not coming immediately from the Hands of Nature, may yet afford proper Occasions of philosophizing to those happy Souls who have the Art of doing it. With all these Objects he had furnished a Museum, surprisingly magnificent for a private Person, and justly famous in Paris. The Virtuosi valued it at forty-five or fifty thousand Livres, an Expence which would have thrown an indelible Blot on the Character of a Philosopher, had the Money been laid out for less curious and instructive Purposes. This Circumstance however proves, that Mr. Tournefort, considering his moderate Incomes, could not lay out a great deal of Money on other Pleasures more frivolous in themselves, tho' more eagerly pursued by the Generality of Mankind.

When we take a View of the fine Qualities of which Mr. Tournefort was possessed, we must readily perceive how well he was calculated for making an excellent Traveller; by which Word I do not mean the Man who runs from one Country to another, without knowing what he is about, or entertaining the least Thought of rendering himself wiser and better; but the Man who attentively views Nature in all her Variety of Shapes, with a View to become useful to his fellow Creatures, and treasure up a grateful Store of Knowledge in his own Mind; so that the faithful Accounts of the Travels of a real Philosopher may be look'd upon as sacred Archives of inestimable Value. We may therefore account it an Advantage to the Sciences, that in 1700. Mr. Tournefort received an Order from the King to travel into *Greece, Asia, and Africa*, not only to take a View of the Plants mention'd by the Antients, and perhaps to discover others unknown to them, but also to make Observations upon Natural History in general, upon antient and modern Geography, and even upon the Customs, the Religion, and the Commerce, of the People. He had Orders to write, as often as he had Opportunities, to Mr. de Pontchartrain, and to give him a Detail of his Discoveries and Adventures. Accordingly Mr. Tournefort, accompanied by Mr. Gundelheimer, a German, and an excellent Physician, and Mr. Aubriet, a skilful Painter, went as far as the Frontiers of *Persia*, collecting and making Observations on Herbs. Other Travellers convey themselves by Sea from one Part to another, if they possibly can; and, when that cannot be done, they take the most beaten and patent Roads by Land. But Mr. Tournefort with his Associates were as little at Sea as was possible, disdain'd the common Roads, and bravely struck out new ones before untrod by Mortals. A Pleasure, blended with Gloom and Horror, rises in the Mind upon reading an Account of their Descent into the Grotto of *Antiparos*, which consists of three or four hideous Abysses, one after another. Mr. Tournefort had here the sensible Pleasure of beholding a new Species of Garden, in which the Plants were different Shoots of Marble, as yet young and springing, and which, according to the Circumstances with which their Formation was accompanied, must necessarily vegetate. In vain did Nature endeavour to conceal the Vegetation of Stones in these profound and inaccessible Caverns, from so bold and curious Virtuosi.

Africa was comprehended in the original Design of Mr. Tournefort's Voyage; but the Plague, which rag'd in *Egypt*, determin'd him to return from *Smyrna* to *France* in 1702. This was the first Accident that put a Stop to the Execution of his vast and extensive Design: However, he return'd, loaded with the Spoils of the *East*; for, besides the numberless different Observations he had made, he brought along with him one thousand three hundred and fifty-six new Species of Plants, most of which ranged themselves, as it were, of their own Accord, under some one or other of the six hundred and seventy three Genuses he had already established; and, for all the rest, he had only twenty-five Genuses to create, without being obliged to augment the Number of Classes. A Circumstance which sufficiently proves the Advantage and Commodiousness of a System to which so many foreign and unexpected Plants were easily reducible. Of these he composed his *Corollarium Institutionum Rei Herbariae* printed in 1703.

When he return'd to *Paris*, he thought of resuming the Practice of Physic, which he had sacrificed to his *Levant* Voyage, at a time when he began to be well employed. Experience shews us, that in every thing depending on the

Taste of the Public, especially Affairs of this Nature, Delays are dangerous. The Approbation of Men is something forc'd, and soon comes to an End. Mr. Tournefort then found a Difficulty in getting into the Business he had left. Besides, he was obliged to go through his former Exercises in the Royal Garden, and those of the Royal College, in which he was one of the Professors of Medicine. The Functions of the Academy also took up some Part of his Time; and, besides these, he wanted to revise and polish the Relation of his last Voyage, of which he had only the simple Memoirs roughly drawn up, and intelligible only by himself. This Multiplicity of Business put him upon studying in the Night-time, a Circumstance which soon broke his Health; and, when he was in this uncomfortable State, he accidentally receiv'd a Blow on the Breast, which he thought would very soon prove mortal to him. Accordingly he languish'd for some Months, and died on the twenty-eighth of *December* 1708.

He made a last Will, in which he left his Museum of Rarities to the King, for the Use of the Literati, and his botanical Books to the Abbé Bignon. This second Article was no less a Proof of his Love to the Sciences than the former, considering the Character of the Abbé.

One Volume of Mr. Tournefort's Travels was printed in the Author's Life-time at the *Louvre*: And the second is, since his Death, printed from his own Manuscript, which was found perfect and finished. This Work, in which the original Form of Letters addressed to Mr. de Pontchartrain is retain'd, contains two hundred Plates of Plants, and other Antiquities, well engraved. Besides the Branches of Knowledge, of which we have already shewn Mr. Tournefort to be possessed, he in this Work discovers an uncommon Degree of Learning, and a very extensive Knowledge of antient and modern History. But one Quality, when possessed in an eminent Degree, is often the Reason why we overlook others, which however, deserve our Attention. *Hist. de l'Acad. des Sciences, A. 1708.*

System of Tournefort.

The Knowledge of Plants has in all Ages and Nations been justly esteem'd an useful and important Branch of Learning. People are generally convinc'd, that Simples make up almost the Whole of Medicine; and as Nature has implanted in certain Animals an Instinct, by which they discover particular Plants to be proper Remedies for their Disorders, so she seems to have acted a still more liberal Part by Man, in furnishing him with an Instinct for Plants in general, and inspiring him with an uncommon Confidence in the Remedies prepar'd from them. But, tho' Nature has been thus bountiful in giving us so useful an Instinct, yet she has left us to use the laborious Methods of Reason, Deduction, and Experiment, in order to discover the Virtues and Uses of each particular Plant; a Task, in the Execution of which, the Reason of Man can with Difficulty come up to the Instinct of some Animals.

The Works of *Theophrastus* and *Dioscorides*, of *Pliny* and *Galen*, are sufficient Proofs, that the Antients had some Knowledge of Plants, tho' their Learning in this Particular was very superficial, defective, and imperfect, since *Dioscorides*, who applied himself to this Study in a particular manner, and acquir'd the greatest Reputation, on account of the Progress he made in it, has only mention'd about six hundred Plants, and described them in a manner so obscure and intricate, that 'tis often difficult, and sometimes impossible, to know them by his Description of them.

The Ages immediately succeeding that of *Dioscorides*, did not greatly enrich Botany; for in them all the Sciences seem to have been veil'd with Clouds of Darkness and Ignorance, which were not dispell'd till the fifteenth Century. Then indeed People began to read the Antients with great Diligence, in order to make themselves Masters of their Knowledge, which had been so long involv'd in Obscurity and Oblivion. The Botanists sought for Plants no-where else than in the Books of the *Greeks* and *Romans*; and even *Matthiolus*, the most celebrated Commentator upon *Dioscorides*, was not at the Pains to compare the Plants produced by Nature, with the Descriptions his Author had given of them; but, attaching himself sacredly and inviolably to the Descriptions, form'd to himself ideal Plants, which he thought Nature must, or at least ought to have produc'd.

But, when the Sciences began again to be cultivated, Reason assumed her just Prerogative, People studied Nature as well as Books, and ventur'd to seek for Herbs in the open Fields. Upon this, Botany was enriched with new Discoveries, and became daily more extensive.

Notwithstanding this favourable Revolution, a Difficulty still remained to be surmounted. The immense Number of Plants, all differing from each other, began to prove a Grievance to Botanists; for what Memory was sufficient to retain so inconceivable a Variety of different Names, as were already in Use, or even all the new ones, which were daily becoming necessary?

The Botanists therefore bethought themselves of inventing a Method proper for the Removal of this Grievance; but it must be own'd, that few of them apply'd themselves to this Discovery; that those who did, were pretty late in doing it; and that others disputed either the Possibility or Usefulness of such a Method. But 'tis no uncommon thing to see the Progress of Learning retarded by the Learned themselves.

The only Method then, which could either be thought of or desired, consisted in distributing all the known Plants under certain Genuses, so that the Knowledge of each Genus might contain, as it were, a compendious and general Account of all the Plants it included; and that they might all, as much as the Nature of the Thing would permit, come under one Denomination common to their respective Genus, that too great a Number of particular and widely different Names might be avoided. Custom has established this Practice with regard to all the Species of the *Ranunculus*; but 'tis a hard Task to extend this Plan to a great many other Plants, whose Species do not easily exhibit to View what they have in common, and such Circumstances as may serve to establish their proper Genus.

In order to preserve that Uniformity which Method requires in the System of Plants, the same Idea must prevail in the Establishment of the different Genuses; and they must all be deduc'd from the same Principles. "A Plant, according to Mr. *Tournefort*, is an organiz'd Body, which has always a "Root, always probably a Fruit or Seed, and almost always a "Stalk, Leaves, and Flowers." These are the five Parts; some of which are essential to all Plants in general, whereas others belong only to some particular Species of Plants. It is evident, that the Resemblance between some of these Parts will constitute the Genuses; but this Resemblance ought always to be between the corresponding Parts; and our whole Business is to find out to which we ought to give the Preference. Mr. *Tournefort* determines for the Flowers and the Fruit taken in Conjunction.

Gesner and *Colonna*, two of the most learned Botanists that have hitherto appeared, were of the same Opinion; and indeed the Intention of Nature seems to point out these two Parts as the principal and most important; since the Whole of the Plant, and all the Apparatus of its Organs, which is greater and more magnificent than is commonly believed, seems only form'd with a View to the Production of the Seed, or, which is the same, of the Fruit, which is the Covering and Nourishment of the Seed. As for the Flower, it is only designed for a short time, to afford the growing Fruit a Nourishment more delicate, better prepared, and more agreeable to its Nature, than what it could draw from the Leaves.

All Plants whose Flowers and Fruits are of the same Figure and Disposition, are, then, of the same Genus, according to Mr. *Tournefort*'s System; and the Roots, the Stalks, and Leaves, are not on this Occasion taken into Consideration. But when any particular Genus is afterwards to be divided into the several Species comprehended under it, we must consider the Roots, the Stalks, and Leaves; and those Plants which either differ in all these three Parts, or only in some of them, are taken to belong to different Species.

As in all this the express Design is not exactly to follow or imitate Nature, (who, in the Production of Vegetables, seems not to have been very solicitous about a System) but only to establish an arbitrary Plan for facilitating the Knowledge of Plants, the Goodness of any Method invented for this Purpose cannot be so properly prov'd by philosophical Reasonings, as by the Advantages it brings along with it; its Clearness and Perspicuity, and the Delight and Satisfaction that may possibly be found in it; and upon these Principles we must judge of the Sufficiency and Perfection of Mr. *Tournefort*'s System.

It must, indeed, be own'd, his Plan is not universal, since there are Plants which have neither Flowers, Fruit, nor Seed; at least the Fruit and Seeds are either not at all visible, without the Assistance of a Microscope, or not easily discovered even with it; so that we are obliged, without perceiving them, to reason analogically for their real Existence.

Now in an Affair of this Nature, 'tis necessary there should be evident and uncontroverted Characteristics subjected to the Eye. And the Assistance of the Microscope is not in this Case admitted, and much less the most plausible and solid Hypothesis. Mr. *Tournefort* is therefore reduced to a Necessity of distributing these Plants into separate Genuses, which he regulates and fixes by their most remarkable Parts. And as these Genuses are only very few in Number, they make, if I may so speak, but a very inconsiderable Chasm in the Universality of Mr. *Tournefort*'s Plan, which, however, is more extensive and general than any other that could have been thought of.

Sometimes also, when the Flowers and Fruits taken in Conjunction are not sufficient for fixing the Genus, he calls in to his Assistance not only the Roots, or the Stalks, or the Leaves, but also, if there is a Necessity for it, some of their most obvious and sensible Properties, such as its manner of growing, or what Botanists call the *Port of a Plant*; that is, its general

Conformation, or what strikes the Eye immediately upon its being presented; for since, in this Case, there is not a natural System whose Rules would be unexceptionable, we must rest contented with an artificial one, as perfect and complete as Diligence and Industry can possibly make it.

The Distribution of Plants under their Genuses renders it more easy to name them; for they have first their generic and common Name, to which we add another, which determines their Species; so that the very Name of each Plant becomes a Definition of it. It is true, as the Botanists, who have gone before Mr. *Tournefort*, have not had the Genuses of Plants at all in their View, or, at least, have not had an Eye to the same Genuses he has establish'd, he is, for this very Reason, often obliged to change the Names which they had affixed to particular Plants; but he carefully mentions the ancient Names given them by different Botanists, provided their Characters were famous enough to deserve his Regard or Attention. And if Students in Botany would but habituate and familiarize themselves to the new Names used by Mr. *Tournefort*, they would reap the Advantage by it, of knowing more readily the Genuses and Species of Plants in a System, which seems excellently calculated for the Advancement and Improvement of Botany.

Some Plants lately discover'd, have, as it were, of their own accord, rang'd themselves under certain Genuses, already established by Mr. *Tournefort*; and when others shall be discover'd, which, in Consequence of their Flowers and Fruits, shall call for new Genuses, we have no more to do than to establish them.

Mr. *Tournefort*, in his Institutions, has reduced the Whole to about six hundred and seventy-three Genuses, which comprehend more than eight thousand eight hundred and forty-six Species, including all Land and Sea Plants hitherto known; so that at present we know more Genuses of Plants, than *Dioscorides* did different Plants.

But as the Memory would be very much burden'd with six hundred and seventy-three Genuses, whose different Characteristics must necessarily be known; and as the Number of these Genuses must undoubtedly be increased in Process of Time; Mr. *Tournefort* found out a happy Expedient for rendering this Task considerably more easy, by reducing the several Genuses to Classes; and he is the first of all the Botanists who formed so noble and useful a Design. In order to establish his Classes, he only considered the Flowers of Plants, if they had any, as indeed most of them have. He determines all the known Figures of the Flowers of Plants, and finds them to be only fourteen in Number, which of Consequence must only produce fourteen Classes, if their Number was not augmented by those Plants which have no Flower, and by the Distinction which it was necessary to make between Herbs or Suffrutesces (*Undershrubs*) and Shrubs or Trees, the Difference of whose Bulks has render'd it improper to range them under the same Class, tho' the Flower in both should be alike. But notwithstanding these Augmentations, the Whole of Mr. *Tournefort*'s Plan in his *Botanical Institutions* is comprehended under no more than twenty-two Classes.

It is then sufficient to retain in the Memory fourteen Figures of Flowers; and when we see the Flower of a Plant which we do not know, we may find in the Institutions to what Class it properly belongs. Some Days after the Flower, the Fruit will appear, which gives the Genus; and all the other Parts of the Plant will determine the Species. If the unknown Plant is not in Flower, we must wait till it appears, before we can pronounce certainly and infallibly.

Mr. *Tournefort* has regulated his Classes by the Flowers, rather than by the Fruits of Plants; because when we see the Flower appear, we have but a short Time to wait before we see the Fruit, and thus determine the Genus; whereas, when we see only the Fruit, we must wait till the ensuing Year, before we can have an Opportunity of viewing the Flower.

Upon this Plan all the Difficulties of Botany are render'd as easy to be surmou'd, as the Nature of the Thing can possibly admit of; and that prodigious Number of Plants, which not only adorn the Surface of our Globe, but also those which vegetate in the Bottom of the Ocean, are reduc'd to so narrow Bounds, as to be easily retained by the Memory, without in the least distracting the Imagination. But all this is no more than the first Institutions, and, as it were, the Out-lines of Botany; for the Knowledge of the Virtues of Plants, which is the most important Part of the Science, is a Field of a vast and unlimited Extent; but 'tis still more spacious and extensive, if to their real inherent Virtues we join these ascribed to them by the Whim, the Ignorance, or Caprice, of different Authors.

Mr. *Tournefort*, in his History of the Plants produc'd about *Paris*, has already given an Essay on the Manner of explaining the Virtues and Uses of Plants; and has propos'd some new Hints founded on the most solid Principles of Physic. See ANALYSIS.

Mr. *Tournefort* thus distinguishes Plants into their proper Classes.

CLASS I. comprehends

Herbs and Undershrubs with monopetalous, campaniform Flowers.

CLASS II.

Herbs and Undershrubs with monopetalous, infundibuliform, and rotated Flowers.

CLASS III.

Herbs and Undershrubs with monopetalous, anomalous Flowers.

CLASS IV.

Herbs and Undershrubs with monopetalous, labiated Flowers.

CLASS V.

Herbs and Undershrubs with polypetalous, cruciform Flowers.

CLASS VI.

Herbs and Undershrubs with polypetalous, rosaceous Flowers.

CLASS VII.

Herbs and Undershrubs with polypetalous, rosaceous, umbel-lated Flowers.

CLASS VIII.

Herbs and Undershrubs with polypetalous, caryophyllated Flowers.

CLASS IX.

Herbs and Undershrubs with liliaceous Flowers.

CLASS X.

Herbs and Undershrubs with polypetalous, papilionaceous Flowers.

CLASS XI.

Herbs and Undershrubs with polypetalous, anomalous Flowers.

CLASS XII.

Herbs and Undershrubs with flosculous Flowers.

CLASS XIII.

Herbs and Undershrubs with semiflosculous Flowers.

CLASS XIV.

Herbs and Undershrubs with radiated Flowers.

CLASS XV.

Herbs and Undershrubs with apetalous, or stamineous Flowers.

CLASS XVI.

Herbs and Undershrubs which have Seeds, but no Flowers.

CLASS XVII.

Herbs and Undershrubs which have no conspicuous Flowers or Fruit.

CLASS XVIII.

Trees and Shrubs with apetalous Flowers.

CLASS XIX.

Trees and Shrubs with apetalous, amentaceous Flowers.

CLASS XX.

Trees and Shrubs with monopetalous Flowers.

CLASS XXI.

Trees and Shrubs with rosaceous Flowers.

CLASS XXII.

Trees and Shrubs with papilionaceous Flowers.

Those who are desirous of being acquainted with the farther Divisions of Plants made by *Tournefort* into Genera and Species, I must refer to his *Rei Herbariae Institutiones*; for, to specify these, would be to transcribe the Book.

Tournefort had for an Antagonist the celebrated Mr. *John Ray*, an Englishman, born in *Black Notly*, an obscure Village of *Essex*, in the Year 1628. Though *Ray's* Father was only a Blacksmith, he sent him to *Cambridge* for the Advantages of a liberal Education. Among the several Branches of Learning taught at this University, *Ray* was principally captivated with

Phytology, by the Love of which he was prompted to range not only the Fields about *Cambridge*, but also the whole County in which it lies, in Quest of Plants, a Catalogue of which he publish'd as a happy Earnest of the future Advances he was to make in Botany. In 1661. he enter'd into Holy Orders; and in 1673. he married *Margaret*, one of the Daughters of Mr. *John Oakley*, of *Launton* in *Oxfordshire*; and betwixt 1648. and the Time of his Marriage, he undertook several Journeys through all the Parts of *England*, *Scotland*, and *Ireland*, with a View to become acquainted with the Natural History of these Countries. Nor did he confine the Scene of his Studies to these Countries alone; for he travell'd through *Holland*, *Germany*, *Italy*, and *France*, as a Companion to Mr. *Willoughby*, an English Gentleman of Note, who was very fond of Natural Knowledge. These Travels laid a Foundation for his compiling a Synopsis of the English, and another of the European Plants. But as his Travels had contributed nothing to the bettering of his private Circumstances, and only procured him the Honour of being created a Fellow of the Royal Society, after having passed four Years in *Warwickshire*, he retired along with his Wife to his native Country, where, being content with a little, an Annuity of sixty Pounds a Year left him by Mr. *Willoughby*, in 1672. being most of his Fortune, he made it his only Business to enrich Botany with his Observations, by comparing which with the Histories of *John Bauhin*, and *Carolus Clusius*, he form'd his Method, which was followed by a general History of Plants, wrote in an elegant and modest Style, and reduced to a more natural Order than any Work of the Kind before published. He was so much assisting to his Patron *Francis Willoughby*, who was then compiling a History of Birds and Fishes, that almost the whole Work may be said to be his. He also prepared for the Press a *Method of Insects*; but being spent partly by running Ulcers in his Legs, and partly by old Age, he at last died in the Year 1705.

Mr. *Ray's* System of Botany differs much from that of Mr. *Tournefort*. According to the last Edition of his *Synopsis Methodica Stirpium Britannicarum*, in which some Improvements have been made by the Editor, it consists in a Division of Plants into twenty-eight different Genera.

Under the first are contain'd the various Kinds of Fungi, which are divided into,

- I. *Fungi Pileati et Lamellati*, that is, Fungi which have a Head or Cap, the inferior Substance of which is divided into Lamellae or Plates.
- II. *Fungi Pileati lamellis carentes*, Fungi which have a Cap or Head, but which are not lamellated.
- III. *Fungi Pileis destituti*, Fungi which are destitute of a Cap or Head. These again are subdivided into,
 1. *Fungoides*.
 2. *Peziza*.
 3. *Agarici*, Agarics.
 4. *Fungi pulverulenti*, Puff-balls.
 5. *Fungi subterranei*, subterraneous Fungi, such as Truffles.

The second Genus contains submarine Plants, or Plants which grow in the Sea. These are divided into,

- I. *Spongiae*, Sponges.
- II. *Alcyonia*.
- III. *Escharae*.
- IV. *Corallia*, Corals.
- V. *Lithophytae*, Lithophytes.
- VI. *Corallinae*, Corallines; which are subdivided into,
 1. *Corallinae per Gomphosin articulatae*, Corallines articulated by Gomphosis.
 2. *Corallinae vel denticulatum divisae, vel Capillamentis Piliferae obstitae*, Corallines either indented, or thick set with Capillaments or Hairs.
- VII. *Fucoides*.
- VIII. *Fuci*. These are subdivided into,
 1. *Fuci non ramosi*, the Fuci without Branches.
 2. *Fuci ramosi*, the branched Fuci.
- IX. *Algae*.

Under the third Genus are comprehended the various Sorts of Mosses, divided into,

- I. *Byssi*.
- II. *Conservae*, subdivided into
 1. *Conservae simplices, et aequabili Filo protensae*, simple Conservae, shooting out with even Threads.
 2. *Conservae geniculatae*, geniculated or jointed Conservae.
 3. *Conservae nodosae*, knotted Conservae.
- III. *Uvae*.
- IV. *Lichenoides*, subdivided into,
 1. *Lichenoides cauliferae*, the Stalk-bearing Lichenoides.
 2. *Lichenoides cauliculis destituta*, the Lichenoides without Stalks.
- V. *Mnia*, subdivided into,
 1. *Mnion capitulis in eadem Planta conjunctis*, Cluster-headed Mnion.

2. *Mnion capitulis tota planta remotis*, scatter-headed Mnion.
- VI. *Fontinales*.
- VII. *Hypna*, subdivided into,
 1. *Hypnum capitulis erectis, vel paulum saltem inclinatis*, Hypnum with upright or very little inclining Heads.
 2. *Hypnum unicum capitulis reflexis*, the single Hypnum with Heads bending backwards.
- VIII. *Polytricha*, subdivided into,
 1. *Polytrichum capsula quadrangulari*, Polytrichum with the quadrangular Seed-vessel.
 2. *Polytrichum capsula subrotunda*, Polytrichum with the roundish Seed-vessel.
- IX. *Brya*, subdivided into,
 1. *Bryon capitulis erectis*, the Bryon with upright Heads.
 2. *Bryon capitulis reflexis*, the Bryon with Heads bending backwards.
- X. *Sphagna*.
- XI. *Selagines*.
- XII. *Selaginoides*.
- XIII. *Lycopodia*.
- XIV. *Lycopodioides*.
- XV. *Lichenastra*, subdivided into,
 1. *Lichenastrum capitulis bifariam se aperientibus*, Lichenastrum with Heads that cleave in two.
 2. *Lichenastrum capitulis in quatuor segmenta florida tanquam totidem petala se aperientibus*, Lichenastrum with Heads that open into four florid Segments like Petals.
- XVI. *Lichenes*, subdivided into,
 1. *Lichen pileatus*, Lichen with a Cap.
 2. *Lichen stellatus*, starry Lichen.
 3. *Lichenes aut Lichenastra dubia duo*, two dubious sorts of Lichen or Lichenastrum.

The fourth Genus contains the capillary Plants, with such others as nearly resemble them. These are divided into those,

- I. *Foliis integris et indivisis*, such as have their Leaves whole and undivided.
- II. *Foliis laciniatis aut pinnatis*, those with jagged or pinnated Leaves.
- III. *Herbæ capillares foliis semel divisis*, capillary Herbs, with Leaves once divided.
- IV. *Herbæ capillares foliis bis subdivisis, seu ramosis*, capillary Herbs, with Leaves twice subdivided or branch'd.
- V. *Herbæ capillaribus affines*, Herbs that have a near Relation or Resemblance to the capillary Genus. These Ray distributes into,
 1. *Ophioglossum*, Adder's-tongue.
 2. *Lunaria minor*, Ger. et Park. Moonwort.
 3. *Lentes palustres, cujus tres species recenset*, three Species of Water-lentils.
 4. *Equisetum, cujus duodecim recenset species*, twelve Species of Equisetum or Horse-tail.
 5. *Charæ quinque species*, five Species of Chara.

Under the fifth Genus Ray comprehends those Herbs which bear an imperfect or staminate, or rather an apetalous Flower. These are divided into,

- I. *Herbæ flore imperfecto seu apetalis staminibus carente*, Herbs that bear an imperfect or apetalous Flower without Stamina.
- II. *Herbæ flore apetalis, staminibus donati*, Herbs with an apetalous Flower, and furnish'd with Stamina. These are subdivided into,
 1. *Calyce vel nullo (secundum Tournefortium) vel monophyllo et indiviso*, those with no Calyx, or Flower-cup, (according to Tournefort) or a Calyx consisting only of one undivided Leaf.
 2. *Calyce donatæ in plures laciniis diviso*, those which have the Calyx jagged in several Places. To this Division belong, (1.) *Flore a semine sejuncto, vel totis plantis, quæ sexu differre dicuntur, vel in eadem*, those which have their Flower separate from their Seed, and that either in distinct Plants, which sort are said to differ in Sex, or in the same Plant. (2.) *Herbæ flore imperfecto, quarum semina floribus contigua, et triquetra*, Herbs with an imperfect Flower, whose Seeds are contiguous to their Flowers, and of a triangular Figure. (3.) *Herbæ flore imperfecto, fructui contiguo, seminibus rotundis*, Herbs with an imperfect Flower, contiguous to the Fruit, which is of a round Figure.

The sixth Genus comprehends all such Herbs as bear a full composite Flower, and afford a lacteous or milky Juice. To this Genus belong,

- I. *Herbæ semine papposo*, Herbs with a pappous or downy Seed.
- II. *Herbæ flore planifolio, natura pleno, lactescentes seminibus solidis, seu flore e flosculis irregularibus tantum composito*, Herbs with a full plain-leaf'd Flower, and affording a milky Juice, with solid Seeds; or Herbs whose Flower consists only of irregular Floscules.

The seventh Genus contains Herbs which are furnish'd with a composite discous Flower, a downy Seed, but yield no lacteous Juice.

The eighth Genus contains such Herbs as bear a composite discous Flower, with Seeds void of Down, and are call'd corymbiferous (cluster-bearing).

To these he adds the *Herbæ corymbiferis affines*, such Herbs as bear a near Resemblance to the corymbiferous, which are some Species of the *Scabiosa* and *Dipsacus*.

Under the ninth he comprehends Herbs whose Flower consists of fistular Floscules, or capitated Herbs.

The tenth Genus comprises Herbs bearing a perfect simple Flower, with naked solitary Seeds, or a single Seed to each Flower.

The eleventh includes umbelliferous Herbs; or such as are furnish'd with an Umbella; and these are divided into,

- I. *Umbelliferæ semine lato compresso, seu foliaceo, aut ala foliacea cincto*, umbelliferous Herbs with a broad flat Seed, or a foliaceous Seed, or one surrounded with a foliaceous Border.
- II. *Umbelliferæ semine et tumidiore et longiore*, umbelliferous Herbs with a long plump Seed.
- III. *Umbelliferæ semine brevioris*, umbelliferous Herbs with a short Seed.
- IV. *Umbelliferæ radice tuberosa*, umbelliferous Herbs with a tuberous Root.
- V. *Umbelliferæ semine striato minore*, umbelliferous Herbs with a small striated Seed.
- VI. *Umbelliferæ semine hirsuto, hispido, aut echinato*, umbelliferous Herbs, with hairy, bristly, or prickly Seed.
- VII. *Umbelliferæ foliis integris*, umbelliferous Herbs with entire Leaves.

The twelfth contains stellated Herbs, that is, such as have their Stalk surrounded, at Intervals, with Leaves imitating the Irradiation of a Star.

Under the thirteenth are comprehended the *Herbæ asperifoliae*, or Herbs which bear a rough Leaf.

The fourteenth comprises the verticillated *Suffrutices* (or *Undershrubs*) and Herbs.

Under the fifteenth are contain'd polyspermous (where more than four Seeds succeed to each Flower) Herbs with naked Seed.

The sixteenth contains bacciferous or Berry-bearing Herbs.

The seventeenth includes Pod-bearing or corniculated Herbs, that is, such as for every Flower produce a Pod.

Under the eighteenth are comprehended such Herbs as bear a single dry Fruit without a monopetalous Flower. These are divided, with respect to their Flower, into such as are furnish'd,

- I. *Flore regulari*, with a regular Flower; and these are subdivided,
 1. *Flore integro, aut minus profunde diviso*, such as have their Flower entire, or with very shallow Divisions.
 2. *Flore tetrapetalum referente, seu tetrapetaloides*, those with a tetrapetalous or four-leaf'd Flower.
 3. *Flore pentapetaloides*, with a pentapetalous or five-leaf'd Flower. Of this Species there are (1.) *Unicapulares*, those with one Seed-vessel, or unicapular; (2.) *Bicapulares*, the bicapular, or those with two Seed-vessels; and (3.) *Multicapulares*, the multicapular, or those with many Seed-vessels.
- II. *Flore irregulari*, Herbs with an irregular Flower.

The nineteenth and twentieth Genera consist of vasculiferous Herbs, with a dipetalous and tripetalous Flower.

The twenty-first contains tetrapetalous Herbs, divided into the,

- I. *Siliquosæ*, those with large Pods, or *Siliquæ*.
- II. *Siliculosæ*, those with small Pods, or Husks, or *Siliculae*. Under these he distinguishes the *Tetrapetalæ siliculosæ monospermæ*, the tetrapetalous Herbs with a small Pod, containing only one Seed.

The twenty-second includes vasculiferous Herbs of an anomalous Kind, with a tetrapetalous Flower.

Under the twenty-third Genus are comprehended Herbs which bear a papilionaceous Flower, or leguminous Herbs. These are divided into,

- I. *Papilionaceæ*, seu *leguminosæ scandentes*, papilionaceous or leguminous, scandent, or climbing Herbs.
- II. *Papilionaceæ seu leguminosæ non trifoliatæ*, *Claviculis carentes*, papilionaceous or leguminous Herbs, not three-leav'd, and without Tendrils.
- III. *Herbæ papilionaceæ Flore*, seu *leguminosæ trifoliatæ*, three-leav'd leguminous Herbs, or Herbs with a papilionaceous Flower.

The twenty-fourth Genus contains vasculiferous pentapetalous Herbs, divided into,

- I. *Pentapetalæ Foliis in Caule ex adverso binis*, pentapetalous Herbs with Leaves on the Stalk, standing opposite in Pairs.
- II. *Pentapetalæ Foliis in Caule alterno aut nullo Ordine positis*, pentapetalous Herbs, whose Leaves stand on their Stalk alternately, or in no regular Order. These are subdivided into,
 1. *Flore regulari*, those with a regular Flower.
 2. *Flore irregulari*, those with an irregular Flower.

The twenty-fifth Genus contains vasculiferous, hexapetalous, and polypetalous Herbs.

The twenty-sixth comprises such Herbs as have a bulbous Root; and such as are akin to bulbous Herbs.

Under the twenty-seventh we have the culmiferous Grass-leav'd Herbs with an imperfect Flower. Under this Genus are comprehended,

- I. *Culmiferæ Grano majore*, *Frumentacea et Cerealia dictæ*, culmiferous Herbs with a large Grain, such as the frumentaceous, or those Kinds of which Bread is made.
- II. *Culmiferæ Grano minore*, *Gramina dictæ*, culmiferous Herbs with a small Grain, call'd Grasses. These are subdivided into,
 1. *Gramina spicata*, Grasses bearing a Spike or Ear.
 2. *Gramina paniculata*, paniculated Grasses. And these are (1.) such as have a simple Locusta, or Husk; and (2.) such as have a squamous one. These again are either *muticæ*, such as have their Locusta without a Beard; or *aristatæ*, such as have it bearded.

The twenty-eighth and last Genus contains the-graminifolious or Grass-leav'd Herbs, with an imperfect or stameneous Flower. This may be divided into,

- I. *Gramen Cyperoides polystachion*, the Cyperoidal Grass with many Ears.
- II. *Gramina Cyperoidea cum Spicis in summo caule, quem spica paleacea non terminat*, cyperoidal Grasses with Spikes on the Top of the Stalk, which does not terminate in a paleaceous Spike.
- III. *Cypero Botanicis dicti*, the Grasses call'd by Botanists *Cypero*.
- IV. *Scirpus*, the Rush, subdivided into,
 1. *Scirpi nudi*, naked Rushes.
 2. *Scirpi foliosi*, leafy Rushes.
- V. *Juncus*, the Juncus, subdivided into,
 1. *Juncus aphyllus*, the Juncus without Leaves.
 2. *Juncus foliosus*, the leafy Juncus, with their several Species.

To these he subjoins the *Graminifolia non-culmiferæ singulares, et sui Generis*, the Grass-leav'd Herbs, which are not culmiferous, but are singular, and belong to no Genus.

To make this Method more complete, the Trees and Shrubs are divided into Genera, with respect to the Difference of their Flowers, in the following manner.

The first Genus comprehends such Trees and Shrubs as have their Flowers remote or separated from their Fruit. Of these there are the following Species.

- I. *Nucifera*, the nuciferous, or Nut-bearing.
- II. *Conifera*, the coniferous, or Cone-bearing.
- III. *Baccifera*, the bacciferous, or Berry-bearing.
- IV. *Lanigera*, the lanigerous, or such as produce a woolly Substance.
- V. *Vasculis foliaceis*, those with foliaceous or leafy Vessels.

The second contains those Trees and Shrubs which have their Fruit contiguous to a petaloidal Flower.

These are divided into,

- I. *Arbores et Frutices Flore summo Fructui insidente*, Trees and Shrubs which have their Flower resting on the Top of their Fruit; such are the pomiferous and bacciferous Species, which produce a great or small moist umbilicated Fruit.
- II. *Arbores quarum Flos Basi Fructus, seu imo Fructui coheret, et primo Fructu per Maturitatem humido*, Trees whose Flower adheres to the Base or Bottom of the Fruit, which, as it ripens, turns to a humid Substance. These are subdivided into,

1. *Prunifera*, the pruniferous, or Plum-bearing.
2. *Baccifera*, the bacciferous, or Berry-bearing.
- III. *Arbores Flore imo Fructui adnascente, Fructu per Maturitatem siccato*, Trees whose Flower grows to the Bottom of the Fruit, which grows dry as it ripens.

There are some very considerable Botanists, who, tho' they have been an Honour to their Country, and a Blessing to Mankind, are, however, not mention'd in the foregoing Account. Among these, the first who occurs is *Carolus Plumier*. He was born at *Marseilles* in 1646. and was contemporary with *Tournefort*. Tho' he was descended of an obscure Family, yet he soon became conspicuous, not only on account of his Mechanical and Botanical Observations, but also on account of the annexed Figures, delineated and engraved by his own Hand. Besides his happy Turn for Mathematics and Mechanics, he was an industrious and skilful Botanist. He presented his first Labours of this kind to *Lewis* the Fourteenth, who, as a Reward for his growing Merit, gave him at once the Title and the Salary of King's Botanist. Besides his Descriptions of *American* Plants, his History of Ferns, and his establishing some new Genuses, there are several other Works, wrote with his own Hand, which are preserved in the Libraries of the Royal Academy, and that belonging to the Monastery of the *Minims* in *Paris*. These Works contain not only the Figures and Descriptions of about nine hundred *American* Plants, but also the History of a great Variety of Birds, Fishes, Shells, and Insects, which he had seen, and whose Figures he had drawn in *America*. Whilst he intended a Voyage to *Peru*, in order to discover something more concerning the famous *Peruvian* Bark, he was seized with a Pleurisy, of which he died in the sixtieth Year of his Age, in 1704.

The Merit of *Samuel Doody* may be judg'd of by the Specimens of his Botanical Observations, given in *Ray's* History of Plants. He was born in the County of *Stafford*, and, by his Diligence, Industry, and Sagacity, soon distinguish'd himself among the Apothecaries of *London*; by whom, on account of his Skill in Natural History and Botany, he was made Master and Protector of their Garden at *Chelsea*. *Ray* ingenuously confesses, that he borrow'd a great many things from him. He was a diligent Inquirer into the Natures of Mosses, capillary Herbs, Fucuses, and Corals; so that Botany and Natural History sustain'd a very considerable Loss by his Death in 1706.

Of those celebrated Botanists who have died since the Days of *Tournefort*, *Petrus Hotto* is the first. He was born at *Amsterdam* in 1648. After he had taken the Degree of Doctor of Physic in the University of *Leyden*, he declin'd Practice, that he might pursue the Study of Botany to the greater Advantage. With this View he travell'd into *Denmark*, in order to make Observations on the Plants of that Kingdom. But he was recall'd thence by the Magistrates of *Leyden*, in order to read Lectures for *Herman*, who was appointed to go to the *Indies* to make Observations on exotic Plants; and he had the Promise of this Professor's Place, if he should happen to die in his Voyage. During *Herman's* Absence he taught with great Applause. *Herman*, upon his Return, resum'd his Place; but, after his Death, *Hotto* succeeded him in 1695.

Besides his elegant Oration de *Historia & Fatis Botanices*, deliver'd that same Year, he endeavour'd a Reconciliation of the Methods of *Tournefort* and *Herman*; but his Death, in 1709. put a fatal Stop to the Execution of so useful a Design.

Among all the Botanists produc'd by the present Age, none is more justly celebrated than Dr. *Sherard*, who had his Education begun at *Merchant-tailors School*, and afterwards became a Fellow of *St. John's College, Oxford*. His Learning, together with his other Qualifications, procur'd him an Opportunity of travelling with two Noblemen at different times; during which he visited many Countries of *Europe*, in which he was a diligent Observer of the Plants produc'd by each. Upon his Return to his native Country, he was created Consul of *Smyrna*, which gave him an Opportunity of viewing the *Asiatic* Plants. At his Death he left three thousand Pounds to the Physic-garden at *Oxford*. He was much admir'd by *Boerhaave*, who also makes honourable Mention of his Brother *James Sherard*, as an accurate and curious Botanist.

Mr. *Isaac Rand*, Dr. *Martyn*, Dr. *Dillenius*, and Mr. *Miller*, are so fam'd for their Knowledge of Botanical Subjects, that, to name them, is to praise them.

It would be doing a Piece of Injustice, not to make honourable Mention of the following Gentlemen, Messieurs *Buddle*, *Lawson*, *Lbwyl*, *Newton*, *Stonestreet*, *Dubois*, *Dale*, *Manningham*, and *Richardson*.

I must add, that Sir *Hans Sloane*, by his Skill, Industry, and Munificence, has greatly contributed to the Perfection of Botany, and laid a Foundation for its farther Improvement.

The last Author I shall mention, who has lent his friendly Aid to the Improvement of Botany, is the justly celebrated *Boerhaave*; and, indeed, by his Performances of this kind, he has, at once, oblig'd the World, and prov'd the Force and Extent of his own Genius; for, as his Aphorisms and Institutions discover

discover the sagacious and discerning Physician; and his Chymistry the skilful Natural Philosopher and Chymist; so his Botanical Productions pronounce him an accurate, a diligent, and penetrating Botanist. Tho', by the surprising Degrees of Perfection, at which this Author arriv'd in other Branches of Learning, one would be tempted to suspect, that he had too small a Portion of Time left for making any considerable Advancements in the Knowledge of Plants; yet, when his judicious Divisions and Distributions of them come to be perus'd, we are inclin'd to think he had employ'd the Whole of his Life in the Study of Botany.

In 1710. the Year after he was made Professor of Botany, he publish'd, in one *Octavo* Volume, an Index of the Plants with which the Physic-garden at *Leyden* was then stor'd. This Work, tho' perhaps the most perfect of its kind the World had ever seen, began by degrees to be look'd upon as very imperfect in its Author's Eyes; for his Impartiality, join'd with the superior Strength of his Judgment, enabled him to discover Blemishes in his own Productions, which escap'd the Eyes of all, except the happy Few, who are bless'd with a discerning Judgment. He had us'd new Names to old Plants; and, as he became sensible, that no Circumstance had a more evident Tendency to create Confusion and Disorder in Botany, he was resolv'd to rectify this Mistake, which was, perhaps, adverted to by few except himself. Accordingly, in 1720. he presented the World with a second Index, in two *Quarto* Volumes, to which he has prefix'd a new and large Preface, with a Plan, and short History, of the Physic-garden. In the Preface to this Work, he affords us an Instance of that disinterested Candour, and noble Humility of Soul, which is, at once, the peculiar Glory of human Nature, and the distinguishing Badge of every Mind that is truly great. It is customary for Men to be blind to the Imperfections of their mental, as well as of their natural Offspring: Indulgent Fathers, and tender Mothers, are not fonder of their vicious, deform'd, and ill-dispos'd Children, than some Authors are of their own Productions, however lame, monstrous, incoherent, and absurd. How far the incomparable *Boerhaave* was remov'd from this Weakness, so destructive of the true Interests of Truth, the Reader may judge from the following Translation of his own Words in the above-mention'd Preface.

"In this Edition I have endeavour'd to avoid the Innovation of Names, as much as the Nature of the Thing would possibly allow. In my former Index I transgressed against this fundamental Law, by imposing new Names upon Plants, which were long ago much better known by other Denominations. I ingenuously confess my Error, and am heartily sorry for my Fault. The Hurry in which the Work was compil'd, and my Mind not being employ'd on Botanical Subjects for a great while before, laid a fatal Foundation for my Error, which I now endeavour to amend; and the few Transgressions of this kind, which are found in the present Performance, will, I hope, be pardon'd by such as have any tolerable Share of Goodness, or a sympathizing Sense of the Frailties to which Mankind is unavoidably subjected. But I am of Opinion, that nothing more fatal can befall Botany, than that every Author should, without any Necessity, and with no other View than the Gratification of his own Caprice, impose new Names on Plants which were before accurately describ'd, and properly denominated."

Nothing paints a truly great Man in Colours that strike the Eyes of the discerning Mind with more Energy, and captivating Force, than a Confession of his Weakness from his own Mouth. He did not use the low and disingenuous Arts of Detraction and Obloquy, in order to establish his own Fame as a Botanist; for his History of his Predecessors is one continu'd Strain of Praise and Approbation. Men who want Merit themselves, are only fond of stripping others of theirs, and raising a short-liv'd Character upon the Ruins of real and uncontested Worth.

His Industry, and conscientious Discharge of the Office with which he was entrusted, appears from this Circumstance, that, in the Space of ten Years, the Time between the Publication of his first and second Indexes, he had enrich'd the Physic-garden with double the Number of Plants it formerly contain'd. But this was not all; he discover'd a fine Taste by the happy Choice he made of them, and the beautiful and regular Order into which he dispos'd them: And, as they were rang'd with a refin'd Taste, so they were cultivated with the nicest Judgment; for it must not be forgot, that all this Variety of delicate and tender Plants, under *Boerhaave's* Management, acquir'd a far greater Strength and Vigour, than the same Plants generally do under the Care and Conduct of other Botanists.

In the Conduct of his Botanical Works, he has discover'd a Mind open to Truth, and entirely free from that base and servile Attachment to Names and Authority, which has, in all Ages, prov'd the Bane of Learning and good Sense. He had a Judgment of his own, and bravely dar'd to use it. He follow'd Truth where-ever she led him, and did not, like some of his Predecessors, blindly follow the Methods of *Ray* and *Morison*, but selected, from a Variety of Authors, such Materials as were proper for forming a better and less exceptionable System; and

VOL. I.

where he found these defective, he added what he thought proper of his own. *Linnaeus*, a competent Judge of these Matters, affirms that he has form'd his *Genera Plantarum* in the most judicious manner; since he was the first of all the Botanists who call'd in to his Assistance all the Parts of Plants which concur to Fructification, and gave so accurate and minute a Description of them, as to render the Arts of Sculpture and Colouring almost entirely useless. *John Baubine*, *Morison*, *Tournefort*, and some others, tho' justly celebrated for enlarging the Catalogue of Plants, and classing them more judiciously than their Predecessors had done, yet added a fresh Load to Botany, before too burdensome to the Memory, by fixing new-coin'd Names to such Plants as were accurately enough described under old ones full as proper. This Misfortune made *Boerhaave* wait impatiently for the Publication of the *Pinax*, expected from Consul *Sherard*, who, in that Work, design'd to fix the various Names given to each Plant, in a manner so correct and accurate, that there should not remain the least Motive or Temptation, for the future, to forge any new Appellations. By this means he proposed to fix a Standard in this Part of Botany, and render it immutable and invariable for ever after. But I don't find this has ever been publish'd.

Tho' it is certain the individual Species of Plants never vary essentially from themselves, yet it is equally obvious, that, by Difference of Soil, Situation, and Culture, they may assume such a Variety of external Appearances as to deceive any one, who does not, with *Boerhaave*, distinguish them by the Parts of Fructification, which never alter. This seems to be the peculiar Excellency of *Boerhaave's* Method, above all others the World has hitherto seen. Since Botanists, after comparing Plants thus settled with the Descriptions of Authors, have collected all the various Names given by different Authors to each Plant; and since *Vaillant*, and some others, have furnish'd us with exact Descriptions and Delineations of them, according to what they really are, in the several Places where they are naturally produced; and by preserving them complete and entire, by means of proper Leaves of Paper, form'd to perfect an *Hortus Siccus*, they have been able to fix the precise Number of Plants hitherto known, and to secure the distinct and discriminate Knowledge of them to the latest Posterity: This, amongst others, is one Advantage, which we originally owe to the Perfection and Extent of Mr. *Boerhaave's* System. The Publication of his Index, abstracting from its own Perfection, produced a very happy Effect, both with regard to himself, and other Botanists, who before were unwilling to communicate their *Duplicates*, without an Assurance, that they should, in return, have their Deficiencies supplied: But when his Index appear'd, they perceived he was possess'd of what they wanted; a Circumstance, from which he was certain of obtaining his Requests from them on the Foot of Exchange. Thus the same Plant came under the Inspection and Management of different Botanists, by which means each had an Opportunity of making his own Observations on it; a Circumstance which tends more to the Advancement of Botany, than perhaps every one is aware of. To his Skill in Botany he added the most extensive and distinguish'd Gratitude; for in an Oration deliver'd in 1731. on resigning his Professorship, he immortalizes the Names of his Correspondents; and, in the warmest Strains of Gratitude, recites the Friendships and Favours of the *Sherards*, Sir *Hans Sloane*, Baron *Bassand*, and about forty more of different Nations.

Besides, his Botanical Knowledge was not of the barren Kind; for it furnish'd him with new Subjects for Chymical Operations, and new Medicines for Use. About seventeen Years after the Publication of his Index, he, in his Lectures, gave a full Description of the Plants, together with an Account of their Virtues; but he never published these, which is much to be lamented.

I shall now proceed to specify some of the modern Discoveries, relative to the Structure and Vegetation of Plants.

The STRUCTURE of VEGETABLES.

In treating this curious Subject, we shall pursue that Method, which, as Dr. *Grew* justly observes, is follow'd by Nature herself, in her continued Series of Vegetations, proceeding from the Seed sown to the Formation of the Root, Trunk, Branch, Leaf, Flower, Fruit, and, last of all, to the Seed to be sown again; to every one of which we shall speak in their particular Order.

The Seed of a Plant, then, is that Part by which the Plant is propagated, and consists of an Embryo, with its Coat or Cover; which Embryo contains the whole Plant in Miniature; and is therefore call'd the Gem or Bud, and is rooted in the Placenta or Cotyledon; which last serves the same Purposes in Vegetables, as the Secundines, or the Chorion and Amnion, in Animals.

But tho' the Constitution of the Seed is essentially the same in all Vegetables, yet, as some are more convenient for Observation than others, we shall chuse to instance the great Garden-bean; which, if we dissect, we shall find cloath'd with a double Vest or Coat. These, while the Bean is green, are separable, and easily distinguish'd; but, when it is dry, cleave so close together,

together, that the Eye, not before instructed, will judge them but one; the inner Coat (which is of the most rare Contexture) so far shrinking up as to seem only the Roughness of the outer.

At the thick End of the Bean, in the outer Coat, there is a very small Foramen or Hole, which, in Dissection, is found to terminate against the Point of that Part call'd the Radicle, of which we shall speak hereafter; and is of that Capacity as to admit a small Wyre, and is most conspicuous in a green Bean.

This Foramen may be observed, not only in the great Garden-bean, but also in the other Kinds; in the *French* Bean very plainly, in Pease, Lupines, Vetches, Lentiles, and other Pulse; and in many Seeds not reckon'd of this Kindred, as in that of Fenugreek, Goats-rue, and others; in many of which it is so very small, as scarcely, without the Help of Glasses, to be discover'd; and in some not without cutting off Part of the Seed, which otherwise would intercept the Sight.

All Seeds which have thick or hard Coats, have the same likewise perforated in this or some other manner; and accordingly, altho' the Coats of such Seeds as are lodged in Shells or Stones, being thin, are not visibly perforated; yet the Stones and Shells themselves always are.

And for the sake of this Aperture it is, that Acorns, Nuts, Beans, Cucumbers, and most other Seeds, are, in their Formation, so placed, that the Radicle still stands next it, that, upon Vegetation, it may have a free and ready Passage into the Mould.

That this Foramen exists, even in old setting Beans, likewise appears, upon their being soak'd for some time in Water; for then taking them out, and crushing them a little, many small Bubbles will alternately arise, and break upon them. And, indeed, a free Access of the Air is as absolutely necessary to maintain the Principle of Vegetation in the dry Seed, (tho' in a less Degree) as to nourish the Plant when germinated; which is well known to the Seedsmen, who find by Experience, that all sorts of Seeds are best preserved, if kept in the Pods or Husks wherein they grew, and not shut up too close from the Air.

The outer Coats of the Bean, then, being stripp'd off, the proper Seed shews itself, which, as we before observed, consists of a main Body, Cover, or Cotyledon, and an Embryo, or young Plant; which last may also be distinguish'd into two Parts, the Radicle, and the Plume.

Now the main Body is not one entire Piece, but is always divided lengthwise into two Halves or Lobes, which are both join'd together at the Basis of the Bean. These Lobes, in dry Beans, are but difficultly separated or observed; but in young ones, especially boil'd, they easily slip asunder.

There are some few Seeds, indeed, which are not divided into two Lobes, but more; as that of Cresses, which have six; and some are not at all divided, but entire, as Corn: Excepting which few, all other Seeds, even the smallest, are divided, like the Bean, into just two Lobes. But in all Seeds whatsoever, they perform the same Office to the infant Plant, as the Membranes, (call'd *Chorion* and *Amnion* by Anatomists) *Placenta* or *Cotyledons*, call'd the After-birth, do to the Embryos of Animals. When the Plant begins to take Root, and receives some Nourishment from the Earth, these Lobes, in all except those of the Pulse Kind, become the *Folia Seminalia*, or Seed-leaves, which still serve to protect the young Plant from Injuries; but, as soon as it has taken sufficient Root in the Earth to shift for itself, the Plant may be said to be born; and then these Seed-leaves, being of no farther Use, wither and drop off, like the aforesaid Membranes in Animals.

Without these Lobes, and somewhat above the thicker End of the Bean, stands the Radicle, which is so call'd, because, upon the Vegetation of the Seed, it becomes the Root of the Plant. Now this is immediately visible, upon divesting the Bean of its Coats, and is of a whiter Colour, and more glossy, than the main Body, especially in a young Bean.

The next Part to be consider'd is the Plume, which lies inclosed in two small Cavities, form'd in the Lobes of the Bean for its Reception. Its Colour comes near to that of the Radicle, to the Basis of which it is fix'd; tho' it has quite a contrary Germination, that is, towards the thin End of the Bean; and this is that Part, which, in Process of Time, becomes the Body or Trunk of the Vegetable.

It is not, like the Radicle, one entire Body, but is divided at its loose End into divers Pieces, all close set together, like Feathers, in a Bunch, whence it derives its Name; and these are so very close, that only two or three of the outermost are, at first, visible; but, upon a nice and curious Separation, others still more inward may be discover'd; all which are so many true Leaves, already form'd, tho' not display'd, intended for the said Trunk, and folded up with it, as afterwards appears upon the sprouting of the Bean. In a *French* Bean the two outermost of these are very fair and conspicuous; and in a great Garden-bean two very small Plumes frequently, if not always, stand one on each Side the great one just now described, from which they differ in nothing but the Size. In many Seeds, indeed, nothing but the Trunk is visible, without any Leaves; notwithstanding

which these last never fail to exert themselves, after the Seed has lain some time in the Ground. The Seed, thus compos'd, is inclosed within two common Membranes, the outer thin, and the inner thicker; and one proper, which we shall call the Cuticle, which covers both the Outside and Inside of the Lobes, as also the Radicle and Plume.

But, before we proceed any farther in the Description of the different Parts of Plants, it will be highly worth while to take Notice of the great Analogy there is betwixt Plants and Animals, in as few Words as may be.

First, then, as a Mixture of Male and Female is necessary in Animals towards Generation, so it is in Plants, as appears, beyond all manner of Contradiction, by a great Number of Experiments.

Again, as the first perceivable Effect of the Mixture of Sexes, in Animals, is the Production of an Egg, which is deposited in the Matrix or Womb of the Female Parent; or else laid in a Nest, to be hatch'd by the Heat of the Mother's Body; or perhaps conceal'd by the Parent in some proper Place, in order to be brought to Perfection by the Heat of the Sun: It is just the same in Plants, where the first Effect of the Mixture of Sexes is the Production of a Seed, which may very properly be call'd the Egg of the Plant; which, when deposited in the Earth, as a proper Matrix or Womb, is, in its Season, as it were, hatch'd by the Heat of the Sun, and becomes a Plant of the same Species as its Parent.

The Embryo of Animals, whilst in the Egg, is inclosed in Membranes, and is nourish'd by a Juice contain'd in the Egg, which it receives by means of a Navel-string, or something that performs the Office thereof; being first collected by a Congeries or great Number of Vessels, which is call'd the Placenta; or, in some Animals, the Cotyledons. In the Seeds of Plants, also, the Embryo is contain'd in Membranes, and the infant Plant is for some time nourish'd by Vessels analogous to the Navel-string, and Placenta, or Cotyledons, which convey to the Embryo proper Nourishment.

When the Animal is born, or hatch'd, the Way of its Nourishment is then very different from what it was in the Egg; for then there are a great Number of small Vessels, call'd by Anatomists Lacteals, which take up, from the Intestines, the finest Parts of the Aliment or Food which the Animal eats, and convey it to the Blood-vessels, where it circulates with the rest of the Juices, till it is again discharged from the Animal by means of Perspiration, Urine, or some other Evacuation. In Plants, the Fibres of the Root perform the Office of the Lacteals, and convey Nourishment to the Plant; which, after having circulated in its Vessels, is again thrown off by Perspiration. And, as curious Observers have found, that a Man in Health perspires about thirty-one Ounces in twenty-four Hours; so Dr. *Hales* has demonstrated by Experiment, that a Sun-flower perspires twenty-two Ounces in the same Time; not that the Sun-flower is the only Plant that perspires, nor a Man the only Animal; but all Plants and Animals throw off vast Quantities of their Juices by Perspiration, some more, and some less, when in Health.

Is the Air necessary to the Support of Animals? It is not less so to the Life of Vegetables; for all Plants whatever will soon wither and die, when deprived of a free Intercourse with the external Air.

Are Animals kept alive, nourish'd, and supported, by the Circulation of the Blood? The Circulation of the Sap is equally necessary to Vegetables, which cannot subsist without it.

And here we cannot sufficiently admire the Wisdom of the great CREATOR, in this surprising Harmony between Plants and Animals, than which we need no other Proof, that God is a God of Order. And it may be no ill Lesson of Humility to us, that as even the very Worm, we tread under our Feet, can say to Man, who is so wonderfully and fearfully made, *I am thy Sister*; so likewise the basest and most noisome Weed is, as well as ourselves, a Link of that golden Chain, by which the Poets feign the World to be fasten'd to the Throne of Jupiter.

The Lobes, as we have already observed, answer the same Purposes as the Membranes in Animal Fœtuses; for between these the tender Embryo is warmly and safely lodged; and by that means secured from all external Injuries, which it might otherwise sustain from the Mould, or the Access of noxious Colds; and this is continued till the little Plant is somewhat inur'd to its new Element, and its Root tolerably fix'd in the Ground, when these two Lobes become the *Folia Seminalia*, or Seed-leaves, whose Office it is still to protect the tender Plant, till the Plume is become sufficiently strong and expanded.

Nor is this the only End they answer; for while they adhere to the little Embryo, they not only guard and defend it in the above-mention'd manner, but likewise prepare and purify the cruder Juice the Plant is to receive from the Earth, by straining it thro' their own Body, and assimilating it to their own Nature; which Nourishment the little Plant receives, and draws to itself by a great Number of small branching Vessels, which it sends into the Body of the Placenta, and which answer the same

same Purposes as the *Funes Umbilicales*, or Navel-strings, in Animals.

Moreover, we find that every Placenta or Cotyledon of a Seed abounds for the most part with a Balsam, disposed in proper Cells, which is oily and tenacious, and not only serves to defend the Embryo from any extraneous Moisture, but, by its Viscidity, to entangle and retain that fine, pure, volatile Spirit, which is the ultimate Production of the Plant; and which is call'd the *Spiritus Rector*, or *Prevailing Spirit*. This Oil, it is true, is never observed to enter into the Vessels of the Embryo, which are too fine to admit so thick a Fluid; but the Spirit, being quicken'd by an active Power, may probably breathe that vital Principle into the Juices which nourish the Embryo, which stamps upon it the Character which distinguishes the Family; after which every thing is changed into the Nature of that particular Plant.

But, before we dismiss the Seed, it may not be improper to observe, that every Plant, even the least and most inconsiderable, arises from a Seed, nor is produced any other way; for, tho' the Earth nourishes every Individual, yet it cannot form an organical Body; and indeed, if it could, it must be endow'd with all the Omnipotence of the Creator.

Having thus taken a View of the Seed, we come next to the Root, or that Part of a Plant, by which it adheres to the Earth, and receives its Nourishment; but, before we proceed in our Anatomy, it may not be amiss to observe, that the Roots of Plants being of various Forms, are accordingly distinguished by Botanists. See the Explications of the different Roots under this Article.

But notwithstanding these Varieties, in regard to Matter of Form, the essential Parts of the Root seem to be the same in all; and are,

1. The Bark.

2. The Wood, or lignous Body; or, in the more herbaceous Plants, something equivalent to it.

3. The Medulla, or Pith.

The Bark, the Wood, and the Pith of the Root, seem to be nothing different from those of the Trunk and Branches. Its Use is to receive the nutritious Juices of the Earth into its Vessels, which are thence convey'd into the Trunk by corresponding Vessels therein; or, according to the Opinion of some, the Vessels of the Trunk are only a Continuation of the Vessels of the Root. Therefore what we are going to observe of the Bark, Wood, and Pith, is to be understood both of those of the Trunk and Branches, as well as those of the Root.

The Bark may be divided into the outward Skin, or Cuticle; and the inner or cortical Substance.

The outward Skin, or Cuticle, seems to derive its Origin from the inner or cortical Substance, and to be nothing more than the old Bark dried and shrivel'd up, being supplanted yearly by a new one, after the same manner as a Snake casts her Skin.

It is composed of little Bladders, or Vesicles, horizontally placed, so as to form a Ring; among which are also intermix'd, more or less, several parallel woody Fibres, or Sap-vessels.

The inner Substance consists, 1. of several Enfoldments of woody Fibres, interwoven in the manner of a Net, and wrapping over each other like the Coats of an Onion. 2. Of a great many little Bladders, or Vesicles, sometimes of an oval, and sometimes an angular Figure, which fill up the Spots or Spaces between the said Fibres; and are placed, as it were, in Lines horizontally towards the Wood. And, 3. of its own peculiar Vessels, which contain the proper and specific Juice of the Plant.

The woody Fibres are certain tubular Bodies, hollow for the Reception of their proper Fluids; and are composed of a great many smaller concave Fibres, disposed in a quadrangular Figure, and communicating one with another. These Vessels do not run in right Lines or Parallels; but, for the most part, are gather'd together, as it were, in little Bundles; which, when extended, or separated from each other, form a kind of Net, or reticular Coat, with which they embrace the Wood. Dr. Grew calls them the lymphatic Ducts, from their containing an aqueous, limpid, and almost insipid Fluid.

The Bladders, or Vesicles, which are full of a Liquor they receive from the woody Fibres, are, for the most part, placed horizontally in right Lines, which run from the Cuticle towards the Wood, and are call'd by Dr. Grew the Parenchyma of the Bark, as being analogous to the Parenchyma in the Bowels of Animals. Into these transverse Vesicles the ascending Fluid, which may be call'd the Chyle of the Tree, is deposited; where having remain'd for some time, and being intimately mix'd with the former Juice, it is at length exalted into the Nature of an Aliment, and from thence distributed to the other Parts of the Plant. And as there is great Plenty of this kind of Fluid in these little Bladders, or Vesicles, it is no Wonder, that the Bark of a Tree should supply the Fire with a stronger and more abundant Pabulum, than any other Part.

The Contents of the Sap-vessels are different in various Plants,

as a Resin in the Fir, Milk in Spurge, &c. This Juice Mr. Ray chuses to call the Quintessence of the Plant, as containing not only its Smell and Taste, but all its Virtues.

The Wood consists of the same Parts, and those connected in the same manner as the Bark, viz. 1. Of certain hollow woody Fibres, gather'd together, as it were, in little Bundles, and interwove in the manner of a Net. 2. Of little Bladders, which fill up the Spaces between the said Fibres. 3. Of the Vessels containing the specific Juice of the Plant. And, 4. of certain Vessels, which we shall call Air-vessels, and which answer to the Lungs in Animals.

The woody Fibres are exactly the same as in the Bark, only there is this Difference between them, that, upon cutting the Trunk transversely, the Sap will voluntarily flow from those in the Bark, but seldom or never from these. They compose far the greatest Part of the Wood, and their Use is for the Strength and Compactness of it. Malpighi will have them communicate one with another, like the Branches of the Veins of Animals.

The little Bladders are rank'd in Lines, between the Fibres and Vessels, from the Bark to the Pith; tho' they do not all extend quite so far, being sometimes interrupted by little Circles, which rise towards the inmost Parts of the Wood. In Shrubs, and those which have not a very thick woody Body, and are pretty pithy, these Bladders are visibly extended as far as the Pith, and resolve themselves into it; whence it plainly appears, that the Bladders in the Bark, and those in the Pith, are of the same Nature. They are composed of oval Bodies, which communicate one with another; whence they are swell'd with the Juice of the Plant, in some with a limpid, in others with a tinctur'd Liquor. Each Bladder consists of a fine transparent Membrane; and, in different Plants, they are very different, both in Number, Size, Texture, and Extension.

The Vessels containing the proper and essential Juice of the Plant are disposed in as many Circles as there are Coats, or Strata, of annual Increase from the Pith to the Bark; for these Strata are the same with the inner Parts of the Bark, which every Year apply themselves to the Wood, being render'd thus compact by the Pressure of the woody Fibres, which surround them on all Sides.

The Air-vessels consist of certain spiral Lines, each of which is composed of a great many squamous parallel Fibres, and of a great Number of smaller Fibres, which run across these, and cover them in the manner of a Coat.

These Air-pipes contain, as it were, certain pulmonary Vessels; and, where they communicate one with another, are sometimes of an oval Form, and always closed at the other End, so that they bear no small Resemblance to the Vessels in the Lungs of Insects. And Nature seems to have given both to Plants and Insects, instead of Lungs, these spiral Vessels, thus composed of hollow squamous Fibres, for the better bearing the sudden Pressure and Dilatation of the Air, in those violent Flexures which Trees are liable to, and the elastic Motion of the included Air.

They are mostly supported, surrounded on all Sides, and sometimes streighten'd by the woody Fibres; whence, on cutting the Wood across, their Orifices frequently appear oval or round, and sometimes angular. They run up almost in right Lines from the Root to the Trunk, whence they are dispersed thro' the Branches, and, growing curved in the Leaves, are interwoven in the manner of a Net. These Vessels, except the Sap-vessels of the Bark, are by far the largest of all, and occur in great Plenty thro' the whole Substance of the Wood; but none have ever been observed in the Bark.

The Pith, which was formerly look'd upon as analogous to the Heart and Brain in Animals, consists of a great Number of little Globules, rank'd lengthways. These Globules, which are so many little Bladders, or membranous Vesicles, in most Plants are of a round, and in some of an angular or cubical Figure, consisting of five or eight Sides.

Now the Pith, tho' it has a different Name from the spongy Substance of the Wood and Bark, yet is of the same Nature and Substance, as appears not only from its Texture, but Continuity; for the little Bladders, which form that spongy Substance, run quite from the Bark thro' the woody Fibres, and end in the Pith; whence it is plain, they partake of the same Nature. And, indeed, they differ in nothing but Size, the Vesicles of the Pith being very large, those of the Bark less, and those of the Wood the smallest of all. The Quantity of Pith is likewise different in various Plants; and is, in general, more in Shrubs, and the herbaceous Kinds, in proportion to their Size, than in Trees. It may be distinguish'd into its Vessels and Bladders; the first of which are placed at the Extremities of the Pith, which they circle round, and embrace. These Vessels contain the proper and essential Juice of the Plant.

The Bladders of the Pith are likewise of different Magnitudes in different Plants, at least an hundred times larger in some than in others; as in the common Thistle, for Example, than in the Oak. And it must also be observed, that the Size of these Bladders bears no Proportion to the Quantity of Pith; for

for in the Pith of the Elder-tree, which is more in Quantity than that of the Berberry-tree, the Bladders which compose it are as small again as those of the latter.

The Pith is only succulent or sappy the first Year, its Bladders, after that, growing dry, lax, and soft; and this Sap it probably receives from the reticular Vessels which surround it.

The Texture of the Branch is exactly the same with that of the Trunk.

But here we must not forget two very material Parts, remark'd by the curious Observers of Nature; and these are the Knots, and the Buds.

The Knots are those Parts of a Plant in which the Buds are lodged, and from whence it shoots out its Branches. They not only serve as Abutments for the dilating Sap to exert its Force upon, but also to prevent the rarefy'd Sap's too free Retreat from the Pith.

The Buds, to use Mr. Bradley's Words, have their first Rise in the Pith; they are there framed, and as they become fit for Action, by being furnish'd with every necessary Part for Vegetation, they are forced along certain Channells, till they meet the Air at the tender Bark, thro' which they make their Way, and would drop to the Ground, were they not restrain'd by a Number of Sap-vessels, which serve as so many Roots to nourish them from the Body of the Tree. These Buds are, in every respect, as perfect as the Seed, or rather more so; for a Bud contains a whole Plant, roll'd up in itself; and has, for the most part, its Juices so well digested, as to come sooner to bear Fruit than the Plant wrapp'd up in the Seed.

The Difference between a Bud and a Seed is, that a Seed consists of Lobes and Ear-leaves, which include the young Plant, and serve to give it the first Stamp, by teaching it what kind of Juices it ought to draw from the Earth for its Nourishment: But a Bud has no Occasion for such Ear-leaves, because it takes Root immediately in the Body of the Tree, where the Juices are already fit for it.

Buds likewise differ from Seeds, inasmuch as they are always constant to the Mother-tree, and exact Representatives of the Plant that produced them; whereas Seeds multiply their own Species, with Variety of Complexions, all the Plants produced by them being some way different from one another, either by some little Variation in the Colour of the Flower, the Taste, or Time of ripening of their Fruit, the Flower or Figure of it, or some Difference in the Shape or Colour of the Leaves. And Nature, in this respect, seems to observe the same Conduct as amongst Animals, where no two Faces are exactly alike; and where no Offspring perfectly resembles either Mother or Sire.

This constant Likeness, therefore, of the Plant, proceeding from the Bud to the Mother-tree, seems as if design'd on purpose to support the Reputation of the Mother-plant, and, in some measure, to make amends to Plants for their Deficiency in the want of local Motion; since, by the Bud, any particular Fruit, or Tree of Merit, may come to be naturaliz'd in any Part of the World.

But it must be observ'd, that the Buds are of several Sorts, viz. either Leaf-buds, or Blossom-buds. The Difference between them may be known in most sorts of Fruit-trees, before they open, by observing, that the Leaf-buds are long, thin, and pointed; but the Blossom-buds short and turgid. The Juices also, in the first, are more fluent and aqueous; and, in the latter, more digested and gummy. But both these sorts of Buds proceed from the Pith of the young Wood, and are disposed for different Offices, as the Plant or Branches that produce them are more or less vigorous. The most vigorous bring Leaf-buds, and those that are smaller, and seem to be less nourish'd, produce Blossom-buds.

They are spread into Branches, when the Temper of the Air is such, as to render the Sap or Juices of the Plant of such a Fluidity as to circulate thro' the Vessels without Interruption; when the Sap, being sufficiently fluid, fills the Buds, and they, by degrees, are open'd into Shoots and Branches, every one of which is properly a Tree growing upon another Tree; which makes it practicable to cut off Branches from any Tree, where we please, without destroying the Tree; whereas, if a Tree was one entire Body, as the Body of an Animal, the cutting off the Branch would endanger the Whole.

But the Buds are not confin'd to the Parts above Ground only, being fram'd in the Pith of the Root, as well as in that of any other Part; and here it is worthy our Notice, that those which are form'd in the Root, are impress'd with the Form of the Root, when put in Action; and so those Buds which are form'd in the Branches, are also model'd for Branches, when they begin to act; but, in their Principles, they are both the same. For if we expose the Roots of a Tree to the Air, after allowing them a little Time to be acquainted with the Element, they will put out Buds in such sort, as to produce Leaves; and if we lay down a Branch of a Tree in the Earth, after it has had time to reconcile itself to that Situation, those Buds form'd in the Pith, when they begin to move, instead of Leaves, or Flowers, or Fruit, which they would have produc'd, if rais'd in the Air, will now bring forth Roots, and from them others.

And hence it is likewise observable, that as the Pith, of consequence, is only found in the younger Shoots; so, if we would increase a Tree by Layers, those Layers must be of the young Shoots, where this Pith is perfect; otherwise they will want those Seeds or Buds, so necessary to the Production of the Root.

The Leaf consists of the same Parts as the Trunk and Branches, that is, woody Fibres, or Lympheducts, Vessels containing the specific Juice of the Plant, Air-vessels, a Parenchyma, or Ranks of little Bladders, which fill up the Spaces between the reticular Fibres, and a Cuticle; all which are substantially the same with those of the Branches: For the Cuticle of the Leaf, for Example, is no more than the Amplification of that of the Branch; as the Fibres or Nerves, dispersed thro' the Leaf, are only the Ramifications of the Wood of the Branch, or lignous Body. So likewise the Parenchyma of the Leaf, which lies betwixt the Nerves, and fills all up, is nothing else but the Continuations of the cortical Body, or the inner Part of the Bark, from the Branch into itself; as in most Plants, with a fat Leaf, may easily be discern'd. For it must be observed, that the Stalk of the Leaf, which is composed of all these, where it enters the Leaf, divides itself, like another Trunk, into a great Number of Branches; and these again are subdivided into a great many lesser Branches or Twigs, which mutually crossing each other, compose a kind of Net-work, which is very visible in the Leaves of some Plants, particularly on the back Side of those of Sage.

That these Fibres are likewise accompanied by the Vessels containing the specific Juice of the Plant, is evident from the different Colour of their Contents, which discovers itself upon Dissection of the Leaves, as a Milk in those of Spurge and Succory, and in those of Celandine a yellowish Liquid. And tho' this is not so apparent in the Leaves of many Plants, where these Vessels are only full of a limpid aqueous Fluid, yet the aforesaid Instances are sufficient to convince us, that they are present in all.

The Spaces between these Vessels and Fibres, being fill'd up by the above-mention'd little Bladders, form the Parenchyma, or fleshy Part of the Leaf; and these Bladders, according to the Nature of the Sap they contain, and the Closeness or Laxity of their Pores, are of different Figures upon the Surface of the Leaf, as in some angular, in others quite irregular.

Between these Bladders and the reticular Fibres, Malpighi observes, that there are several little Cells or Pores dispersed, which serve for the Discharge of some Fluid, or the Exhalation of some Vapour.

The Whole is cover'd with a fine Cuticle, or Epidermis, which partakes of the Colour of its Contents.

Dr. Grew divides the Flowers of Plants into the Empalement, Foliation, and Attire.

The Empalement is the outermost Part of a Flower, which covers it before it is blown, and forms a kind of Support for it afterwards. This is call'd by some the Perianthium, as surrounding the Flower; and by others, improperly, the Calix, or Cup; for the Calix is properly the hollow Cup form'd by the Perianthium, or Empalement, out of which the other Parts of the Flower grow. There are some Flowers whose Petals, or Flower-leaves, have a firm and strong Basis, sufficient to support themselves, and therefore stand in need of no Empalement or Perianthium; and accordingly Nature has given them none, as may be seen in the Tulip. These, however, have a Calix or Cup.

By the Foliation Dr. Grew means the Assemblage of the Petala, or those finely colour'd Flower-leaves, which constitute the Beauty of the Flower. These Petala, or Flower-leaves, grow generally immediately within the Perianthium, or Empalement, from the Edges of the Calix or Cup, and inclose the Attire, or Male and Female Parts of the Flower. Some Flowers consist of one Petal, or Flower-leaf, and are of different Shapes in different Plants, as that of a Bell, or a Funnel; and sometimes of two, three, four, or five Petals; and sometimes of a Number, as in the Marygold and Sun-flower.

There is a large Class of Plants which have no Petals at all, and therefore are call'd apetalous, as Hops, Mercury, Nettles, and Docks. These are also call'd stameneous Flowers, from their great Number of Stamina or Chives.

These Petals are design'd by Nature for the Safeguard of the Parts of Generation in the Flower; and hence we see them expand themselves at the Rising of the Sun, to receive the Heat; and close up, some more, others less, at the Approach of Rain or Night. Nor is this their only Office; they also draw and convey Nourishment to the Embryo; Fruits, and Seeds; for as soon as the Pistil is form'd into a small Fruit, now impregnated with its minute seminal Tree, furnish'd with its Secundines or Membranes, the Blossom falls off, leaving this new-form'd Egg, or first-set Fruit, to imbibe Nourishment for itself, and the Foetus with which it is impregnated; which Nourishment is brought within the Reach and Power of its Suction by the adjoining Leaves.

We now come to the generative Parts of Plants, call'd by Dr. Grew the Artire. These consist of the Male Parts, call'd the Stamina or Chives, and Apices; and the Female Parts, call'd the Pistillum or Stylus.

The Stamina are those fine Threads which grow up within the Foliage, surrounding the Pistil, as may be seen in Tulips and Lilies.

On the Tops of these Stamina, or Chives, are placed the Apices, or little Knobs, which may properly be call'd the Testicles of Flowers; because they contain the *Farina fecundans*, or Seed necessary for the Impregnation of the Pistillum, which may be call'd the Womb of the Plant.

In some Flowers these Stamina are exceedingly short, and in others there are none at all; but in those the Apices, with the *Farina fecundans*, or impregnating Dust, are fix'd immediately to the Capsula, or Pod, which contains the Seed.

In other Flowers, as the Thistle, and Lettuce, several of these Stamina, uniting together, form a little kind of Tube, or Pipe, which incloses the Apices, furnish'd with their impregnating Dust.

The *Farina fecundans*, or impregnating Dust, is form'd in the Apices, which, when ripe, burst; and then the *Farina* falls upon the Head of the Pistil, or Female Part of the Flower; and is thence convey'd to the Matrix, or Womb, in order to impregnate the Seed.

This *Farina fecundans* is what is gather'd by the Bees, in order to make their Wax.

The Pistil is the Female Part of the Plant. It grows upright from the very Middle of the Cavity form'd by the Flower-leaves, which is call'd the Calix; and, when ripe, forms the Pod that contains the Seed, or becomes the Fruit. Sometimes the Pistil is enlarged at both Ends, in the Shape of a Pestle, whence it derives its Name; sometimes it is, as it were, only a sort of Thread; in some Plants it terminates in several Branches, or Horns, which have their Rise from as many Pods, containing Seeds; sometimes it is round, sometimes square, triangular, or oval.

The Pistil in some Flowers is cover'd, at the Top, with very fine Hairs, which make it like Velvet. In others it is furnish'd with a sort of Plume; and others are cover'd with Vesicles, or small Bladders, full of a glutinous Juice: But all Pistils, of whatever Shape they are, have little Openings at the Top, which receive the *Farina fecundans*; and have also little Channels within, which convey the same *Farina fecundans* to the Seed, in order to its Impregnation.

Some Authors make no Distinction between the Pistil and Stylus; but Malpighi, and after him Bradley, seem to call it a Pistil when it contains the Seed within it; and name that Part the Stylus, which, in some Flowers, dries and falls off, after the Impregnation of the Seed.

Many and very different are the Opinions of Authors, in regard to the Generation of Plants: Without entering into their Disputes, we shall give that Account of it, which seems to us most probable; after having observed, that most Plants are Hermaphrodites, among which some, and that the greatest Part of them, contain both the Male and Female Parts of Generation in the same Flower. Others, the Melon for Example, bear Flowers upon the same Stem, of different Sexes, the Female, which produce Fruit, and the Male, which produce none. There are also some entire Plants, which bear Flowers without Fruit; whilst others, of the same Species and Name, bear Fruit without Flowers; and they are hence distinguish'd into Male and Female Plants. Of this last Kind are the Palm-tree, Poplar, Hops and Hemp. The Male are those which produce the Flower, and the Female those which produce the Seed.

Now 'tis highly probable, that the Embryo of the young Plant, or that Part which we have before describ'd as lying in the Middle of the Seed, and which we have distinguish'd into the Radicle and Plume, is form'd by the *Farina fecundans*, which, falling down the Pistil into the Uterus or Womb of the Plant, meets there with a proper Receptacle, where it fixes; and that the Lobes of the Seed, above describ'd, which perform the same Office as the Membranes, Placenta, Cotyledons, or After-birth, do to the Young of Animals, are furnish'd by the Female Part of the Plant.

When the Male and Female Parts of the Flower are pretty near to each other, it is not difficult to conceive, how the *Farina fecundans*, or, as it may be call'd, the Male Sperm, is convey'd to the Pistil, or Womb: But when the Male and Female Flowers are at a Distance from each other upon the same Stem, but more particularly when they grow upon different Plants of the same Species, it is not so easy to comprehend how the impregnating Dust of the Male Plant is convey'd to the Female Plant, especially when they are at a great Distance from each other.

We have a Story in *Jovianus Pontanus*, which will give the Reader an Idea of the vast Distances to which this impregnating Dust may be carried. He tells us, that there was a Female Palm-tree which grew in the Wood of *Otranto*, and a Male Palm-tree at *Brindisi*, fifteen Leagues from the Female; that

the Female was barren for several Years, and bore no Fruit at all; till at last growing above the other Trees of the Wood, it began to be fruitful, and bore great Quantities, tho' there was no other Male Palm-tree nearer than that at *Brindisi*.

Most Authors, that have treated of the Generation of Plants, have quoted this History; and, I think, generally agree, that the Male Dust must be brought from the Male Tree at *Brindisi*, to the Female at *Otranto*, by the Wind; and therefore conclude, that the Wind is the Agent which carries the Dust from the Male Plant to the Female. This would be very probable, provided these Palm-trees grew betwixt the Tropics, where the Wind, for at least three Parts of the Year, blows from the East, and the Situation of the Male Tree had been towards the East of the Female; but if the Female had been placed East of the Male, it would have proved a very unfortunate Position for the Female, which must therefore have certainly been barren.

For my own part, I don't think it probable, that the Supreme Being, who always orders all the Operations of Nature to be perform'd in the best manner, should leave a Thing of so much Consequence, as that of the Generation of Plants, to be conducted by so uncertain an Agent as the Wind; which would undoubtedly leave a great Number of Plants barren, if it did not happen to blow from a right Point, just at the Time that the Dust of the Male, being arrived at Maturity, was ready to be carried to the Female Plant.

I am therefore of Opinion, that there is some Power in Nature, which has not yet been duly consider'd by the Learned, capable of affording so sure a Conveyance to the Male Dust, that it can never fail impregnating the Female.

There is a Power in Nature to which Philosophers have given the Name of *Electricity*, because first observed in Amber, call'd in Latin *Electrum*. This is an attractive or magnetic Force, which the aforesaid Amber, Glass, and many other Bodies, exert, when rubb'd till they are warm, and by which they draw to themselves any light Body that is near them, and sometimes repel the said Bodies from them. Mr. Gray, of our own Royal Society, and Monsieur du Fay, of the French Academy of Sciences, have, by their indefatigable Researches, discover'd many amazing Properties of electrical Bodies, too long to enumerate in this Place. But it is very much to our present Purpose to observe, that Bees-wax is endued with this attractive Power, at least as much as any other Body whatever, and that without any rubbing at all; and this electrical or attractive Force Bees-wax retains longer than any other Body.

Now, if we consider, that Bees-wax is little more than a Mass of the *Farina fecundans*, or impregnating Dust of Flowers, collected by the Bees; it seems very likely, that every Particle of this was endu'd with a certain electrical or attractive Force, before it was gather'd from the Flower; and if so, why may we not presume, that the Pistil or Womb of the Plant, and the *Farina fecundans*, or impregnating Dust, strongly attract each other? And as some Bodies are known to exert an attractive Force to a prodigious Distance, we may easily conceive, that it is possible for the *Farina fecundans* of a Male Palm to sail, even against the Wind, from *Brindisi* to *Otranto*, though fifteen Leagues asunder, when the Female Palm was grown high enough to receive the *Farina*, which, before that, would be intercepted in its Passage by the other Trees of the Forrest.

There are some Circumstances relating to Electricity, which seem to confirm, that what we have hinted at is, at least, one of its principal Uses. One is, that this electrical Virtue of Bodies is much diminish'd by a moist Air. Another is, that it does not exert itself so vigorously, during the Heat of the Day.

Curious Observers of Nature will discover, upon Examination, that the Generation of Plants is principally carried on in the most temperate Part of the Day, and when the Sun has been risen long enough to dry in some measure the Air, and elevate the Vapours to some Distance from the Surface of the Earth. At this time the Mulberry, and many other Trees, during the Season of their generating, may be seen surrounded, as it were, with a Cloud of Dust; and this Appearance is not observable at any other Season of the Year but that in which they generate, nor any other time of the Day but early in the Morning.

Having now dispatch'd the Structure of Plants, and their Generation, we shall next proceed to their Vegetation or Growth.

Of the Vegetation or Growth of Plants.

In order to form some Idea of the Vegetation of Plants, it will not be amiss to consider the Production of a Plant as the Result of a Chymical Process, in which Nature is the Operator, and the Person who cultivates the Ground an Assistant.

The first thing then, that is done, is to manure the Land, or, in other Words, to furnish it with an alkaline Salt. Here we must suppose, that the Earth to be manur'd was before depriv'd of all its Salts, by bearing too frequent Crops; otherwise this Part of the Operation would be unnecessary; Nature un-

assisted being abundantly sufficient to supply the Ground with a due Quantity of Salts; but, when these are taken away, Nature unaided is a long time in providing more.

These Salts, while they retain their alkaline Nature according to their known Property, divide the Earth into small Particles, and render it light, and disposed to crumble and fall in Pieces, like Lime, when Water is pour'd upon it; and thereby promote its Fertility. It is for this very Reason that frequent Ploughing, or Digging, fertilizes the Ground, and is what People mean when they talk of *making it mellow*.

When this is done, Nature furnishes these alkaline Salts with a Fluid to dissolve them, that is, they attract strongly the Vapours and Dews floating in the Air, which have already been render'd somewhat oily, by the Oils of Animals and Vegetables, which perpetually float in the Atmosphere. By these oily Dews, they are dissolv'd into a kind of Oil, *per Deliquium*, and sink into the Bosom of the Earth, which may be esteem'd as the Vessel in which this Operation, or Process of Vegetation, is perform'd; and here again they meet with an Oil, of which all Earths contain more or less.

It has been observ'd under the Article *ALKALINE*, that if Salts are mix'd with any Acid, especially when in a fluid State, an Effervescence is rais'd, with Ebullition, and a violent intestine Motion; and that they attract the Acid of the Air so strongly, as in time to be impregnated therewith, and to become entirely neutral. It is then easy to understand, that whilst these Salts lie in the Bosom of the Earth, dissolv'd into what the Chymists call an Oil *per Deliquium*, or, in other Words, a *Lixivium* or *Lye*, as they gradually attract the Acid of the Air, a gentle Effervescence, or Ebullition, must be caus'd, which must divide and break those Parts of the Soil, which before cohered strongly together, and render the Earth yet more light and mellow.

Now let us call to mind, that when alkaline Salts are digested with an Oil, they intimately unite with it, and form a penetrating deterging Substance, which is dissoluble in Water, and is of a Nature very different, both from the component alkaline Salt, and Oil; and this is commonly called Soap.

When therefore these alkaline Salts are committed to the Earth, and dissolv'd into a kind of *Lye*, meeting there with an Oil, these Salts and this Oil are digested by the Heat of the Sun, united together, and converted into a Soap much more perfect than the artificial Sort we make use of; for this last always retains some of the Acridness of its Parent Salt, which renders it unfit for the Purposes of Vegetation till neutraliz'd; whereas that form'd in the Soil is render'd entirely neutral as it is made, the Salts attracting and imbibing the Acid of the Air, at the same time that they are mixing with the Oils of the Earth, in order to be transform'd into a Soap. See *ACETUM*.

As all Vegetables whatever contain a large Quantity of Earth, it seems at first View somewhat difficult to explain, how it should be able to get there; because the Pores of the Roots are too small to admit of Earth undissolv'd, and perhaps even of Water; or, if they would admit Water, we find that utterly incapable of dissolving Earth. How therefore Earth comes to be dissolv'd, and render'd capable of entering through the Pores of the Roots, we are now endeavouring to explain.

The Solution of a Body is nothing more than dividing it into Particles small enough to swim in the Menstruum, or solvent Liquor, without being visible. Thus, when Salts of any kind are dissolv'd in Water, their Particles are so divided by the Menstruum, Water, as to become invisible whilst they float in it. Now the dividing the Earth into small Particles, in the manner just above-mention'd, is one Step towards a Solution.

Let us now consider the saponaceous neutral Juice, form'd in the Earth by an alkaline Salt, an Oil, and the Acid of the Air, as a saponaceous or soapy Menstruum, or Solvent, and see how it is capable of acting upon Earth; and, in order to make this the more plain, we shall give a very obvious Example, which falls under the Observation of every body.

When Cloaths, or Linen, or any thing else, are dirty, that is, have Concretions of Earth sticking to them, we find the most effectual way to make them clean, is to wash them in Water wherein Soap has been dissolv'd. Here then Soap penetrates the Pores of the Earth, divides it into exceeding fine Particles, and in some measure dissolves it. A saponaceous Fluid, therefore, bids the fairest of any thing we are acquainted with, to be the Menstruum or Solvent of Earth, and it is probable, that the saponaceous Fluid which is made in the Bosom of the Earth by a long Digestion, is more penetrating than any artificial Soap, and consequently more capable of dissolving Earth.

We shall be still farther confirm'd in this Opinion, if we consider this Juice of the Earth as a neutral Menstruum or Solvent; for it appears by a great Number of Chymical Experiments, that neutral Menstruums will dissolve many Bodies or Substances, especially those that are of an earthy Nature, which no other Menstruums or Solvents will touch.

From what has been said, it appears very plain, that whe the Earth has for a considerable time been, as it were, digested by the Heat of the Sun, in a saponaceous, neutral Liquor, the Rains, falling in great Quantities, dilute this saponaceous Liquor more, extract a kind of Tincture from the Earth, that is, dissolve a Quantity thereof sufficient for the Purposes of Vegetation, which, entering the Pores of the Root, is carried into the Stem of the Plant; and by this means is brought about what could not be effected by Water alone, that is, a Solution of Earth.

The Antients, who were fond of concealing all their Knowledge under Allegories, seem, however, to give some Hints of the Earth being impregnated by the Air. Thus *Homer* tells us, that when *Jupiter*, that is, the Air, lay with *Juno*, meaning the Earth, on the Top of *Gargarus*, the Flowers sprung up under them to make them a Bed.

Ἡ δὲ γὰρ καὶ ἀγλαὴ ἐμαρτὶς Κόινε παῖς ἦν παρακοίβην.
Τοῖσι δ' ὑπὸ χθονὶ δῖα φέρον νεοθηλῆα ποίην,
Λαλὸν θ' ἐρρήναι, ἰδὲ κρόνον, ἡδ' ἑάνιθον
Πικρὸν καὶ μαλακὸν ὅς ἀπὸ χθονὸς ὕψος' ἔεργε.
Τῷ ἐνὶ λεξέσθην, ἐπὶ δὲ νεοθῆλην ἔσσασθαι
Καλὴν, χρυσέην σιληναὶ δ' ἀπ' ἐπὶ πύλον ἔεργασαι. II. 14. 346, &c.

Gazing, he spoke; and, kindling at the View,
His eager Arms around the Goddess threw.
Glad Earth perceives, and from her Bosom pours
Unbidden Herbs, and voluntary Flow'rs.
Thick new-born Violets a soft Carpet spread,
And clust'ring Lotos swell'd the rising Bed:
And sudden Hyacinths the Turf bestrow,
And flamy Crocus made the Mountains glow.
There golden Clouds conceal the heav'nly Pair,
Steep'd in soft Joys, and circumfus'd with Air;
Celestial Dews, descending o'er the Ground,
Perfume the Mount, and breathe Ambrosia round. POPE.

Virgil in some measure explains this Passage in *Homer*, speaking of the Spring.

Tum Pater omnipotens fecundis Imbribus Æther
Conjugis in Gremium lætæ descendit, & omnes
Magnus alit, magno commixtus Corpore, Fœtus.

Georg. L. 2. v. 325, &c.

For then Almighty *Jove* descends, and pours
Into his buxom Bride his fruitful Show'rs.
And, mixing his large Limbs with hers, he feeds
Her Births with kindly Juice, and fosters teeming Seeds.

DRYDEN.

Both these great Poets seem equally sensible, that the Earth owes its Fecundity to the Air; but I don't know, that either they, or any more modern Authors, have explain'd the Manner how this Impregnation is brought about.

We have before observ'd a great Analogy betwixt Animals and Vegetables. It will very much illustrate the Doctrine already laid down, in regard to the Preparation of the Food of Vegetables, that is, the Juices which enter their Roots for their Nourishment, to explain the Ways which Nature takes to prepare the Food of Animals in their respective Stomachs.

There have for many Ages been great Disputes amongst Authors who have wrote upon the Animal Oeconomy, concerning the Digestion of Food taken into the Stomach. Most have agreed, that some kind of Menstruum was necessary for its Solution. Amongst these, some have affirm'd it to be an alkaline Solvent, some an acid: There are others, who have attributed this Solution to a Ferment in the Stomach, and some have imagin'd, that Digestion was perform'd by Trituration, or grinding, as it were, the Aliment, contain'd in the Stomach, betwixt the Diaphragm and the Muscles of the Belly. But *Papin*, and since him, many more tell us, that the Aliment is digested by the Heat of the Stomach, which, rarefying the Air contain'd in the Food, breaks it into small Particles, and reduces it into a Fluid. It would be endless to enter into a Detail of all the Inconsistencies which have been broached upon this Subject: I shall therefore content myself with observing, that it is probable, that the Saliva, or Spit, together with the Juices pour'd into the Stomach out of its own Glands, much of the same Nature as the Saliva, furnish a Menstruum or Dissolvent entirely neutral, of a penetrating saponaceous or soapy Nature, capable of dissolving the Aliment by the Assistance of a gentle Heat, without having recourse to an acid or alkaline Menstruum, Ferments, and Trituration. When this Operation is perform'd in the Stomach, the Aliment, thus far digested, is protruded by a gentle Pressure from the Diaphragm and Muscles of the Belly into the Intestine, or Gut, called by Anatomists the *Duodenum*, where it again meets with a Fluid of all others, perhaps, the most saponaceous and penetrating, I mean the Bile, or, as it is usually called, the Gall; and, mixing therewith, undergoes a farther Solution, is render'd more fluid, and fitted to enter the Mouths of the

Lacteal

Lacteal Vessels, which open into the Intestines, and perform the same Office to Animals, as the fibrous Parts of Roots do to Vegetables.

That the Saliva, or Spittle, is of a saponaceous Nature, any one will readily be convinc'd, that thinks it worth while to try an easy Experiment; for he will find, that Spittle will dissolve Concretions of Earth, or, in other Words, Dirt, adhering or sticking to any Substances much sooner than Water.

There is a Remedy recommended by the good old Women for Wens, or other small Swellings upon the Surface of the Body, which, however vulgar, is said to be a very good one; it is to anoint the Part with Fasting-spittle: Now the good Effect it has in these Cases, is owing to its saponaceous, penetrating Nature.

Gall is so commonly known to be a natural Soap, that it is frequently used in Washing, especially that of Oxen, which is easily procur'd, instead of artificial Soap.

It is remarkable, that the Gall of Pikes, Eels, and other Fishes of Prey, which want some Helps to Digestion which other Animals enjoy, have a Gall the most penetrating and saponaceous of all other Animals. See BILIS.

From what has been said about Digestion, it appears how little those People consult their Health, who draw off vast Quantities of their Saliva, or Spittle, by smoking, or chewing Tobacco.

From hence also it appears, that Nature is simple and uniform in preparing the Pabulum, or Food, both of Animals and Vegetables.

This Subject must not be dismissed without animadverting upon an Error of many Authors, who have compar'd the Roots of Plants to the Stomachs of Animals, which seems to be without the least Foundation; for the Food of Plants, or the Juices which are to circulate therein, are prepar'd in the Bosom of the Earth before they enter the Pores of the Root; and the Office of the Root seems to be little more than to furnish Conduits, or Pipes, to convey these Juices to the Stem; though it is probable, they may undergo some Alteration by circulating in the Vessels of the Root.

The nutritious Juices of Plants being thus prepar'd in the Bosom of the Earth, we are now to explain, how it comes to pass, that they enter into the Seed. In order to do this, we must observe, that all Bodies whatever are expanded, that is, grow larger, by Heat. When therefore a Seed has lain all Winter in the Ground without any Signs of Germination, in the Spring, as the Seed is distended by the Heat of the Sun in all its Dimensions, though never so little, there must be some vacant Spaces within it; and, as Fluids press every Way, the nutritious Juices in the Earth, with which the Seed is surrounded, will enter the Foramen, or Hole, which we have describ'd to be at one End thereof, and fill up these Vacancies. When they are once got within the Seed, being extremely penetrating, they enter the Pores of the Cotyledons, or Lobes, for the very same Reason that they first enter'd the Seed. From hence passing through the *Funis umbilicalis*, or Navel-string, they are communicated to the Radicle and Plume, which are thereby distended, or, as it were, unfolded. And thus is the Circulation in the Infant Plant carried on, till the Radicle, by degrees extending itself into the Earth, fixes there, and becomes capable at last of furnishing the whole Plant with a nutritious Juice, whilst the Plume, shooting in a contrary Direction, in a very little time, flourishes above the Surface of the Earth.

Some Gentlemen of the Royal Academy of Sciences have pretty much puzzled themselves, and their Readers, in endeavouring to give the Reasons why the Plume ascends, and the Radicle descends, when a Seed happens to be inverted in the Earth, which must often be the Case, or, in other Words, when the Plume, which ought to tend upwards, lies lowermost; or in any other Direction but perpendicular, viz. pointing to the Surface of the Earth. 'Tis certain, that Seeds of all Kinds, from the smallest to the largest, tho' thrown never so confusedly into the Earth, and lying there in all manner of Directions, notwithstanding these Disadvantages, redress themselves when they come to spring and rise with the Plume perpendicular to the Surface of the Earth; and this is one of those amazing Instances of the Wisdom of Providence, which never leaves the Welfare of its Productions to Chance, but conducts the most inconsiderable Parts of the Creation with so much Art and Oeconomy, that the more we are acquainted with it, the more we must admire it. It seems exceeding easy to explain how this Perpendicularity is effected, if we only consider, that, whilst the Radicle is fixing itself in the Earth, the Plume lies betwixt the two Lobes, which Lobes afterwards shoot out of the Ground, together with the Plume, and become the seminal Leaves in all Plants, except those of the Pulse Kind, which have something analogous to them. We must also consider, that Fluids of all Kinds contain a great Quantity of Air.

This Part then of the Operation of Vegetation seems to us to be perform'd in the following manner; the Lobes of

the Seed are distended with, and full of, the nutritious saponaceous Juice of the Earth, which Juice has in it a great Quantity of Air: This Air, being rarefied by the Heat of the Sun, is perpetually endeavouring to ascend, and get above the Surface of the Earth, that it may perspire through the Pores of the Lobes, and mix with the Atmosphere, as we find in Fact it does, when these Lobes become the seminal Leaves, and get above the Surface of the Ground; but the Pores of the Lobes being stopp'd by the surrounding Earth, the Air, which cannot yet make its Escape, acting perpetually upon the Inside of the Lobes, forces them to tend perpendicularly upwards, and with them the Plume.

If it should be said, that the Grains of Barley, in Steep in order to be made into Malt, or that Acorns, Chestnuts, Pistachio-nuts, or any other Seeds, when laid in a moist Place to sprout, send the Radicle downwards, and the Plume upwards, notwithstanding the Pores of the Lobes cannot in this Situation be stopp'd by the surrounding Earth; I answer, That even supposing the Pores of the Lobes not to be stopp'd at all, the same End will yet be answer'd, and the Lobes, together with the Plume, will be elevated perpendicularly, by the rarefied Air perspiring through the Pores, and tending upwards.

But if we may suppose, that the perspiring Air carries along with it a Portion of the nutritious Juice, in the Form of a Vapour, imperceptible to the naked Eye, as such Vapours always ascend, they must necessarily make the Lobes from whence they perspire, endeavour to do so likewise, because they must have this Tendency to rise, before they have quitted the Vessels in which they were contain'd, whilst circulating in the Lobes.

Now, if this Reasoning, in regard to the Elevation of the Plume, holds good, 'tis not necessary to mention the Reasons why the Radicle shoots downwards, because the Radicle must necessarily grow in a Direction contrary to that of the Plume.

Let us now pursue the Progress of the nutritious Juice, or Sap, and endeavour to investigate the Method taken by Nature to conduct this Embryo to a perfect State.

We have observ'd above, that the Radicle and Plume receive their first Nourishment from the Lobes. Now, when the Radicle has fix'd itself in the Earth, and has put out Fibres sufficient for the Support of the Plant, 'tis probable, that the Order of Circulation is chang'd, and that the Lobes, now about to become the seminal Leaves, receive, in their turn, Nourishment from their Root, either by the same Vessels which originally convey'd Nourishment to the Radicle, or by others, which last is most probable.

These Lobes, now become seminal Leaves, and got above Ground, are of great Use to the Plant; for, if these are taken away before the true Leaves are expanded sufficiently to perform their Office, the Plant immediately withers and dies. The Office they perform I take to be this.

'Tis a known Maxim in Hydraulics, that when a Number of Branches proceed from one large Pipe, or Canal, if one of these Branches is open'd, a greater Quantity of the Fluid circulating in these Pipes will flow to every Branch proceeding from the same Pipe. Now these seminal Leaves, once got above Ground, are in a perpetual State of Perspiration, when the Heat of the Atmosphere is sufficient to rarefy the Juices of the Plants enough for that Purpose; or in an imbibing State, when the Heat is not so great as to make them perspire, inasmuch that Plants generally perspire in the Day-time, and imbibe the Air, and its Contents, in the Night, at the Leaves. When therefore these seminal Leaves are in a State of Perspiration, a greater Quantity of the nutritious Juice is deriv'd not only to these seminal Leaves, but also to the leading Stem or Head of the Plant, which is nourish'd by Vessels proceeding from the same Trunk with those which nourish the seminal Leaves. By means of this Perspiration, there is a perpetual Supply of a nutritious Fluid drawn to the ascending Branch of the Plant for its Support and Increase, which ceases, if the Perspiration of these seminal Leaves is by any means stopp'd, or if the Leaves are taken away before the true Leaves are expanded, and grown large enough to perform their Office, and by perspiring in a due Quantity to draw a sufficient Nourishment to the leading Stem, or Head.

As soon then as the true Leaves are fit to do their Duty, there being no farther Occasion for the seminal Leaves, they immediately wither and rot off; and this Decay of the seminal Leaves is probably caused by the Air, which, entering the Pores of the true Leaves, is from thence communicated to the Air-vessels of the Trunk, which, being distended therewith to the very Root, the small Vessels, which before convey'd the nutritious Juice to the seminal Leaves, are compress'd and stopp'd up; the Consequence of which is, that the seminal Leaves must perish. Here again we have an Instance of an exact Uniformity in animal and vegetable Productions; and may observe, with Wonder, the Analogy betwixt the one and the other.

A young Animal originally receives its Nourishment from a Placenta or Cotyledon, by means of a Navel-string; but as soon as the Animal is born, and is capable of taking in its Nourishment

ment at the Mouth, there being no farther Occasion for the Placenta or Cotyledon, the Navel-string rots, and the Animal is separated from them. Mean time the Air, falling into the Vessels of the Lungs, entirely alters the Circulation of the Blood and Juices.

'Tis pretty much the same in Vegetables, where the Infant Plant is originally nourish'd by Juices which it receives from the Lobes, by means of Vessels analogous to a Navel-string; but as soon as the Mouths of the Plant, that is, the Pores of the Root, are sufficiently opened to provide for its own Support, the Circulation is somewhat altered; and the Root giving Nourishment to the Lobes, they become the seminal Leaves, which rot off as soon as the Plant has no farther Occasion for their Assistance.

Animals are kept alive by an alternate Inspiration and Expiration of the Air, that is, by the Air's being taken into, and soon after expell'd out of, the Lungs; and if this Inspiration and Expiration is prevented for but a very little time, the Animal dies. There is also something in the Air, which, in all Probability, is communicated to, and mixes with, the Blood of Animals; entering the fine Pores of the Blood-vessels in the Lungs during Inspiration. This I take to be the Acid floating in the Air; and a fresh Supply of this is so necessary to Life, that no Animal can live long, if confin'd in a close Place where there is no Communication with the external Air.

Something of the very same Nature happens to Vegetables; they inspire or take in Air at the Leaves, during the Night, and in moist Weather; and in the Day-time, especially in the Morning, when the Weather is warm, they expire, that is, the Air is expell'd from the Plant, and carries along with it a Part of the nutritious Juice or Sap, in the Form of an exceeding fine Vapour, as it does from the Lungs of Animals, where it is visible in frosty Weather. And this Acid of the Air, or whatever is so necessary to the Life of Animals, is not less so to the Life of Vegetables; for all Plants whatever will quickly die, if set in a close Place, or covered with any Vessel in such a manner, as to be depriv'd of a free Intercourse with the external Air.

The Leaves then of Vegetables may justly be esteem'd their Lungs, and are so necessary to their well-being, that if all the Leaves are pull'd off a Plant, it will neither inspire nor expire; and an immediate Stop is put to all Accretion or Growth, inasmuch that the Plant generally dies. 'Tis upon account of this Perspiration of Plants at the Leaves, that when Trees are transplanted, they cut off a great many of the Leaves and Branches, that they may not perspire too much, and kill themselves before the Roots are sufficiently fix'd in the Ground, to supply them with a due Quantity of Nourishment; and prudent Gardeners shade their Plants, when first transplanted, that the Sun may not make their Perspiration too great, before the Roots are capable of bringing a proportional Supply of Juices. But this Inspiration and Expiration of Plants at the Leaves is only necessary at that Season of the Year when they increase or grow; and accordingly we find, that against the Winter the Leaves drop off, when there is no farther Occasion for their Ministry, from all but Ever-greens, which probably always, in some Degree, inspire and expire.

We have now conducted the Plant above the Surface of the Earth: It remains, that we examine into some Circumstances relating to its Accretion or Growth, and shew by what means it is brought to Perfection.

What has been said of the seminal Leaves drawing Nourishment, holds good of all the true Leaves of a Plant; for they all bring Nourishment to themselves, and the adjacent Parts, by the Means, and for the Reasons already taken Notice of: And as the rarefy'd Air and Vapour in the Leaves is perpetually tending upwards, this still preserves the Perpendicularity of the Plant, and keeps the Stem in an upright Direction, unless it is forced to deviate from its Perpendicularity, by some intervening Accident.

There is another thing which may also contribute something towards the Perpendicularity of Plants, and that is the different Density of the Air at different Distances from the Earth. 'Tis well known, that the Air is heaviest at the Surfaces of the Earth; and that it decreases in Gravity every Inch, to the utmost Limits of the Atmosphere. Now, when a Vegetable is once got above the Surface of the Earth, the Direction of its Growth must be towards that Part where it meets the least Resistance; and as the Air is less dense above the Plant than round about, it must meet with less Resistance upwards, and consequently tend that Way.

I am sensible, that the Difference in the Air's Gravity at such little Distances from the Earth, is very small; but small as it is, it may have a considerable Effect upon so tender a thing as a young Plant.

As the Body of the Plant is daily more and more distended by the Heat of the Sun in all its Dimensions, the Fluids it contains are yet more distended by the said Cause, I say more, because Fluids having a less Degree of Cohesion than Solids, their component Parts more easily recede from each other, and therefore

take up more Room: The Consequence of this is, that the containing Vessels of the Plant must be press'd on all Sides by the contained Fluid, and grow larger; mean time the Air contained in the Air-vessels of the Plant is also rarefied and distended, so as to keep constantly of the same Density as the external Air. Thus we see the Plant is constantly compress'd betwixt the internal and external Air; and as the Vessels of the Plant are more expanded by the Rarefaction of the internal Air, the external Air is also rarefied, and consequently, pressing less upon the Surface of the Plant, gives it more Liberty to increase its Dimensions outwards, and yield to the internal Pressure both of the Sap, and internal Air; but as the Heat of the Atmosphere is seldom many Moments exactly the same, the Rarefaction and Density both of the internal and external Air must be perpetually altering, as the Heat increases and decreases; inasmuch that the Force of the Air acting upon the Inside of the Plant, and upon the Surface, is different almost every Moment; so that by this Pressure, a Plant is acted upon much in the same manner as a Potter, who is going to form a Vessel, would act upon his Clay; pressing the Inside with one Hand, and the Outside with the other.

The reflecting Reader will readily observe, that something more than what we have already mention'd is necessary towards Vegetation, otherwise the Plant would indeed be distended; but then its Vessels would grow much thinner, just in the same manner as a Glass Vessel under the Hands of the Maker decreases in Thickness, as the Surface is enlarged by the Air the Operator forces within; or the Sap-vessels and Air-vessels of the Plant would be like a Parcel of Bladders laid contiguous to each other, some of them distended with Water; and others with Air, where the containing Vessels would decrease in Thickness, as they were expanded by their Contents: We are therefore to explain how it comes to pass, that Plants increase in Solidity as well as Dimensions.

This Part of the Operation then seems to be performed by the means of Cold, in the following manner:

The Heat of the Sun in the Day-time having distended the Sap in the Vessels, and made a Part of it perspire through the Pores of the Leaves, in order to draw Nourishment to themselves and the adjacent Parts, the Coldness of the Night immediately succeeding, when Plants are not in a State of Perspiration, this Coldness contracts both the Solids and Fluids of the Plant; for 'tis the Nature of Cold to contract all Bodies whatever, and reduce them into a less Space, which must be effected by making the Particles of Matter, of which they are compos'd, approach nearer each other; and the Particles of Matter are known to attract each other very strongly at small Distances, and infinitely more when their Surfaces exactly touch each other: Therefore that Part of the fluid Sap which is nearest the solid Sides of the Vessels, is, by the Action of Cold, which contracts both the Solids and Fluids, forc'd into Contact with the Solids, where it sticks fast by reason of the increas'd Attraction; and thus are the Salts and Earth, which were dissolv'd in the Sap, applied to the Vessels, and reduced to a Solid; and in this the Salts and Earth are much assisted by the Oil and Water, which, entering betwixt each Particle of Matter, fill up the vacant Spaces, and render the Cohesion stronger; just in the same manner as two polish'd Pieces of Marble applied to each other will adhere very strongly when the Surfaces are oiled; and as Leather or Paper will stick closely to any Body when wet.

When once these Particles of Matter have acquired such a Degree of Cohesion, the Heat of the Sun, next Day, approaching by gentle Degrees, is not capable of dissolving this Union, which however it would do, was it more sudden and intense; and indeed we find, that this Union is utterly dissolv'd by Heat or Fire applied to Vegetables in a certain Degree; for, when Vegetables are burnt, the Oil and Water is dissipated or destroy'd, whilst the Salts and Earth remain without any considerable Cohesion.

But so far is this gradual Heat from destroying this Cohesion of the Particles of Matter, that it increases it; and by drying up the superfluous Moisture, helps to harden it, and renders it more solid; just in the same manner as Bricks, before they are committed to the Kiln to be burnt, are dried and hardened by the Heat of the Sun.

Thus we see how necessary a Vicissitude of Heat and Cold is to the vegetable World; for without it not a single Plant could grow upon the Face of the Earth: Was the Atmosphere to be always hot, Vegetables would be in a perpetual State of Perspiration, so long as the Earth could afford a Supply of Juices; but then they could never be enlarg'd, or grow bigger, but would be little more than the Neck or Pipe of an Alembic, affording only a Conveyance to that Fluid which is forced thro' them by the Fire. As a Confirmation of this, we may frequently observe in very hot Summers, that Plants set in a warm Place, much expos'd to the Sun, perspire themselves almost to Death, and grow but very little; whilst others, planted in the Shade, and defended from the too violent Heat of the Sun, increase in Bulk considerably, and become very large.

Was it always to be cold, Plants would want the Cause of their Extension, and consequently not grow at all.

In either of these Cases the whole Brute Creation must want Subsistence, and consequently Mankind.

Thus, as we were originally miraculously formed, we are still supported by a perpetual Chain of Miracles; inasmuch that if it pleas'd the supreme Being to dissolve a single Link thereof, an immediate End would be put to the whole Race of Animals upon the Face of the Earth, without having recourse to a Deluge, or a Conflagration.

Many have been the Disputes amongst Naturalists concerning the Circulation of the Sap in Vegetables; some will have it, that it rises in Vessels analogous to the Arteries in Animals, and is again return'd towards the Root by other Vessels analogous to the Veins; others again are of Opinion, that there is no such Retrogradation of the Sap; and both Parties bring Experiments to justify their different Sentiments. For my own Part, I believe there are no peculiar Vessels in Plants destined, like the Arteries and Veins in Animals, for the Flux and Reflux of the circulating Juices; but that the Sap rises, and in some measure again retires, by the same Vessels, as both the solid and fluid Parts of the Plant are dilated by Heat, and contracted by Cold.

It may not be amiss to make one more Observation concerning the strict Analogy there is betwixt Animals and Vegetables. It is well known to Anatomists, that the Bodies of Animals abound with Glands of different Sorts; which are destin'd by Nature to separate various Kinds of Liquors from the Blood, necessary either for the Preservation of the Animal, or the Propagation of the Species; thus the Bile or Gall is separated by the Liver, and the Saliva or Spittle by the Glands about the Mouth and Throat. I don't in the least doubt, that there is a Mechanism like this in Plants of all Sorts; and that Vegetables are furnished with Glands in vast Numbers dispersed all over them, which separate different Liquors from the Sap, according to the Exigencies of those Parts where they are plac'd; and by these Glands I apprehend the nutritious Juices of the Earth are converted, if I may use that Expression, into the specific Juices of the Plant; which Juices distinguish every Plant upon the Face of the Earth from every other Plant, as much as their Forms and Complexions.

What we have above call'd, after Dr. Grew, the *Parenchyma*, I take to consist of a great Number of Glands destin'd to separate a peculiar Fluid from the Sap; and I also take the Pith to be a Congeries or Bundle of Glands, tied to each other; or what the Anatomists call a conglomerate Gland; and as the Pith is in greater Quantity in proportion, and more juicy, in young Plants, and the young Shoots of Trees, than in old ones, I conclude, that it furnishes a Fluid absolutely necessary to the Accretion or Growth of the Plant. Now, as the Buds are form'd in, and proceed from, the Pith, if I may be allow'd a Conjecture, do not the Glands of the Pith separate a Liquor necessary for the Formation and Support of the Bud? And may not the Apices of Flowers be considered as Glands separating the *Farina fecundans*, for the Impregnation of the Pistil or Uterus?

I am far from entering into those romantic Notions and Opinions of some late Writers, who dream that the first Plant of every Species which grow upon the Face of the Earth, contain'd in it every individual Plant, with its Seeds, in Miniature, which have since been propagated from it; for it seems to be more consistent with the general Order observ'd by Providence, that one Plant should, by a particular Mechanism, be render'd capable of forming another of the same Species out of such Materials as the Juices of the Earth afforded, than that at the Creation one Plant should be stuffed into another, and another into that, and so on, *ad infinitum*, like a Nest of Boxes.

We proceed now to make some Observations on the Flowers: The first thing then that occurs worthy of Observation in Flowers is, that they perform the same Office to the generative Organs, as the Leaves do to other Parts of Plants, that is, draw Nourishment to them for their Support, by perspiring; and that they do actually perspire, and in great Quantities, is certain; because they transmit to our Organs certain Effluvia, which affect us with that Sensation which we call Smelling. These Effluvia are a Portion of the *Spiritus Rectior*, or prevailing Spirit; which is exactly alike in no two Plants of different Sorts, but the same in every Branch of the same Family, allowing for the Accidents of Soil and Climate, and is inimitable by Art. This *Spiritus Rectior* resides in the essential Oils of Vegetables, and is probably form'd by the finest and most volatile Parts of these essential Oils, exalted by, and mixt with, the Particles of Light or Heat, which are embodied with them, and reside therein in a solid Form; and this I rather believe, because the essential Oils of Plants are of an alkaline Nature, especially those of the aromatic Kind, which, growing in hot Climates, have a greater Proportion of the Particles of Fire in their Composition. Instances to our present Purpose are the Oils of Cloves, Sassafras, and Caraway, which make a violent Effervescence, when mixt with fuming Spirit of Nitre. Now, in many Instances, Fire

renders Bodies it acts upon alkaline, or, however, dissipates or neutralizes the Acids which they contain. Therefore, as essential Oils are of an alkaline Nature, I think it highly probable, that they are render'd so by the Particles of Fire, which enter their Composition. And when I consider the extreme Volatility of this *Spiritus Rectior*, I am farther confirm'd in the Opinion, that the Particles of Light or Fire are a Part of its Composition.

If we wanted an Instance to prove the Destruction of Acids by Fire, we might find one in most Kinds of Fruits, which are originally acid; but this Acid is by Degrees destroy'd, and the Juices of the Fruit neutraliz'd, as it imbibes the Particles of Fire, that is, as the Fruit ripens.

I have a few more Observations to make upon Flowers with regard to their Colours, which, however various and beautiful, may easily be accounted for by the Action of the Acid of the Air so often mentioned, upon a Portion of the Oil, or, as the Chymists call it, Sulphur of Plants, when exposed to the Air upon the Surfaces of the Petals or Flower-leaves; and, indeed, if we consider that the Varieties in Colours depend entirely upon the different Reflexions, Refractions, and Suffocations, the Rays of Light undergo upon the Surfaces of Bodies, 'tis not surprising that so penetrating a thing as the Acid of the Air, acting forcibly upon Sulphur, which the Chymists, by a Multitude of Experiments, have prov'd to be the Parent of Colours, should so far alter the Disposition and Texture of its Particles, as to produce those beautiful Colours which we observe in the Petals of Flowers; and as the most minute Difference conceivable in Sulphurs or Oils will also make a Difference in the Action of the Acid thereon, the Variegation, or the Variety of Colours in the same Flower, may, from these Principles, be easily accounted for.

A great many Liquors, originally clear and limpid, will, by being expos'd to the Air, become red; and if a Bottle is fill'd half or three Parts full of these Liquors, the small Quantity of Air contain'd in the Bottle, though closely stopp'd, shall have this Effect upon them. That this is caused by the Air, is very plain; because if another Bottle is fill'd quite full with the same Liquors, and guarded carefully from the Air, the Liquors will retain their Limpidity.

And indeed nothing is more common than for Acids to change the Colours of Bodies; thus Nitre, which contains an Acid, and even the acid Smoak of Wood, will make Flesh intensely red.

Those who are concerned in the Trade of Dying, observe, that a cloudy, moist Air, very much interferes with the Vividness and Beauty of their Colours; and, on the contrary, a serene Sky exalts their Colours, and makes them more elegant. Now, it is certain, that an Acid does not so much abound in a moist, cloudy Air, as in one which is serene.

The Colours of Flowers are also liable to the very same Accident; for in cloudy, moist Weather, they are never so vivid and exalted as when the Air is serene and dry.

So much has been said already upon the Seeds of Plants, and their Generation, that 'tis unnecessary to repeat it in this Place: I shall therefore proceed to the Decay of Vegetables.

An annual Plant, when it has once brought the Seed to Perfection, has answer'd the End of Providence; and now the Vessels which bring Nourishment to the Leaves being furr'd up, incrust'd within-side, and render'd impervious, that is, no longer hollow, the Leaves can no more perspire, but wither and drop off; mean time the Vessels of the Root and Stem undergo the same Fate with those of the Leaves; inasmuch that the whole Plant dies, rots, and helps to supply the Earth with a fresh Pabulum or Food for a succeeding Generation.

There is a large Class of Plants which are called perennial, of which Sort are Trees that live for Ages; these, like annual Plants, lose their Leaves against Winter, and for the same Reason; but then the Sap-vessels in the Root and Trunk continue pervious or hollow, so that even in the Winter a sort of very languid Circulation is maintain'd, much like that by which Tortoises, Snakes, and many Sorts of Insects, are kept alive during Winter. These, at the Approach of Spring, when the Heat is increas'd, and the Earth has been for many Months laying in a Stock of Pabulum, or Food, for their Support, put out Leaves afresh, perspire and grow, till at last the Sap-vessels in the Root and Trunk are obstructed, and become impervious by Degrees, inasmuch that when the Circulation is entirely stopp'd in any Part of it, the Air dissolves its Texture, and it gradually decays, dies, and rots.

As the Decay of Trees begins in the Middle, this is a strong Evidence, that the Air penetrates into their inmost Recesses; for nothing can rot, unless expos'd to the Air. And this Observation helps to confirm what we have already laid down in regard to the Air-vessels of Plants.

I have purposely omitted obviating some Objections which may be made against many things I have advanc'd, (and which I think may easily be defended) for fear of being too prolix; and for the same Reason I have not drawn all the Corollaries that the Subject would have admitted of. As I hope I have led the

Reader in a just way of Thinking upon these Subjects, his own Reflection will supply him with many philosophical and useful Truths, which I have either omitted, or, perhaps, not observ'd; and the more he pries into the Myſteries of Nature, the more will he adore the Power and Goodneſs of the Supreme Being, who created all Things in the Beginning, and ſtill continues to protect them by a Series of Miracles not leſs wonderful than that of their firſt Creation; otherwiſe the whole Frame of the Univerſe would, in an Inſtant, be utterly diſſolv'd, and all things degenerate into their original Chaos.

There is one Experiment, which ſhould be taken Notice of before we diſmiſs the Subject of Vegetation, which is this: Immerſe the Ends of a Parcel of cylindrical Glaſs Tubes, open at both Ends, in Water, and the Water will riſe in theſe Tubes above the Surface of the reſt of the Water, but always higheſt in the leaſt Tube: Now, as 'tis very likely ſomething of the ſame Nature happens in the Sap-veſſels of Plants, this may be a great Help to Vegetation, and contribute much to the Riſing of the Sap.

I ſhall conclude the Article of Botany with ſome Account of the principal Authors upon the Subject, and to theſe I ſhall add the Names of others who have wrote on the different Parts of the *Materia Medica*, not with a View of giving Information to thoſe who are already acquainted with the Science; but with a Deſign to direct thoſe, who are inclined to be more acquainted with it, to proper Authors. I ſhall alſo explain the Abbreviations of Authors Names generally uſed, and ſpecify the Editions refer'd to in this Work.

Zorn (Bartholomæus) Botanologia Medica, in High Dutch. BOTANICON, βότανικόν. The Name of a Plaster described by P. Æginet. Lib. 7. Cap. 17.

BOTARGUM. The salted Spawn of the Mugil, or Mullet; which are prepar'd in the following manner:

They take out the Follicles of the Spawn entire, and cover them with rough bruised Salt for four or five Hours; after this they put them in a Press, between two wooden Planks or Boards, for a Day and a Night: Then they wash them, and afterwards dry them in the Sun for thirteen or fourteen Days together, taking them into the Houfe at Night.

Others say they hang them up in the Smoke, but far enough from the Flame, that they may not be injured by the Vehemence of the Heat.

They excite a decay'd Appetite, and provoke Thirst, and give a Relish to Wine. Dale, from Ray's Ichthyologia.

BOTHOR is taken by some for an Abscess of the Nostrils. Bothor, among the Arabians, has three Significations; in the largest Sense it comprehends all Tumors; in a more restrain'd one, a Tumor with a Solution of Continuity; but, in the strictest Acceptation, it signifies only small Tumors. Castellus.

BOTHRION, βόθριον, [a small Ditch] is a hollow or pure Ulcer in the Black of the Eye. Gal. Def. Med.

Of Ulcers in the Eye, the hollow and pure one, which is seated in the Cornea Tunica, is call'd Bothrion; but that Ulcer which is wider, but not so deep as the Bothrion, is call'd Cælo-ma. P. Æginet. Lib. 3. Cap. 22. Aetnarius de Meth. Med. Lib. 2. Cap. 7.

BOTIN, Butino, Turpentine; also the Balsam of Turpentine, when it is gather'd at a certain Season, according to its balsamic Influence. Rulandus.

Paracelsus mentions a distill'd Botin for extracting the Flos Eris. Lib. 10. Chirurg.

BOTIUM. A stumous Tumor or Abscess in the Throat. Rulandus. See BRONCHOCELE.

BOTOTHINUM. An obscure Term in Paracelsus, which he explains by the Flower of a Disease; whence he calls the Gout in the Feet Locusta gummata Botothina. Lib. 2. de Pedagric. Necromantia.

BOTOU, or BOTOUA. The same as PAREIRA BRAVA, which see.

BOTRACHOU, βότραχον, in Hippocrates, according to Galen's Exegesis, is written for Batrachou, βάτραχος, the Genitive of βάτραχος, a Frog; and some, he says, read it Batrachou; so βότραχον is expounded in Hesychius βάτραχος. Foesius.

BOTRYTES, Botritis, βότρυτις, from βότρυς, a Cluster, properly, of Grapes. A sort of burnt Cadmia, resembling a Cluster of Grapes, and collected from the upper Part of the Furnace where it is burnt; as what is collected in the lower Part is call'd Placitis, πλακίτις. Goræus.

Schroder, Lib. 3. Cap. 19. says, that the Botrytes is collected in the middle Part of the Furnace, the Placitis in the upper, and the Ostracitis in the lowest.

BOTRYS, Offic. Ger. 950. Emac. 1108. Pharm. Edenb. 4. Raii Hist. 1. 196. Botrys vulgaris, Park. 89. Botrys ple-risque Botanica, J. B. 3. 198. Botrys Ambrosioides vulgaris, C. B. 138. Botrys sive Ambrosia, Cod. Med. 22. Atriplex odora seu suaveolens, Hist. Oxon. 2. 605. Atriplex Chenopodia Ambrosioides folio sinuato, Hort. Monsp. 29. Chenopodium Ambrosioides folio sinuato, El. Bot. 406. Tourn. Inst. 506. Boerh. Ind. A. 2. 90. OAK OF JERUSALEM. Dale.

BOTRYS is a Plant all over yellow, shrubby, wide spreading, and running out into a Multitude of Branches. The Seed grows quite round the Branches; the Leaves are numerous, and much like those of Succory. The whole Plant has a very fragrant Smell, and is for that Reason laid among Cloaths. It grows chiefly by the Sides of Precipices, and the Banks of Torrents.

Drank in Wine, it has a pægoric Virtue in the Case of an Orthopncea. The Cappadocians call it Ambrosia, others Artemisia. Dioscorides, Lib. 3. Cap. 130.

The Leaves of Oak of Jerusalem somewhat resemble the Leaves of the common Oak, whence it derives Part of its Name;

Name; only they are longer and narrower in proportion, and pointed at the End, having the like Incisions; they are somewhat rough, and of a yellowish-green Colour, of a pleasant agreeable Scent. The Stalk is striated, or chanel'd, growing about half a Yard high, much branch'd, and full of the like Leaves. On the Tops of the Branches grow long Spikes, loaded with Bunches of small round, greenish, mossy Flowers; in which lie very small, round, and black, shining Seeds.

This Herb is of a bitter Taste, and of a strong, but not a disagreeable Smell: It is of a heating, drying, dissolving, opening, cleansing, and purgative Nature. It resists Putrefaction, and is singularly efficacious in Oppressions, Coughs, and all cold Disorders of the Breast, and Difficulties of Breathing. It is also very effectual for dissipating viscid Matter lodged in the Thorax, *Hier. Cappivacc. Pract. Medic. L. 2. C. 2. Hier. Mercurial. Med. Pract. L. 2. C. 2.* It opens Obstructions of the Liver, Kidneys, and Matrix; cures the Jaundice, prevents Dropsies, promotes a Discharge of the Menfes and Lochia, and cures Pains of the Uterus and Belly. The Venetian Women find the *Botrys* to be a sure and infallible Remedy against hysterical Fits, both when used internally and externally, *G. H. Velsch. Mictomim. ad Societ. Nat. Cur. Cent. 2. Obs. 35.* Fumigations of the Herb itself are excellent for provoking the Menfes, and expelling dead Fetuses, *Dom. Ghabr.* The Leaves dried, reduced to Powder, and mix'd with Honey, are excellent for Vomiting of Blood, and Disorders or Ulcers of the Lungs, *Camerar. in Hort. Med. Matthiolus* informs us, that by this Medicine he cured Patients, who had spit up Pieces of their Lungs. A Decoction of the *Botrys*, with Syrup of Violets, is recommended, as good for Abscesses, by *J. Heurn. L. 2. Meth. ad Prax. C. 8.* In the foreign Shops there is a Conserve made of the young Leaves, and a Water distil'd from the whole Plant when it flowers: Both these are very good Medicines in Oppressions of the Breast, and in Pains of the Belly. A Lohoch of the *Botrys* is recommended as an excellent Medicine for all Disorders of the Breast, by *P. Forest. L. 16. Obs. Med. 4. in Schol. Guil. Fabr. Hildan. Cent. 1. Epist. Chirurg. 49.* And the *Syrupus Diabotrys* is, by *Levin Fischer. L. 3. Corpor. Med. Imper. Tit. 4.* said to be an excellent Medicine for those who are phthical. The Herb itself, boil'd in any Lixivium, kills Vermin, and carries off other Sordes of the Head, if wash'd with it. *Joh. Theod. Tabernemont. in his Herb. L. 1.* informs us, that the Seeds of this Herb, if sown with Corn, kill the little Worms which prove so hurtful to it. *Barthol. Zorn Botanolog.*

BOTRYS MEXICANA, *Cod. Med. 22. Botrys Ambrosioides Mexicana*, *C. B. Pin. 136. Raii Hist. 1. 196. Botrys Americana*, *Park. Theat. 89. Atriplex odorata suaveolens Americana*, *Mexicanave*, *Hist. Oxon. 2. 605. Chenopodium Ambrosioides Mexicanum*, *Tourn. Inst. 529. Elem. Bot. 406. Boerh. Ind. A. 2. 90. Epazoth, Atriplex odorata Mexicana*, *Hern. 159. MEXICO THEA.*

This is only found in Europe, in the Gardens of the Curious. The Herb and its Root are in Use; both which are said to corroborate the Stomach, and to relieve in Asthmas and Obstructions. A Decoction of the Root restrains Dysenteries, dissolves Inflammations, and is said to be disagreeable to poisonous Animals, and therefore to keep them at a Distance. *Dale from Hernandez.*

BOTUS, *bocia, botus barbatus*. A Chymical Vessel, otherwise called *Cucurbita*. Also a Vessel upon a Vessel, a Vessel for melting, a Crucible. *Castellus.*

BOUBALIOS, *βεβάλιος*, in *Galen's Exegefis on Hippocrates*, is expounded by *σίνος ἀγρίος*, a wild Cucumber. But *βεβάλιος*, in *Hesychius*, is expounded the wild Cucumber in *Hippocrates*, and also the *Pudendum Muliebre*.

BOUBON, *Βεβών*, in *Hippocrates*, sometimes signifies the Groin, and the Place where the Thigh-bone and Hip-bone meet; sometimes it means the Glandules on either Side, and a Tumor and Inflammation of the same. Hence the Appellation has been transferr'd to Tumors or Inflammations in the Glandules of the Neck and Arm-pits, which are sometimes called *Βεβώνες*. Places to this Purpose are very frequent in *Hippocrates*, as in his Books, *de Epid. Coac.* and *Lib. 2. de Morbis*; also in *Aretæus* and *Galen*.

Βεβών is also taken universally for an Inflammation of a Glandule of any kind, whether it be in the Neck, in the Arm-pit, in the Groin, or behind the Ears; as *ὅτι ἐπὶ βεβώνσι πυρετοί*, "Fever proceeding from Buboes," (Inflammations of the Glands) *Apb. 55. Lib. 4. and Lib. 4. Epid. So Lib. 2. Epid. ὅτι ἐπὶ πυρετοῖσι βεβώνες κακώτεροι*, "Buboes from Fevers are of a worse kind." *Galen* also *Meth. Med. Lib. 13.* says, *ὁνομάζουσιν δὲ τὰς ἐξ αἰσθησάσας ἀδένες βεβώνας*, "they call Tumors of the Glands Buboes." And in his first Book *de Diff. Febr. βεβών ἐκ τοῦ γένους ἐστὶ τῶν φλεγμονῶν*, "a Bubo is a kind of Inflammation." See **BUBO**.

BOUCERAS, *Βούκερας*, from *βῦς*, an Ox, and *κέρας*, an Horn, in *Galen's Exegefis*, is expounded *ἡ τῆλης*, Fenugreek; to which he adds, that *Mnetrus*, in the Titles of Medicines, thought that *Anagallis* came under that Name. It is also called

Βούκερας, by Contraction from *Βούκερος*, in *Theophrastus*. And *Pliny, Lib. 24. Cap. 19.* says it is called *Telis*, by some *Carphos*, by others *Buceras*, by others *Agoceras*, because its Fruit is corniculated, by us (*Latins*) *Silicia*. *Columella* calls it *Siliqua*, because its Pods resemble those of the *Siliqua*. *Hesychius* says, that *Βούκερας* signifies τὸ σπέρμα τῆς τῆλης, "the Seed of Fenugreek." The Word is used by *Hippocrates* (*Lib. 1. περὶ γυναικ.*) *ὃ βούκερας, ἢ αἰσθησάσας πυρετὸς μάλλον χυλός*, "and Fenugreek, or rather the Juice of Pisan made of Wheat."

BOVILLÆ, with the antient Physicians, were the same as the *Morbilli*, or Measles, with the Moderns, in the Opinion of *Raym. Vinarius de Peste, Lib. 3. Castellus.*

BOVINA AFFECTIO. A Disease among Black Cattle, caused by a Worm lodged between the Skin and the Flesh, and perforating the same.

Something analogous to this is a cutaneous Disorder, with which some scorbutic Constitutions are frequently affected. It seems to be owing to an Obstruction of the perspirable Matter, which concretes in the Pores of the Skin, and forms a sebaceous Substance, resembling a Worm with a black Head, which may be squeez'd out; and sometimes causes a small Suppuration, and is discharg'd along with the Pus. I never heard of these being attended with any great Inconvenience. But as they are Blemishes, I have given a Preparation of Gall, which is said to cure them, under the Article *BILIS*, from *Homberg*.

BOVISTA. The same as *LYCOPERDON*, which see

BOULIMUS, *βούλιμος*, from *βῦς*, a Particle which in Composition augments the Sense, and *λιμός*, Hunger, is a Disease which causes a Desire of Food at very short Intervals. Persons thus affected faint, and fall down, lose their Colour, are cold in their extreme Parts, feel Oppression at their Stomachs, and have a weak Pulse. *Galen. Def. Medica.*

Boulimos, as the Name itself indicates, is a great Hunger. It proceeds, as Reason seems to inform us, from the immoderate Heat and Weakness of the Mouth of the Stomach, which causes the Patients, unless supported with an excessive Quantity of Food, to faint and fall down; under which Misfortune there is hardly any so ignorant, but knows how to have recourse to such Smells as are proper to recal and recollect the dissipated vital Spirits. Among such Things as remarkably affect the Sense of Smelling, it is usual to offer Bread fopp'd in Wine, roasted Swines Flesh, or Kid, and, in general, all such things as have a nidorous and well-savour'd Smell. They compress the Extremities, prick them in every Part, rub their Ears, and pull them by the Cheeks, and by the Hair. When they are come to themselves from the Lipothymy, the most proper Thing to be given them in the first Place, is Wine, and, after that, other Food. In our future Management, we are to restore them by such Meats as are of good and quick Nutrition, but difficult of Alteration and Digestion; they are also to be treated with such things as refrigerate and strengthen; by this Method they are greatly benefited, and, in Process of Time, are restored to a good Temperament. Some for a *Boulimos* have given Opium in cold Water, in order to allay the excessive Heat; but I would advise you to be cautious how you give Opium, but rather let the Patients take such Food as is difficult of Concoction and Alteration. I knew a Woman who eat a vast Variety of Meats, and in immoderate Quantities, and digested them all, and never said she was satisfied, but felt a Gnawing at her Stomach, and a Pain in her Head; at last, she took the Cathartic Powder, called *Hiera*, which brought away from her by Stool a Worm supposed to be above twelve Cubits in Length; after which her immoderate and furious Appetite ceased, and it appear'd, that it was not a *Boulimos*, but this mischievous Animal, which compelled her to take such Quantities of Food, and consume it all. *Alex. Trallianus, Lib. 7. Cap. 4.*

Paulus Aegineta gives much the same general Account of a *Boulimos*, as this of *Alexander's*.

In the *Caninus Appetitus*, there is a Desire after much Food, and great Quantities are eaten, which, oppressing the Stomach, are again discharg'd by Vomit: The Patient being thus relieved, his Appetite returns, which having gratified, he finds himself obliged to ease his Stomach again, like a Dog, by vomiting.

Sometimes this Disorder has procur'd a *Boulimos*, a deep Sopor, a Lientery, Dropsy, Atrophus, and Death itself.

In a *Boulimos*, the Patients at first labour under a great Hunger, which however, does not last long. At every turn also they faint away, and at the same time their Breath fails them; in which Case a Syncope may be feared to be at Hand, followed by Death. *Lomii Med. Obs.*

Boulimos is sometimes called *Phagedæna*, *φάγδαίνα*, which is also a Name for eating, spreading Ulcers; and *Fames canina*, because the Persons affected have their Appetites vehemently set upon their Food, after the manner of Dogs.

It is to be observ'd, that some make a Distinction between *Boulimos* and *Fames canina*, whereas others take them for the same.

fame. The former say, that in the *Fames canina* the Patient is taken with Vomiting, as Dogs are, after eating too great a Quantity of Food; tho' some are seized with a Flux of the Belly instead of Vomiting, Nature that way discharging the Superfluity of Aliment, which the Stomach was incapable of digesting; but the *Boulimos* is not attended with Vomiting, but sometimes with a Lipothymy. Some there are who labour under this insatiable Desire of eating, and yet are not molested with Vomiting, nor a Flux; but thoroughly digest all the Food they take, and are sick if they are not readily supplied with more. *Sennertus* relates a Story of a Student, a Man of a black Complexion, who would be eating not only in the Day-time, but in the Night, and perfectly digested whatever he took, without Vomiting; nay further, he could not be satisfied with delicate Food, but long'd for coarser; for which Reason he did not eat such Bread as was made by the Bakers, but what was bak'd by the Peasants in the neighbouring Villages, as being more solid and substantial. He would often eat a great Number of raw Garden Parsnips in the Morning, without the least Injury.

Galen makes the immediate Cause to be, first, a vicious and acid Humour stimulating the Stomach; and, secondly, a want of Nourishment from too great a Digestion.

The vicious Humours lodged in the Stomach excite an immoderate Hunger, because by their excessive Coldness, Acidity, and Austerity, they cause a Constriction, Corrugation, and Vellication of the Mouth of the Stomach, and so excite a Sensation like that of natural Hunger.

The perpetual Craving after Food is sometimes owing to a Defect of Nourishment, on account of excessive Evacuations, by a Hemorrhage, Flux of the Belly, Vomiting, Sweating, or the like, or from too great a Consumption of the alimentary Substance, effected by the immoderate Heat of the Parts, the Thinness of the Humours, the rare Contexture of the Body, and Laxity of the Pores, want of Sleep, Bathing, immoderate Exercise, or excessive Venery; all which Things cause a great Dissolution of the alimentary Matter, and consequently a great Inanition, and want of Nourishment; whence the Food is hurry'd out of the Stomach with greater Speed than it ought to be.

Sometimes this Affection is owing to Worms consuming the Chyle, as in the Case related by *Trallian*.

The diagnostic Signs of this Disorder are sufficiently evident, as well to the Patients as Attendants, who cannot but observe a depraved and excessive Appetite, which compels them to receive into their Stomachs an immoderate Quantity of Victuals, which afterwards proving burdensome and oppressive to Nature, are thrown up again by Vomiting, in which Case the Distemper is the *Fames canina*; or, if there be no Vomiting, the Patient is seized with a Lipothymy, and then it is a *Boulimos*.

The different Causes of this Distemper are distinguishable by the Circumstances, which are antecedent, attendant, and consequent to it. Acid Evacuations and Vomitings, crude Stools, and want of Thirst, are Signs of an Acid abounding in the Stomach. In Defect of Nutrition, the Patients are emaciated; and lastly, the Signs of Worms, are to be taken from their proper Symptoms.

As to the Prognostics of this Disorder, if it depends wholly on external Causes, there is no Danger, provided these are speedily remov'd; and what proceeds from Worms carries but little Danger in it, because their Effects cease as soon as they are destroy'd. In Pregnancy, where an inordinate Appetite is frequent, there is no Danger to be apprehended from it.

But the Distemper is very dangerous when followed by large Evacuations or Colliquations of the Body; and especially, when after receiving Food, while the Stomach is yet full, the Patient is seized with fainting Fits; for when those Things, which ought to give most Relief, prove of none or ill Effect, it is a Sign of a great Disorder in the Tone of the Stomach.

So also the canine Appetite, when the Vomiting or Flux is obstinate, is not void of Danger; for it commonly degenerates into a Cachexy, Dropsy, Lientery, Atrophy, and other fatal Distempers.

For the therapeutic Part, since the *Fames canina* generally takes its Rise from redundant Humours inherent and lodging in the Stomach, we are to use evacuant and alterative Remedies, not omitting such as are proper to strengthen the affected Part.

Evacuation is to be perform'd either by Vomits or Purges, and that by means of such Remedies as are proper for those who labour under a want of Appetite; for, though these Affections are contrary one to another, yet they are usually produc'd by the same Humours, differing only in Degrees of Frigidity, and some very different secondary Qualities which affect the Stomach after a different manner. A Remedy of this kind, which is very much commended by *Galen*, is *Hiera* made into Pills, in the following manner.

Take of choice Aloes macerated [*nutrita*] in the Juice of Wormwood, one Dram; Troches of Agaric, two Drams; Rhubarb pulverized, and sprinkled with White-wine, one Dram; Nutmegs and Spikenard, each half a Dram; Salt of Tartar, Mastich, and Cinnamon, each one Scruple; and with Syrup of Wormwood make them into a Mass for Pills, six of which gilt are to weigh a Dram, and are a Dose in the Morning, if the Patient has a mind to purge thoroughly; or three of them may be taken two Hours before Dinner, two or three times in a Week.

Such Remedies also as heat and strengthen the Stomach, both internal and external, are of very great Service: Of this Nature are Syrup of *Pontic* Wormwood, taken to the Quantity of an Ounce in the Morning fasting, for some Days together; or, instead thereof, Wormwood-wine may be substituted. Or,

Take Conserve of Rosemary-flowers, Mint, Lemon-peel preserved, Nutmegs preserved, each half an Ounce; Chebule Myrobalans preserved, Number one; Confectio Alkermes, three Drams; the inner Membrane of Hens Gizzards prepared, two Drams; Cinnamon pulverized, and Aromaticum Rosatum, each one Dram; make them into an Opiate with Syrup of Mint, or into a Conserve with Sugar of Roses. Let it be used in the Morning, drinking after it a little generous Wine.

Salt of Wormwood, or Chymical Oil of Mint, may very properly be added to the above-recited Remedies: Or,

Take of Salt of Wormwood, and Orange-peel, or either of them, half a Dram, and take them in Wine or Broth.

The following Mixture is also very effectual:

Take of Syrup of Quinces, and preserved Lemon-peel, each two Ounces; Cinnamon-water, one Ounce; Oil of Sulphur, twelve Drops; mix, and give a Spoonful at proper Intervals.

In a very great Frigidity of the Stomach, Cinnamon-water by itself is of excellent Use; or it may be mixed with Syrup of Wormwood, of Mint, or of Coral, to which Ambergrise may properly be added.

External Remedies are Fomentations, Liniments, and Plaisters, such as the following.

Take of the Root of Cyperus, Galangal, Florentine Orris, dry'd Lemon-peel, each two Ounces; the Leaves of Mint, Hyssop, Sage, Rosemary, and Marjoram, each one Handful; Anniseeds, Bay-berries, Nutmegs, Cloves, and Cinnamon, each three Drams; Flowers of Stoechas, Schoenanth, and Rosemary, each one Pugil: Cut and bruise them, and inclose them in two Bags, which must be macerated in generous Wine, and by turns applied warm to the Stomach. Or,

Take Oil of Wormwood, Oil of Mint, and of Hops, each half an Ounce; Oil of Nutmeg, two Drams; Lignum Aloes, Mace, Cinnamon, each a Scruple, with a little Wax; make a Liniment. This may be improved by adding of Oil of Cloves, six Drops; of Musk and Ambergrise, each seven Grains: Or a Liniment may be made of Oil of Nutmegs, and Balsam of Peru; or of Oil of Wormwood, and Balsam of Peru.

For a Plaister.

Take Mastich, one Ounce; Aromaticum Rosatum, one Dram; Oil of Nutmegs, a sufficient Quantity; mix, and make a scutiform Plaister, which apply to the Region of the Stomach.

Crato greatly recommends the following Plaister:

Take of Ladanum, two Ounces; Wax, four Ounces; Oil of Nutmegs, three Drams; make them into a Mass for a Plaister, and add of Tacamahac and Mastich, each one Dram.

Galen, *Lib. 7. Meth. Med.* advises not to suffer Plaisters of this kind to continue long on the Place, because by long Continuance they dissolve the natural Heat.

Besides the above-mention'd Medicines, pure Wine alone, drank in sufficient Plenty, is a most powerful Reliever of Hunger, according to the Aphorism of *Hippocrates*, 21. *Sect. 2.* And the Spirit of Wine, commonly called *Aqua Vita*, has still a more powerful Effect than way.

Such

Such Medicines as mightily relax and moisten the Stomach, and correct the Acidity of the Humour, have a peculiar Virtue, in taking off the Sense of Hunger. Of this Sort are all pinguious and oleaginous Things; as Fats, Oils, and the Extremities of Animals. Thus *Villanovanus* relates, that a certain Man, affected with this Disorder, eat hot Bread dipt in Lees of Oil; and that a Woman, in the like Case, drank twice the melted Fat of Beef with a like Quantity of hot Oil; and that both these Patients contracted so great a Loathing of Food, that neither of them eat any thing for five Days, and so got rid of their Distemper.

Narcotics, by blunting the too exquisite Sense of the Stomach, have a Virtue of moderating the *Fames canina*. Among other Remedies of this sort, *Venice Treacle*, when new, is of common Use; because, besides its narcotic Virtue, it has a Power, as an *Alexipharmac*, of correcting the malignant Quality of the Humours, which some suppose to belong to this Affection.

But, because Narcotics are seldom, and never without Necessity, to be used, old *Venice Treacle* is to be used at other times, as well for the Reasons above given, as for the sake of corroborating the Parts.

Ambergise to the Quantity of five or six Grains, taken in a poach'd Egg, not only strengthens the Stomach, but is supposed to be endu'd with a specific Virtue against this Disease. *Riverius, Prax. Med.*

So far *Riverius*; and it must be confess'd, that the most rational Way of curing a Disorder, which is caus'd by an acrid Humour irritating the Stomach, is, first, to evacuate such Humour, or correct its Acrimony; and then to restore the Stomach, and the Organs employ'd in Digestion, to their natural Tone and State, that no more may be generated.

BOUNIAS, *βουνίας*, a Species of *Napus*, which has a round Root, and delights in *βρύσις*, or rugged Places. *Blancard. See BUNIAS.*

BOUSTHE, *βούσθη*, a corrupt Word, tho' found, as *Foefius* says, in all the Copies of *Hippocrates*. It is in a Passage of his *παρρησιαί*, which is, *δυσχεαίμει δ' ἀν' ὑπεράλειος βούσθη*. Here plainly appears, says *Foefius*, a Mistake, and all Translators read it *βούσθιν*, rendering the Place thus: "I would with Confidence ask Assistance," or, "I would confidently desire them to give their Assistance." For the Subject of the Discourse are those Physicians, who, being destitute of a Method of curing, insinuate themselves into popular Favour by pompous Words. With such Physicians *Hippocrates* declares himself unwilling to hold a Conference concerning a Method of Therapeutics, but rather desires Assistance from them, or calls upon them to perform, by their Actions, what they so confidently pretended to by their Words.

BOXUS, *Μίστο*, growing on Trees, such as Mistletoe of the Oak. *Castellus from Dornæus.*

BRABE, in *Oribasius*, is an Herb, a Cubit high, shooting forth thin Branches on both Sides, with Leaves like those of Dittander, but softer and whiter. At Top it bears an Umbella like that of Elder, with white Flowers. *Oribas. Med. Coll. Lib. II.*

BRABYLA, *τὰ βράβυλα*, large, sweet, black-azure Plums, commonly call'd *Damaſcene* and *Hungarian* Plums. They are reckon'd by *Galen, Lib. 2. de Alim. Fac. cap. 38.* amongst Aliments which afford but little Nourishment to the Body, and are of bad Juice; but the boil'd Juice is accounted amongst Stomachic Medicines by the same Author, *Lib. 6. de C. M. S. L. cap. 2.*

BRACHERIUM. A Surgeon's Bandage and Truss for an Hernia. *Castellus. Scultetus* gives Figures of two of these, *Tab. 39. Fig. 6. and 7. of his Armamentar. Chir. printed 1657.*

BRACHIA, *βραχίαιες*. The Branches of Plants, especially Trees; so call'd because they are extended like the *Brachia* (Arms) of a Man. *Blancard.*

BRACHIÆUS. There are two Muscles which go by this Name. The first is the *Brachiaeus internus*.

This derives its Name from its Situation, lying partly under the Biceps. It ariseth fleshy from the internal Part of the Os Humeri, at the Insertion of the Deltoides and Caracobra-chialis Muscles; and, descending over the Junction of the Cubit with the Arm-bone, it's inserted, partly fleshy, and partly tendinous, to the superior and fore Part of the Ulna. This helps to bend the Arm.

The second is the *Brachiaeus externus*. This seems to be the third Beginning of the Gemellus. Its Origination is continu'd from above the Middle of the Insertion and back Part of the Os Humeri to its Cavity, which receives the Olecranon in the Extension of the Cubit, where, joining with the tendinous Outside of the Gemellus, it is inserted into the superior and external Part of the Ulna, call'd Olecranon, and Ancon, or the Elbow. *Cowper. See GEMELLUS.*

BRACHIALE. The same as CARPUS, which see.

BRACHIUM, *βραχίον*, in *Hippocrates*, signifies the Bone which lies between the Cubit and the Joint of the Shoulder.

Galen, in the Beginning of his second Comment on Hippocrates of Fractures.

But the fore Arm, as we express it, the *Avant Bras* of the French, signifies properly that Part of the superior Extremities which lies betwixt the Elbow and Wrist.

That the Reader may not lie under a Necessity of turning to too many different Articles, for an Account of the Parts belonging to the Arm, I shall, in this Place, take into Consideration the entire superior Extremities, and describe particularly the Bones, Cartilages, and Ligaments, belonging to these.

The Os Humeri, or Bone of the Arm, is both longer and thicker than any other Bone of the upper Extremity. It is situated under the Acromium, along the lateral Part of the Thorax, from which, however, it may be remov'd to a considerable Distance in all Directions. Its Figure is irregularly cylindrical, and it is thick at one End, and broad at the other.

It is divided into the Body and two Extremities, or into an upper, middle, and lower Part.

The upper Part is generally call'd the Head of the Os Humeri, and the Part immediately below that, is call'd the Neck.

In the Head, we consider a Half-globe obliquely inclined, cruſted over with a smooth Cartilage; two Tuberosities, one large, terminating upward in a Point, over-against the Half-globe; the other small, placed laterally between the large one and the Half-globe: A Chanel or Groove between the two Tuberosities; four muscular Impressions, three of which are on the large Tuberosity; one in the Apex, one on the Side opposite to the Groove, and the third lower down on the same Side, over-against the small Tuberosity upon which the fourth is found. Of these four Impressions, that on the small Tuberosity, and the second of the other three, are the largest. All these Parts of the Head of the Os Humeri, are one Epiphysis in Children, of which very plain Marks remain sometimes in an advanc'd Age.

The Chanel, or Groove, between the two Tuberosities, is continu'd downwards, in an oblique Direction, thro' one Quarter of the Length of the Bone; and there becoming rough, it forms a muscular Impression, not always equally sensible. The Edges of this Chanel are two Ridges, or prominent Lines, continu'd down, as it were, from the two Tuberosities. That from the great Tuberosity is the most considerable, and is continu'd down to the Middle of the Bone, where it is lost in a long, broad, rais'd muscular Impression, more or less rough. The other, which comes from the small Tuberosity, is less prominent, and shorter. At the Side of this Ridge, toward the lower Part, are two other narrow, longitudinal, and superficial muscular Marks, one above the other, the lower Extremity of the first reaching down on the fore Side of the upper Extremity of the second.

The middle Part, or Body of the Os Humeri, comes nearer to a cylindrical Figure than the Extremities. It is a little rais'd at the rough Eminence, or Impression, already mention'd. On each Side of this Eminence is another muscular Impression, which uniting immediately below it, it appears to be inclos'd between them as between the two Prongs of a Fork. On that Side which answers to the Middle of the Half-globe, we see likewise a longitudinal muscular Mark; and about the Middle of that Side which is even with the great Tuberosity, there is an oblique hollow Turning, of a considerable Length and Breadth, which, running down by the Side of the fork'd Impression, makes this Part of the Bone appear contorted.

The lower Extremity of the Os Humeri is triangular from its very Beginning, and from thence grows very broad and flat, being bent a little near the End, towards that Side which answers to the small Tuberosity in the upper Extremity. It is divided into three Sides, two anterior, and one posterior, which is the broadest; and into three Angles, one anterior, and two lateral.

At the End of this broad Extremity are two Tuberosities; one short and prominent, answering directly to the Middle of the Half-globe; the other oblong, rough, and resembling a Crista, which answers to the Apex of the great Tuberosity of the Head. The short Tuberosity is call'd the internal Condyle, the other the external Condyle.

Between these two Condyles, on the very lowest Part of the concave Side of this Extremity, are two articular Eminences; one double, like a Pulley, next the short Condyle; the other rounded, like a small Head, next the long Condyle. The Pulley has a great and small Edge, with a Depression between them. The small Edge is lost in the round Eminence, or Head; the great one is gradually widen'd, and ends in a sharp Circumference. This Pulley is situated obliquely; for, on the concave Side, it approaches toward the short Condyle, and, on the other, it is turn'd from it.

Three Fossulae are likewise observable in this lower Part of the Bone; two anterior, one immediately above the Pulley, the other above the small Head; and one posterior, which is very large, and situated likewise immediately above the Pulley. In Children, the Pulley, the small Head, and the short Condyle, are Epiphyses.

The outer Substance of this Bone is compact, especially in the middle Part, within which there is a large tubular Cavity, containing a reticular Texture of bony Filaments. The Out-sides of the Extremities are less solid, and their inner Substance is cellular.

The particular Situation of this Bone deserves well to be consider'd, because we are often misled in forming an Idea of it, by viewing the Bone itself separated from the Trunk of the Body, by the Figures which have been given of it, and by the undue Application of the Terms External, Internal, Anterior, and Posterior, to the different Parts thereof; which Mistakes may be of very bad Consequence in many surgical Cases.

When we examine the Os Humeri, as lying along either Side of the Trunk, in its natural Situation, the Head will be found so dispos'd, as that the Half-globe is turn'd inward and backward, answering to the Situation of the Glenoide Cavity of the Scapula, the great Tuberosity outward and forward, the Chanel between the two Tuberosities almost directly forward, the long Condyle, said commonly to be external, turn'd as much forward as outward, and the short Condyle, call'd the Internal, turn'd as much backward as inward.

This Bone is articulated above with the Glenoide Cavity of the Scapula, by Enarthrodia, which is much plainer in the fresh Bones than in the Skeleton; and below, with the two Bones of the fore Arm.

The Uses of this Bone are generally well enough known. The Explication of all its different Motions presupposes the Knowledge of the fresh Bones, and of their Ligaments and Muscles.

The BONES of the FORE ARM; and, first, the ULNA.

The fore Arm is made up of two long Bones, whereof one is nam'd Cubitus, or Ulna; the other Radius.

The Ulna is irregularly triangular, diminishing in Thickness from one End to the other. It may be divided into the Body or middle Part; and two Extremities, one great, the other small.

In the great Extremity we observe two Eminences, one large, call'd Olecranon or Ancon; the other small, call'd Corone, or the Coronoide Apophysis; and two Semilunar or Sigmoide Cavities; one great, the other small.

The Olecranon is a large Apophysis ending in a rough Tuberosity, and an obtuse Point. The Tuberosity makes the Corner of the Elbow; the Point is lodg'd in the posterior Cavity of the lower Extremity of the Os Humeri, when the fore Arm is extended. Next under the Tuberosity is a flattish, oblong, triangular Surface, on the Outside of which is another of the same kind; but longer, and a little hollow, together with a muscular Fossula.

The Coronoide Apophysis is prominent, and a little pointed; resembling a broad short Beak. It is receiv'd into the anterior Cavity above the Pulley, at the lower Extremity of the Os Humeri, when the fore Arm is bent.

The great Sigmoide Cavity lies directly between these two Eminences, reaching from the Point of one to the Point of the other. It is articular, cover'd with a smooth Cartilage, and divided thro' its whole Length by a middle angular Line; being thus suited exactly to the Pulley of the Os Humeri, upon which it moves obliquely; these two together making a most perfect Ginglymus, as well in respect of their Structure as of their Use. The Half-cavities on each Side the angular Line are also divided transversely by another Line a little hollow, which terminates at the Middle of each Edge of the Cavity, by a very small Notch.

The small Sigmoide Cavity, which may likewise be term'd transverse or lateral, is a sort of transverse Notch in the inferior Portion of one Edge of the great Sigmoide Cavity, at the Side of the Coronoide Point, directly opposite to the muscular Fossula already mention'd. It is cover'd with a Cartilage as well as the great one, of which it appears to be a true Continuation, and it belongs to the Articulation of the Radius. Near this Cavity, directly under the Coronoide Apophysis, there is a very rough muscular Impression, sometimes rais'd like a Tuberosity.

This upper Extremity is oblique, and its Obliquity answers to that of the Pulley in the Os Humeri.

The small Extremity is cylindrical, of a less Diameter than any other Part of the Bone. It may be reckon'd a kind of Neck, ending in an inverted Head, flat at Top, and of a cylindrical Circumference, both which are cover'd with the same smooth Cartilage; and the Circumference is broader on the Side of the Coronoide Apophysis; and small Sigmoide Cavity, than any-where else. From the Head runs down a short Styloide Apophysis, on the Side of the Tuberosity of the Olecranon, distinguish'd from the rest of the Circumference by a small Notch.

The middle Portion, or Body of the Ulna, is divided into three Sides and three Angles. One of the Sides is narrow and rounded, one broad and hollow, and the third flat; and mark'd with an oblique Line on its upper Part. The narrow Side answers to the Tuberosity of the Olecranon, and is cover'd only by the common Integuments. The other two Sides are distinguish'd from the former by two blunt Angles; and they unite

at a sharp Angle, which lies opposite to the rounded Side; and answers to the Point of the Coronoide Apophysis. The hollow Side is even with the small Sigmoide Cavity, and the flat Side opposite to it. These two Sides give Insertions to many Muscles; and the sharp Angle, to what is call'd the Interosseous Ligament. At the Top of this Angle there is a narrow, oblong, muscular Impression. The Angle common to the rounded and flat Sides ends below in an oblong, uneven, muscular Eminence.

The Substance of the Ulna is much the same with that of the Os Humeri, already describ'd. The Tuberosity of the Olecranon, and the small interior Head, with its Styloide Apophysis, remain for a long time Epiphyses in some Subjects.

It is connected with the Pulley of the Os Humeri, by an angular Ginglymus; with the two Extremities of the Radius, by a compound lateral Ginglymus; and with the Hand, by Ligaments, and not by Articulation.

The Situation of this Bone may be consider'd two ways; either when the fore Arm is extended, and lies along the Side of the Trunk, or when it is bent, and lies on the lower Part of the Breast. The first Situation appears to be most commodious for determining what Parts of the Bone are to be call'd anterior, posterior, superior, inferior, external, and internal; but the second seems most natural, as being the most common in living Bodies, whether sitting or standing, and has accordingly been follow'd by some of the Antients.

The RADIUS.

The Radius is nearly of the same Length with the Ulna, bigger at one End than at the other, irregularly triangular, a little bent, and situated along the Side of the Ulna. Its Name is taken from the Resemblance it bears to the Spoke of a Wheel.

We are to consider in the Bone two Extremities, and a middle Portion. One Extremity is small, and like a kind of Head set upon a Neck; the other is large, resembling a Pedestal or Basis; and therefore it might be divided into a Head, Body, and Basis.

The Head, or small Extremity of the Radius, is very short or low, the Top of it is concave, and the Circumference cylindrical; and both the Glenoide Cavity and the Circumference are cover'd with the same smooth shining cartilaginous Crust; and about one Quarter of the Circumference is broader than the rest. The Neck is small, and its Situation a little oblique. It ends by a lateral Tuberosity, which lies directly under the broad Part of the Head, being rough in the Middle and on one Side, and smooth and superficially cartilaginous on the other.

The Basis, or great Extremity of the Radius, is much broader than it is thick, and has two broad Sides, and one narrow. One of the broad Sides is a little hollow, and pretty even; the other is unequally convex, and divided by longitudinal Eminences, or bony Lines, into three or four longitudinal Chanels, much more distinct in fresh Bones than in the Skeleton. The narrow Side is concave lengthwise, and between its Edges, and those of the two broad Sides, two Angles are form'd, by which the three Sides are distinguish'd; and, opposite to it, the broad Sides form a common Edge, and a third Angle. This narrow Side ends in a semilunar Cavity, border'd with a smooth Cartilage, and lying almost in the same Direction with the Tuberosity. The broad Sides end at their common Angle, by an obtuse Point or Production, which has been call'd the Styloide Apophysis of the Radius, and is really a Continuation of one of the bony Lines.

The whole Basis ends in an oblong, triangular, Glenoide Cavity, the Cartilage of which is continu'd over the hollow Edge of the narrow Side. This is an articular Cavity, resembling an Arch, and ending on one Side at the Styloide Apophysis, and hollow'd on the other, by the Cavity of the narrow Side. It appears divided into two Portions by a small transverse Line, and in the natural State the hollow'd Side is lengthen'd out by a cartilaginous Production, the Description of which belongs to the History of fresh Bones.

The Middle, or Body of the Radius, is a little incurvated, the Concavity lying between the Tuberosity in the Head, and semilunar Cavity in the Basis. It has three Sides, one rounded, which forms the convex Side of the Curvature, and two concave; three Angles, two of which are obtuse, distinguishing the two concave Sides from the convex; and the third sharp, lying between the two concave Sides, opposite to the convex Side. In each of these Sides there are several muscular Marks.

The Substance of this Bone is like that of the Ulna. The Head and Basis are Epiphyses in Children, and, in some Subjects, remain such for a long time afterward.

The Radius is connected with the Ulna, the Os Humeri, and Carpus. It is articulated with the Ulna, at its two Extremities, by a double lateral Ginglymus; the cartilaginous Circumference of the Head turning in the small Sigmoide Cavity, and the semilunar Cavity in the Basis turning upon the small Head, at the lower Extremity of the other Bone; and thus the small Extremity of one Bone is join'd to the great Extremity of the other.

It is articulated with the Os Humeri, by the Application of the Cavity in the Top of its Head to the small Head at the lower Extremity of the other Bone. By this Conformation it would be capable of moving in all Directions; but, as it is ty'd to the Ulna at both Extremities, its Motions on the small Condylloid Head, at the lower Extremity of the Os Humeri, are confin'd to two kinds; that of Rotation, when it turns on the Sides of the Extremities of the Ulna, and that of Flexion and Extension, in common with the Ulna; and both these Motions may be perform'd at the same time.

The Articulation of the Radius with the Bones of the Carpus shall be explain'd in describing these Bones.

The BONES of the HAND; and, first, the BONES of the CARPUS.

The Hand is the last Part of the upper Extremity, and is divided into the Carpus, Metacarpus, and Fingers. It may be further divided into the concave and convex Side. The concave Side is likewise call'd the Inside, because it is commonly, and, as it were, naturally, turn'd toward the Body, and so hid. The convex Side is, for the same Reason, nam'd the Outside, as being, for the most part, turn'd outward, and expos'd to View. The first is also nam'd the Hollow or Palm of the Hand, the other the Back of the Hand.

The Carpus, or Wrist, consists of eight small, unequal, and irregular Bones; and, taken all together, they represent a sort of Grotto (*Grote*) of an irregular quadrangular Figure, and connected principally with the Basis of the Radius. Consider'd in this manner, the whole Collection of them has two Sides, and four Edges. One of the Sides is convex and external, the other concave and internal. The Convexity of the Outside is pretty uniform; but the inner or concave Side has four Eminences, one at each Corner. One of the four Edges touches the fore Arm, and is, as it were, the Head of the Carpus: another Edge may be term'd the Basis, and touches the Metacarpus; the third is toward the Point of the Radius, and the fourth toward the Point of the Ulna. The first of these last I shall call the small Edge, and the other the great Edge.

The Bones of the Carpus are divided into two Rows; the first of which lies next the fore Arm, the second next the Metacarpus. Each Row consists of four Bones; but the fourth of the first Row lies, in a manner, out of its Rank. Each Bone has several cartilaginous Surfaces for their mutual Articulations; and, in some of them, for their Articulations with the Radius, and Bones of the Metacarpus and Thumb.

It is to no purpose to distinguish the three ordinary Dimensions in any of these Bones, except one; but, in most of them, we may consider six Sides, one external, turned toward the convex Surface of the Carpus; one internal, toward the concave Surface; one toward the fore Arm, which I call the brachial Side; one toward the Fingers, which I call the Digital Side; one toward the Point of the Radius, or the Radial Side; and one toward the Point of the Ulna, or the Cubital Side.

Of these Sides some are bony, others cartilaginous or articular. These last I shall call Sides, the other Surfaces, as being Portions of the common Surface of the Carpus in its natural Situation.

To distinguish these eight Bones from each other, they are call'd first, second, third, and fourth Bones of the first or second Row, beginning to count from the Radius or Thumb.

Lyserus has been at the Pains to give a particular Name to each of them: He calls the first Bone of the first Row Os Scaphoides, or Navicular; the second, Os Lunare; the third, Os Cuneiforme; the fourth, Os Pisiforme: The first Bone of the second Row, Os Trapezium; the second, Os Trapezoides; the third, Os Magnum; and the fourth, Os Unciforme.

OS SCAPHOIDES.

The first Bone of the first Row is term'd *Scaphoides* in Greek, and *Navicular* in Latin, from its Resemblance to a small Boat. Next the Radius it has a convex Side, by which it is articulated with the Basis of that Bone; and a Tubercle, which is one of the four Eminences on the concave Side of the Carpus. Toward the Thumb it has two Half-sides; a large one for the Os Trapezium, and a small one for the Os Trapezoides. It has likewise a hollow Side for the Os Magnum, and a small semilunar Side for the Os Lunare. The inner and outer Surfaces are rough.

OS LUNARE.

The second Bone of the first Row is call'd *Lunare*, because one of its Sides is in form of a Crescent. The articular Sides in this Bone are four in Number; one convex, for the Basis of the Radius; one semilunar, for the Os Scaphoides; one almost triangular, for the Os Cuneiforme; and one hollow, which, with the hollow Side of the Os Scaphoides, forms a Cotyloid Cavity for the Head of the Os Magnum. The convex Side, together with that of the Os Scaphoides, forms an oblong Convexity, answering to the oblong Concavity in the Basis of the

Radius. The outer and inner Surfaces are small and rough. This Bone would be better nam'd Os Semilunare.

OS CUNEIFORME.

The third Bone of the first Row, call'd *Cuneiforme* from its Figure, appears rather like a Wedge sticking between the two Rows. It has a rough Surface, with a small Tubercle upon it, which forms the greatest Part of the cubital Edge of the Carpus; and four articular Sides, whereof one is convex, which completes the articular Convexity of the Carpus; one orbicular and internal, or on the concave Side of the Carpus, on which the Os Pisiforme is set; and two which make an Angle between them; one for the Os Semilunare, and the other for the Os Unciforme.

OS ORBICULARE.

The fourth Bone of the first Row, call'd *Orbiculare*, *Pisiforme*, and *Lenticulare*, from its Figure and Size, is irregularly round. It has but one cartilaginous Side, irregularly orbicular, the Border or Circumference of which represents a sort of narrow Collar. The rest of the Bone is rough, convex, and irregularly round, making one of the four Eminences on the concave Side of the Carpus. This Bone, and the Os Cuneiforme, may be suppos'd to make a third Row distinct from the other two.

The four Bones of the second Row lie all in a Line, the first being articulated with the Thumb, the rest with the Metacarpus.

OS TRAPEZIUM.

The first Bone of the second Row is nam'd *Trapezium*, as being suppos'd to be of an unequal square Figure. Its outer Surface is rough, and makes a Portion of the convex Side of the Carpus. On its inner Surface is an oblong Eminence, which makes one of the four Eminences on the concave Side of the Carpus; and, on the same Side, it has a Groove or Channel. There is likewise a small Tubercle on the outer Surface.

It has several articular cartilaginous Sides; one Brachial, one Digital, and two Cubital Sides.

The Brachial Side, which is hollow, is articulated with the Os Scaphoides; the Digital, with the first Phalanx of the Thumb; one of the Cubital Sides, with the Os Trapezoides, and the other with the first Bone of the Metacarpus.

The Side which is articulated with the first Phalanx of the Thumb, appears to be made up of two superficial Sigmoide or Semilunar Half-sides, distinguish'd by an Eminence of the same Figure, being each more hollow toward the Sides than at the Middle, which makes a Portion of a sort of superficial Pulley, with the Edges much worn.

One of the Cubital Sides, which is articulated with the Os Trapezoides, is large; the other, which joins the first Metacarpal Bone, is small.

OS TRAPEZOIDES.

The second Bone of the second Row deserves the Name of *Pyramidale*, rather than *Trapezoides*, being a kind of Pyramid with the Point broke off. Its Basis makes a Portion of the outer or convex Side of the Carpus, and its Point a Part of the concave Side.

It has several articular Sides; one Brachial, which is the least of all, and articulated with the Os Scaphoides; one Digital, of a considerable Length, notch'd on each Side, and divided into two Havles, by a sort of middle Line or Angle, which gives it the Appearance of a Pulley, articulated with the Basis of the first Metacarpal Bone; one Radial, irregularly triangular, and articulated with the Os Trapezium, and one Cubital, a little hollow, and articulated with the Os Magnum.

OS MAGNUM.

The third Bone of the second Row, call'd *Os Magnum*, is the largest of all the Bones of the Carpus. It is of a considerable Length, and has a kind of articular round Head, which is receiv'd into the Cotyloid Cavity form'd by the two first Bones of the first Row; and this Articulation is capable of a small Degree of Flexion and Extension.

The Digital Side is a cartilaginous Basis, unequally and obliquely triangular, the Apex being turn'd inward. It is articulated with the second Metacarpal Bone, and is also a little notch'd on the Radial Edge, for its Articulation with the small Edge of the first Metacarpal Bone.

The Radial Side is very small, and, near the Basis, it is articulated with the Os Pyramidale; the rest of this Surface is without Cartilage. The Cubital Side is double, answering to a like Side in the Os Unciforme, with which it is articulated.

The outer Surface, which forms a Portion of the convex Side of the Carpus, is broad, rough, and uneven, for the Insertion of Ligaments. The inner Surface is likewise rough, but narrower; and round both Surfaces are several Depressions, which, in the natural State, are fill'd with small Glands and Ligaments.

Os UNCIFORME.

In the fourth Bone of the second Row we are to consider the Body, and hook'd or Unciform Apophysis, from whence it has the Name of *Unciforme*. This Apophysis, one of the four Eminences on the concave Side of the Carpus, is flat, and the hollow Side of its Curvature is turn'd toward the Os Magnum. The outer Surface of its Body is rough, and, in some measure, triangular. It completes the convex Side of the Carpus, and, toward the Ulna, terminates in a small Tuberosity, which is all the Cubital Side of this Bone.

It has three articular or cartilaginous Sides, one Radial, one Brachial, and one Digital.

The Radial Side is double, answering to the Cubital Side of the Os Magnum. The Brachial Side is very oblique, partly a little concave, and partly a little convex, answering to the Digital Side of the Os Cuneiforme. The Digital Side is double, or distinguish'd into two Halves, by a Sigmoid angular Line, for its Articulation with the two last Bones of the Metacarpus.

The Bones of the Carpus are articulated with each other by Arthrodia, but the first Row forms a sort of Ginglymus with the second, because the Head of the Os Magnum may turn in the Cotyloide Cavity of the first Row, while the two first Bones of the second Row slide upon the Digital Side of the Os Scaphoides, and the Os Unciforme in the same manner on the Os Cuneiforme.

When all these Bones are in their natural Situation, a transverse Depression is form'd on the convex Side of the Carpus, by which the two Rows are distinguish'd. This Depression appears most between the Os Scaphoides and the three last Bones of the second Row, and looks like a kind of Fold, by which the second Row is thrown a little back upon the Convexity of the first. The four Eminences on the concave Side of the Carpus are for the Insertion of a strong transverse Ligament. The inner Substance of all these Bones is spongy, and their Surfaces are not very compact.

The BONES of the METACARPUS:

The Metacarpus is the second Part of the Hand, situated between the Carpus and Fingers. The Antients, who call'd the Carpus, *Brachiale*, from whence the Word Bracelet seems to be deriv'd, term'd the *Metacarpus*, *Post-Brachiale*.

The Metacarpus consists of four Bones, one Side of which forms a broad Cavity, call'd the Palm of the Hand; the other a gentle Convexity, call'd the Back of the Hand. The ancient Anatomists reckon'd five Bones in the Metacarpus, including that Bone which is now look'd upon as the first Phalanx of the Thumb.

The Bones of the Metacarpus are long, thicker at the Extremities than at the Middle, and of unequal Length and Bigness. The first is the largest, the rest are lessen'd by Degrees in all their Dimensions. The two first are sometimes, tho' very rarely, equal.

Each Bone is divided into the Extremities and Middle-part; or into a Basis, Body, and Head. The Bases are angular, and turn'd toward the Carpus; the Heads rounded like Condyles, and turn'd toward the Fingers. Both are cover'd with Cartilages, and the Heads remain for a long time very distinct Epiphyses.

The Bases are narrow, and almost angular, toward the Palm of the Hand; toward the Back of the Hand their Breadth is considerable; but, on the other two Sides, they are very broad; and there they have small articular Sides, which I call lateral Sides. The Heads are flatted on the two Sides, which answer to the lateral Sides of the Basis; and their greatest Convexity is turn'd toward the Palm of the Hand, terminating in two obtuse Points. Several Notches and Fossulae break in upon the lateral Sides, and the flat Sides of the Heads are a little depress'd, a small Tubercle arising in the Middle of each Depression.

The Body of each Bone is contracted, of a triangular Figure, and distinguish'd into three Sides, whereof one is external, and a little convex, contributing to make the Back of the Hand; the other two internal, and a little concave, one being turn'd obliquely toward the Radius, the other toward the Ulna. These three Sides are separated by the same Number of Angles; and that Angle, which parts the two internal Sides, is sharp. It is by these two Sides, and the Angle between them, that the Hollow of the Palm of the Hand is form'd.

FIRST BONE.

The first Bone of the Metacarpus is longer, thicker, and bigger, than any of the rest, and supports the fore Finger. Its Basis is a little hollow, answering to the Digital Side of the Os Pyramidale of the Carpus. On the outer Edge there is a small angular Notch, and, on the Cubital Edge of the Basis, a small lateral Line, which is articulated with the Basis of the second Bone. The inner Edge is terminated laterally by an oblique Angle, which is articulated with the neighbouring An-

gle in the Basis of the Os Magnum. Round the Basis are Inequalities and Depressions, for the Ligaments and articular Glands. The Outside of the Body of the Bone is broader toward the Head than toward the Basis.

SECOND BONE.

The second Bone of the Metacarpus supports the middle Finger, and has this peculiar to it, that its Basis is very oblique, terminating at the outer Edge by an angular Point, turn'd toward the first Bone. By the triangular Side of its Basis, it is articulated with the Basis of the Os Magnum; and, by its lateral Sides, with those of the first and third Bones of the Metacarpus.

THIRD BONE.

The third Bone of the Metacarpus supports the Ring-finger, being less than the first and second. Its Basis is irregularly triangular, and proportionably less than the two former; and by the principal Side thereof, it is articulated with the first Half of the Side of the Os Unciforme. The small lateral Sides of the Basis join those of the second and fourth Bone of the Metacarpus.

FOURTH BONE.

The fourth Bone of the Metacarpus supports the little Finger. The principal Side of its Basis, instead of being triangular, as in the other Bones, is all of an equal Breadth, a little oblique, somewhat convex, somewhat concave, and is articulated with the second Half of the Side of the Os Unciforme. By its lateral Side it joins the corresponding Side of the Basis of the third Bone; but in a much looser manner than in the other Articulations of the like Kind. On the opposite Side there is a small Tuberosity.

The BONES of the FINGERS.

The Fingers make the third Part of the Hand, and terminate the whole upper Extremity. They are five in Number in each Hand, call'd the Thumb, the fore Finger, the middle Finger, the Ring-finger, and the little Finger.

They may be said in general to represent the same Number of compound, long, small, bony Pyramids, convex on one Side, somewhat concave on the other, and join'd by their Bases to the Carpus and Metacarpus, from whence they diminish gradually, and end in a sort of small Heads.

The Thumb is the biggest of all the Fingers; next to that is the third, call'd the long Finger. The second and fourth are shorter than the third; the fourth being a very little longer than the second. The fifth is the smallest of all.

Each Finger consists of three Pieces, call'd *Phalanges*; the first of which is longer and thicker than the second; and the second than the third. Each *Phalanx* is divided, in the same manner as an entire Finger, into a Basis, middle Portion, and Head; into two Sides, one convex, the other concave; and into two Edges. The Bases of the Phalanges remain Epiphyses for a long time, as well as the Heads of the metacarpal Bones.

FIRST PHALANX of the THUMB.

The first Phalanx of the Thumb is not like those of the other Fingers. Ancient Authors reckon'd it among the Bones of the Metacarpus, which it resembles very much; and then they counted five Metacarpal Bones, allowing only two Phalanges to the Thumb. The convex Side of this Phalanx is very much flatten'd, and broader toward the Head than toward the Basis. On the concave Side is a kind of angular Line, which in some measure distinguishes it into two Parts. Its Head is like those of the metacarpal Bones, only flatten'd at the Top.

The articular Side of its Basis is proportion'd to the Digital Side of the Os Trapezium of the Carpus; and fram'd in such a manner, as that the Sigmoid Cavities and Eminences in both Bones cross each other. This Articulation has something very particular in it. It is a kind of double Ginglymus, which readily allows of Flexion and Extension, Adduction and Abduction, but with Difficulty permits the oblique Motions; because then the two Sides run counter to each other.

The Head and Basis carry for a long time the Marks of Epiphyses; and for all these Reasons, this Bone may be reckon'd a Metacarpal Bone degenerated.

The SECOND PHALANX.

The second Phalanx of the Thumb is shorter than the first; its Body convex or semicylindrical on one Side, flat on the other, and contracted between the Edges. The articular Side of the Basis is gently concave, and surrounded near the Edges by small Tuberosities; as also near the Angle of the Phalanx. The Head is a regular Portion of a Pulley, which projects more on the concave than on the convex Side; and on each Side of it there is a small Fossula, and some Inequalities in form of Tubercles. On the flat or concave Side of the Phalanx are two rough Lines, one near each Edge, which are often destroy'd in cleaning the Bones; they are the Impressions or Marks of the articular

articular Vagina, which shall be explain'd in describing the fresh Bones.

The Connexion of this Phalanx with the first is by a kind of Arthrodia, or by a flat Enarthrosis, which permits a Motion in several Directions; though more limited than in other Articulations of the same Kind. It is articulated with the third by a very perfect Ginglymus.

THIRD PHALANX.

The third Phalanx of the Thumb represents the half of a sort of Cone, cut lengthwise; and by joining it to the same Bone of the other Thumb, an entire Cone is form'd. The convex Side is more even than the flat Side; and on each Edge there is a Tuberosity near the Basis. The Basis has two hollow Sides, which form a Ginglymus, with the Head of the second Phalanx. The Head is small and flat, ending in a rough semi-circular Border; which, on the flat Side of the Bone, represents a Horse-shoe.

The FINGERS.

The other four Fingers in general, and their Phalanges in particular, are all nearly of the same Structure, differing chiefly in Size. The fore and Ring-fingers are almost equal, only the fore Finger is generally a little bigger, and sometimes a little shorter than the other. The middle Finger is the longest; and the little Finger the least. Almost the same Proportions are to be observed in the Phalanges.

FIRST PHALANGES.

The first Phalanges of these four Fingers are made nearly in the same manner with the second of the Thumb; only they are longer in proportion, flatter on the concave Sides, and more rounded on the convex Sides. The Edges of the flat Sides have the same rough Line as the second Phalanx of the Thumb. Their Bases are more hollow for their Articulations with the Heads of the metacarpal Bones, and their Heads are like Pullies, as in the second Bone of the Thumb.

SECOND PHALANGES.

The second Phalanges are shorter, narrower, and thinner than the first. Both Phalanges are somewhat incurvated, and resemble each other in Structure, except that the second contracts by Degrees from their Bases to the Heads, which are very small; and that their Bases have a double Cavity for their Articulation, by a Ginglymus, with the Heads of the first Phalanges. Their flat Sides have the same rough Lines already mentioned.

THIRD PHALANGES.

The third Phalanges are in every thing like that of the Thumb, except that they are smaller, each of them being proportion'd to the Fingers they belong to.

It is to be observed concerning all the Phalanges, that their Bases have small Tuberosities; and their Heads, except those of the last Phalanges, have on each Side a roundish sort of Fossula, border'd with small Eminences.

The particular Situation and Uses of the BONES of the UPPER EXTREMITIES.

The Hand is generally represented in Skeletons and Figures, as lying in the same Plane, and in the same longitudinal Direction with the Bones of the fore Arm. This gives a very false Idea of its true Situation, which, with respect to the fore Arm, is oblique in two respects. The Back of the Hand is inclined upon the convex Side of the Carpus, and makes an Angle with the fore Arm; and, besides, the fourth Bone of the Metacarpus is inclined towards the Ulna in particular. In a Word, the Breadth of the Hand makes an Angle with the Breadth of the fore Arm; and the Thickness of the Hand, at the same time, with the Thickness of the fore Arm. I mean here that Part of the fore Arm which is next the Hand.

This is owing to the Structure and Situation of the Bones of the Carpus, and to their Connexion with those of the fore Arm. First, the two Rows of these Bones make a sort of transverse Fold on the convex Side of the Carpus; and the articular Brachial Sides of the two first Bones of the first Row are turn'd a little toward the same convex Side of the Carpus; which obliges the whole Hand to be a little bent back in its natural Situation. Secondly, the Edge of these Bones next the Ulna is much shorter than that next the Radius; which makes the Cubital Edge of the whole Hand incline to that Side.

By not considering this, a large void Space is commonly left in Skeletons, between the Extremity of the Ulna and the Os Cuneiforme of the Carpus. It ought likewise to be observed, that the Edge of the Metacarpus next the Ulna is shorter than the other; so that in the Metacarpus a small and great Edge may as justly be distinguished as in the Carpus.

In this oblique and natural Situation of the Hand, the Fingers being extended, and a little separated, the Extremity of

the fore Finger will be found to answer to the Interstice between the Bones of the fore Arm; and if in this Situation we make alternately the Motions of Pronation and Supination, the Extremity of the fore Finger will be found to be in some measure the common Centre of these Motions.

This Disposition of all the Bones of the Hand is moreover very well contrived, to give it several kinds of Attitudes; for by means thereof it may be lengthen'd, flatt'd, shorten'd, and contracted. The Hand is lengthen'd or widen'd, and flatt'd, by extending all the Fingers, and turning back the Thumb, which is what is called extending or opening the Hand. It is shorten'd by bending all the Fingers, whether in what is call'd closing the Fist, or in grasping any thing; and to this the Situation of the Thumb, and the oblique Disposition of the Bones of the Metacarpus and Fingers, contribute in a particular manner. And as in this Case the Thumb counterbalances all the other Fingers, the Articulation of the first Phalanx thereof with the *Os Trapezium* appears to be render'd more firm and steady, by partaking a little of the Nature of a Ginglymus, without hindering its other Motions. Lastly, the Hand is contracted, and made into a sort of Gutter or Furrow, by the Adduction of the Thumb, and the easy Motion of the fourth Metacarpal Bone; and if at the same time we bend the Fingers, and press them close together, we both shorten and contract the Hand; and thereby form a Hollow, which is called *Diogenes's Cup*.

In the Fingers we ought likewise to remark, that though the Articulation of the second Phalanx of the Thumb, and first Phalanges of the other Fingers, be moveable in many Directions, and framed nearly in the same manner as that of the *Os Humeri* with the Scapula; yet these Phalanges cannot be moved round their Axes. This is not owing to their Conformation, but to the want of proper Muscles. The same thing cannot be said of the first Phalanx of the Thumb; because, though it had proper Muscles, yet the kind of Half-ginglymus, by which it is articulated, would not allow of such a Motion.

The Thumb is situated differently from the other Fingers. The Fingers, both with respect to their Sides and Edges, have, in their natural Situation, nearly the same Direction with the Plane of the Metacarpus. The Thumb being in its natural Situation, and free from the Action of all its Muscles, its convex Side answers to the convex Side of the Radius, and its flat Side is turn'd toward the little Finger; and the first Phalanx makes an hollow Angle with the Radius, and a prominent Angle with the second Phalanx; but both this, and the third Phalanx, lie in a strait Direction, like that of the fore Arm.

The Carpus is the Basis and Centre of all the Motions of the Hand, except that of Rotation. By means thereof, we can bend the Hand in all Directions, but with more Ease toward the Sides and Edges, than any other Way. The four Bones of the second Row may have a small Degree of Motion on the first, such as a Ginglymus can allow of.

The Radius is in a manner the Handle of the Hand; and it is chiefly by means thereof, that we can move the Hand reciprocally as on the Axis, turning either Edge of it toward the Body. This Motion or Attitude is term'd Pronation; and when the Cubital, or small Edge, is toward the Body, it is term'd Supination. In the natural and most ordinary Situation of the Hand, the Palm is turn'd toward the Body, and not the Edges.

This Disposition of the Hand determines the true Situation of the Radius, which is not on one Side of the Ulna in a parallel Direction, as the Figures and Skeletons commonly represent it; but the Radius crosses the Ulna obliquely in such a manner, as that the Styloide Apophyses in both Bones are directly over-against each other. This is its true natural Situation. The Radius, being bent, may be still farther cross'd over the Ulna, than in its natural Situation; and this happens in Pronation, but in Supination it is parallel to the other Bone.

The Ulna supports the Handle of the Hand, without being itself articulated with the Hand. Two lateral *Ginglymi*, and very strong Ligaments, connect the Radius closely with it, so that in the most violent Motions these two Bones cannot be separated. When we push or press any thing with the Hand, the whole Force is sustain'd by the Radius, the Basis of which supports the Wrist, and its concave Head is strongly press'd against the small inferior Head of the *Os Humeri*. The oblique Direction of the Pully of the Ulna is the Reason, that, in bending the fore Arm upward, the Extremity of that Bone is naturally turn'd toward the Thorax, and not without Difficulty toward the Articulation of the Scapula.

An Account of the Cartilages and Ligaments are not less necessary to a Knowledge of the superior Extremities, than the preceding Detail of the Bones. For this Reason, I shall give

WINSLOW'S Remarks upon the FRESH BONES.

The Cartilage by which the Hemisphere of the Head of the *Os Humeri* is covered, is gradually thicker toward the Middle, than toward the Edges;

The four Surfaces of the Tuberosities, which appear cartilaginous in dry Bones, serve only for the Insertion of the Tendons of four Muscles, which move the Os Humeri on the Scapula.

The Channel or Sinus between the two Tuberosities is partly covered by a thin Crust, which appears rather ligamentary than cartilaginous; and partly by a tendinous Stratum, of which hereafter.

The Trochlea and small Head of the lower Extremity of the Os Humeri are covered by a common Cartilage, in which the same Proportion of Thickness is observable, as in that of the upper Extremity. This holds pretty generally of all the convex articular Cartilages.

The Fossula near the Pulley and small Head are covered with a kind of thin cartilaginous or ligamentary Varnish.

The Capsular or mucilaginous Ligament loosely surrounds the whole Articulation of the Scapula with the Head of the Os Humeri. From its Insertion round the Edge of the Glenoid Cavity, it is continued over the Hemisphere of the Head of the Os Humeri, and fixed near its Edges, towards the muscular Surfaces of the great and small Tuberosities.

Afterwards parting from them on both Sides, in the large Space left between the two Tuberosities, that is, between the small Tuberosity and the lowest Surface of the great Tuberosity, it runs down gradually on the Neck of the Bone below the lowest Part of the cartilaginous Hemisphere.

In all this Course the Capsula is closely fixed in the Bone, except in the small Space left between the two Tuberosities, that is, at the Channel or Sinus, where it forms a Production like the Tube of a Funnel, proportion'd to the Capacity of the Channel, and strongly fix'd in the upper Portion thereof. This membranous Tube is the Vagina of the inter-articular Tendon of the Biceps.

The true Ligament of this Joint appears to be composed of two Ligaments closely united together; one a Capsular Ligament, which surrounds the whole Articulation; and the other, fram'd by several true Ligaments which run over, and closely adhere to the former in different Places.

Thus the Capsula, or mucilaginous Bag of this Articulation, is in part strongly united to four flat Tendons inserted in the two Tuberosities; and in part covered by true ligamentary Bands, which, between the four Tendons, and on both Sides of the first and last, form a considerable Thickness. The rest of the Space between the first or superior Plane of the great Tuberosity and the small Tuberosity is so little provided with ligamentary Fibres, that it has been believed to be altogether without them; and Anatomists have satisfy'd themselves with telling us, that in these Places the orbicular Ligament is very rough on the Outside, but shining and smooth on the Inside.

On the Body of the Os Humeri there are two particular Ligaments, which I term intermuscular, or lateral. They are long, flat, thin, strong, and narrow, fixed on one Edge along the two lower Thirds of the Bone, and reaching to both Condyles. They are braced pretty tight, and are very narrow at the upper Part, but broader toward the Condyles.

The lower Extremity of the Os Humeri is joined to the Bones of the fore Arm by two Fasciculi of Ligamentary Fibres, one fixed to the internal Condyle, the other to the external. Each Fasciculus is composed of Fibres closely joined together at the Condyle, and afterwards parting in distinct Bands like a Goose's Foot.

The Capsular Ligament is fixed to the Condyles, and there covers them; and afterwards it is fixed round both Sides of this lower Extremity above the Fossula. Its Insertion in these Sides is Archwise; so that it is there at a much greater Distance from the Articulation, than at the Condyles. The Fossulae are slightly varnish'd over with a cartilaginous Substance.

This Capsula appears to be strengthen'd by a Ligamentary Web, the Fibres whereof cross each other in different Directions; but we must not take for Ligamentary Filaments some tendinous Fibres of Muscles, to which the Capsula adheres very closely. It appears larger and looser when the Muscles are separated from it, than in its natural State, when closely united to the Muscles.

The two Sigmoid Cavities in the upper Extremity of the Ulna are covered by a Cartilage common to both, which is a little interrupted about the Middle of the Edges of the Cavities by the transverse Notches mentioned before. This cartilaginous Crust seems to be thicker at the Edges, than in the Middle.

The inferior Extremity, or small Head of the Ulna, is crufted over by a Cartilage round its cylindrical Border, in the Notch near the Styloide Apophysis; and for some Space on the Apophysis itself.

The Cartilage which covers the Head of the Radius is likewise stretch'd over the cylindrical Border thereof; and a lateral Portion of the muscular Tuberosity immediately below the Neck is also covered with a thin shining Cartilage.

All the concave Side of the Basis of the Radius is cartilaginous, and often divided by a small cartilaginous prominent Line. The

lateral Notch of the Basis is likewise covered by a Continuation of the same Cartilage.

The lateral Half-grooves or Channels of the Basis of this Bone appear likewise to be crufted over with a cartilaginous Matter; but this I rather take to be Portions of the annular Ligaments.

At the Basis of the Radius there is likewise a particular additional Cartilage, or triangular Production, longer than it is broad, very thin, and rather flat than concave on both its smooth Sides. It is fixed by its Basis, or shortest Side, to the lateral Sigmoid Notch of the Basis of the Radius, in such a manner as that one Side of it is on a Level with the large cartilaginous Surface of the Basis of the Bone, and its Apex directly opposite to the Styloide Apophysis. The other Side touches the flat Extremity of the small Head of the Ulna, but is not fixed to it.

This Cartilage may be term'd the interarticular Cartilage of the Joint of the Wrist. It is tied to the Radius by very short Ligaments; and sliding on the small Head of the Ulna, it follows all the Motions of the Radius. It is therefore a sort of articular Production of the lower Side of the Basis of the Radius, and fills in the natural State the void Space, which, in the Skeleton, appears between the End of the Ulna, and the neighbouring Bone of the Carpus.

Some of the Ligaments of the Bones of the fore Arm are common to them with the Os Humeri; some common to them with the Bones of the Hand; and some are proper. These last are two in Number; one call'd the interosseous Ligament of the fore Arm; and one which may be termed the coronary Ligament of the Radius. To these may be added the annular Ligaments, which only serve for the Passage of Tendons, and other Ligamentary Expansions, which may be called muscular Ligaments.

The interosseous Ligament of the fore Arm is very like that of the Leg. It is fixed by one Edge along the sharp Angle of the Ulna, and by the other along that of the Radius. It is principally made up of two very strong Planes of Fibres, which cross each other at oblique Angles, and leave Holes at different Distances for the Passage of the Blood-vessels.

This Ligament ties the two Bones closely together; and the two Planes serve for the Insertion of several Muscles. In the Supination of the Hand it is very tightly braced; but in Pronation it is folded a little Lengthwise.

The Coronary Ligament of the Radius is a sort of Ligamentary Hoop surrounding the circular Circumference of the Head of that Bone, reaching from one Side of the small lateral sigmoid or transverse Cavity of the Ulna to the other, in an Arch, which is about three quarters of a Circle. It is very strong, and comes near the Solidity of a Cartilage. The Side next the Radius is very smooth; and though it connects that Bone very closely to the Ulna, yet it leaves it room enough to turn in the Motions of Pronation and Supination.

The Capsular Ligament of the Joint of the Elbow runs down from its Insertion in the Os Humeri, and is fixed in the Olecranon round the Edge of the great Sigmoid Cavity, including both the Apex of the Olecranon, and of the Coronoid Apophysis. It likewise runs over the Head of the Radius, and is fixed to the Coronary Ligament quite round. Thus it completely surrounds the Articulation of these three Bones, and serves to contain the mucilaginous Liquor furnished by the Glands, and fatty Substance, both which are found in great Quantities near the Extremity of the Bone which forms the Elbow.

The true common Ligaments by which the Os Humeri is connected to the Bones of the fore Arm, call'd lateral Ligaments, are the two Fasciculi before-mentioned, which, after being inserted in the Condyles of the Os Humeri, are expanded like a Goose's Foot. That which is fixed in the inner Condyle may be call'd Brachio-cubital, and the other Brachio-radial.

The Brachio-cubital Ligament running down over the Capsula, to which it closely adheres, below the great Edge of the Trochlea of the Os Humeri, is inserted like Radii (of which its other Extremity fixed in the Condyle is the Centre) on the Side of the great Sigmoid Cavity of the Ulna. It is covered on the Outside by several Tendons which adhere closely to it, and seem to strengthen it.

The Brachio-radial Ligament is disposed much after the same manner, but is of a greater Extent. It is expanded from the external Condyle of the Os Humeri, as from a Centre; and is inserted round the Coronary Ligament, and from thence all the Way down to the Neck of the Radius; and also in the neighbouring Parts of the Ulna. Through all this Passage it covers the Capsular Ligament, and is covered by several Tendons adhering closely to both.

Of the Ligaments by which these Bones are connected to those of the Hand, one is like a roundish Cord fixed in the Styloide Apophysis of the Ulna, and from thence passes directly over the Os Cuneiforme of the Carpus, in which, and in other Bones, it is inserted in a peculiar manner. Another pretty broad Ligament is fixed in the Point of the Radius; and by its other Extremity, in the Bones of the Carpus.

From this Styloide Ligament of the Radius, along each Edge of the Basis of that Bone, are Ranks of Ligamentary Fibres lying much in the same Direction with the Ligament itself, and continued all the Way to the Styloide Ligament of the Ulna; those nearest the Ulna inclose the interarticular Cartilage of the Basis of the Radius, and near the Styloide Ligament of the Ulna there is a particular Fasciculus inserted in the Point of that Cartilage.

All these Ligaments surround and cover the Capsular Ligament so closely, that they can hardly be distinguished from it. The Capsula is likewise in part cover'd by a Portion of a great oblique Ligament, which being by a very broad Insertion fixed in the large Extremity of the Radius, about two Fingers Breadth above the Styloide Apex, afterwards crosses obliquely, partly over the convex Side of the *Basis Radii*, and partly over that of the Carpus; and then turning towards the Os Orbiculare, is inserted therein. It is called the external transverse Ligament of the Carpus; and may likewise be named the great oblique Ligament of the Wrist.

There are several small annular Ligaments placed at different Distances on the convex Side of the *Basis Radii*, from its Styloide Apex to its Articulation with the Extremity of the Ulna. They are at least six in Number, some of them being often double or triple.

The first is fixed in the Styloide Apex; the second in the Groove near that Apex; the third, in the small narrow or middle Groove; the fourth, in the Groove next the former; the fifth, in the Corner of the semilunar Notch of the Basis, at its Articulation with the Ulna; and the sixth, in the Extremity of the Ulna; near the Styloide Apophysis.

These particular Ligaments are almost wholly covered by the great oblique Ligament, and are fixed as strongly in it on one Side, as they are in the Bones on the other. They are all very strong; and their concave Sides, serving for *Fræna* to the Tendons of several Muscles that pass over them, are very smooth, and accompanied with thin mucilaginous *Vagina*.

To these we may add the Ligamentary Expansions, with which several Muscles are cover'd, and separated from each other, as by so many distinct *Septa*; which are all very thick and strong, where they are inserted in the Bones. One kind of them may be term'd Ligamentary Bands, or muscular *Vagina*, the other Ligamentary *Septa*, or intermuscular Ligaments.

All the Bones of the Carpus, Metacarpus, and Fingers, are crusted over with Cartilages at those Places, which I term'd Cartilaginous Surfaces, in the Treatise of dry Bones: but in fresh Bones they are thicker, softer, and whiter, than in the Sceleton. In adult Subjects, their Figure remains the same in both; but it changes in the dry Bones of younger Subjects, and in those of Children it is quite different. The Impressions and Notches in which the mucilaginous Glands are lodged, are most sensible in the Cartilages of fresh Bones, because of their Thickness.

The Ligaments of the Carpus are very numerous. Some of them tie each Bone to one or two neighbouring Bones in the same Rank; and these are composed of a great Number of Filaments, but so very short, as to allow these Bones only a small Degree of Motion. Some of them tie the Bones of one Row to those of the other; which are likewise made up of many Filaments, but not so short as the former, and therefore allow these Bones a more manifest Motion, as we see in bending the Wrist. Lastly, there are other Ligaments of the Carpus, by which the three first Bones of the first Row are connected to the Bones of the fore Arm; and to these may be added the Ligaments by which the Bones of the second Row are join'd to those of the Metacarpus, and first Phalanx of the Thumb.

We have already describ'd all the Ligaments belonging to the Articulation of the Carpus, with the Bones of the fore Arm, except their Insertions in the Carpus. The Styloide Ligament of the Radius is fixed round the neighbouring Tuberosity of the Os Scaphoides. The Styloide Ligament of the Ulna is fixed first in the Os Cuneiforme, and then in the Os Unciforme, from whence it is a little stretched over the fourth Bone of the Metacarpus.

The Ligamentary Ranges, which lie between the above-mention'd Ligaments, the Basis of the Radius, and a small Portion of the Head of the Ulna, are fixed round the common Convexity of the three first Carpal Bones, as is also the mucilaginous Capsula, by which these Ligaments are lined.

Besides all these small short Ligaments belonging to each Bone in both Rows, the rough Surfaces of all the Bones, especially those which form the Convexity of the Carpus, give Insertion to a great many Ligamentary *Fasciculi*, stretched over, and closely united to the former small Ligaments, and serving, probably, to strengthen them. Some *Fasciculi* of the same kind are found on the concave Side of the Carpus, but they are fewer in Number, and not so strong.

There is likewise a considerable Ligament, called the inner transverse Ligament of the Carpus. It was formerly called an

annular Ligament, and may still very justly retain that Name in the Sense already explain'd, when I spoke of the Ligaments in general.

The Bones of the Metacarpus, besides the short Ligaments by which they are tied to the second Row of the Bones of the Carpus, have several Rows, by which both their Bases and Heads are connected together. The Bases of the third and fourth Bones are not so closely tied as the rest, and therefore they have a very sensible Motion, which, however, is greater in the fourth than in the third.

The Heads of these Bones are firmly tied to each other, by a strong transverse Ligament, situated in the Palm of the Hand, and fixed by distinct Productions in the neighbouring Part of the Heads, in such a manner, as to form in the Spaces between the Heads, as it were, perforated or chanel'd *Fræna*, through which the Tendons of the Flexor Muscles of the Fingers have a free Passage, and these *Fræna* are also supported by aponeurotic Expansions.

The first Phalanx of the Thumb is fixed to the Os Trapezium by short Ligaments, which pass obliquely over the Articulation. The first Phalanges of the other four Fingers are joined to the Heads of the Metacarpal Bones, almost in the same manner, and by Ligaments like the former, which are strengthen'd by adhering to the transverse Ligament. The second Phalanx of the Thumb is joined to the first, by Ligaments of the same kind.

The third Phalanx of the Thumb is joined to the second; the second Phalanges of the other Fingers to the first, and the third to the second, by lateral Ligaments almost in the same manner as the Bones of the fore Arm to the Os Humeri; that is, these Ligaments spread from a Point fixed in the lateral Tubercles of the Heads of the Phalanges, and are inserted by their other Extremity like *Radii*, in the Bases of the neighbouring Phalanges.

The two first Phalanges of each Finger have a very strong Ligamentary *Vagina* inserted in the rough Lines or Ridges on their flat Sides. These *Vagina* are lined with a mucilaginous Membrane, which runs like a Tube, from one Phalanx to the other, over the Articulation. They serve for *Fræna* to the Flexor Muscles of the Fingers, the Tendons of which pass through them. *Winslow*.

All these Bones would be useless, and an Incumbrance, if they were not furnish'd with Muscles, in order to move them in such Directions, and for such Purposes, as the Exigencies of Mankind may require. All these Muscles are described, and their Uses are specify'd, under their proper Names. I shall therefore only, in this Place, give their Names, and some Observations of Mr. *Cowper*, relative to them.

Galen, *Jacobus Sylvius*, and *Vesalius*, describe seven Muscles belonging to each Arm, that is, the

PECTORALIS.

DELTOIDES.

TERES MAJOR.

LATISSIMUS DORSI.

SUPRASPINATUS.

INFRASPINATUS, and

SUBSCAPULARIS.

Arantius, in his Anatomical Observations, counts another, by *Riolanus* called,

CORACOBRACHIÆUS.

To which *Julius Casserius Placentinus* adds the

TERES MINOR

By some reckoned as the eighth Muscle of this Part, which is therefore called OCTAVUS HUMERI PLACENTINI.

The MUSCLES of the CUBIT.

The lower Part of the Arm, from the Elbow to the Wrist, is called the Cubit, which is either bended or extended by five Muscles, which are the

BICEPS.

BRACHIÆUS INTERNUS.

GEMELLUS.

BRACHIÆUS EXTERNUS, and

ANCONÆUS.

Of the MUSCLES of the PALM of the HAND.

The antient Anatomists mention but one Muscle belonging to the Palm, which is the PALMARIS LONGUS.

But *Fallopian* describes the PALMARIS BREVIS, communicated to him by *Joannes Baptista Cananus*, an eminent Anatomist, his Contemporary, and was first published by *Valverda*, in his Anatomy written in *Spanish*.

The MUSCLES of the FOUR FINGERS.

The Muscles of the four Fingers are divided into common and proper. The common Muscles of the Fingers are such as arise

arise from the external or internal Protuberances of the *O. Humeri*, and, subdividing themselves, are inserted into most, if not all the Fingers; they are the

PERFORATUS.
PERFORANS.
LUMBRICALES, and
EXTENSOR COMMUNIS DIGITORUM.

The proper Muscles of the Fingers are such as have their Beginnings distinct, and are inserted, without any Subdivision, into each respective Finger; as the

EXTENSOR INDICIS.
ABDUCTOR INDICIS.
EXTENSOR MINIMI DIGITI.
ABDUCTOR MINIMI DIGITI.

Of the MUSCLES of the THUMB.

Authors disagree concerning the Number, Rise, and Insertions of the Muscles of the Thumb; which may partly proceed from that great Variety, which may be so frequently observed in divers Subjects: They are the

FLEXOR TERTII INTERNODII, SEU LONGISSIMUS POLLICIS.
ABDUCTOR POLLICIS.
FLEXOR PRIMI ET SECUNDI OSSIS POLLICIS.
ADDUCTOR POLLICIS.
EXTENSOR PRIMI INTERNODII POLLICIS.
EXTENSOR SECUNDI INTERNODII OSSIS POLLICIS.
EXTENSOR TERTII INTERNODII OSSIS POLLICIS.

Of the MUSCLES of the WRIST or CARPUS.

These are generally well described by most Authors, and receive their Names from their Situation and Use.

FLEXOR CARPI RADIALIS.
FLEXOR CARPI ULNARIS.
EXTENSOR CARPI RADIALIS.
EXTENSOR CARPI ULNARIS.

Of the MUSCLES of the RADIUS.

The Radius is moved in common with the Ulna, or Cubitus; but besides that, it hath also a proper Motion, in which the Carpus, together with the Hand, is chiefly moved, or turned either upwards or downwards: And to this End there are two sorts of Muscles; of which some are called *Pronatores*, or those that turn it inwards, and the Palm of the Hand downwards; and others *Supinatores*, which turn it outwards, and the Palm of the Hand upwards. These have their Names from their Figure and Use, and are,

PRONATOR RADII TERES.
PRONATOR RADII QUADRATUS.
SUPINATOR RADII LONGUS.
SUPINATOR RADII BREVIS.

For the Blood-vessels of the superior Extremities, see *ARTERIE*, and *VENÆ*. And for the Nerves, see *NERVI*.

BRACHUNA. The same as *ACRAI*, which see.

BRACHYCEPHALI, *βραχυκεφαλοι*, from *βραχυς*, short, and *κεφαλη*, a Head. A kind of Fish, condemn'd by *Oribasius*, *Med. Coll. Lib. 2. cap. 58.* as of bad Juice, and a rank Smell.

BRACHYCHRONIUS, *βραχυχρονης*, from *βραχυς*, short, and *χρονος*, Time. An Epithet of a Disease which continues but a short Time. *Galen. Def. Medicæ.*

BRACHYLOGIA, *βραχυλογία*, from *βραχυς*, short, and *λογος*, a Word or Sentence. A short Sentence, such as the Aphorisms of *Hippocrates*.

BRACHYPNŒA, *βραχυπνοια*, from *βραχυς*, short, and *πνέω*, to breathe; most frequently signifies a short and small Respiration, and one fetch'd by long Intervals, according to *Galen*, *Lib. 3. de Diff. Resp. Cap. 8.* So *βραχυπνοος* is one who draws his Breath small and rare, that is, by long Intervals, from an universal Refrigeration of the Body, and Extinction of the natural Heat, *Lib. 3. Epidem. Ægr. 1. & 15.* But, *Lib. 1. Epid. and Lib. 6. Epid. Sect. 2. Aph. 9.* *βραχυπνοος* is a short Respiration at small Intervals, or small and frequent, and is oppos'd to *μακρόπνοος*. *Galen, Lib. 3. de Diff. Resp. Cap. 11. Foesius.*

BRACHYPOTÆ, or BRACHYPOTI, *βραχυποται* ή *βραχυποτοι*, from *βραχυς*, short, small, and *πότης*, Drink. Little Drinkers. Persons in a Phrensy are said, *Lib. 1. Prorrhætic.* to be *βραχυποται*, that is, to drink little and seldom. The same in *Galen, Com. 3. in 3. Epid.* are call'd *βραχυποται*, which he explains to be *οσοι εβραχυ εδιδ πολλη πινεσιν*, "such as "drink little at a time, and at long Intervals."

Some have erroneously imagin'd, that by this Word *Hippocrates* means to express the Dread of Fluids, with which People under a Hydrophobia are seiz'd. But it is plain, that he only

means a Symptom very common in Fevers of the worst kind; and which is necessarily bad, because it prevents the Patient from taking sufficient Quantities of diluting Liquors; which are of great Importance in the Cure of acute Diseases:

It seems not unlikely, that this Disgust at Fluids may arise from a Dryness, and consequent Closure of the Mouths of the lacteal Vessels, which prevents Liquors from entering into them: Hence Liquors swallow'd are a Burden in the intestinal Tube; and consequently are nauseated:

Upon this Subject, I remember a pretty Observation of a Physician of Reputation, communicated to me; which was; that he attended a Patient in a Fever, whom he imagin'd plentiful Diluting would relieve; but could not prevail on him to take any Fluids, 'till, at last, he offer'd him some Oil of sweet Almonds, which he took with Pleasure, and would not be easy without taking it in large Quantities 'till he recover'd. If we consider the Lacteals, in this Case, as obstructed by extreme Dryness, and, at the same time, reflect upon the relaxing Nature of Oils, we may readily conceive why Oils should be agreeable to this Patient, whilst he could bear to drink nothing else:

BRACHYS. See *BREVIS*.

BRACIUM. Copper. *Rulandus*:

BRACTEA, *ελασμα*, *ελασμός*, *πτερον*. The same as *Lamina*, a Plate, or thin Piece of Metal. *Rulandus*:

BRADYPEPSIA, *βραδυπεψια*, from *βραδύς*, slow, and *πέψω*, to concoct. A slow, weak, and imperfect Concoction of Food. *Gal. de Diff. Sympt. Cap. 4*:

BRADYS, *βραδύς*, slow. See *TARDUS*.

BRANCA, an Italian Word, signifying Foot. Hence the *Acanthus* is call'd *Branca ursina*, that is, *Bear's-foot*, from the Resemblance of its Leaves to the fore Feet of a Bear. *Blancard*:

BRANCA LEONIS, or PES LEONIS. The same as *ALCHIMILLA*, which see.

BRANCA URSINA, *Germanica*. See *SPHONDYLIVM*.

BRANCHUS, *βραγχος*, *τὸ*, a Diffusion of Humours upon the Fauces, being a Species of Catarrh, call'd by *Cælius Aurelianus*, *Lib. 2. Tard. Pass. cap. 7*: *Rauitas*, a Hoarseness: Hence, *Lib. 1. Epid. βραγχώδεις φωναι*, and *βραγχώδης ἀλσάδα*, *Lib. de Aer. Loc. et Aqu.* are Waters which very much dispose to a Hoarseness. *Foesius*.

BRANCHI, or BRANCHÆ, is also a Name for those glandulous Tumors in the Fauces, which resemble two Almonds, and are accompany'd with a Difficulty of Spitting, and a troublesome Respiration. *Castellus*.

BRANCIA. Glass. *Rulandus*:

BRANTA, or BERNICLA. A kind of Goose in *England* and *Scotland*, which has been the Subject of many fabulous Stories; as that it grows on Trees, and hangs on the Trunk or Branches; or is generated of rotten Wood: It is described by *Aldrov. Ornith. Lib. 19. Cap. 23*. Its Flesh is more unfavoury and rank, than of the common Goose, but is esteem'd a Delicacy in the inland Parts of *Scotland*.

BRASE. Coals. *Rulandus*:

BRASILIA, Offic. *Arbor Brasilia*; *Raii Hist. 2. 1736*. *Park. Theat. 1644*. *Brasiliun lignum*, *J. B. 1: 490*: *Brasiliun lignum*, *Chab. 37*: *Lignum Brasilianum*, *Geoff. Tract. 310. Mont. Exot. 8*. *Pseudosantalum rubrum*, sive *Arbor Brasilia*, *C. B. Pin. 393*: *Ibirapitanga sive Lignum rubrum*, *Pison. (Ed. 1658.) 164*: *Ibirapitanga Brasiliensis*, *Marcg. 101*: *Crista pavonis Coronilla folio tertia*, sive *Tinctoria maxima Brasiliensis*, *flore variegato parvo odoratissimo*, *siliquâ aculeatâ*, *lignum Brasiliun dictum ferens*, *Breyn. Prod. 2. 37*. *Ethythoxylum Brasiliun spinosum*, *foliis Acaciæ*, *Herm. Par. Bat. Prod. 333*: *BRASIL WOOD*. *Dale*.

This is the Wood of a Tree call'd *Pseudosantalum rubrum Brasiliæ*, *C. B. P.* It is used by Dyers in dying Red, as the yellow *Brasil Wood* is for that Colour. *Geoffroy*.

It is cold and dry, mitigates the Heat of Fevers, and is a Refrigerant and Strengtheners, like the Wood of *Sanders*. *Dale*.

BRASIUM. The same as *BYNE*, which see.

BRASMA, *βεγσμα*, in *Dioscorides*, *Cap. 189. Lib. 2*: is a light empty sort of black Pepper, which is good for nothing; *John Bauhine* assures us, that it is the same with what is now observed to corrupt on the Plant, and never come to Maturity.

BRASMOS, *βεγμός*. The same as *ζύμωσις*, "Fermentation;" for which a very ancient Greek Author, *Pharnuthus*, is quoted. It is also call'd *Ecbasmus*, *εκαβεγμός*. *Castellus*.

BRASSATELLA, *Brassadella*. The same as *OPHIOGLOSSUM*, or *Adder's Tongue*. *Rulandus*:

BRASSICA. A Cabbage. A celebrated Plant among the Antients, and much in Use among the Moderns.

The Garden Cabbage is agreeable to the Stomach, if it be eaten slightly boil'd; for, after thorough Boiling, it binds the Belly; and much more, if it be twice boil'd, or boil'd in a Lixivium. The Summer Cabbage is more acrimonious and hurtful to the Stomach. What grows in *Egypt* is not eatable, because of its Bitterness.

Cabbage, in Food, is good for Dulness of Sight and Tremblings: Eaten after Meals, it prevents the mischievous Consequences of Surfeiting and Drunkenness. The tender Shoots are most agreeable to the Stomach, but fuller of Acrimony, and more diuretic; but, being put in Pickle, are hurtful to the Stomach, and disturb the Belly. The Juice of raw Cabbage, taken with Iris and Nitre, mollifies the Belly; and, drank in Wine, is good against the Bite of a Viper. Mix'd with the Meal of Fenugreek and Vinegar, it helps the Gout in the Feet and Joints; and is effectually apply'd to old and foul Ulcers. Infused by itself into the Nostrils, it purges the Head; and, made into a Pessary with Meal of Darnel, provokes the Catamenia. A Cataplasm of the Leaves, either alone or bruised with Polenta, is effectual against all kinds of Inflammations, cedematous Swellings, and Erysipelas; and cures the Epinyctides and Lepra. The Leaves, applied with Salt, cause a Carbuncle to break, and restrain the Falling-off of the Hairs of the Head. The same boil'd, and mix'd with Honey, stop the Progress of a Gangrene; and, eaten raw with Vinegar, relieve those who labour under splenetic Disorders: Chew'd in the Mouth, so as that the Juice be swallow'd, they restore a lost Voice. A Decoction of Cabbage, drank, loosens the Belly, and provokes the Menfes. The Flowers, used in a Pessary after Child-birth, prevent Conception. The Seed, especially what grows in Egypt, being drank, expels Worms; and is an Ingredient in theriacal Antidotes. It also clears the Face of Freckles. The green Stalks, burnt, with the Roots, and then mix'd up with old Swine's Fat, and applied, mitigate inveterate Pains of the Sides. *Discorides, Lib. 2. Cap. 146.*

Wild Cabbage grows, for the most part, in craggy Places, and by the Sea-side. It is like the Garden Kind, only whiter, more hairy, and bitter. The tender Buds, boil'd, in a Lixivium, are not unfavourable to the Palate.

A Cataplasm of the Leaves conglutinates Wounds, and dissolves cedematous Tumors and Inflammations. *Idem, Cap. 147.*

It would require a long Time to speak all that has been said in Praise of Cabbage. *Chrysippus* the Physician wrote a Volume on this Subject; which he digested under general Heads and Sections, according to the different Parts of the human Body; and *Diaches* has written another: But, before them all, *Pythagoras* and *Cato* were no less liberal of their Encomiums on Cabbage. The Opinion of *Cato* concerning its Virtues deserves to be fully represented; and the rather, that we may know what sort of Phylic the Roman People used for six hundred Years together.

The most antient *Greeks* made three Species of Cabbage: As, first, the curled, which they call'd *Selinas*, from the Resemblance of its Leaves to those of Apium. This Kind is friendly to the Stomach, and gently mollifies the Belly. Another Species was the smooth, shooting forth broad Leaves from its Stalk, whence it was call'd by some *Caulodes*: It was of no Use in Medicine. The third was properly call'd *Crambe*, which produced thinner Leaves, plain, and growing very thick together: This is of a bitter Taste, but of great Virtues. *Cato* most approves of the curled; next to which he prefers the smooth, with the large Leaves, and great Stalk.

He tells us, that it is effectual for Pains of the Head, Dimness of Sight, and Scintillations of the Eyes; for the Spleen, Stomach, and Præcordia, if it be taken in the Morning raw, in Vinegar and Honey, mix'd up with Coriander, Rue, Mint, and the Root of Lafer, to the Quantity of a Quarter of a Pint: That there is so great a Virtue in this Medicine, that the very Person who bruises the Ingredients will feel an Increase of Strength. It may be supp'd after it is bruised with these Simples, or taken out of the Liquor and eaten. Mix'd with Rue, Coriander, a little Salt, and Barley-meal, it makes a Cataplasm for the Gout. A Decoction of it in Water wonderfully helps the Nerves and Joints; and is an effectual Fomentation for Wounds, whether recent or old; and even for a Carcinoma, which can be cured by no other Medicine. He first orders the Part to be fomented with the warm Decoction, and the Herb to be bruised and applied twice in a Day; and by the same Method are hollow Fistulas incarn'd, and Tumors discuss'd. Boil'd Cabbage, plentifully eaten fasting, with Oil and Salt, relieves under Want of Sleep: Twice boil'd, and eaten with Oil, Salt, Cumin, and Polenta, it eases the Gripes; if eaten without Bread, it will have the more Effect. Among other Virtues, drank in black Wine, it purges Bile. The very Urine of one that usually eats Cabbage, being kept a while, and heated, is a Remedy for the Nerves. I will express the Author's Mind in his own Words, which are as follow: "If you wash little Boys with that Urine, they will never grow weak." He also advises the Juice of Cabbage, in Wine, to be infill'd warm into the Ears, and assures it to be good for Dulness of Hearing; and says, moreover, that it cures the Impetigo without ulcerating the Parts. So far *Cato*, for whose sake it is fit that I should subjoin the Opinions of the *Greeks*, which I shall do only in those Things which he has omitted. They hold it, if par-

boil'd, to be a Cholagogue, and to loosen the Belly; but, after two Boilings, to be binding: That it resists Wine, as being an Enemy to Vines: That taken first at Meals, it prevents Drunkenness; if last, Surfeits: That, eaten as Food, it conduces much to Clearness of Sight; but is much more effectual, if only the Corners of the Eyes be touch'd with the raw Juice, mix'd with Attic Honey: That it is a Food of very easy Concoction, and cleanses and quickens the Senses. The Disciples of *Erasistratus*, with one Voice, assert, that there is nothing more beneficial to the Stomach and Nerves, and prescribe it in Palies, and Tremblings, and Spitting of Blood. *Hippocrates* orders it, after two Boilings, with Salt, to be given to those who labour under the Colic or Dysentery. He judges it also to be good in the Tenesmus and Affections of the Kidneys, and to procure Plenty of Milk to Women in Child-bed who eat it, and to provoke the Menfes. The Stalks, eaten raw, expel the dead Fœtus. *Apollodorus* advises the Drinking of the Seed or Juice, against the Poison of Mushrooms [*Fungi*]. *Philisius* recommends the Juice in Goats Milk, with Salt and Honey, for the *Opisthotonici*. I find also, that some have been freed from the Gout by eating it, and drinking the Decoction; and it is prescribed for the Cardiac Passion, and the Epilepsy; and also for Disorders of the Spleen, in White-wine, for forty Days. The raw Juice of the Root is order'd to be gargarized, and drank, for the Jaundice, and in a Phrensy. For the Hiccough it is prescribed to be drank in Vinegar, with Coriander, Dill, Honey, and Pepper; and Inflammations of the Stomach have been relieved by anointing it with the same. The Decoction only, with Barley-meal, or the Juice in Vinegar, or with Fenugreek, heal the Bites of Serpents, and old fordid Ulcers. Some apply it to the Joints affected with the Gout; and an Application thereof cures also the Epinyctides, or any other spreading cutaneous Affection; also a sudden Dimness [*Caligines*], which it also helps, if eaten with Vinegar. The simple Juice takes off the livid Marks of Blows in the Face, or any other Part, if it is anointed therewith: The same, with round Alum and Vinegar, cures the Lepra and Psora; it prevents also the Falling-off of the Hair. *Epicharmus* asserts, that an Application of it is very effectual in Diseases of the Pudenda; and that its Virtue is increased by mixing it with Bean-meal. Mix'd with Rue, it cures Convulsions; and, taken with the Seeds of Rue, it allays the Heat of burning Fevers, helps Disorders of the Stomach, and expels the After-birth. The Powder of the dried Leaves cures the Bites of the Shrew-mouse.

Of all the sorts of Cabbage, the sweetest are the *Cymæ* (young Sprouts, after the first Cutting); tho' they are of no Use in Medicine, are difficult of Concoction, and noxious to the Kidneys. We ought also to take Notice, that the Liquor of boil'd Cabbage, so much commended for its manifold Usefulness, stinks when pour'd upon the Ground. The Ashes of burnt Cabbage-stalks are reckon'd among Caustics; and, mix'd with very old Fat, help the Sciatica. With Lafer and Vinegar they serve as a Psilothrum, to prevent the Growth of Hairs after they have been pull'd out. Drank in heated Oil, or in Water wherein they alone have been boil'd, they are effectual in Convulsions, inward Ruptures, and Bruises by Falls.

Are there, then, no ill Properties belonging to Cabbage? Yes, these same Authors acknowledge, that it gives a Person a rank Breath, is hurtful to the Teeth and Gums; and in Egypt they will not eat it, on account of its Bitterness.

Cato is very diffuse in his Praises of the wild Cabbage, and affirms, that the Powder of the dried Plant, made into an Er-rhine, or the Smell of it alone, taken up the Nostrils, cures all Defects, and amends the ill Scent therein. Some call this the Rock Cabbage, and say, that it is a great Enemy to Wine, that the Vine avoids it above all things, and, if it cannot get rid of it, dies. It has two small round smooth Leaves, and is much like the Garden Colewort, but whiter and more hairy. *Chrysippus* recommends it for Inflammations, and melancholy Disorders; also for recent Wounds, being applied with Honey, and not taken off before the seventh Day: For strumous Swellings and Fistulas, he orders it to be bruised in Water. Others affirm, that it checks the Progress of spreading Ulcers, which they call *Nomæ*; consumes Excrescences, and smooths the Skin from Seams and Scars; that being chew'd, or the Decoction of it gargariz'd with Honey, it heals Ulcers of the Mouth, and Affections of the Tonsils; and that three Parts of it, mix'd with two Parts of Alum, in strong Vinegar, cure the Psora, and inveterate Lepra, if anointed therewith. *Epicharmus* will have the Application of it a sufficient Cure for the Bite of a mad Dog; but it is more effectual with Lafer and strong Vinegar. It is also said to kill Dogs, if given to them in Fleth. The Seed, roasted, is a Remedy against the Venom of Serpents, and the poisonous Effects of Mushrooms, and Bulls Blood. The boil'd Leaves are given in Food for Disorders of the Spleen; and are applied crude, with Sulphur and Nitre, by way of Cataplasm, to the affected Part, with good Success; as also to a Hardness of the Breasts. The Ashes of the Root cure a Swelling of the Uvula, by touching it; and, made into a Litus, with Honey,

Honey, repels the Parotides, and heal the Bites of Serpents. We shall here add one great and wonderful Argument for the Virtues of Cabbage, which is, That if all your Vessels, used for Boiling, have contracted a Crust or Foulness on the Inside, to such a Degree, that you know not how to remove it, Cabbage boil'd in your Vessels shall effectually scour it off, and leave them clean.

The Lapsana is a Species of wild Cabbage, a Foot high, with hairy Leaves, and very much resembling the Napus, but that it has a whiter Flower. It is eaten in Food, and gently mollifies the Belly.

The Sea Cabbage purges with more Violence than any of the rest: It is dress'd with fat Flesh-meats on account of its Acrimony, and is very offensive to the Stomach. *Pliny, Lib. 20. Cap. 9.*

Cabbage twice boil'd, if it be eaten, binds the Belly; but Cabbage once, and not much, boil'd, and then taken in Oil, Garum, or Salt, is rather loosening than binding; and the Juice thereof is also more purgative than that of Lentils: But the *Brassica marina*, or Sea Cabbage, is more manifestly of a purging Quality, which may be known by its saltish and bitter Taste. *P. Aeginet. Lib. 1. Cap. 74.*

Cabbage is of a drying Quality, whether eaten or outwardly applied, without any manifest Acrimony; for which Reason it conglutinates Wounds, and cures malignant Ulcers, and Tumors which are difficult to be discuss'd. It has also somewhat of a deterfivè Property, by which it heals the Lepra. The Seed, especially what grows in Egypt, being drank, destroys Worms. The Ashes of the burnt Stalks are a Caustic; and, mix'd with Fat, are effectual in removing an inveterate Pain in the Sides. The wild Cabbage is stronger than the Garden Kind upon all Accounts, and is therefore not to be taken inwardly without Injury. *Idem, Lib. 7. Cap. 3.*

The Juice of Cabbage has somewhat of a purgative Quality, tho', according to the common Notion of Dryers, it should rather bind, than dispose to Excretion. Cabbage is, indeed, as much a Dryer as Lentils, and therefore dulls the Sight, except the Eye be preternaturally moist. However, it is not so wholesome a Green as Lettuce, but contains a bad and stinking Juice. *Oribasius, Med. Coll. Lib. 2. Cap. 5.*

The same Author recommends a Decoction of the Root of Cabbage as a Diuretic and Emmenagogue. *Synops. Lib. 1. Cap. 22.*

A Way of preparing CABBAGE, quoted by Oribasius, from Mnesitheus Cyzicinus.

Cut up a Cabbage with a very sharp Knife; then wash it, and throw away the Water. After this, pound the same with a sufficient Quantity of Rue and Coriander; then sprinkle it well with Oxy-mel, and throw over it some fine Scrapings of Silphium.

Half a Quarter of a Pint of this Medicine, being taken, will suffer no Collection of noxious Matters in the Body, and expels them, if already gather'd. Besides, it helps Dimness of Sight, Shortness of Breath, and all manner of Disorders in the Region of the Diaphragm and Hypochondria, opens Obstructions of the Spleen, and extenuates that Part, when increased to an enormous Size; and is wonderfully effectual in Disorders proceeding from the Atra Bilis, by purging the Veins. In Diseases of the Joints, there is nothing of such Efficacy as this Preparation of Cabbage, taken in the Morning fasting.

For the Gripes it is prepared in the following manner:

Let the Cabbage be first macerated in Plenty of Water; then put into hot Water, and boil'd till it be much wasted. This done, the Water must be all thrown away, and Oil put to it: Let them boil together, and then be put into a Vessel. It is to be eaten alone cold, or with other Food, not once only, but every Day in the Morning, for many Days together; but not much of it must be taken at a time, lest it should do more Harm than Good. *Oribasius, Med. Coll. Lib. 4. Cap. 4.*

Simeon Sethi, an Author amongst the lower Greeks, and who lived about the Year 1070. writes thus of Cabbage.

Cabbage generates depraved and melancholic Juices, weakens the Sight, and interrupts Sleep with frightful and disagreeable Dreams. Its Juice is purgative, but the Substance of the Cabbage itself is binding; for which Reason, when we intend to stop Diarrheas, we pour out the Water in which the Cabbage has boil'd for some time, and add fresh Water to it immediately; and, after it has been thus boil'd, it is to be used without being exposed to the Air, or put in cold Water to cool it. Its Juice is more prejudicial in the Summer than in the Winter-time. It provokes Urine, kills Worms, and removes the bad Consequences arising from a Surfeit of Wine. It is said to render the Sight of sound Eyes dim; and, on the other hand,

VOL. I.

to remove that Species of Dimness which arises from a superfluous Humidity. It loses much of its noxious and hurtful Quality, by being boil'd with fat Flesh. Its Seeds, applied to the genital Parts, by a certain peculiar occult Quality, corrupt the seminal Juices, and hinder Women from conceiving; they are also prejudicial to the Lungs: It is reported, that Cabbage is, of all other Foods, the most proper for preventing Intoxication by Liquors; and that its Juice, exhibited in Honey, wonderfully restores the Voice when lost or disorder'd. If applied to Wounds, it conglutinates them; and cures malignant Ulcers, and scirrhous Inflammations. *Simeon Sethi.*

From these Observations of the Antients it is obvious, that in Cabbage we are to consider two kinds of Substances, on which the different Effects produced by it depend: The one is a solid and terrestrial Principle, from which it derives its drying, astringent, and obstructing Qualities, and its Tendency to generate depraved and melancholic Juices. The other is its Juice, to which its abstergent, opening, and deobstruent Virtues are to be ascribed. This Doctrine is also inculcated by the *Schola Salernitana*, C. 57. in these Words:

Jus Caulis solvit, cujus Substantia stringit.

But as the Sentiments of Dr. Hoffman will, in all Probability, be of greater Weight with the present Age, I shall here give his Opinion of Cabbage, in a Translation of his own Words.

Common red Cabbage, says he, is evidently possess'd of a medicinal Quality; and abounds with a Juice, which, by its nitrous, sweet, emollient, laxative, aperitive, attenuating, and stimulating Qualities, promotes those Excretions which are absolutely necessary to the Preservation of Health. For this Reason it is not only a Preservative against Diseases, especially of the chronical Kind, but also contributes very considerably to their Cure. *Bartholine*, in *Lib. de Medicina Danorum Domest. Dissert. 1.* extols Cabbage in these Words: "The common Cabbage of the Country-people is justly preferable to other Pot-herbs, since, both raw and boil'd, it is possess'd of such salutary Qualities, as to prevent Occasions for the Medicines used in the Shops. For this Reason, when a certain foreign Physician came into Denmark with a Design to settle, and saw the Gardens of the Country-people so well stock'd with Cabbage, he, with good Reason, prognosticated small Encouragement for himself in that Part of the World. It keeps the Belly in an easy and soluble State, and a Decoction of the Tops of its tender Shoots discharges such an incredible Quantity of Bile and Phlegm, that no Medicine proves a quicker, a safer, or a more efficacious Purge, Hellebore and Scammony not excepted." In the Shoots of the common red Cabbage, cut longitudinally, when the Autumn is pretty far advanced, there is a Juice whose Taste resembles that of Honey or Manna, which flows from them when laid in a cool Place for some time, and which I have often experienced to be of a purgative Quality. It is a bad Method of preparing Cabbage, first to boil it for some time, and pour out the Water; and then to boil it again with fresh Water; since, by this means, its salutary and medicinal Juice is in a great measure lost. For this very Reason I cannot help commending the Method of preparing it used by the Inhabitants of *Westphalia*, and the Duchy of *Brunswick*; for they do not throw away the Broth, which is impregnated with the more noble and salutary Virtues of the Plant; but, adding Salt and Fat to it, prepare it in such a manner, as that it becomes not only agreeable to the Taste, but wholesome and salutary to the Constitution. Of the Tops of red Cabbage, Water-cresses, Ground-ivy, Spinage, Asparagus, Succory-root, and Dead-nettle, boil'd in Beef or Capon Broth, a Food is prepared, far preferable to all other Medicines in pthysical and scorbutical Disorders. *Hoffman de Præstantia Medic. Domest.*

The Juice of Cabbage is of such a Nature as not only to afford a sufficient Supply of Nourishment to the Body, but also to correct the acrid Salts of the Juices, allay the Acrimony of the Blood, cleanse the Intestines, and scour the Kidneys. For this Reason, Cabbage is highly salutary in Disorders of the Breast, if baked in a close Vessel in an Oven, adding Sugar or Honey to it, after it is taken out; for by this means it will, in the Space of half an Hour, become a Jelly, or thick Juice, which, used as a Lambative, is of singular Efficacy in dry Coughs, excoriated Fauces in old Men, and Cases where a purulent Matter is expectorated. A Decoction of Cabbage, with an Addition of Raisins, is used by Preachers and Pleaders in Hoarseness, and Defects of Voice, arising from too long Speaking. Its Juice, used for ordinary Drink, proves an excellent Remedy for the Scurvy; and this was, in all Probability, the Reason why the foreign Physician, mention'd by *Bartholine*, promised himself so poor Encouragement in Denmark, where the Scurvy is endemial, when he saw their Gardens so well stored with this Plant. The *Italians* put the young Tops of the *Brassica fimbriata*, or Boor-cole, into their Sallads, in order to render the Body soluble, and provoke Urine. *Kapigijs* gives

as an Account of a dropical Patient, who, after despairing of Relief from the Physicians, was at last happily cured by a Quack, by means of Cabbage infused in Wine, with proper Correctors. The Plant itself, a little boil'd, with an Addition of Lemon-juice, and new Butter, is an excellent Remedy in phthical and hectic Disorders. The red Cabbage is preferable to the white, in Cases where the Body is afflicted with Ulcers, since, in such Constitutions, the white soon assumes a putrid Quality, and becomes fetid. I am of Opinion, that the moderate Use of it may, in some Cases, produce salutary Effects; but can't persuade myself to believe, that large Quantities of it, frequently taken, supply the Body with laudable nutritious Juices. Where Urine is to be provoked, or the Body render'd soluble, it, by its stimulating Muriatic Acid, proves effectual, with such as are not accusom'd to take Physic. Many People, especially in Poland, use pickled Cabbage for dissipating the Remains of a Debauch, which Intention they find it answers very well. Besides, it has been observed, that the Pickle of Cabbage plentifully drank, by the Country-people, has removed continued Fevers, cured Dropsies, and carried off the most obstinate Tertian Agues. When the Peasants of Croatia are seiz'd with Fevers, they successfully apply Cataplasms of pickled Cabbage to their Foreheads. The Pickle of Cabbage is said to be very effectual in Burns, Gangrenes, and the Beginnings of Inflammations in the Fauces, where the Intention is to refrigerate and repel, especially with an Addition of Lemon-juice. Nor is unpickled Cabbage less useful for various external Purposes, since it refrigerates, repels, opens, and deterges. Thus 'tis usual, after Vesicatories are taken off, to apply the Leaves of white Cabbage, anointed with Butter; but they ought to be removed every two Hours. According to *Etmuller*, they may also be very properly laid upon Issues, in order to carry on the Discharge of the Matter, and prevent Consolidation. Nurses also apply the Leaves of Cabbage to their Breasts, in order to prevent Coagulations of their Milk, and hinder it from being accumulated in too large a Quantity. Some apply them to Abscesses of the Breast, in order to prevent Inflammations, and promote the Consolidation of the Ulcer. The Country-people, in order to cleanse Wounds and Ulcers, either pour the Juice of Cabbage into them, or lay its Leaves bruised to them. Some use red Cabbage-leaves, after having stripp'd off the outer Skin and Ridges, by way of Plaister, in inflamed Wounds, and itchy Ulcers. The Leaves, anointed with Rape-oil, are, in pestilential Disorders, very successfully applied for the Maturation of Ulcers and Carbuncles. *Diemerb. de Peste*. The Leaves, boil'd up into a Cataplasma, with Butter, maturate and break Impostumations. It is said, that when the Achors of Children are repel'd, the Leaves of the *Brassica Capitata*, applied to them, never fail to make the Discharge of the Matter return. *Simon Pauli* tells us, that he himself knew a certain Girl, who, in the Space of fourteen Days, had an incredible Number of Warts taken off one of her Hands, by anointing them with the Juice of Cabbage, which she allow'd to dry on them. In feverish Heats the Leaves are applied to the Soles of the Feet, with Salt, instead of Vesicatories. *Etmuller* informs us, that an antipleuritic Ointment is prepar'd of the Root of Cabbage, mix'd with Clove-gilly-flowers and Honey. *Bartholæus* gives Directions with regard to the Method of using it in Pleurifies, and affirms, that he has known many restored by its means, without the Concurrence of Venesection. Others make it thus:

Take fresh Hogs-lard, and Cabbage-juice, each two Ounces; and of Cummin-seed, three Drams. Mix up into the Form of an Ointment, to be applied to the Part affected. *ETMULLER*.

The Efficacy of Cabbage, so much extol'd by the Antients in arthritic Pains, was happily experienced by a certain strolling Quack in Holland, by whose Prescriptions many were sensibly relieved from the most racking arthritic Pains and Swellings, in the Feet, Hands, and Knees. The Leaves of red Cabbage, for this Purpose, are to be warm'd at the Fire, and applied to the Parts affected. Some use them anointed with new May Butter. *Forest. Obs. Med. L. 29. Obs. 10.* The Seeds of the red Cabbage, and especially the black Seeds of the *Brassica Fimbriata*, are possess'd of an anthelmintic Quality; and, when bruised, with Sugar, contribute to invigorate the Organs of Speech, and render the Voice clear, strong, and sonorous. But when they are grossly pounded, boil'd in Flesh-broth, and drank with the Broth, they are said to give certain and immediate Ease in Colic Pains. When reduced to the Form of an Emulsion, with Succory-water, they are also an excellent Medicine in nephritic Pains, and scorbutic Cases: If they cannot be had, Turnep-seeds are used as a Succedaneum to them.

The *Syrupus Brassicæ rubræ*, in the *Pharmacop. Argentoratensis*, is made of the Juice of that Plant mixed up with Sugar, and is highly recommended in Disorders of the Breast, especially Coughs and Asthmas. The *Laboch de caulibus Gor-*

donii in the Pharmacop. Augustana, and *Antwerp.* is prepar'd of the Juice of red Cabbage, with Saffron, Sugar, and Honey, and is highly extol'd in Hoarseness, and in Coughs, which arise from Cold. The same Medicine is, by *Mesue*, prepar'd of the Juice of the Cabbage, with Sapa and Honey. Cabbage is a flatulent Species of Food, and of hard Digestion; for which Reason it is a good, as well as an antient Custom, to boil it with fat Flesh, that it may become tender, and easily digested, and to eat it with gross-pounded Pepper, in order to prevent Flatulencies. That Cabbage is of a hard Substance, is obvious from its being render'd more sweet and tender by Frosts, and nipping Colds; for 'tis probable, that its compressed and constricted Fibres are by the penetrating Cold so chang'd and alter'd, as to become softer when boil'd, and consequently more easily digested by the Stomach. With regard to the Method of preparing Cabbage, I shall here give the Advice of *Brayerinus*. "I must, says he, expose an Error which is no less common, than pernicious, in preparing Cabbage. Most People, in consequence of the Ignorance of the Cooks, eat it after it has been long boil'd, a Circumstance which does not a little diminish both its grateful Taste, and salutary Qualities. But I observe, that those who have a more polite and elegant Turn, order their Cabbage to be gently boil'd, put into Dishes, and season'd with Salt and Oil, by which Method they assume a beautiful green Colour, become grateful to the Taste, and proper for keeping the Body soluble. This Circumstance ought not to be forgot by those who are Lovers of Cabbage." The Antients boil'd their Cabbage with Nitre, which render'd it at once more grateful to the Palate, and more agreeable to the Eye. Hence *Martial, L. 13. Epigr. 17.* gives the following Advice.

*Ne tibi pallentes moveant fastidia caules,
Nitrata viridis Brassica fiet aqua.*

Among the Antients it seems to have been a Tradition commonly receiv'd, that Cabbage not only carried off the troublesome Consequences of a Surfeit, but also guarded against Intoxication, if eat before a Drinking-match was undertaken. For this Reason, the Egyptians were esteem'd a debauch'd and intemperate People, because they used previously to eat boil'd Cabbage, that they might indulge themselves the more freely and immoderately over the social Bowl. The Seeds of the Cabbage were also previously taken by many, with a View to prevent Intoxication. Besides, the Antipathy between the Cabbage and Vines was believ'd to be so great, that the latter yielded a poor and weak Wine, if the former happen'd to grow near them. See *Athen. L. 1. C. 25. Alex. Trallian. L. 1. C. 10. Pallad. R. R. L. 9. C. 5.* This Antipathy they accounted for, by a Fable almost too ridiculous to be mention'd. They affirm'd, that the Cabbage sprung from a Tear shed by *Lycurgus*; for, said they, when *Bacchus*, being afraid of *Lycurgus*, enter'd into the Sea, *Lycurgus* in the mean time, begirt with the pliant Branches of the Vine, dropt a Tear, from which the Cabbage rose; and ever since there was an Antipathy betwixt the Vine and the Cabbage; for, say they, when the Vine and Cabbage happen to grow near each other, the Cabbage itself either decays immediately, or causes the Twigs of the Vine to do so. They affirm'd also, that in Consequence of this Antipathy, when the Uvula or Columella was too much relaxed by a Defluxion of Humours, the Juice of raw Cabbage applied to the Head drew it back. They maintain'd in like manner, that if Cabbage and Vines were planted near each other, the springing Shoots of the Vine, when beginning to approach the Cabbage, ceased to come forth in their former Direction; but were turned backwards, as if they had been conscious of the mutual Antipathy between themselves and the Cabbage. In like manner they said, that when the least Quantity of Wine was pour'd upon Cabbage when it was boiling, it would after that become incapable of being boil'd, and have its Colour spoil'd. *Geopon. L. 12. C. 17.*

Aristotle, L. 3. Prob. 17. starts the Question, why Cabbage removes the Consequences of hard Drinking; and seems to account for it, from its sweet and discenting Juice. Whether what he advances on this Head is consonant to Philosophy, and good Sense, or not, 'tis yet certain, that aqueous Liquids possess'd of an abstergent Quality, as the Juice of Cabbage is, not only dilute the Humours of our Bodies, and allay their Fervor, but also make a Revulsion from the superior to the inferior Parts; and consequently carry off a Crapula, by freeing the Head from the offensive Matter; and that Cabbage, eaten previously to a Debauch, dilutes the spirituous Liquors drank, and blunts their Strength, so as to make them act less powerfully than they would otherwise do. But Experience convinces us, that the Efficacy of Cabbage is not so great in this respect, as entirely to prevent the Effects of immoderate Drinking.

As for the innate Antipathy between the Vine and the Cabbage, some of the Moderns have endeavour'd to account for it from the Nature of these two Plants, by saying, that they are both so fond of nutritive Juice, as greedily to suck up the Moisture of the Earth; from which it happens, that when they are planted in the Neighbourhood of each other, the one must languish and decay, because the other robs it of a sufficient Supply of Moisture. *Levin. Lemn. Mir. L. 2. C. 52. L. 4. C. 10. And Baco. H. N. Cent. 5. Exp. 479, 480.*

This Account however ingenious, labours under a terrible Disadvantage, which is, that it is contradicted by Experience, since we find, that Cabbages thrive no-where better than among young Vines, which in their Turn thrive as well as if there was no Cabbage near them. See *Eph. N. C. D. 2. a. 7. o. 64.*

The several Species of Cabbage best known, and most used, are the following.

BRASSICA SATIVA, *Caulis*, Offic. *Brassica capitata alba*, or white Cabbage Cole. Ger. 244. Emac. 312. C. B. Pin. 111. J. B. 2. 826. Chab. 268. Raii Hist. 1. 794. Tourn. Inf. 219. Elem. Bot. 188. Boerh. Ind. A. 2. 21. Hist. Oxon. 2. 206. *Brassica capitata*, Park. Theat. 268. *Brassica capitata vulgaris*, Park. Parad. 503. **WHITE CABBAGE and COLEWORTS.**

This Species of Cabbage is among the Germans most frequently used for Food; and of it they make their celebrated pickled Cabbage, called *Sauer Kraut*, of which *Gesner* says, that if *Cato* had only tasted it, he would have pray'd, *Totum ut se facerent Dii Palatum*, that the Gods would convert every Part of him into the most exquisite Organs of Taste, that he might regale himself with so delicious Food.

BRASSICA CAPITATA RUBRA, Offic. Ger. 245. Emac. 313. J. B. 2. 831. Chab. 270. C. B. Pin. 111. Raii Hist. 1. 794. Hist. Oxon. 2. 207. Park. Parad. 204. Tourn. Inf. 219. Elem. Bot. 188. Boerh. Ind. A. 2. 10. **RED CABBAGE.** *Dale.*

This Species of Cabbage is cultivated in Gardens, and its Leaves are only used, a Decoction of which, sweeten'd with a little Sugar, and drank at medicinal Hours, is an excellent Medicine for promoting a Discharge of the purulent Matter in Empyemas by Urine. *Dale* from *Etmul.*

It bears the Winter better than most others; and is for medicinal Purposes esteem'd preferable to the white; for which Reason it is used in the Preparation of Syrups and Lo-hochs.

CAULIS RUBRA, Offic. *Brassica rubra*, C. B. Pin. 111. Ger. 244. Emac. 312. Tourn. Inf. 219. *Brassica rubra vulgaris*, J. B. 2. 831. Chab. 270. Raii Hist. 1. 796. *Brassica sativa rubra aperta laevis*, Hist. Oxon. 2. 207. **RED COLEWORTS.**

This Plant is cultivated in Gardens, and its Leaves are only in Use, a Decoction of which, sweeten'd with Sugar, is a celebrated Remedy in Asthmas. *Dale* from *Riverius.*

This Species of Cabbage bears the Cold of the Winter very well. In the Kitchens 'tis principally used in the Winter Season, after it is exposed to the Frost. In the Beginning of the Spring the Tops of its Shoots are by many thought a choice Ingredient in their Sallads.

BRASSICA SABAUDA, Offic. Ger. 247. Emac. 315. Park. Parad. 504. *Brassica alba, capite longo, non penitus clausa*, C. B. Pin. 111. Tourn. Inf. 219. Elem. Bot. 188. Hist. Oxon. 2. 207. Boerh. Ind. A. 2. 11. *Brassica Italica tenerima glomerata, flore albo*, J. B. 2. 827. Chab. 268. Raii Hist. 1. 795. **SAVOY CABBAGE.**

In the Gardens of England, this Species of Cabbage is only cultivated for the Kitchen. *Dale.*

The Savoy Cabbage is very delicate and tender, for which Reason it is much sought after by those who have nice Palates, and are acquainted with its agreeable Taste.

BRASSICA FLORIDA, Offic. Park. Theat. 269. Ger. 246. Emac. 314. Raii Hist. 1. 795. *Brassica cauliflora*, C. B. Pin. 111. Hist. Oxon. 2. 208. Tourn. Inf. 219. Boerh. Ind. A. 2. 11. *Brassica multiflora*, J. B. 2. 828. Chab. 269. *Caulis florida*, Park. Parad. 505. **THE COLLIFLOWER.**

This Species of the Cabbage is cultivated in Gardens, and is much used in the Kitchen. *Dale.*

The Use of the Colliflower is well enough known to Cooks, who prepare it much after the same manner they do the other Species of Cabbage. In Conjunction with other proper Ingredients, they also add it to Pyes and Sauces, which are very agreeable both to the Sick, and to the Healthy.

BRASSICA GONGYLODES, B. *Brassica caulorapa, Rapocaulis vulgo*; and *Brassica caule rapum gerens*. The **TURNIP-CABBAGE.**

The Heart of the Stock of this Cabbage, boil'd in fat Broth, is eat in the same manner Turneps usually are.

In Egypt the Eunuchs eat this Cabbage cut into small Portions, and boil'd in fat Broth; sometimes they also use it

boiled in Water; preparing it with Oil, Salt, and Vinegar. *Prosp. Alpin.*

The Seeds of the Turnep Cabbage yield an Oil by Expression, very proper for Lamps, and for the Purposes of those concern'd in the Woolen Manufactory: After the Oil is obtain'd, what remains is allotted for Food to the Cattle.

BRASSICA FIMBRIATA, B. *Brassica tophosa*; *Brassica crispa laciniata*. The **BOOR-COLE.**

This Species, both for Food, and medicinal Uses, is not inferior to the red Cabbage.

Its Seeds are of a blackish Colour, an acid aromatic Taste, and of a Smell sufficiently grateful, tho' not strong.

BRASSICA CAMPESTRIS *perfoliata, flore albo*, C. B. P. *Perfoliata filiquosa*; Perfoliated wild Cabbage, with a white Flower.

This Species grows spontaneously in Spain, in some Parts of Austria, Provence in France, and in the Corn-fields about Marbach, in the Duchy of Wirtemberg. It flowers in the Summer, and brings its Seeds to Perfection. It is thought to be possessed of singular, if not more powerful Qualities, than the other Species of Cabbage; for which Reason it is by some called *Brassica rustica*; it is not used as Food. It is by other Authors distinguish'd by the Epithets, *Perfoliata, Napifolia*. *Bauh. Morif. Garidel. Boccler. and Clus. Hist. Morison* thinks, that it is the *Kegupn d'yeia* of *Dioscorides*, and the *Brassica Sylvestris* of the Latins, for the Virtues of which, see the Passage already quoted from *Pliny*, L. 20. C. 9. and that from *Dioscorides*, L. 2. C. 114.

BRASSICA CAMPESTRIS *perfoliata, flore purpureo*, C. B. P. or, *Perfoliata filiquosa purpurea*. Perfoliated wild Cabbage, with a purple Flower.

Its Seeds, Root, and medicinal Virtues, agree pretty much with those of the perfoliated wild Cabbage with white Flowers.

BRASSICA RADICE NAPIFORMI, C. B. P. or, *Brassica Sylvestris*, called *Napobrassica*. **TURNIP-ROOTED CABBAGE.**

This Species of Cabbage is principally cultivated in the colder Parts of Germany, in the Mountains especially, and towards Bohemia. Its Root may be eaten, and some pickle it, like the Colliflower.

BRASSICA ASPARAGODES CRISPA, *Brassica Epiphyllitis*, C. B. P. *Brassica thyrsoides*. **CURLED COLEWORT.**

This Species lasts a long time, and endures the Rigors of the Winter in England. It was by the Greeks called *Asparagodes*, from its sending forth small Shoots like Asparagus, which are prepar'd in fat Capon or Mutton Broth. *Ray.*

BRASSICA SATIVA ALBA, *vel viridis*; *vulgaris aperta laevis*; or, *Brassica vulgaris sativa*. *Brassica laevis Theophrasti, Catonis, & Plinii*, the last of whom also called it **CAULODES.**

BRASSICA ALBA CRISPA; and *Brassica Sabauda rugosa*. **WHITE CURL'D CABBAGE.**

This Species is cultivated in Gardens, but does not endure the Winter. *Morison.*

BRASSICA CAPITATA ALBA MINOR MUSCOVITICA, H. A. The **RUSSIAN CABBAGE.**

This Species was formerly in much greater Esteem than at present, since 'tis now only to be found in particular Gentlemen's Gardens, who cultivate it for their own Use, but 'tis rarely ever brought to the Market. *Miller.*

BRASSICA CAPITATA ALBA COMPRESSA, Boer. Ind. The flat-sided Cabbage.

BRASSICA capitata alba pyramidalis. The Sugar-loaf Cabbage.

BRASSICA capitata alba praecox. The early Battersea Cabbage.

BRASSICA Sabauda byberna, Lob. Ic. The white Savoy Cabbage.

BRASSICA capitata viridis Sabauda, Boer. Ind. Green Savoy Cabbage.

BRASSICA rugosa, longioribus foliis, J. B. Brown Broccoli.

BRASSICA arvensis, C. B. P. Common Colewort.

BRASSICA Alpina perennis, Tourn. Perennial Alpine Colewort.

SOLDANELLA, *Brassica marina*, Offic. Chab. 123. *Soldanella*, Merc. Bot. 1. 72. Phyt. Brit. 115. *Soldanella marina*, SEA BINDWEED, Ger. 690. Emac. 838. Mer. Pin. 114.

SEA COLEWORT, Raii Hist. 1. 726. *Soldanella maritima minor*, C. B. Pin. 293. *Soldanella vulgaris volubilis marina*, Park. Theat. 167.

Brassica marina, sive Soldanella, J. B. 2. 160. *Convolvulus maritimus Soldanella dictus*, Raii Synop.

3. 276. *Convolvulus maritimus nostras rotundifolius*, Hist. Oxon. 2. 11. Boerh. Ind. A. 245. Tourn. Inst. 83. Elem. Bot. 73. SCOTTISH SCURVY-GRASS, or SOLDANELLA.

It is produc'd in the most sandy Parts of the Sea-coast, and flowers in June. The whole Herb is in Use, and, as it is excellently calculated for discharging Water, it contributes very much to the Cure of Dropsies and Scurvies. Dale from Schrod.

Of this Plant Miller enumerates the three following Species.

1. The *Soldanella Alpina rotundifolia*, C. B. P. Round-leav'd Soldanella of the Alps.

2. *Soldanella Alpina rotundifolia, flore niveo*, C. B. P. Round-leav'd Soldanella of the Alps, with a Snow-white Flower.

3. *Soldanella Alpina, folio minus rotundo*, C. B. P. Soldanella of the Alps, with a Leaf less round. Miller's Dictionary.

What they call the Sea Cabbage is, in all respects, different from the cultivated Kind, as producing numerous thin slender Leaves, like those of round Birthwort, each proceeding from a very red Spray, and standing upon a single Pedicle, like those of Ivy. Its Juice is white, but not copious; and tastes saltish, with a kind of Bitterness, and is of a fat Consistence.

The whole Plant is hurtful to the Stomach, and acrimonious; and, if boil'd and eaten, is extremely opening to the Belly. Some boil fat Flesh-meats with it, because of its Acrimony. Dioscorides, Lib. 2. C. 148.

The Root of Soldanella is small, white, and stringy, sending forth long weak trailing Branches, climbing on any thing it lays hold on, like the common Bindweed. The Leaves grow alternately on the Stalks, in Shape and Bigness like the lesser Celandine, set on long Foot-stalks. The Bell-fashion'd Flowers come forth at the Joints, with the Leaves in Shape like the common Bindweed, of a reddish-purple Colour. The Seed is black and corner'd, contain'd in a round Capsula. The Root, Stalk, and Leaves, afford a milky Juice.

It grows upon the Sea-beach, in many Parts of the North of England; and flowers in June.

Sea Cabbage evacuates watery Humours very powerfully, and is by some given as a good Purge in the Dropsy; but it works very ruggedly, and very much disorders the Stomach, and therefore needs good Correctives. It is given likewise in the Scurvy and Rheumatic Cases; tho' it is but seldom us'd. Miller's Bot. Off.

BRASSIDELICA Ars. A Way of curing Wounds in Paracelsus, Lib. 2. de Vita longa, cap. 14. by applying the Herb Brassidella, or *Ophioglossum*, to the Place.

BRATHU, *βραθυ*, in *Oribasius* and *Aetius*, is the Herb Savine. See SABINA.

BREGMA, *βρέγμα*, *βρέγμα*, *βρέγμα*, from *βρέχω*, to irrigate, or moisten. The middle and fore Part of the Head, situated above the Forehead, and extended on the Sides as far as the Temples, call'd by *Cael. Aurelianus*, *Tard. Pass. Lib. 1. cap. 4. Medium Testæ*. *βρέγμα* is expounded in *Hesychius* by τὸ μέσον τῆς κεφαλῆς, "the Middle of the Head;" by others the *Sinciput*. Thus *Homer, Iliad. 3. εὐρύχως ἐκπρεσ δ' ἵππε, κῆρυγας ἐν ζορίῳ ἐπὶ βρέγμαν τε καὶ ὤμους*, "he fell forward out of his magnificent Chariot into the Dust, upon the Sinciput and Shoulders." Where *Eustathius*, on this Place, writes, that the Part is call'd *βρέγμα*, because, in Infants, it is not only tender, but very humid, so that it may seem *βρέχεται*, "to be irrigated." *Hippocrates, Lib. de cap. Vul.* says, that "the thinnest and weakest Bone of all the Head is," τὸ κατὰ βρέγμα, "that at the Bregma." Again, in the same Treatise, he says, "the Brain is very tender, and quick of Sense, in Wounds which affect the Flesh and Bone," κατὰ τὸ βρέγμα, "about the Bregma;" καὶ ὁ πλεῖστος ἐνέμεται ὑπὸ τὸ βρέγμα καὶ νῆται, "and that great Part of the Brain lies under the Bregma."

BRELISIS. The Caranna (a sort of Gum). *Rulandus*.

BRENTHUS, *βρένθος*, a Species of Duck or Moor-hen, accounted delicious Food by the *Bæotians*. *Aldrovandus Ornitholog. Lib. 19.*

BREPPOS, τὸ βρέπω, whether from *τρέπω*, to nourish, by changing *τ* into *β*, or from *βρέβο* of the same Import, by a Metathesis of the Letters *ε* and *ρ*, let Philologists determine. An Infant. *Castellus*.

BREVE VAS, or *Vasa Brevia*. These are form'd by some Branches of Veins from the Coronary Veins of the Stomach, which join with the splenic Veins at the Spleen.

Thro' these Vessels the Antients thought that a melancholic Humour was convey'd from the Spleen to the Stomach, which served to vellicate the Membranes of it, and to excite Appetite. But this Fancy is refuted by the Discovery of the Circulation of the Blood, which has demonstrated, that nothing comes thro' those Vessels from the Spleen to the Stomach; but that, on the contrary, Blood is convey'd from the Stomach into the Splenic Vein, and by that to the Vena Porta. *Drake*.

BREXANTES, *βρέξαντες*. An Epithet of a kind of small green Frogs, in *Galen, Lib. 10. de San. tuend.* where he ex-

poses the Vanity of a Remedy, prepar'd of the Blood of those Frogs, for hindering the Regeneration of Hair. The Word *Brexantes* is made by an Onomatopoeia taken from the Sound of the Voice of these Animals. *Castellus*.

BREYNIA. A Plant so nam'd in Honour of Dr. *Breynius*, a learned Botanist at *Dantzick*. It has a Rose-flower, consisting of many Petals, which are placed in a circular Order, from whose Flower-cup rises the Pointal, which afterwards becomes a Fruit or Pod, which is soft and fleshy, in which are several Kidney-shap'd fleshy Seeds. There are two Species of this Plant, which are, the *Breynia* with broad Almond-leaves, and that with Leaves like those of the wild Olive. It grows very common in *Jamaica*, and several other Parts of *America*, being a Tree thirty Feet high, with a Trunk of the Bigness of a Man's Thigh. I find no medicinal Virtues ascrib'd to it. *Miller's Dict.*

BRICUMUM. The Name by which the *Gauls* call'd the Herb *Artemisia*. *Marcellus Empiricus, cap. 26.*

BRINDONES. *Indici Fructus rubentes acidi*, J. B.

In *Goa*, in the *East-Indies*, as *Garcias* relates, there is a kind of Fruit, which they call *Brindones*; it is a little reddish on the Outside, but the Inside is as red as Blood, and of a very four Taste. Sometimes the Outside is blackish, which Colour it contracts by Maturity; and the Fruit is not near so sour as the other, but altogether as red in the Inside. This Fruit is very agreeable to many Palates, but not to mine, says *Garcias*, because of its excessive Sourness. The Dyers use it, and the Rind is preserved, and transported to make Vinegar, for which Purpose it is used by some in *Portugal*. *Raii Hist. Plant.*

BRISTOL WATER. These Waters, in respect to Heat, are the fourth in Degree amongst the Waters which are esteem'd warm. Those of *Bath* are the first, *Buxton* the second, *Matlock* the third, and *Bristol* the next.

As to the Virtues of the *Bristol* Water in particular Cases, the Physicians upon the Spot are the best able to adapt them properly; but, that I may not omit some general Account of their Uses, I shall insert the subsequent Extract from Dr. *Wynner's Cyclus Metasyncriticus*.

In speaking of the Differences betwixt *Bath* Waters and those of *Bristol*, I would willingly, says he, do strict Justice to both, with the utmost Impartiality: But since they can never prove Rivals, but on the contrary, Friends, and, by reason of their Vicinity, of mutual Good to each other, there can arise no Emulation, no Competition, much less Contention. Some, indeed, have endeavour'd to raise the Repute of the one, by lessening and denying the other: But this Practice, so dishonest in itself, must fall to the Ground, after I have made it appear, that they are of Qualities and Effects altogether different; that where the one is useful, the other is improper; and that therefore they are to be us'd in different Cases.

I shall likewise observe one Caution more; that I will not, with almost all the Writers who have gone before, make each Water to cure every Disease, and thereby render either suspected of having none, when each has manifestly so many good Qualities.

Dr. *Guidot*, indeed, has made these two Waters of one Kind; and then says, *Bristol* Waters cannot do the same as the *Bath*, as being impregnated with far less Quantity of Salts than they; but drank in greater Quantities, and for a longer Time, their Effects are not unlike those of the *Bath* Waters.

Who is there, that sees not the Doctor has hereby, with great Address, render'd the *Bristol* Waters of no Use at all? For who would chuse to drink more Water, or continue sick longer, than Necessity obliges him? But this Insinuation happens to be as false, as it is artful; and, indeed, I cannot forbear applying the Character a certain great Man gives Dr. *Morton's* Performances on another Subject, to our Author: He often wants Method, Clearness, and Judgment; is tedious, without instructing; and arguing, like the other, from chimerical Principles, draws not only trifling, but absurd and wrong Conclusions.

The learned Professor *Pittairn* has laid it down as a certain Maxim, That due Secretions from the Blood, and their proper Distributions, are as necessary to the Preservation of Life, as the Circulation itself; and that the greatest Part of Diseases take their Origin from the glandular Secretions being too much increased or diminished. Whether this Doctrine will hold in acute or epidemic Diseases, the Cause of which the Antients ascrib'd to the Anger of the Gods, and the wisest of the Moderns profess themselves ignorant of, I shall not inquire: but it seems to be evident, that chronic Diseases are owing to one or other of these Causes.

The Blood is sometimes too thin, and then too great a Quantity of its serous Part is separated either by the Glands of the Skin, Guts, or Kidneys; as in colliquative Sweats, Fluxes of the Belly, and Diabetes: The Blood grown too viscous, occasions Obstructions not only in its own Canals, but in the Glands; and then the Secretions are less than they should be in a State of Health, and hence various Maladies.

Again,

Again, there is, in some Cases, too great Fulness; in others, Deficiency of Blood. Both these interrupt due Secretions.

Bath Waters, then, are beneficial, where the Secretion is diminished; *Bristol*, when too much increased. *Bath* attenuates powerfully; *Bristol* incrassates: *Bath* is spirituous, and helps Defect; *Bristol* is more cooling, and suppresses Plenitude, with its Consequences, Inflammation, and Hemorrhage.

The Medicinal Waters of *Bristol* are by no means so modern a Discovery, nor is their Use of so late a Date, as is generally imagined. Dr. *Venner*, near seventy Years ago, writes professedly of them, and recommends them internally in all the Diseases for which they are at this time so deservedly celebrated; the Diabetes excepted, which was not known 'till near thirty Years after. From the Doctor's so full a Knowledge of their Qualities, we may infer, that they must have been in Repute and Use long before. Indeed, in his Time, and some Years after, they were not so much frequented, which might have been owing intirely to their inconvenient Situation, and want of Accommodation, which have been but of late sufficiently remedied. The incomparable Dr. *Maplet*, the Ornament of his Age, in the Year 1665. confirms their Virtues in the Stone and Gravel, Ulcers of the Kidneys and Bladder; and adds their external Force in curing cancerous Ulcers, in a very short time, which the Doctor thought incurable; by washing and fomenting them therewith. And, in a Letter to the Dean of *Wells*, 1669. he says, *Ad rupem Vincentianam tibi confugiendum esse arbitror, è qua prosiliunt aquæ renibus, & vesicæ, frivæ calculosis, sive exulceratis succurrere, necnon sanguinis massam contemperare, & ab illâ segregandam Urinam lenire, & educorare aptæ natæ.*

Thus, you see, the Virtues of *Bristol Waters*, and the several Diseases in which useful, were known to the Learned long ago: But that they are at this time so universally known, so successfully administered; that they are so much frequented by Persons of all Ranks in our own Kingdom, and in such Esteem abroad, is owing to Dr. *Mead* and Dr. *Lane*, who have so established their Reputation, that it seems of an equal Period with their own.

I find myself again oblig'd to retire to my old Sanctuary, Experience; for it will be demanded, I should give an Account of the Contents and Cause of Heat in these Waters; and from thence, by an easy Hypothesis, deduce their Effects as a necessary and natural Consequence. But I had rather give the Assertions of others, than my own Conjectures, in Matters so abstruse.

Dr. *Venner* tells us, this Water receives its medicinal Faculties from Sulphur and Nitre, and from both but in a small Degree: He adds also, Iron; from which, he is persuaded, it has some Tincture; because a Patient of his, troubled with Gravel, and subject to Obstructions in the Spleen, in the Use of it, voided black feculent Matter by Stool.

Dr. *Guidot* says, their Impregnation is from Iron, a small Proportion of a nitro-sulphureous Salt, and Lime-stone: He informs us, that they can have but very little of Iron, because they neither turn purple with Galls, nor curdle Milk: But what I am surpris'd at is, how the Doctor came to find out they had any Iron Particles at all, since they give not the least Sign of it, torture them as you will.

I have taken the Courage now to add my Conjecture, which is, that if we may judge of their Contents from their Effects, which are exceedingly deterfivè and healing, they partake chiefly of Chalk, Lapis Calcaris, and Calaminaris, the Virtues of which, we know, are to dry, to cleanse, to incrust, or fill Ulcers with Flesh, and cicatrize them.

But, whatever the Substances are that impregnate them, it is very plain they are very subtle, and that there is but little of a terrestrial Part in them, from their specific Lightness above all other Waters; which is of itself so excellent a Quality, as by no means to be overlook'd; and also from Experiment; for, after Evaporation, I found only three Drams two Grains of the mineral-like Substance in five Gallons; and, after Distillation, no more than one Dram and a half of a white Powder, like levigated Pearl: So that the highest Proportion the vital Part bears to the elemental, is as 7 to 6814 in each Quart.

But when we consider how agreeable to the Sight, Smell, and Taste; how clear, pure, and soft, they are; their gentle Degree of Heat, so adapted to sundry Diseases; we cannot but conclude, that these Waters have imbib'd some salutary Particles in their Passage thro' the Earth; and, from the many Cures yearly wrought by them, that they have an undoubted Title to a Place in the first Class of Medicinal Waters.

Nor is it necessary, that Medicinal Waters should contain so large a Quantity of the Particles they have imbib'd, as may be evident to our Senses; for we know, by Experiment, that *Regulus of Antimony*, frequently macerated in Wine, loses nothing of its Weight or Substance, tho' the Wine prove strongly Emetic: In vain, therefore, do many Physicians erect Labora-

Vol. I.

tories, and take great Pains, to discover what that adventitious Matter is, which these Waters carry with them.

The Diseases in which *Bristol Waters* are more properly prescribed, are internal Hemorrhages and Inflammations, Blood-spitting, Dysentery, and immoderate Fluxes of the Menfes, purulent Ulcers of the Viscera: Hence in Consumptions, Dropsy, Scurvy with Heat, call'd by Dr. *Willis*, *Scorbutus sulphureo-salinus*, Stone, Gravel, Strangury, the Habitual Gout, that kind of Rheumatism which Dr. *Sydenham* terms *Scorbutic*, Diabetes, slow Fevers, Atrophy, Pox, Cancer, Gleet in both Sexes, and King's-evil, in these Disorders *Bath Waters* are not only improper, but hurtful; they rouse the too languid, and quicken the too lazy Circulation; these allay the Heat, and restrain the too rapid Motion of the Blood: Those impregnate the phlegmatic; these attemperate the choleric Constitution. *Bath Waters* seem to be adapted to the Maladies of the Stomach, Guts, and Nerves; *Bristol*, to those of the Lungs, Kidneys, and Bladder. Again, *Bath Waters* are at Variance with a Milk-course; and the *Bristol* can never be judiciously directed, but where that may be joined with Reason and Success. This is so great a Truth, that it holds even in the Diabetes, in which Milk is of great Service, and prescribed as early as the Age of *Arctæus*, who, say the Learned, is at least as ancient as *Galen*: Tho' that this Disease was little known to Antiquity, is certain, since it is not once mention'd by *Hippocrates*: *Galen* says he never saw it but twice; and *Rabbi Moses* affirms the Diabetes is very seldom seen in the Western Parts of the World, but oftener in the hot and Eastern Countries, insomuch that, in *Egypt*, in ten Years Practice, he saw more than twenty Patients of this kind; but we see a greater Number, almost every Year, in our Western World.

Perhaps some may be surpris'd to find *Bristol Waters* prescribed in Dropsies, in which Authors order also those of *Bath*; but which of the two, with best Judgment, is worth while to inquire. That diuretic and drying Medicines are of great Service in this Disease, no one can doubt; that *Bristol Waters* have these two Qualities in a greater Degree than the other, is also as evident. For which Reason I should prefer the *Bristol* to *Bath*, in this Instance, unless where it happens, as it too often does, that a Jaundice attends it; and here *Bath* claims the Precedence, from its great Efficacy in opening Obstructions of the Viscera, where there is no formidable Inflammation.

But there is another Question of more Importance, and that is, Whether *Bristol Water* be specific in the Diabetes? A specific Remedy for each Disease would prove in Physic, what finding the Longitude must in Navigation: We should go directly to the Cure, without the Circle of the alternative Course: But, at present, there is as little Probability of discovering the one, as the other. We know but one Specific, and but one Disease cur'd by it, unless I can prove this to be such in the Diabetes.

The Diabetes, then, is defin'd to be the too quick and large Excretion of crude, unalter'd, and sweet-tasting Water, exceeding the Proportion of the Fluids taken into the Body, accompanied with intolerable Thirst: And a specific Medicine is that which cures a Disease, without promoting any sensible Evacuation.

Suppose then a Person labouring under a Diabetes, voids a given Quantity of such Urine, (for Example, four or five Quarts in twenty-four Hours) let him drink as many of this Water, and he shall excrete less daily; from whence it is manifest, that it proves no Evacuant. Another Argument to prove it specific is, that, in this Instance, we need not observe the Rule of drinking Mineral Waters in small Quantities; for 'tis specific, and may be taken in as large Doses as the Stomach will bear; and this is no bad News to a Person dying with Thirst. In all other Disorders, where it acts by its counteracting, alternative, and healing Qualities, the Rule holds good. A third is; that we see, by daily Experiments, its Effect in Diabetes more quick and sudden than in any other Disorder, the Patient being certain of a Cure in a very short time.

The proper Seasons of drinking *Bath* and *Bristol Waters* are generally known. *Bath Waters* may be drank, with Benefit, the whole Year; I think best in the cold, or, at least, the cooler Months of *April*, *May*, *September*, and *October*. The *Bristol* are to be taken medicinally, only during the hotter Months, as from *April* to *September*. *Wynter's Cyclis Metasyneriticus*.

BRITANNICA. *Betarrica*.

The *Bretanica*, or *Bettonica*, is an Herb with Leaves like the wild *Lapathus*, but blacker and more hairy, and of an astringent Taste. It sends forth no great Stalk, and its Root is but short and slender. The Juice is expressed from the Leaves, and inspissated in the Sun, or by the Fire-side.

It has an astringent Virtue, and is particularly accommodated to eating Ulcers of the Mouth and Tonsils. It is effectual also to all those Purposes for which Astringents are required. *Discoïdes*, Lib. 4. Cap. 2.

10 M

Not

Not only Beasts, but even Waters and Places, shew their Malignity to Mankind. When *Germanicus Cæsar* had removed his Camp beyond the *Rhine* in *Germany*, they had only one Spring of fresh Water in that maritime Tract of Land, by drinking of which, within the Space of two Years, their Teeth fell out of their Heads, and the Joints of their Knees were enfeebled and relaxed. The Physicians call'd these Disorders *Stomacace* and *Scelotyrbe*. There was a Remedy at length discover'd, which was the Herb *Britannica*, a most salutary Medicine not only to the Nerves, and in Diseases of the Mouth, but also against an Angina, and the Poison of Serpents. It has oblong black Leaves, the Juice of which they express, as also from the Root. They call the Flowers *Vibones*, which, being gather'd and eaten before Thunder is heard, secures the Person from being thunder-struck. The *Frisians* who were in the Camp, shew'd it to our Men; and I cannot but wonder how it came by its Name, unless the People who are Borderers on the *Britannic* Sea, gave it the Name of *Britannica*, out of Respect to the neighbouring Island of *Britannia*; for it is certain, *Britannia* now lying open, that it does not take that Name because that Island abounds with it. *Pliny*, *Lib. 25. Cap. 3.*

The Virtues attributed to this Plant agree pretty well with those of the *Hydrolapathum*, *Offic. Hydrolapathum magnum*, *Ger. 312. Emac. 389. Hydrolapathum majus*, *Park. 1225. Lapathum aquaticum, folio cubitali*, *C. B. 116. Hist. Oxon. 2. 579. Tourn. Inst. 504. Boerh. Ind. A. 2. 85. Dill. Cat. 111. Buxb. 178. Lapathum palustre maximum*, *Schw. 218. Lapathum maximum aquaticum, sive Hydrolapathum*, *J. B. 2. 986. Raii Hist. 1. 171. Synop. 35. Lapathum maximum aquaticum*, *Chab. 309. Britannica antiquorum vera, sive Lapathum longifolium nigrum palustre*, *Munt. Herb. Brit. 150. GREAT WATER DOCK. Dale.*

It has a thick, round, broad, juicy Root, spongy when old, about a Hand's Breadth in Length, divided below into several pretty thick Parts, and surrounded with fibrous little Roots; the Colour of it, when newly taken out of the Ground, is black on the Outside, and white within, but soon alters into a reddish-yellow, like that of the true Rhubarb; and the Root, when dry, turns quite brown. The Leaves are not many; but the longest of all belonging to any of the kinds of Docks, situated near to one another, tho' not closely joined, but separate, always pointing upwards, of a Foot and half, or two Feet in Length, and three or four Fingers broad, being widest in the Middle, and running up to a sharp Point, like the Head of a Spear, of a deep Green, or Sky-colour, inclining to a dark Green above, but paler underneath, with pale-green Fibres, of a pretty thick, hard, dense, close, and firm Substance, the Edges sometimes, especially of those which grow to the Stalk, a little curl'd; they stand on Pedicles which are of a moderate Length and Thickness, and sometimes red near the Ground; they have also an Astringency, with something of an Acidity, and fall off towards the End of *August*. The Stalk is single, or multiply'd, according to the Age or Bigness of the Plant, two, three, and sometimes four Feet in Length, strait, round, green, hollow, adorn'd on both Sides with lesser Leaves, which bend a little upwards as well as downwards, from whose *Ala*, here and there, proceed little Sprigs, laden with little, short, and tender pendulous Leaves, and pale Flowers, which open towards the End of *July*, and are thinly dispos'd about the Joints, but not in the manner of Whorles. The three outer Petals of the Flower are conspicuous on both Sides, for two hairy pale-whitish Gemmule; but these are observ'd in no Species of the *Lapathum*, but the *Virginian Britannica*. The Seed is small, triangular, and of a spadiceous Colour.

Abr. Muntingius is persuaded, that this Plant is the true and genuine *Britannica* of the Antients, since both its Figure and Virtues answer, in all Points, to the Descriptions which they have left us of it. He endeavours also to prove, that the Word *Britannica* is of *Frisian* Original, for it is not likely that this Plant took that Denomination from the Island of *Britain*, to which, as a respected neighbouring Land, the *Frisians* dedicated it, as *Pliny* conjectures. *Brit*, in the *Frisian* Language, signifies to consolidate, render firm and compact; but *Tan* is a Tooth; and *Ica*, or *Hica*, signifies Ejection. Hence *Britannica* is as much as to say, the Herb which consolidates and confirms the loosen'd Teeth, or cures the Disease that makes the Teeth fall out.

Every Part of this Herb, as the Stalks, Leaves, Flowers, Seed, but principally the Roots, are powerfully astringent, consolidating, and conglutinating; for which Reason it restrains and heals all Sorts of Putrefactions, as Erysipelas, ulcerated or not, Herpes, Phagedenic Ulcers, and Gangrenes. It stops Hæmorrhages from any Part, as also the Hæmorrhoids and Menfes, and is effectual for all those Purposes in which other cold Astringents are requir'd.

It cures all manner of Diseases of the Nerves, as Twitchings, Contractions, Tremblings, Convulsions, Palsies, febrile Heats, or Rigors. It chafes away Serpents and other venom-

ous Animals, and heals their Bites; for which Reason it is reckon'd among Alexipharmacs. It gives Relief under all Species of the Angina, Relaxation of the Uvula, Swelling of the Tonsils, and other like Diseases of the Mouth, Fauces, and Stomach, which require Astringency; as also Abscesses, Tumors, and Ulcers. It removes various sorts of Defluxions; and, lastly, Diseases which proceed from hidden Causes, as the *Stomacace*, the *Scelotyrbe*, (the Scurvy affecting the Mouth and Legs) and Ulcers in the Legs.

The green Leaves are apply'd to ulcerated Parts for twelve Hours, and then changed; the Juice also harden'd by the Dog-days Sun, or inspissated by the Fire, is used to anoint the Sore.

Now because the Scurvy, says *Muntingius*, has taken such deep Root in some Persons, that they can receive but little Benefit from a Decoction of *Britannica* alone, I am willing to communicate the Preparation of a Medicine, never yet, that I know of, made public, that all may have the Knowledge of so useful a Medicine, and be able to prepare it for themselves; for the Remedy is more precious than Gold, and ought to be kept in Houses, as an inestimable Treasure, in Readiness against all Attacks, or bare Suspicions, of the Scurvy.

Take of Saffron, two Ounces; Mace, Liquorice, the best Cinnamon, black Pepper, Gentian-root, each three Ounces; *Britannica*, six Ounces: Pulverize them all grossly, and infuse them in sixteen Pints of *Spanish* White-wine, together with three Pints of Elder Vinegar, or some other very strong Vinegar; and add thereto three Yolks of new-laid Eggs. Let them lie macerating together in a glazed Stone Vessel, well closed, for seventy-two Hours, in hot Ashes, Horse-dung, or hot Sand, but with no greater than a tepid Heat; after which set it aside for Use.

Let the Patient take of this Decoction three, four, five, or even six Ounces, according to the Nature of the Subject, in the Morning fasting, for fourteen or twenty Days together, or more. To quench his Thirst, let him drink every Day of the best *Rhenish* Wine; or, if he be accustomed to Beer, let him take it not new, but defecated, and well boiled; and as often as he drinks it, he must also have three Spoonfuls of this Wine.

But it is here to be observed, that if the Patient labours under a Dryness, a violent Cough, or is suspected to be in a Consumption, instead of the Pepper, let six Ounces of Liquorice be added; when the Wine is almost consumed, an equal, or twice the Quantity of Wine, may be pour'd to the Ingredients.

By the Use of this Wine, not only an inveterate Scurvy, especially if it be without a Fever or Inflammation, but also all other scorbutical Disorders, inveterate Hernia's, Palsies, and Lues Venerea, are most successfully cured. *Raii Hist. Plant.*

Its Leaves are styptic, a little bitter, and give a deep Tincture of red to blue Paper. The Root gives it a little fainter; it also is very styptic and bitter. Its Bark is thick, of a Flesh-colour, streaked; its Heart is soft, and of a pale Yellow.

It is probable, that the Salt of this Plant may be composed of Alum and Sal Ammoniac, mix'd with a great deal of fetid Oil. *Martyn's Tournefort.*

I believe this Plant is very effectual in scorbutic Symptoms; and am convinc'd by Experience, that it will effectually cure bleeding of the Gums, if chew'd in a Morning.

Muntingius has wrote an intire Volume in 4to. on the Subject of this Plant.

BRITHOS, *ῥιθός*, a Weight, a Load, *Lib. 1. ῥιθὸς γυναικὸς*, *ῥιθὸς ἐν τῇ γαστρὶ ὑγερῆσαι*, "and there be a (Sense of) Weight in the Belly." And in the same Book, *ῥιθὸς γυναικὸς ἐν τῇ μήτρῃ*, "and there be a Heaviness in the Uterus." Hence the Verb *ῥιθίζω*, which, in many Places of *Hippocrates*, carries much the same Sense.

BRIZA, *Offic. Briza monococcus*, *Ger. 67. Emac. 73. Zea Briza dicta, seu monococcus Germanica*, *C. B. Pin. 21. Theat. 415. Hist. Oxon. 3. 205. Zea monococcus, sive simplex, sive Briza*, *Park. Theat. 1124. Zea monococcus Briza quibusdam*, *J. B. 2. 413. Raii Hist. 2. 5242. Zea simplex & monococcus Briza*, *Chab. 174. Hordeum distichum, spica nitida, Zea seu Briza nuncupatum*, *Tourn. Inst. 513. Boerh. Ind. A. 2. 159. ST. PETER'S CORN.*

It is cultivated in *Germany*; and the Seed is used, which agrees in Virtues with the *Zea*, or *Spelta*.

BROCHOS, *ῥοχός*. The same as *Laqueus*, Bandage. See **LAQUEUS**, and **FASCIA**.

BROCHTHUS, *ῥοχθος*, in *Hippocr. Lib. 2. de Morb.* is a small kind of Drinking-vessel. *ῥοχθος* also signifies the same as *ῥοχός*, "the Throat;" whence *καλαβροχθίς*, and *καλαβροχθίς*, in *Coac.* are both used to express the Action of Deglutition.

BROCHUS, *ῥοχός*. One who has a prominent upper Lip; or, as others would have it, one with a full Mouth, and prominent Teeth. *Castellus.*

BRODIUM. A Pharmaceutical Term, signifying the same as *Fusculum*; or the Liquor in which some solid Medicine is preserved, or with which something else is diluted. *Castellus*.

BROMA, βρώμα, Food, any thing eatable, by way of Distinction from πόμα, Drinkables. *Galen, Lib. 1. de Alim. Fac.* expounds βρώμα by τὰ ἐσθίμενα, ἢ ἐδεσς, ἢ τροφὴς, ἢ σίτια, which are different Words for Eatables. In *Hippocrates, Lib. 2. Epidem.* τὰ βρώματα καὶ τὰ πόματα πείρης εἶναι, ἐπὶ τὸ ἴσον μένει, “whether Meats and Drinks are of equal Continuance, (equally “long in Passage) must be judg’d from Experience.” And *Lib. 6. Epid. Sect. 5. Aph. 35.* βρώματα τὰ μὲν ταχέως καταλείτται, τὰ μὲν ἐν αἵματι, “of Foods, some are soon overcome, “(digested) with others the contrary happens.” And *Aph. 31.* πυρρὰς βρώμα φασι, κίχχοι, κολοκύθαι, “Lentils, “Millet, and Gourd, are very cold Foods.” *Lib. περὶ ἀρχ. αἰσθ.* ἰσχυρὰ βρώματα are strong hard Meats, which require a strong Digestion; and, in the same Book, ἰσχυρὰ βρώμα signifies strengthening Foods. In the same way of speaking, βρώματα are said to indicate πλῆρωσις, “a Plenitude.” βρώμα also, *Lib. 4. Epid.* signifies an Erosion of a Tooth; as it does also in *Galen, Lib. τῶν ἐμπορίων*, where he says κατέπλεσε τὸ βρώμα, “apply some Cataplasma to the corroded Tooth.”

BROMION, βρόμιον. The Name of a Plaister, in *P. Aegineta, Lib. 7. Cap. 19.*

BROMUS, Offic. *Bromus sterilis*, or WILD OATS, *Ger. 69. Emac. 76. Mer. Pin. 16. Bromus herba sive Avena sterilis, Park. Theat. 1147. Ægilops, Chab. 177. Ægilops Matthioli forte, J. B. 2. 439. Festuca avenacea sterilis elatior, seu Bromus Dioscoridis, C. B. Pin. 9. Theat. 146. Raii Hist. 2. 1289. Synop. 3. 412. Hist. Oxon. 3. 212. Festuca & Avena Græca, Merc. Bot. 1. 35. Phyt. Brit. 41. Gramen avenaceum, panicula sparsa, locustis majoribus & aristatis, Tourn. Inst. 526. Buxb. 142. Gramen Festuca sterile elatius, Tourn. Hist. Plant. Bar. 91. DRANK, or WILD OAT-GRASS.*

The Bromus is a Plant much like the Ægilops, being of a drying Quality; for which Reason, if it be boiled with the Roots in Water to a third Part, and then strained, and mixed with an equal Quantity of Honey, and again boiled to the Consistence of liquid Honey, it makes a good Remedy for an Ozæna, by dipping a linen Cloth in the Decoction, and then putting it up the Nostrils. This Effect it has by itself; but some mix Powder of Aloes with it, and use them in the same manner. Boiled in Wine with dry’d Roses, it amends a fetid Breath. *Dioscorides, Lib. 4. Cap. 140.*

A Decoction of the Root is recommended for the Worms in Children. *Dale.* See ÆGILOPS.

BRONCHIA, βρογχία. So *Hippocrates* calls the great Artery, (*Lib. περὶ ἀναιμίας*) ἀπὸ δὲ καρδίας ἐς πύλας βρογχίαν πάλιν καθήκει, καὶ μετὰ βρογχίης φλέβος μεγάλη καλεούμενη, δι’ ἧς ἔρχεται τὸ αἷμα πρὸς τὰς πύλας. “From the Heart to the Liver, “extend numerous Branches of the Bronchia (Aorta); and “with them the great Vein, as it is called, (*Vena Cava*) “by which the whole Body is nourished.” This Place *Galen*, in his Exegesis, seems to have in his Eye, when he expounds βρογχίης by τῆς βρογχώδους ἀρτηρίας, “the bronchoidal Artery;” where for βρογχίης, I suppose should be read βρογχίης. See BRONCHOS.

BRONCHOCELE, βρογχόκελη, from βρογχός, the Windpipe, and κέλη, a Tumor. A Tumor in the Neck, principally in Women, frequently call’d a *Derby Neck*, probably on account of the Inhabitants of that Town, or rather County, being much subject to it; which is not unlikely to happen for the same Reasons, that the Inhabitants about the Valleys of the Alps, and other mountainous Countries, are so much affected with these Tumors, as to have been taken Notice of proverbially by *Juvenal*.

Quis tumidum Guttur miratur in Alpibus?

Whether this proceeds from the Coldness of the Waters which they drink, or from some Mineral with which their Waters are impregnated in the Bowels of these Mountains, I will not pretend to determine.

In the Neck, between the Skin and the Aspera Arteria, there rises a Tumor, call’d by the *Greeks* βρογχόκελη (*Bronchocele*); which incloses sometimes an inert Kind of Flesh; sometimes a sort of Humour, resembling Honey or Water; and sometimes Hairs mix’d with small Bones; but whatever may be the Contents within the Coat of this Tumor, they may be treated with Caustic Medicines; which, penetrating the outer Skin, with the subjacent Tunica, or Coat, make a Way for the included Matter, if it be a Humour, to run out; or if it be of a denser Substance, to be drawn out with the Fingers; which done, the Ulcer is healed up with Dressings of Lint. But the shortest way of Cure is by the Knife. The Tumor is laid open by one strait Incision in the Middle, as far as the Tunica. Then the corrupt Sinus, being separated from the sound Parts with the Finger, is taken out entire together with its Tunica; after which the Place is washed out with Vinegar, with which some mix Salt or Nitre; and the Lips of the

Wound are joined by a single Suture, upon which must be applied what is usual in other Sutures; and the Whole must be bound up in a gentle manner, so as not to bear hard upon the Fauces. If the Tunica cannot be taken out, you are to sprinkle the Cavity with Cathartics, and dress the Wound with Lint, and other Suppuratives. *Celsus, Lib. 7. Cap. 13.*

There is a large and round Tumor of the Neck, which takes its Name from the inward Parts, and is call’d *Bronebocele*, of which there are two Kinds, the *steatomatous*, and the *eurysmatous* (εὐρυσματώδης). This latter is known by the same Marks as an Aneurysm; and the Cure of it, for the same Reasons, is look’d upon as desperate; for as almost all Aneurysms are dangerous in the Operation, so especially is an Aneurysm about the Neck, because of the Largeness of the Arteries. The steatomatous Tumor is to be treated like a Steatoma, by separating and passing beyond the Vessels, in the same manner as we are directed in strumous Cases. *P. Aeginet. Lib. 6. Cap. 38.*

Albucasis, treating of a Bronchocele, or a Rupture in the fore Part of the Neck, which, he says, is most frequent in Women, is fuller than the *Greeks* or *Celsus*; and he very rightly distinguishes between that which is natural, and that which is accidental. The first Sort is not to be touch’d. Of the second there are two Species; one like a Tumor, which contains some gross Substance; the other like an Aneurysm. But though he is so bold in using the Knife, he advises the Operation only in the former Case; and even not there neither, unless the Tumor be loose, and little, and inclosed in a Cystis. This Sort of Swelling may, no doubt, be removed by Art. Sometimes these Excrescences are full of Water, sometimes they have nothing in them but Air; and these Cases may likewise be remedied by Incision, Friction, or Compression. Sometimes they turn to a fleshy Substance, which, lying between the Skin and the Wind-pipe, resembles a Flap or Dew-cap hanging out, just like that of a Turkey-cock, when he is angry. This is a frequent Distemper in those Countries where they drink great Quantities of cold Water; especially where they do not cool their Water in Snow, as in other warm Climates; but pour Ice into it, as the way is with the ordinary People, who live upon the bleak Mountains of *Genoa* and *Piedmont*. The Matter of Fact is as true, as that they themselves attribute it to the drinking this Water; and from the Nature of Cold, it is not difficult to account for this Effect: For the Liquor in going down, must needs chill the Muscles of the Throat, that is, it contracts the Vessels, and thickens the Humours which circulate through them at the same time; from whence must follow a Stagnation or Obstruction, and, after a while, a Swelling, in those Parts. And it is remarkable, that Tumors, which owe their Origin to this Cause, are and always continue fleshy; whereas other Bronchoceles, which proceed from Strains, Bruises, and such-like Accidents, often suppurate, or turn to a Melicoris, Steatoma, &c. as *Albucasis* observes. Among the *Spaniards*, Swellings in the Glands of the Throat are very frequent; who indulge themselves immoderately in the Use of cold Liquors. And that the Coldness not only of the Liquors, but of the Climate itself, may produce these Effects, seems to be plain, from the Observations we find in Writers, that these Swellings about the Throat and Head are much more frequent among the Northern Nations, than the Southern.

Tumors very often happen in the Thyroidal Glands; but such a Swelling is not properly a *Bronchocele*, though sometimes so miscalled, but a *Struma* or *Scrophula Colli*. In morbid Bodies I have seen these Glands enlarged to an extraordinary Bigness, so as to reach down almost to the Clavicles; and in such Cases they generally turn scirrhus. When the Swelling here is thus confirm’d, we may easily learn from Anatomy, were we not warn’d of it, that the Distemper is in its own Nature incurable; for, I believe, neither any inward Medicine, nor outward Application, can dissolve it; and Repellents would rather do Mischief, and throw the Humour upon some other Part. Neither would any prudent Surgeon, I presume, attempt to extirpate such a large Tumor, for fear of cutting an Artery or Vein, or the recurrent Nerve. And *Albucasis* gives us a sufficient Caution, in telling the Story of an ignorant Operator, who, in this Case, by wounding the Arteries of the Neck, killed the Patient upon the Spot. *Freind’s History of Physic.*

The *Bronchocele* is a Tumor situate upon the investing Membrane of the Windpipe, or betwixt that and the Muscles of the said Part; where it sometimes takes so large a Compass, as to extend itself from one Jugular to the other, lying high and prominent, like a Semisphere, or half Globe, or at least of a spheroid Figure.

It takes its Rise commonly from loud Crying, Coughing, and Vomiting; as also from a sudden Jerk, or hasty Turn of the Neck, as I have been inform’d by some therewith affected.

It is call’d also *Hernia Branchialis*; but if there be a Rupture in the Case, as that Name will imply, it is most likely to be that of some lymphatic Vessel, diffusing or shedding its Contents betwixt the Membranes of the Aspera Arteria, and the Muscles incumbent, where being leisurely accumulated, it distends

diffends the containing Parts, and, from the broken Fibres thereof, makes itself a Cover, which grows along with it in like manner, as the other Capsulate Tumors.

There are others who derive their Origin from some nutritious Juice extravasate, and turning into a Flesh-like Substance, after the manner of certain other Sarcomata; and indeed both these may be right, since we often find the Body thereof made up partly of a fluid, and partly of a more firm and glandulous Substance: But to proceed to the Prognostic and Cure thereof.

The *Bronchocele*, by reason of its unhappy Situation among the large Blood-vessels, the recurrent Nerves, and Windpipe itself therein concern'd, at least its investing Tunicle, affords a very hazardous and uncertain Issue; and if it admit not of Discussion, there is little Encouragement to meddle farther: For if it suppurates, there is left commonly a very fordid and sinuous Ulcer, which since you cannot dilate so conveniently as in other Parts might be done, nor have any Advantage by rolling, which the same will not allow, you may be put upon risking your Patient's Life, or leave him in a Condition worse than you found him, with an incurable gleeing Fistula, or Dyspepilotic Ulcer; so that if any thing be done in order for the Cure, it ought always to be attempted first of all by some proper Discutient. For this Use also serves the Empl. Antimoniale of Dr. Fuller, to be met with in his *Pharmacopœia extemp.* but indeed these Tumors are most commonly left to themselves; the great Danger by Incision on account of their Situation, and the Difficulty of healing when they come to suppurate, having very much discourag'd their Undertaking. Wherefore the much greater Number now content themselves without any Surgery, when apprised of their stubborn Nature, and the Uncertainty of Success.

'Tis much more rare to find these Tumors in the Necks of Men than Women, or at least-wise, being less obvious to Sight, they pass unheeded, and we are not so often consulted about them. I am sure, to one that I have observed in our Sex, I have met with half a Dozen on the Throats of Women.

That the Nature of this Tumor may be the better apprehended, I will here transfer an Account thereof, presented by the ingenious Dr. Douglass to the Royal Society, in these Words.

I had lately (*said he*) the Opportunity of opening a Woman about fifty Years old, who had a very large Tumor, or hard Swelling, in the fore Part of the Neck, possessing all the Space between the whole Extent of the lower Jaw, and the upper Part of the Sternum, with a considerable Rising in its Middle, laterally its Point inclining to the Left Side, though the biggest Part of the Tumor was on the Right. The Skin on the Apex of this protuberating Part was thin and shrivel'd, of a Colour different from the rest, and look'd as if the Swelling would have broke in that Place.

The Skin was exceeding thin, having no Fat under it, only in a Cavity between two Lobes, to be afterwards describ'd. On its Right Side there was a small Appearance of some; for the Skin being less stretch'd there, the Cells of the Membrana Adiposa were not quite emptied. The fleshy Fibres of the *Latissimus Colli* were scarcely visible, the *Massoideus* and *Coracohyoideus* were extremely thin, and in their Ascent they adher'd very firmly to the subjacent Tumor. The *Sternohyoideus*, and the *Sternothyreoideus* that run up the fore Part of this Swelling, were diffended so thin, that it was difficult to separate them, especially the last named. The Right Carotid Artery, in its Ascent to the Head, ran along the outer Edge, which increasing, much obstructed the Current of the Blood that Way.

The internal Jugular, the Par Vagus, and the Intercostal Pair, went also over some Part of this Swelling, in their Descent to the Thorax; two of the Lymphatic Glands of the Jugular Vein were swell'd to the Bigness of little Eggs, being placed at some Distance one from the other, with a Hollow between, where some Fat was found; these two Lobes made the Tumor very uneven also on its Right Side.

These Muscles, the Jugular with the Glands adhering to it, and the rest of the forenamed Vessels, being remov'd on both Sides, I could easily observe the Bigness, the Figure, and the Circumscription or Limits of this preternatural Tumor, with all its Adhesions to the adjacent Parts. In Magnitude it seem'd to exceed that of two Fists join'd together: Its Figure was almost triangular, with a broad Basis under the Chin, sloping a little on each Side, as it descended to the upper Part of the Sternum, where its Point was pretty narrow; its Surface was made uneven by three Risings, of which the largest was turn'd to the Left Side, the other being plac'd on the Right, as above remark'd. It adher'd by membranous Filaments to the maxillary Glands, to the *Digastric* Muscle, and to the *Stylohyoideus*, under which, on the Right Side, a small Portion of it, in the Form of a Nipple, did intrude itself, as it were, under the Tongue; in the upper and fore Part it also adhered to the *Os Hyoides*.

Laterally it was connected to the *Levator Scapulae*, and lower down to that Part of the *Cucullaris*, which terminates in the Clavicles backwards, to all the fore Part of the *Aspera Arteria*, between its third and fourth cartilaginous Rings, and the *Os Pectoris*, as also to that Muscle of the Head called *Rectus internus major*, and to some Part of the *Scaleni*; its lower Part was engag'd under the Jugulum, or lunated Part of the Breast-bone to which it adhered. It was easily freed from its Connexions to all these different Parts, but not so from the *Glandulae Thyreoidae*, to which it adher'd after a far different manner; for where the Thyreoidal Glands are joined to one another, a little below the *Cartilago Cricoides*, on the fore Part of the *Aspera Arteria*, there was no separating of it without cutting its Substance; whence it plainly appears, that the Union of these Glands was the Root or Beginning of this Tumor; and yet, which is very remarkable, the Glands themselves kept their usual Figure, and were no larger than ordinary.

This Tumor was hard, and very firm, being exactly of the Consistence of a Cow's Udder when boiled; yet in a few Places it was softish, containing a liquid and thick Juice. Its Colour was chiefly of a whitish-yellow, only in some Places it was exceeding red, from its having a greater Store of Blood-vessels, and in others it was very white: I pared off all the soft Part, and the hard Substance, that remain'd, I boil'd, and then clear'd it very well, having left sticking to it at one Centre a soft cartilaginous Body, which possibly, had the Patient lived longer, would have acquir'd the same Degree of Induration. It very much resembles a Piece of white unpolish'd Rock Coral; but whether it may be reckon'd osseous, or if it be rather the viscid Humour of the Glands; hardened and concreted into this irregular, chalky or gravelly Substance, or whatever else it may be, I leave to better Judgments.

The first Appearance of this large Swelling was about thirty Years ago, caused by the breaking of a Vein, as the good Woman used to express it, in a hard and very difficult Labour. It increased very slowly, not arriving to any considerable Bulk, till a few Years before she died: It was never very painful, being a true Scirrhus. Many Things by several Persons had been used, and applied unsuccessfully: Its Bigness at length became very troublesome, in impeding her Swallowing and free Breathing, and at last it quite choked her, by compressing the Windpipe, upon which it lay. *Turner's Surgery.*

I was formerly acquainted with a Woman who was in great Reputation for resolving these Tumors. Her Secret consisted in anointing the Part frequently with the Oil of Chamomile made by Infusion.

But the most celebrated Remedy for this Disorder is one which is sold at *Coventry*, and, which is kept as a Secret by the Preparer. It is order'd to be laid under the Tongue every Night going to Bed.

I am pretty well inform'd, that this secret Remedy is thus prepar'd.

Take of Sponge, Cork, and Pumice-stone calcin'd, each equal Parts. Half a Dram of this is mix'd with Sugar, and, with the Addition of some Syrup or Conserve, is made into a Bolus, and laid under the Tongue every Night.

What makes me the more inclinable to believe this the true *Coventry* Receipt is, that *Mustanus*, as I remember, has one much like it, which he directs to be used in the same manner for such Tumors. And I remember there is a Receipt in some of the old *German* Dispensatories, not very different from this, with an Addition of the *Pila Marinae*, which is order'd to be laid under the Tongue, as a Remedy *ad Botium*, for the *Bronchocele*; but I cannot at present recollect the Authors.

Rondeau also gives a Receipt for the same Purpose, which he intitules, *Pulvis pro Botio D. D. Wolfgangi Gabelchoveri*, as thus.

Take of Sponge and Lapis Calaminaris calcin'd, each two Ounces; of Pumice-stone, and Lapis Spongiae, each four Ounces; fine Sugar, three Ounces: Mix, and make a Powder.

But they all agree in making the Sponge a principal Ingredient.

BRONCHOTOMIA, *βρογχότομία*, from *βρόγχος*, the Throat, and *τέμνω*, to cut, Bronchotomy. See ANGINA.

BRONCHUS, *βρόγχος*, *βρόχης*, *βρόχιν*. The Word *βρόγχος*, according to *Galen*, in the Beginning of his seventh Book de *G. M. S. L.* is the *Aspera Arteria*, which reaches from the Larynx to the Lungs, consisting of a Multitude of cartilaginous Bodies, called *βρόγχια* (*Bronchia*). The same Author, *Com. 3. in Lib. de Art.* says that *βρόγχος* is put for the entire *Aspera Arteria*, or only for the Fauces. *βρόγχος*, in *Hippocrates*, signifies the Throat, whence, *Lib. de Artic. ἐξ ἐξέβρογχος* is expounded by *Galen*, *τὸς ἐξέχοντα ἐς τὸ πρὸς τὸν βρόγχον ἐχόντας*, "those who have a prominent Throat. And,

And *Lib. 5. Epid.* ὁδὸν ὑπὸ τὸν βρόγχον, "a Tumor under the Throat." And *Lib. de Rat. Viâ. in Morb. acut.* διατεταμένους τὸν βρόγχον, "dilate, as it were, with expanded Wings the Throat." See PULMONES.

The *Bronchia* or *Bronchi*, as now understood, are the Ramifications of the *Aspera Arteria*.

BRONTE, βροντή. Thunder; see TONITRU. I don't know, that this relates to Medicine, farther than as it purges some People by the Fright.

BRONTIS, from βροντή, Thunder. The Thunder-stone. See BELEMNITES, and CERAUNIA.

BROTOS, βρώτος, from βρώσκειν, to feed. An Epithet of Man, signifying his Necessity of eating and drinking, and consequently his Mortality; but the Word is more in Use among the Poets than the Physicians.

BROUILLAMINI. A Term given by the French to such Masses of Bole, which are as thick and long as a Finger. They also call these *Bol en Bille*.

BRUCHUS. A sort of Caterpillar. *Forestus* in his Observations relates, that a *Bruchus* was thrown up by vomiting as big as a little Ball, inclosed in a Bit of Flesh as in a Pod. *Hartman*, in his *Praxis Chymiatrica*, writes that *Bruchi*, that is, May-worms dry'd, and given to such as are mad by the Bite of a mad Dog, will in a short time cure them of their Madness. But I am afraid he is mistaken.

BRUMA. The same as HYEMS, Winter; but especially that Part of Winter which is about the Solstice, when the Days are shortest.

BRUMASAR, a Spagirical Term, signifying Silver, or, the *Magn. Castellus*.

BRUMATI terreum. A glazed Vessel. *Rulandus*.

BRUNELLA. The same as PRUNELLA, which see.

BRUNSFELSIA. A Plant which takes its Name from Dr. *Brunsfelsius*, a famous Physician.

The Flower consists of one Leaf, shap'd like a Funnel, which is tubulous, and cut into many Parts at the Top, from whose Calyx arises the Pointal, which afterwards becomes a round, soft, fleshy Fruit, containing roundish Seeds between the Rind and the Flesh.

There is but one Species of this Plant, which is,

BRUNSFELSIA *Flore albo, Fructu croceo molli*, Plum. N. G. *Brunsfelsia* with a white Flower, and a soft Saffron-colour'd Fruit.

It is very common in *Barbadoes* and *Jamaica*, but I find no Medicinal Virtues ascribed to it.

BRUNUS, *Ignis sacer*, St. Antony's Fire, or Erysipelas. *Rulandus*.

BRUSATHAER. The Name of a Tree that grows in *China*. *Ray's Index to his Hist. Plant.*

BRUSCANDULA. The same as LUPINUS, a Lupin, which see. *Blancard*.

BRUSCUS, *Ruscus*, Offic. *Ruscus sive Bruscus*, or *Kneeboline*. Ger. 752. Emac. 907. Mer. Pin. 107. *Ruscus*, J. B. 1. 579. Chab. 46. C. B. Pin. 470. Park. Theat. 253. Raii Hist. 1. 664. Synop. 3. 262. *Ruscus myrtifolius aculeatus*, Tourn. Inst. 79. Elem. Bot. 70. Boerh. Ind. A. 2. 63. *Ruscus*, *Bruscus*, *Oxymyrsine*, Merc. Bot. 1. 65. Phyt. Brit. 107. BUTCHERS-BROOM. Dale.

Ruscus, or the wild Myrtle, has a Leaf like the Myrtle, only broader, and pointed at the Top like a Spear; a round Fruit, which sticks to the Middle of the Leaf, and is red when ripe, with a stony Inside. From one Root proceeds a Multitude of twiggy Stalks, hard to break, a Cubit in Height, and cover'd with Leaves. The Root is like that of the *Agrostis*, and is of a tart and bitterish Taste; it grows in rough and craggy Places.

The Leaves and Berries, drank in Wine, provoke Urine, and the Menfes, and break the Stone in the Bladder. They also cure the Jaundice, Strangury, and Head-ach; a Decoction of the Root in Wine, if drank, produces the same Effects. The young Stalks, when they have just begun to shoot, are eaten instead of Asparagus, or other Greens; they are diuretic, and of a bitter Taste. *Dioscorides*, *Lib. 4. Cap. 146*.

The Roots of Butchers-broom are white, thick, and knobbed, matted together, and sending down large Fibres. The Stalks grow to be about a Foot high; they are tough, pliant, and hard to break, striated and thickly beset with small, stiff, rigid, nervous Leaves, about the Bigness and Shape of the small Myrtle, ending in a sharp and prickly Point, and sticking close to the Stalks. The Flowers grow on the Backs of the Leaves, being small and purple, made up of six Leaves apiece; and after them come round red Berries, like the Berries of Asparagus, containing two Seeds. This Plant grows in Hedges and Thickets, as on *Epping-forest*; plentifully flowering in Summer.

The Root of *Ruscus*, which is the only Part in Use, is one of the five opening Roots. It opens Obstructions of the Liver and Spleen, and helps the Jaundice and Dropsy. It is a strong Diuretic, provoking Urine, and helping the Stone and

Gravel; and brings down the Catamenia. *Tournefort* commends a Conserve of the Berries to stop a Gonorrhea. *Miller's Bot. Off.*

What *Dioscorides* has said of the *Ruscus*, does not disagree with the Plant now called by that Name: the Seeds in the Berries are very hard; so I believe we must read in *Casalspinus*, *quasi cornea substantia*, instead of *carnea*: The Root is one of the five opening Roots, good to remove Obstructions of the Bowels, and to evacuate by Urine. For the Dropsy, Cachexy, Jaundice, Stone, and Retention of Urine, it is prescribed in Broths, Ptisans and Apozems. For scrophulous Tumors, they give to drink, for several Days, a Pint of White-wine, in which a Dram of the Powder of the Roots of Butchers-broom, with the same Quantity of those of Figwort and Dropwort, have been infused. The Conserve of the Berries is good for Heat of Urine: the Seeds are used in the *Benedicta laxativa*.

The Flower is monopetalous, three Lines in Diameter, greenish, divided into three larger and three smaller Segments. It has a Violet-colour'd Sheath, instead of Chives, which sustains six Summits, and is raised with six rounded Ribs running lengthwise. *Vaill. Martyn's Tournefort*.

BRUTA, is that Virtue of the Celestial Influence which is manifested by brute Animals to the rational; as the Virtue of Celandine communicated to Mankind, by reason of the Swallow; the Use of Salt in a Clyster, taught by the Stork. *Rulandus*.

BRUTIA. An Epithet for the fattest and most refinous kind of Pitch, which was therefore thought fit to be used in making a factitious Oil, called *Oleum pistum*, *Pliny*, *Lib. 15. Cap. 7*. We often meet with *pix Brutia*, in the ancient Physicians, which was so called from *Brutia*, a Country in the extreme Parts of Italy, where it was produced.

The *Brutii* were a People of Calabria, over-against Sicily, beyond the *Lucani*. *Pliny*, *L. 16. C. 11*. gives the ancient Method of making this Pitch, from the *Tæda*, Mountain-pine.

BRUTOBON. A barbarous Name for some Greek Ointment, the Preparation of which is unknown. *Castellus*.

BRUTUM, βροτον. An Epithet for Animals void of Reason, signifying the same as irrational, *Galen*. *Orat. Suasor. ad Artes*. He also calls them βροτομαῖα (*Brutomata*), 4. de R. V. I. A. In the *Theatrum Chymicum*, Vol. 4. the Philosopher's Stone is call'd *Cor Brutorum*. *Castellus*.

BRUXANELI, H. M. *Baccifera Indica, flosculis umbellatis, baccis umbilicatis dicocis*. It is a tall Tree, about the Bigness of an Apple-tree, growing in the mountainous and woody Parts of the Kingdom of Malabar: It flowers in July and August, and the Fruit is ripe in November and December. The Tree lives a long time.

Of the Juice of the Leaves, mix'd with fresh Butter, is prepared a Liniment, which is used in the Cure of a Carbuncle. A Decoction of the Bark of the Tree is held to be diuretic. Of the Bark of the Root, mix'd with Ginger and Turmeric, in Butter-milk, they make a Poultice, which is highly commended for arthritic Pains. *Ray's Hist. Plant.*

BRYCHIOS, βρυχιος. Deep, sunk; the same as ὑπεβρυχιος. In *Lib. περὶ ὁρίων φασ*. we read, ἀπὸ τῆς διὰ τῆς ἐπιγαστρικῆς ἐστὶ τὸ εἶδος διὰ τῆς κνήμης τὸ μὲν, βρυχίν ῥεταλαρ "This (Vein) extends itself by the Patella, and, passing by the Muscle of the Tibia, runs deeply into the inner Parts." *Brychion*, in *Erotian* upon *Hippocrates*, is expounded ὡς ἐν βύθῳ, κατὰ βάθος, κείμενον, "as it were, submerged, and lying in the Deep." *Hesychius* expounds βρυχιον and ὑπεβρυχιον, by βυθίζεσθαι, "submerged, and sunk in deep."

BRYGMUS, βρυγμος, is expounded by *Galen*, in his *Exegesis*, ὁ ἀπὸ τῆς ὁδὸς συνιπνομένης ᾠδῆς, "the grating Noise made by the Gnashing of Teeth." *Erotian* makes βρυγμος to be ἰσχυρὰ ποῖς ᾠδῆς, "a peculiar Kind of Noise"; that is, such as is made by the Gnashing or Collision of the Teeth. *Hesychius* expounds βρυγμος by τρισμαὶ ὁδὸς ἢ ἀκόντισις μύλων "A Stridor Dentium, or a Grinding of the large Teeth, or Dentes Molares." *Brygmus*, *Lib. περὶ γυναικ. φασ*. signifies a Stridor Dentium; as κατὰ τὸν αὐτὸν καὶ βρυγμος λαμβάνεται, "a Fever seizes her, attended with a Stridor Dentium." And it has the same Signification in many other Passages of *Hippocrates*.

BRYON, βρύον, is a Moss which grows to the Barks of Trees, being the grey Hairs of Trees, as *Pliny* expresses it, *Lib. 12. Cap. 23*. which appear most remarkably upon Oaks. *Bryon*, and βρύα, are used by *Hippocrates*, *Lib. περὶ γυναικ. φασ*. and *Lib. 2. περὶ γυναικ.* in Suffumigations for the Uterus.

Bryon Thalassium, βρύον θαλάσσιον, in the Alga, or Sea-moss, which *Hippocrates* applies, by way of Cataplasm, to Women labouring under an Inflammation of the Uterus, *Lib. περὶ γυναικ.* calling it βρύον θαλάσσιον, ὅ ἐστι τὰς ἰχθύας ἐμπλάσσον "Sea-moss, which they cast over Fishes." *Galen*, *Lib. 3. Meth. Med.* directs the Bandage of an Ulcer to be βρυώδες καὶ μαλακόν, "soft and yielding, like Alga;" to which is opposed ἑταῖς σκληρὸν ὡς θλίβειν, "one so hard as to press or squeeze the Part."

I have given an Account of what is at present meant by *Bryum*, in the Explication of Botanical Terms.

Bryon, by some call'd *Splachnon*, is found upon Cedars, white Poplars, and Oaks; that upon Cedars is the best, and that upon Poplars is next to it in Goodness. The white and fragrant is the most valued, but the blackish is not so good.

Bryon has an astringent Virtue, is temperate in Quality, between Heat and Cold; and the Decoction of it makes a good Infusion for uterine Affections, and is mix'd with Unguenta Balanina, and with Oils or Litufes, because of its inspissating Quality. It is also an useful Ingredient in the Preparation of Suffumigations, and Medicines call'd *Acopa*. *Dioscorides*, Lib. 1. Cap. 20.

Bryon Thalassum, Sea-bryon; grows upon Stones and Shells by the Sea-side. It is a capillaceous Plant, slender, without Stalk, of a very astringent Taste, and effectual in Inflammations, Gouts, and other Disorders in which Astringents are proper. *Idem*, Lib. 4. Cap. 99.

Bryon must be reckon'd among Sea-herbs: It has Leaves like Lettuce, but shrunk and shrivel'd. It grows mostly on Rocks and Shells, which stick in the Ground. It is of a remarkably drying and inspissating Quality, by which it represses all Collections of Matter, Inflammations, Gouts, and other Disorders which want Refrigeration. *Pliny*, Lib. 27. Cap. 8. See ALGA.

BRYONIA ALBA, Offic. Ger. 720. Emac. 869. Raii Hist. 1. 659. Synop. 3. 261. Merc. Bot. 1. 24. Phyt. Brit. 17. Mer. Pin. 16. *Bryonia alba vulgaris*, Park. Theat. 178. *Bryonia aspera sive alba, baccis rubris*, C. B. Pin. 297. Tourn. Inst. 102. Elem. Bot. 85. Boerh. Ind. A. 2. 61. *Bryonia aspera incana alba, baccis rubris*, Hist. Oxon. 24. *Vitis alba vel Bryonia*, J. B. 2. 143. *Vitis alba, Bryonia*, Chab. 120. **WHITE BRYONY.** Dale.

This Bryony has a large thick Root, frequently as big as a Man's Arm, growing very deep in the Earth, of a light Brown on the Outside, and White within, of a bitter unpleasant Taste. In the Spring it sends forth a great many rough and hairy slender Stalks, which have curl'd Tendrils at the Joints, which climb to a great Length upon the Hedges near which it grows. The Leaves are, in Shape, like Vine-leaves, whence it is call'd *Vitis alba*, the white Vine; they are rough and hairy. The Flowers grow several together, on a common long Foot-stalk, each of a single Leaf, cut into five Segments, of a whitish-green Colour; after which follow red small Berries, full of Seeds. It grows in Lanes, and by Hedge-sides, flowering in May, the Berries being ripe in September.

Paulus Aegineta, Lib. 7. C. 3. informs us, that the young Shoots of white Bryony are used as a Food grateful to the Stomach. But in this he himself has either been in an Error, since it only holds true of black Bryony, or the Hands thro' which his Works have pass'd, have made him say a thing which is absolutely false. Neither can I comprehend how white Bryony should generate Milk, unless, with *Baubine*, we say, that it may accidentally produce this Effect by purging such Nurfes as are valetudinary, and in a bad State of Health; for all the Parts of the Plant are of an acrid exulcerating Quality; which *Mesue*, R. III. L. 2. C. 25. seems to have had in his View, when he uses these Words: "Its young Shoots, when they first appear, are principally used with Aromatics, and correct the fetid and disagreeable Smell of the Breath, especially when that Misfortune proceeds from a Corruption of the Humours lodged in the Stomach." For, by the Addition of the Aromatics, the drastic purgative Quality of the Plant must, in some measure, be corrected and balanced. The same Author, for a Purge, prescribes from one Dram to two Drams of the Juice of its Root; and of itself, in Substance, from one Dram and an half to three Drams. Later Authors have observed, that not only the Roots, but also the young Shoots and Berries, are possess'd of a very drastic and powerful purgative Quality, and must consequently be proper for removing Obstructions. The Root alone is, at present, used for medicinal Purposes; and Authors, I believe, are sufficiently agreed, that it is intolerably acrimonious and nauseous, that it provokes Urine, purges violently, and vomits briskly. It is generally class'd among the phlegmagogue and hydragogue Medicines; and is, on account of the Violence with which it operates, call'd *Rusticorum Purgatio*, the Purge of the common People. The Dose of the Root, reduced to Powder, is from two Scruples to one Dram: Half an Ounce of its Juice may be given; and three Drams of Infusions or Decoctions of it may be used. But to whatever internal Purposes it is used, *Tournefort* thinks it expedient to correct its strong and drastic Qualities, by the Addition of a proper Quantity of Cream of Tartar, or *Tartarus Tartari-satus*.

According to *Le Mort*, an excellent Purge is prepared of Bryony in the following manner:

Take of fresh Bryony, a sufficient Quantity; after having bruised it, and express'd the Juice, let it be well dried.

Then bruise it a second time; and to one Ounce of the dried and pulverized Root, add three Drops of the Oil of Cloves, and half a Dram of distil'd Vinegar: Mix all together; and lastly, dry the Whole, either over a very slow Fire, or by the Heat of the Sun. Thus will you have an excellent and efficacious Purge in Cachexies, and all Obstructions of the Uterus. The Dose is from five Grains to one Scruple. *Coll. Leyd.*

Baubine informs us, from *Jo. Stoffelius*, that if we cut the Bryony-root close by the Surface of the Earth, and excavate that Part of it which is left in the Ground, covering it over with that Part of the Root which was cut off, in order to hinder Dust and Earth from falling into the Cavity, we shall next Day, upon uncovering it, find it full of a certain milky Juice, which continues in it till the third Day; and that a Spoonful of this Juice purges a Man no less safely than speedily. *Ray* also, from *Daleus*, informs us; that by taking from one to two or three Spoonfuls of this Juice every Morning, many dropical Patients have been cured; provided the Juice has been gather'd in the Spring of the Year, when the Moon is increasing. *Hoffman* acquaints us; that *Platerus* took the white Bryony-root before it germinated; and, after pulling off the Bark, and cutting it into Shreds, pass'd a Thread thro' it, and hung it up to dry, either by the Heat of the Sun, or that of the Fire; and that, when it was sufficiently dry, he infused it in generous Wine, and dried it a second time: This Method he repeated several times, and affirm'd, that, when thus prepared, it purged excellently, and without creating any Uneasiness. The same Author prepares Troches of white Bryony in this manner:

He reduces the Bryony, thus corrected, to a Powder; and, after sprinkling it with *Malmsey* Wine, in which Ginger has been infused, he forms it into small Cakes, which, when dry, he reduces to a Powder, and uses in Infusions: When thus prepared, it purges, according to that Author; in the same manner the Troches of Agaric do.

Now since this Root, when used internally, acts by its stimulating and resolvent Acrimony, 'tis obvious, that it may be exhibited with Success in Cases where heating Medicines are indicated, and when the Intention is to stimulate the Nerves strongly, and give a Concussion to the whole System. To this Quality it is also owing, that it is so much extol'd in Intermittent Fevers, in provoking the Menses, curing those uterine Disorders to which young Women are subject, and in killing and dislodging Worms lodged in the Intestines; for, being possess'd of a highly drastic Virtue, it powerfully incides the tenacious Juices, and surprisngly opens and removes Obstructions. Thus *Ray* informs us, that the Bulk of a Nutmeg of the Conserve made of its Root, taken twice a Day, and persisted in for a long time, often proves the happy Means of removing and entirely curing Epilepsies, and hysteric Passions; and that the same good Effect is produced by continually putting a Piece of its Root into the Cup, out of which the Patient drinks. *Baubine*, from *Arnaldus de Villa Nova*, gives us the History of a certain Patient, who, in the Space of three Weeks time, was completely cured of an Epilepsy, only by purging himself with depurated Juice of Bryony, edulcorated with a little Sugar. *Matthiolus*, in his Commentaries on *Dioscorides*, informs us, that he knew a certain Woman, who, for several Years, had been daily subject to hysteric Fits; and who was at last advised, by a common Herb-man, once a Week, when going to Bed, to drink White-wine, in which an Ounce of Bryony-root had been boil'd; by which Medicine, continued for a Year, her Disorder was entirely removed. *Forestus*, *Obs. Chir. L. 6. Obs. 22. Schol.* informs us, from *Avicenna*, that Patients render'd delirious by dangerous Wounds, are in a great measure restor'd, either by drinking Bryony-root for some Days, in some refrigerating and diluting Liquor, or using it in any proper Food, capable of obtunding and blunting its Taste. The Root, externally applied, has, in many Cases, given incontestable Proofs of its resolvent Qualities. When newly bruised, and mix'd up with Salt and Vinegar, it resolves cold Tumors, and removes the discolour'd Marks arising from extravasated Blood, if applied to them. *Helmont* affirms, that in Contusions, where a black discolour'd Blood is lodged under the Skin, Bryony-root alone, shaved down and applied, will, in a few Hours, resolve the Blood into Water, and draw it thro' the Pores of the Skin. According to *Etmuller*, Bryony-root not only cures the Dropsy, when exhibited internally, but also evacuates the Waters collected in the Abdomen, when applied externally, by way of Cataplasm, to the Region of the Loins, either bruised by itself, or made up with the Dung of a Cow, the Pigeon's, or Goat's. It is also applied to cedematous Swellings of the Feet and Legs, a Hydrocele of the Scrotum, and other Disorders of a similar Nature, in which Cases it carries off the Serum, and consequently discusses the Swellings. It is also properly applied to scrophulous Swellings, whether exulcerated or otherwise; for which Intention,

B R Y

Let half a Pound of the Root, cut into small Shreds, be fried in a Pan till the Shreds are shrunk and shrivel'd up: Then let the Liquor, strain'd off, be reduced to the Consistence of an Ointment; with half a Pound of Refin of the Fir-tree, and five Ounces of Wax. Let this Ointment be applied to the strumous Swelling every Morning and Night, upon a Piece of Linen Cloth.

This Medicine either dissolves the *Strumæ*, or brings them to Suppuration; and heals the Ulcers, as *Zacutus Lusitanus* affirms from Experience. If the Root of the white Bryony is excavated in the Ground, and cover'd with some proper Covering, the Liquor collected in it proves an excellent Medicine for arthritic Pains, if applied immediately to the Parts affected. The Root itself also, fresh bruised, mix'd up with Linseed-oil, and applied warm, removes sciatic and arthritic Pains: This Medicine must be repeated till the morbid Matter is resolved and dissipated. It is also excellent for Contusions, and for dissolving grumous and coagulated Blood. The Leaves of Bryony also, if bruised, and applied to livid and discolour'd Spots in the Skin; powerfully discufs the grumous Blood. For this Reason, in Gangrenes, and other Tumors, *Tacius* made Trial of the Root fresh bruised, or cut down, either alone, or mix'd with Chervil, by way of Cataplasim. It is also thought good for curing wandering arthritic Pains, by Transplantation, as it is commonly call'd. The Method of doing this is to hang the Bryony-root for some time to the Member or Part affected, and to bury it, when taken away, in any Garden or fruitful Soil where it grows. In the last Place, when the Uterus is to be purged, white Bryony-root may either be used as an uterine Pessary, or by way of Fumigation. See *Etmuller, Lib. 1.*

According to *Baubine*, the Root is by some highly esteem'd in arthritic Pains; and their Method of using it is to cut it down, and macerate it in Brandy, which they afterwards distil, and steeping Linen Cloths in the Water, when warm'd, apply them to the Parts affected. *Dr. Hopper, in Eph. N. C. D. 1. a. 4. App. p. 47.* informs us, that Warts, on any Part of the Body whatever, are safely and effectually destroy'd by Ashes of Bryony-root, mix'd with the Juice of the same.

It is not, on this Occasion, improper to inquire, whether, from a Knowledge of the component Parts of Bryony, we can account for its Effects, and ascertain the particular Form in which it may best answer the Intentions of a Physician, when prescrib'd for internal Purposes? *Tournefort* informs us, that its Leaves are insipid, contain a viscid Juice, and do not, in the least, tinge blue Paper with a reddish Colour; whereas it is considerably tinged by the Root: From which Circumstance, he says, we may reasonably conjecture, that the Acid of Sal Ammoniac, which, in this Plant, is superior to its other Principles, is free and disentangled in the Root, in consequence of which it is left at Liberty to act agreeably to its own Nature; whereas in the Leaves this Acid is sheath'd up in a larger Quantity of Sulphur; and that the Root, subjected to the Fire, yields a large Quantity of an acid Liquor, a great deal of fetid Oil, and a considerable Portion of a volatile concreted Salt. *Mr. Boulduc* affirms, that the Root consists of saline, without any Mixture of resinous Principles; that it acts more powerfully when taken in Substance, than in any other Form whatever; and that, for a Dose, one Dram of the dried Root is sufficient; whereas, when fresh gather'd, four Drams of it are requir'd, because it then abounds with a superfluous Moisture. But as it is to be dreaded, lest too violent Effects should be produced by the Bryony-root in Substance, he thinks it more safe and expedient to have recourse to Infusions, Decoctions, and Extracts of it. He also prefers Infusions to Decoctions of it; and approves more of infusing it in Wine than in Water. When the precise and only Intention is to discharge the Waters from the Abdomen, he maintains, that Extracts prepared from its Juice, are preferable to those obtain'd by Infusion or Decoction, *Hist. Ac. Roy. des Sci. A. 1712.* It is to be observed, that the Root, when fresh gather'd, is thought to act more powerfully, than when it is dried; for which Reason, according to *Pomet*, it is call'd, by the Country-people of France, *Nouveau enragé*. In *Lemery's Pharmacopæia*, the *Aqua Bryoniæ Composita* is directed to be prepared in the following manner:

Take of the Juice of Bryony-root, four Pounds; of the Juices of the Leaves of Rue and Mugwort, each two Pounds; of dried Savin-leaves, three Handfuls; of Feverfew, Catmint, and Pennyroyal, each two Handfuls; of sweet Basil, and Dittany of *Crete*, each one Handful and an half; fresh Orange-peel, four Ounces; Myrrh, two Ounces; Castor, one Ounce; and rich Canary Wine, twelve Pounds. Digest for four Days in a proper Vessel; then subject it to Distillation in *Bainæ Mariæ*. About the Middle of the Distillation express and strain; and then, by continuing the Distillation, and inspissating the Tincture, make an Hysteric Extract.

B R Y

R E M A R K S.

The Bryony-root must be fresh gather'd, rasp'd down, and the Juice express'd. The Leaves of the Rue and Mugwort must be also fresh gather'd, and bruised in a Mortar, and the Juice express'd in the common way. The Savin-leaves must be dry. The Dittany of *Crete*, together with the other Leaves, must be bruised and mix'd with the Orange-peel, the Myrrh, and the Castor. When all together are put into a large Cucurbit, the Juices and Canary Wine must be pour'd upon them, and the Cucurbit must be close stopp'd, put in a warm Place, and the Ingredients allow'd to digest for four Days. Then distil in *Bainæ Mariæ*; and when half of the Quantity is drawn over, express what remains in the Alembic, and distil the express'd Liquor as before, till there remain but little in the Still; and then evaporate the Humidity till it acquires a pretty solid Consistence. Thus you will have an Extract to be kept for Use. Mix the distil'd Waters together, and thus you will have the COMPOUND BRYONY-WATER, which must be kept in a well-stopp'd Bottle.

This Water is antihysterical, aperient, good for the Vapours, and proper to excite the Menses, resist Poison, fortify the Brain, corroborate the Nerves, and eliminate noxious Humours by Transpiration. Its Dose is from half an Ounce to three Ounces.

The Extract is also antihysterical, and proper to promote the Menses. *Lemery's Pharm. Univers.*

In the *London Dispensatory*, from which *Mr. Lemery* took the above-mention'd Recipe, Spirit of Wine is order'd for the Distillation. In the *Edinburgh Dispensatory* Spirit of Wine is also used for that Purpose, but the Castor is rejected. Instead of the Extract, *Tournefort* recommends an Infusion of the Root in Wine, which he orders to be inspissated. In the *Collect. Leyd.* there is an Extract of Bryony prescrib'd, which, in the Opinion of *Mr. Le Mort*, tho' a Medicine of a low Price, is yet a Purgative of great Value and Efficacy. It is prepared in the following manner:

Take of dried Bryony, one Pound; of the Herb Fumitory, two Pounds; and of Sena-leaves, four Drams: Boil all together for two Hours, in a sufficient Quantity of Water; and let the express'd Liquor be reduced to the Consistence of Pills. The Dose is from half a Scruple to half a Dram.

The *Electuarium Diabryonias Democriti*, in *Mesue*, is said to be wonderfully efficacious in Epilepsies, Palsies, Vertigoes, and other cold Disorders of the Brain, and Spinal Marrow, and of the Nerves which arise from them. It is prepared thus:

Take of Bryony-root, cleansed and tritured, five Pounds; of the Rob of Grapes, four Pounds; roasted Squills, and the Kernels of Pine-nuts, each half a Pound; Agaric, three Drams; Nutmegs, Cardamoms, Mace, and Ginger, each two Drams; Cloves, Long-pepper, and Stoechas, each one Dram and a half; Seeds of Hartwort, Sal Gem, and the Trochisci Galliæ Moschatæ, each one Dram; and of Spikenard, half a Dram: Mix up into an Electuary, according to Art. After it has stood six Weeks, the Dose is from two Drams to five or six; tho' *Lemery* orders an Ounce and a half.

As *Mr. Lemery* thinks the above Preparation very faulty in several respects, he proposes the following in its stead, under the Title of *Electuarium Diabryonias Emendatum*, which he prepares thus:

Take of the Juice of cleansed Bryony, fresh extracted, four Pounds; of the best Honey, two Pounds: Let them be boil'd to the Consistence of Honey; then add, of the Powder of Turbith, Hermodactyls, Jalap, Agaric, and Salt of Bryony, each six Drams; and of the *Fæcula Bryoniæ*, half an Ounce. Make up into an Electuary, according to Art. The Dose is from one Dram to one Ounce. *Lemery Pharm. Univers.*

By the above-quoted *Mesue* a Syrup is ascribed to the said *Democritus*, which is compounded of the Juice of Bryony, Aromatics, the Rob of Raisins, and Honey. This Syrup is said to be as efficacious as the former Electuary, if two Ounces of it are taken for a Dose.

In the *Dispensatorium Borussæ-Brandenburgicum*, there is a *Syrupus de Bryonia*, prepared of the Juice of Bryony-roots, with Honey and Sugar, which may be given to asthmatic and hysterical Patients; and in Cases where Animals are suspected to be lodged in the Stomach or Intestines. *Faber, in Myroth. L. 6. C. 10.* prepares a Syrup of Bryony, from a Decoction of its new-pull'd Roots, inspissated, and Sugar; to which he afterwards adds the finest of the Salt, procured by drying the Root,

and

and reducing it to white Ashes, allowing half an Ounce of the Salt for each Pound of the Syrup. He informs us, that this Medicine gently purges all ferous Humours, powerfully promotes the Menfes, and safely cures most of the Disorders to which young Women are subject, because it opens all Obstructions, and purifies the Blood. Half an Ounce of it, or in strong Constitutions a whole Ounce, is exhibited for a Dose, in some proper Broth, early in the Morning, with an empty Stomach: A Regimen must at the same time be observed, as in other Cases.

An Ounce of the *Fœcula Bryoniæ*, or the Powder which subsides in the express'd Juice of its Root, is by many exhibited as a Medicine safer than the Root itself, or its Juice, and is expressly class'd among the Openers of the Uterus; but, as *Ludovicus* in his *Pharmacop.* well observes, it is a very ineffectual Preparation, unless assisted with Chalybeats; since, according to *Etmuller*, it is a dead Calx, of no manner of Use nor Efficacy; besides, what is commonly sold is for the most part adulterated. The *Nectar Succosum* of *Clossæus*, which, in *Schroder's Phar.* is directed to be prepared of one Ounce of the express'd Juice of Bryony, mix'd with one Dram of the Oil of Vitriol, or Sulphur, is, in *Etmuller's* Opinion, a very safe and proper Purge, provided the Dose does not exceed one Dram.

But, that we may see how prone some People are to Fraud and Imposture, I shall here recount some Circumstances mention'd by *Morison*. "Mountebanks, says he, and some Botanists, form very strange Monsters of the Bryony-root; upon which, if bifurcated when taken from the Earth, as it frequently is, they with a Pen-knife form the genital Parts of a Boy; and endeavour, by a proper Fissure, to imitate those of a Woman, by *Laurentius* call'd the Sacred Cave. After they have taken these Measures, they bury the Root for some time in Sand, or rather in a sandy Soil, till the wounded or factitious Parts have assumed a Skin; after which they confidently expose it to Sale, as the Male and Female Mandrakes. We daily observe, that many Roots, such as Carrots, and some others of the umbelliferous Kind, grow spontaneously bifurcated; and I boldly assert, that, if sufficient Art is used, they may be caused to grow in the Shape of other Parts of the human Body. Now, when the Bryony-root happens to be old, thick, and bifurcated, these trifling Forms may easily be obtain'd. But to complete the Farce, and render, as they think, the Imposture beyond the Hazard of a Discovery, these Wonder-working Botanists put the Seeds of Oats into the Wound made in the Bryony-root, which germinate in the Earth, and make an Effort to send forth Leaves; but wanting sufficient Nourishment, and being shut up from the Influence of the Air, they degenerate into small capillary Fibres. This Piece of Fraud may easily be detected by a skilful and quick-sighted Botanist. I myself remember to have seen such forced Productions carried about by strolling Mountebanks, both at *London* and at *Paris*, where their despicable Proprietors did not scruple to expose them to Sale for the genuine Roots of the Mandrake."

Dioscorides gives the following Account of the white Bryony.

The white Vine, otherwise call'd Bryony, *Ophiostaphylum*, *Chelidonium*, *Melothrum*, *Psilothrum*, *Archezostis*, *Agrostis*, and *Cedrostis*, in its Branches, Leaves, and Tendrils, resembles the cultivated Vine, only is more hairy in every Part. It twines about the neighbouring Shrubs, taking hold of them by its Tendrils. Its Fruit grows in Clusters, of a deep Yellow, and is used by the Tanners in taking off the Hairs from their Skins.

The tender Shoots of the first Budding, being boil'd and eaten, loosen the Belly, and provoke Urine. The Leaves, Fruit, and Root, are of an acrimonious Quality; and therefore proper, being made into a Cataplasm with Salt, for *Chironian*, gangrenous, and phagedenic Ulcers, and for putrid Ulcers in the Legs. The Root, with bitter-Vetches, Earth of *Chios*, and Fenugreek, absterges and clears the Skin from Wrinkles, Sun-burns, Freckles, and black Marks. Boil'd in Oil till it be liquefy'd and dissolved, it works the same Effects. It takes off the livid Diffols of Blows in the Face, and represses the *Pterygia* of the Fingers. Applied in a Cataplasm with Wine, it discusses Inflammations, and breaks Abscesses; and the Powder of it, in a Cataplasm, extracts Splinters of Bones: It is a proper Ingredient in septic or suppurative Medicines. A Dram thereof, drank every Day for a whole Year, is a Medicine for the Epilepsy; and is good for those who are subject to an Apoplexy or Vertigo. Two Drams of it, drank, are effectual against the Bite of the Viper, and kill the Child in the Womb. Sometimes it slightly disturbs the Reason. Being drank, it provokes Urine; and, apply'd as a Pessary, extracts both Birth and Afterbirth. It is made into an Eclegma with Honey, for the Use of those who are oppress'd with a Strangulation, or a Dyspnoea, and for Coughs, Pains in the Sides, Ruptures, and Convulsions. Half a Dram of it, taken in Vinegar, for thirty Days together, wastes the Spleen; and, applied by way of Cataplasm with a Fig to the Place, is effectual for the same Purpose. Its Decoction is proper for Inseptions, being a Purger of the Uterus, and expelling the dead Fœtus.

The Juice is expressed from the Root in the Spring-time, and is drank in Hydromel for the foremention'd Purposes, being a Phlegmagogue. The Fruit, us'd by way of Unction, or Cataplasm, is of Efficacy against the Psoa and Lepa; and the Juice of the Fruit, supp'd with boil'd Wheat, causes Milk to flow in Plenty to the Breasts. *Dioscorides*, *Lib. 4. Cap. 184.*

Pliny, in the first Chapter of his twenty-third Book, ascribes the same Medicinal Virtues to white Bryony, with those now enumerated from *Dioscorides*.

There are several other Species of Bryony, such as,

1. The *Bryonia Zeylanica*, *foliis profunde laciniatis*, B. This Plant is frequently us'd in Dropsies, by the Inhabitants of *Ceylon*, an Island in the *East-Indies*, where it grows spontaneously on ruinous Walls, and in other uncultivated Places. *Buccler.*

2. The *Bryonia alba vulgaris procerior, folio cucurbitæ*. This agrees in Virtues with the other white Bryony.

3. The *Bryonia Indica* or *Americana*. The same with *MECHOCANNA*, which see.

4. The *Bryonia Africana glabra, foliis in profundas lacinias divisis, flore luteo*, Olden. Smooth African Bryony, with deep-cut Leaves, and yellow Flowers.

5. The *Bryonia Americana, olivæ fructu rubro*, Plum. Cat. American Bryony, with red Olive-shap'd Fruit.

6. The *Bryonia Africana, fructu variegato*, Hort. Elth. African Bryony, with a variegated Fruit.

7. The *Bryonia Africana laciniata, tuberosa radice, floribus herbaceis*, Par. Bat. African cut-leav'd Bryony, with a tuberose Root, and herbaceous Flowers.

BRYONIA NIGRA, Offic. Ger. 721. Emac. 871. Raii Hist. 1. 660. Mer. Pin. 16. *Bryonia sylvestris nigra*, Park. Theat. 178. *Bryonia lævis sive nigra racemosa*, C. B. Pin. 207. Hist. Oxon. 2. 5. *Bryonia nigra, sigillum Beate Mariæ officinarum*, Merc. Bot. 1. 24. Phyt. Brit. 17. *Vitis nigra quibusdam, seu Tamnus Plinii folio cyclamini*, J. B. 2. 147. *Vitis nigra sive Bryonia nigra quibusdam*, Chab. 120. *Tamnus racemosa, flore minore luteo-palescente*, Tourn. Inst. 103. Elem. Bot. 85. Boerh. Ind. A. 2. 62. Raii Synop. 4. 262. BLACK BRYONY. Dale.

The black Vine, which some call black Bryony, others the *Chironian* Vine, has Leaves like Ivy, but more nearly resembling those of the Smilax, only larger; their Stalks also are alike. This Plant, as well as the white Bryony, takes hold of the neighbouring Trees by its Tendrils. The Fruit grows in Clusters, and is green at first, but black when ripe. The Root is black on the Outside, but of the Colour of Box within. The Shoots of the first Budding are eaten as other Greens.

They provoke Urine and the Menfes, waste the Spleen, and are good for epileptical, vertiginous, and paralytical Persons. The Root has the same Virtues as that of the white Vine, and performs the same Effects, but in a less efficacious manner. A Cataplasm of the Leaves with Wine cures the gall'd and ulcerated Necks of Beasts of Burden, and is apply'd also to Luxations. *Dioscorides*, *Lib. 4. Cap. 185.*

The black Vine, properly call'd Bryony, is by some named *Chironia*, by others *Gynecanthe*, or *Apronia*; it is like the white Vine, except in Colour. The tender Shoots of it, eaten as Food, are prefer'd, by *Diocles*, before Asparagus, for provoking Urine, and diminishing the Spleen. It delights to grow among Shrubs and Reeds; the Root is black on the Outside, but of the Colour of Box within, and is more effectual in extracting Splinters of Bones, than the white Vine; but it has a peculiar Virtue of curing the gall'd Necks of Beasts of Burden. They say that if a Farm-house be mark'd with it, Hawks will not approach it, and so the Poultry will be kept in Security. The Plant, bound about the Ankle of Man or Beast, cures a Defluxion of Phlegm or Blood upon the Part. *Pliny*, *Lib. 3. Cap. 1.*

The Root of the black Bryony is less than that of the white, blackish on the Outside, whitish within, more solid, but slimy withal. The Branches grow as long as the white, climbing and ramping upon the Hedges in its Way, but without Tendrils or Claspers; they are smooth as well as the Leaves, which are of a dark-green Colour, and shining, in Shape of an Heart inverted, but longer pointed. The Flowers grow among the Leaves in long Clusters, much smaller than those of the white Bryony, of a greenish Colour, of one Leaf cut into six Parts; after which come red Berries, as in the former. It grows in the same Places with that, and flowers about the same time.

Some Authors affirm, that the Root of this Bryony is a strong Purge; but *Hoffman* could not find any purgative Quality in it, no more than *Dr. Lister*, tho' both try'd it several times. It provokes Urine, and cleanses the Reins from Gravel. A Cataplasm of the Root, with Vinegar and Cow-dung, helps the Gout. It is but rarely us'd. *Miller's Bot. Off.*

There are several Species of the black Bryony, or *Tamnus*; such as,

1. The *Tamnus racemosa, flore minore luteo-palescente* of *Tournefort*. The common black Bryony mention'd above.

It flowers in June, and its Root is only in Use. It incides and attenuates viscid Phlegm, especially in Disorders of the Thorax. *R. H. p. 661.* It provokes Urine and the Menfes, and

and discharges Sand from the Kidneys, if drank in a proper Liquor. *Label.* Concerning its purgative Quality, I have as yet found nothing. *C. Hoffman.* *Gesner* affirms, that it is possess'd of an exulcerating Quality. It is possess'd of very violent Qualities, and is said to have something of a poisonous Nature in it; for which Reason it is very improperly us'd instead of the white Bryony. *Dale* from the above-quoted Authors.

2. The *Tamnus Cretica, trifido folio*, *Tourn. Cor.* Black Bryony of *Crete*, with a trifid Leaf.

3. The *Tamnus Americana tubifera, radice fungiformi*, *Plum.* American black Bryony, with a Root resembling a Mushroom.

4. The *Tamnus Americana racemosa minor*, *Plum.* Smaller branching American black Bryony.

5. The *Tamnus Americana racemosa major*, *Plum.* Greater branching American black Bryony.

6. The *Tamnus Americana, amplis foliis, subtus purpureus*, *Plum.* American black Bryony, with large Leaves, which are purple on their under Side.

7. The *Tamnus Americana, anguria folio*, *Plum.* American black Bryony, with a Water-melon-leaf.

BRYOPTERIS, or **DRYOPTERIS**, from βρύον, Moss, or βρύς, an Oak, and πτερίς, Fern. White Fern of the Oak, which grows on Moss of the Oak. *Blancard.* See **DRYOPTERIS**.

BRYTHION, a Malagma so call'd; the Composition of which is describ'd by *P. Ægineta, Lib. 7. Cap. 18.*

BRYTIA, βρύτια. The solid Parts of Grapes, remaining after the Must is expressed. *Galen, Lib. 2. de Alim. Fac. Cap. 9.*

BRYTON, βρύτον. A kind of Drink, made of Barley, which *Aristotle* calls πινον (*Pinon*). They who get drunk with it, do not fall indifferently any way, as with other Liquors, but always supine, and on their Backs. *Hellanicus* says the *Bryton* is made of Rice; and it may be also made of Millet, as *Athenæus* informs us; who also says, that πρὸ βρύτον, "the *Bryton*," is by some call'd κριθίνου διῶν, "Barley Wine;" and tells us, in the same Place, that this κριθίνου διῶν is call'd πινον. But *Eustathius* says there is this Difference, that the πινον is made of Barley, but the βρύτον also of Roots. *Goræus.*

BUBALUS, *Offic. Schrod. 5. 272. Gesn. de Quad. 122. Bubalus, Ital. Bufalo, Raii Synop. A. 72. Buffelus, Bellon. Obs. edit. Clus. 102. Jonf. de Quad. 38. Buffelus five Bubalus vulgaris, Aldrov. de Quad. Biful. 365. THE BUFFAL.* *Dale.*

The Parts us'd in Medicine are the Horns, Hoofs, Tallow, and Dung, of which the Horns and Hoofs are good against Convulsions; and the other Parts are reckon'd to be endu'd with the same Virtues as those of the Ox.

Those who have wrote the History of Quadrupeds, deny this Animal to be the *Bubalus* of the Antients, but rather the wild *Indian Bos*, describ'd by *Aristotle* without a Name, and said to be found among the *Arachotæ*. But the learned *Ray* is strongly of Opinion, that the Name of the *Bubalus* came into *Italy* with the Animal to which it belong'd, and which, consequently, took its Name *Bubalus* from its native Country in *India* or *Asia*. *Bellonius, Observ. Lib. 2. Cap. 50.* takes the *African Bos* for the *Bubalus* of the Antients. *Idem ibidem.*

BUBO, βουβάλιον. A Bubo.

A *Bubo*, *Phyma*, and *Phygethlon*, are Affections of the Glands. A *Phyma* is an Inflammation of a Gland; a *Bubo* is the Inflammation of that Gland, hastening to a Suppuration; but the erysipelatous Inflammation of that same Gland is call'd a *Phygethlon*. *Actuarius, Meth. Med. Lib. 2. Cap. 12.*

According to *Galen*, a *Bubo*, *Phyma*, and *Phygethlon*, are Affections of the Glands; and a *Bubo* is an Inflammation, but a *Phyma* an Inflammation of a Gland tending to a Suppuration. But, according to others, all preternatural apostematous Tumors, in whatever Part they arise, are call'd *Phymata*. *Hippocrates* says, that they who are molested with *Phymata* in their urinary Passage, are freed by the Suppuration and Breaking of the same. Buboes which owe their Rise to Bruises, other Ulcers, or Pains, are not dangerous; but such as proceed from a Fever, as it usually happens in Pestilences, are of a very malignant Kind, whether they be near the Thigh, or in the Armpit, or about the Neck.

Buboes of the first or milder Sort are to be treated, like all other Inflammations, with Refrigerants and Astringents, and such Medicines as have a repelling Virtue; such are Applications of Sponges dipp'd in Oxycras, or Wool moisten'd with Wine and Oleum Omphacinum (ελαιν ομωτρίβες), Oil of Roses, Oil of Quinces, Oil of Mastich, or Oil of Myrtle. After these, discutient Remedies are to be us'd; but, if the Body abounds with Humours, they are first to be evacuated. If there be nothing that requires Purging, we are to apply ourselves to the Cure of the Ulcer from whence the Bubo was generated, which must be treated like other Ulcers. The Inflammation in the Glands must be mitigated by Applications of Wool moisten'd with some laxative kind of Oil, and the same must also be

wrapp'd about the Part. The Tumor, when suppurated, is not hastily to be open'd, but we must try to resolve it by Medicines made into Cerates, particularly the Cerate nam'd *Diapyranon*, and that call'd *Botanicon*. If the Resolution does not succeed, we must endeavour to break it by the same means as are us'd for other Abscesses; and the Cure is the same. In Buboes proceeding from Fevers, or a mere Redundance of Humours, Repellents are to be avoided, lest we should repel the Matter upon the inward Parts; but we must begin with Discutients: If the Age and Strength of the Patient will permit, Blood is to be first taken from the Vein of the Cubit; after which we must use Fomentations of the Decoction of Chamomile, Dill, and such-like Herbs. The other Medicines are such as we have recommended as proper for the Parotides, and for Inflammations. After *Atticus*, call'd also *Bubonium*, from its Virtues in this Distemper, is said to cure it, not only if it be apply'd to the Sore, but worn as an Amulet. *P. Ægineta, Lib. 4. Cap. 22.*

There are some sorts of Tubercles, or Tumors, which never appear but in certain Places, which are in a manner appropriated to them. To these kinds belong what we call Buboes, which infect no Parts but the Groin and Armpits, and may be divided into the mild and the malignant; which Distinction, because it includes a different Method of Cure, requires a little Explication. A mild Bubo is so nam'd, first, when it rises, as it were, spontaneously; that is, when the Patient is in a State of Health, and wholly free from any contagious or pestilential Disease, in the same manner as a Furunculus, or Phlegmon, arises, especially on Infants; tho', for the most part, without Danger: Or, secondly, a Bubo is said to be mild, when it makes its Appearance at the End of some mild and favourable kind of Fever, the Violence of the Disease being, by the Strength of Nature, diverted that Way. A malignant Bubo is one which owes its Rise to some pestilential Contagion, or the Lues Venerea, and is therefore usually call'd a pestilential or venereal Bubo.

As to the Causes of a mild Bubo, I must remark, that this, as well as all other Inflammations proceeding from internal Causes, takes its Rise from the Stagnation of some glutinous and inspissated Blood; and, consequently, no way differs from other Inflammations, except its Place, which is in the Groin or Armpit, where much Fat, and many Glands, are situated.

A mild Bubo is not difficult to be distinguish'd, if we consider, that it is nothing but a Tumor, with an Inflammation, in the Parts above-mention'd, without any pestilential or venereal Contagion.

This kind of Bubo also is very seldom of dangerous or pernicious Consequence, being commonly resolv'd, or brought to a Suppuration. But this Resolution or Suppuration is sometimes brought about with Difficulty, especially in Persons of a bad Habit of Body, inasmuch that these suppurated Tumors have sometimes ended in stubborn Fistulas. A Bubo in the Armpit is more easily brought to a Suppuration than one in the Groin; but neither of them is so difficult of Suppuration as the Parotides.

For Buboes which happen without any other Distemper, especially in Infants, the best way is often to administer frequently some purging Medicine, mix'd with Mercurius dulcis, that the glutinous and coagulated Blood may be drawn by Revulsion from the affected Part, and, at the same time, dissolv'd. Then other Medicines, which attenuate the Blood, are to be prescrib'd, as Decoctions of the Woods. If the Bubo be attended with a slight Fever, a Physician ought to be consulted, for administering some antifebrile Medicines.

Where the Inflammation is but moderate, and, consequently, Resolution may be hop'd, it will be proper to apply digestive Plaisters, such as those of simple Diachylum, Sperma Ceti, Galbanum, Diasaponis, or De Ranis cum Mercurio; for these sorts of Tumors are often resolv'd by such external Applications.

If the Inflammation be violent, and the Pain intense, or if outward Digestives have no Effect, we are immediately to have recourse to Suppuration, by applying a Plaister of *Diachylum cum Gummi*, which is of excellent Service in this Case. If the Pain be very great and intolerable, digestive Cataplasms, applied warm to the affected Part, and often chang'd, are usually of very great Efficacy, not only in mitigating the Pain, but resolving the Tumor. Cataplasms for this Purpose may be compos'd of Crums of wheaten Bread, and Milk, boil'd to a Poulitis, with an Addition of some Saffron; or of Meal, with Honey and fresh Butter, work'd to a Cataplasm by the Fire-side; to which may conveniently be added a small Quantity of *Venice Treacle*. This is to be apply'd hot, and often chang'd.

When, by these and such-like Medicines, we have reduc'd the stagnating Matter to Maturation, we are to make use of some Caustic, or of the Knife; but all imaginable Care is to be taken, that, in making an Incision, we do not injure the axillary Vessels under the Armpit, or the crural Vessels which lie under the Groin, and, by that means, excite a very dangerous Hemorrhage. The Abscess, when open'd, is to be

treated according to the general Method of treating Abscesses; tho' we ought to observe, that a Plaister of Diachylum is of extraordinary Use in this Case, as being extremely well adapted to the mollifying or resolving any Hardnesses or Callosities about the Edges of the Ulcer. *Heister.*

Gulielmus de Saliceto, an Author who wrote before the Venereal Disease was imported from America, mentions a Bubo *propter concubitum cum fœda muliere*. This Dr. Freind does not think was a Venereal Bubo; because all Buboës are not Venereal; and both these, and Tumors, and Abscesses in any of the genital Organs, may be contracted by conversing with Women, who, without having the Leprosy, or the Venereal Disease, are affected with Ulcers and Impostumations in those Parts.

Hippocrates takes Notice of a sort of Bubo arising on account of a Suppression of the Catamenia, and coming to Suppuration, in his Treatise *de Natura Pueri*. He calls it *φύμα κατά τὸν βελόνα, πύον γυναικῶν*.

PESTILENTIAL BUBOES.

Pestilential Tumors are, by Professors of Surgery, generally divided into Buboës, and Carbuncles, or Anthracæ. Under the Name of Bubo they comprehend all inflammatory Tumors from a pestilential Cause, which arise not only under the Ears, in the Armpits, and in the Groin, but also in the Neck, on the Breast, Arms, Feet, or any other fleshy Part of the Body; the corrupt and pestiferous Matter being, by the Benefit of Nature, driven to the external Parts.

A pestilential Bubo may be known from other Tumors, by its appearing commonly just at the Time of a Pestilence, and its being accompanied with other pestilential Signs. For it is to be consider'd, that the best of our later Writers, who liv'd in the last pestilential Times, have assur'd us, that Persons seiz'd with the Pestilence, unless they died on the Spot, were every-where observ'd to have an Eruption of such Tumors. This Eruption happens sometimes quicker, sometimes slower; for some perceive them before they are sick, or have any Sense of the pestilential Poison; on others they appear not till the second, third, or fourth Day after their being seiz'd with the Contagion; but they are very rarely observ'd to come forth later. Sometimes these Buboës are accompany'd with a Carbuncle, or Anthrax, but are more frequently without them; whereas a Carbuncle very seldom happens without a Tumor.

It is an old Observation, and confirm'd in the last Pestilences, that most of those on whom Tumors appear'd, if they were not attended with very severe Symptoms, or an Accession of other Disorders, had the good Fortune to recover. Therefore our later Physicians have come into an Opinion, and not without Reason, that the principal Part of our Business in managing the Pestilence consists in promoting, by all imaginable means, the Growth of the Tumor, or Bubo, without the Benefit of which there is no Preservation of Life under the Pestilence; and that the Physician, who takes a right Method of curing the Bubo, at the same time cures the Pestilence. This being granted, digesting, dissolving, or repressing Medicines, Phlebotomy, or Purging, are so far from conducing to the Cure of the Pestilence, that, by retracting the Poison into the Blood, they destroy the Patient. The principal Business therefore of the Physician, or Surgeon, in this Case, is, to assist provident Nature, by promoting the Expulsion of the Tumors forming in the Body, and reducing them as soon as possible to a Suppuration or Maturity.

For the more ready Accomplishment of this End, it is much the safest way for the Patient, as soon as he perceives the Eruption of a Tumor, to confine himself to his House, and avoid the Air, and even to betake himself to his Bed; for, by this Method, he may be the more successfully defended from the external pestiferous Air, and the Buboës, by the right Administration both of internal and external Remedies, be the more easily expel'd, and brought to Suppuration.

As to external Management, it will be extremely proper to rub the swelling Part, with some Vehemence, both with the Hands, and with Linen Cloths; and, what is most effectual to the Purpose, after that to apply some emollient and maturing Remedies, to promote a speedy Eruption. A very good Remedy, in particular, is a Malagma compos'd of Ferment of Bread hot, alone, or mix'd with Salt and Mustard-seed bruis'd. By virtue of this Medicine the constricted Parts are wonderfully mollify'd and stimulated, till the pestiferous Matter, being attracted from the Blood toward the intumescent Parts, passes into a Suppuration. Of the same Virtue are Cataplasms, suppurative of other Tumors; especially one compos'd of Onions, roasted under the Ashes, and work'd with Treacle and Butter; or a Cataplasm prepar'd of the Inside of a wheaten or white Loaf, and well boil'd with Milk and Saffron. There are some Surgeons, who, to avoid exposing the Body to the Air, because of the frequent Change of Cataplasms, by which Transpiration may be disturb'd or hinder'd, are rather for applying emollient Plaisters, particularly a Plaister of Diachylum, simple or compound, instead of Cataplasms:

Barbette, a very noted Physician, in his Book of the Pestilence, prescribes the following, which seems a very good one.

Take Plaister of Diachylum and de Mucilaginibus, each half a Pound; Mustard-seed pulveriz'd, four Ounces; Unguentum Basilicum, four Ounces: Mix them, and make them into a Plaister. This must be laid upon the swelling Part, which must first be well rubb'd, and renew'd every Day, or every other Day.

Hodges, a famous English Physician, in the Description of that terrible Plague which rag'd at London in the Year 1665. very much commends the following.

Take Plaister of Oxycroceum, three Ounces; Gum Galbanum strain'd, and Caranna, each one Ounce; common Pitch, two Drams. With Oil of Chamomile melt and make them into a Plaister according to Art, which must be applied in the same Method as the former.

Nor does that Plaister deserve to be despis'd, which consists of Honey, Meal, and Yolks of Eggs. The Remedies which most of the ancient Physicians us'd to accelerate Suppuration, as Vesicatories of Cantharides, and dry Cuppings, are almost wholly rejected by the Moderns, and those the most experienc'd Physicians in curing the Pestilence.

But what is much to be admir'd, and deserves a deeper Consideration, is, that the very celebrated *Beintema*, Physician to the Emperor, in his Latin Treatise of the last Pestilence, assures us that pestilential Buboës were often safely and successfully resolv'd and cur'd by the bare Imposition of hot Ashes. But tho' there be hardly any besides this Author, who advises the Resolution or Cure of Buboës in a Pestilence, it will not be amiss here to observe, that the pestiferous Venom was not, by the Resolution, repress'd and repelled into the Blood, but rather extracted out of the Body, by means of the hot Ashes, and quite subdu'd.

To these external Medicines it will be proper to add the Use of internal Remedies, by whose Assistance the latent Venom may be expel'd by gentle Sweat; but immoderately heating and vehement Sudorifics have been always found to be noxious and dangerous, by Physicians of later Times; whereas sucking of small Liquors hot has been experienc'd to have a very good Effect, as being excellently accommodated to excite a gentle Sweat, and to temper the Blood. Medicines of this Nature, among others, are Potions of Tea, mix'd with a little Saffron, or of other alexipharmic Herbs, as Sage, Scordium, Rue, Millesolium, or Betony; Pisan also, prepar'd with, or without, the Root of Scorzoneria, and drank hot, in order to maintain a continual, but gentle Sweat. And as vehement Sudorifics, so cold Liquors are not a little dangerous; for they not only repress the Sweat, but, in a remarkable manner, restrain the Eruption and Growth of the Buboës, on whose kindly Promotion and Increase the Fate of the Patient so much depends. The Air of the Chamber in which the Patient lies, must be kept in a temperate State, neither too hot, nor too cold; the Bed also must be kept in the same Temperament, and as commodious as possible. If the Patient be weak and low, but without any remarkable Degree of Heat, it will not be improper to give thirty or forty Drops of Elixir Proprietatis, or the Mixture Simplex, the Bezoartic Tincture, Essence of Myrrh, Essence of Scordium, two or three times every Day, in some warm Liquor; or exhibit some good Bezoartic Powder. On the contrary, for those who are of a hot Complexion, or are molested with immoderate Heat, nothing is more proper than Nitre depurated, with Crabs-eyes, and testaceous Powders, or temperate Acids, such as the Juices of Citrons, Currants, and Pomegranates, or the Syrup and Water of Borage, Bugloss, or any other temperate and cooling Simple, often exhibited, instilling at the same time, if the Heat be vehement, some Drops of sweet Spirit of Vitriol.

The Remedies above prescrib'd are of sufficient Virtue to expel all the Poison of the Contagion from the inward and noble Parts, on the Authority of the most learned and experienc'd Physicians, who have written on the late Pestilence in Poland, Prussia, Denmark, Austria, Hungary, and Ratibon. These, then, are to be frequently repeated, till either the Tumors are digested and resolv'd, which, they tell us, sometimes happens without Suppuration, or, what more generally happens, are brought to Maturation. In some Cases the Tumor immediately inclines to Suppuration, sometimes it remains for whole Weeks, without being in the least mollify'd. When this happens, the Use of the above-prescrib'd Medicines is to be continu'd till the Tumor either breaks of itself, or is open'd with the Incision-knife; and the pestiferous Matter, being thereby prohibited from returning into the Blood, is evacuated, and the Wound thoroughly cleans'd.

The Abscess being open'd, we must immediately set about cleansing it, which being completed, the Wound must be heal'd by means of some vulnerary Balm. For the Purpose of cleansing,

cleansing, we have a most noble Remedy, which is, the digestive Ointment, (Turpentine with the Yolk of an Egg) mix'd with a small Quantity of Venice Treacle, and Balsam of Sulphur with Oil of Turpentine. At every Dressing the Pus is to be gently absterge'd from the Ulcer, which is afterwards to be dress'd with the before-mention'd Ointment, but not tented, except the Orifice be too narrow; and a Plaster must be laid thereon, and the Place carefully bound up. Some of the best Plaisters in this Case are Diachylon, or what is compos'd of Meal and Honey, and these may very properly be apply'd till the Wound is heal'd.

As to the most convenient Time for making the Incision, Physicians are not agreed. Many Authors, especially among the Moderns, who have given us Precepts concerning the Pestilence, are utterly against opening a pestilential Bubo till it be perfectly ripe, and thoroughly soft. For, besides that these Buboes, as some have observ'd, almost constantly break of themselves, there is very great Danger, if we may believe these Authors, lest a too hasty and precipitate Incision of a Bubo should be succeeded by a Fistula of a bad kind, by an Immobility of the Limbs, and even by a Gangrene. Others, on the contrary, assert that the immediate Incision of a pestilential Bubo in the Beginning is not only safe, but the most likely means to preserve the Patients, and the surest, as well as speediest, way to free them from the Contagion.

Tho' some of the ancient Physicians have directed the utter Excision of pestilential Buboes, in order to extirpate the Venom, later Authors, for good Reasons, have been of a contrary Opinion. For such a Method of Cure is esteem'd not only too violent, but even very dangerous, especially in some Parts of the Body.

Thus also Cathartics and Emetics of all kinds, Phlebotomy, and internal healing Medicines, such as a Bezoartic Tincture, distil'd Oils, with hot volatile antipestilential Spirits, Venice Treacle, and Mithridate, are almost unanimously reject'd by later Physicians, tho' former Physicians laid a great Stress upon them. *Heister Chirurg.*

Of VENEREAL BUBOES.

Venerae Buboes are painful, hard, renitent Tumors of the Conglobate or Lymphatic Glands, which are situated in the Groins, and which tend slowly to Suppuration, arising mediately or immediately from impure Venereal Commerce. Therefore when this Species of the Venereal Disease affects either Male or Female immediately after impure Embraces, or in a few Days after, some or more Glands, in either or both Groins, give some slight Pain in walking; and, upon feeling them, it may be perceived, that they are somewhat tumefy'd. The Tumor increases faster or slower, and grows hard, tense, and renitent; hence the Pain in the Part increases, a Sensation of preternatural Heat is perceiv'd, but the Skin still retains its natural Colour; the Patient finds more Difficulty in walking; at length a manifest Bubo appears, which are different in Figure, as orbicular, oblong, or round; sometimes of the Size of a Pigeon's or Hen's Egg, sometimes as large as a Man's Fist.

Venerae Buboes admit of a threefold Distinction. 1. They may be distinguish'd by the Manner in which they make their Attack; for some proceed immediately and solely from impure Embraces, and constitute an *essential* Disease; others accompany a Gonorrhea which is suddenly suppress'd, or has but a small Discharge; or else attend chancrous Ulcers of the Penis, and form a *symptomatical* Disease; lastly, others arise spontaneously without any immediate previous Embraces, and constitute a Pathognomonic Sign of a latent Pox.

2. They may be distinguish'd by their Qualities; for some are attended with great Pain, Heat, and Pulsation, and are of the Phlegmon kind; others have but little Heat, Pain, Pulsation, and Hardness, but are rather soft, and retain the Marks of the Fingers after Pressure, and are of the oedematous kind; lastly, others being quite void of Pain, Heat, and Pulsation, are very hard, and are call'd *scirrhus*.

3. They may be distinguish'd by their manner of terminating, which is various; for some, either spontaneously, or by the Force of the Remedies applied to them, are dispersed by Degrees, and disappear; others come to Suppuration, and, after Evacuation of the Pus which was collected in them, at an Aperture made by a Caustic or Incision, form a Cicatrix; lastly, others, eluding the Force both of Ripeners and Emollients, persist in their Hardness and Renitency.

CAUSES of VENEREAL BUBOES.

The inguinal Glands cannot be tumefy'd after impure Embraces, and indurated into a Bubo, unless the Lymph, which is convey'd to them from the neighbouring Parts, as to a common Reservoir, and ought to flow thro' their Cells or Vesicles, in order to be carried off again, stagnate there, and be accumulated in them. But the Lymph cannot stagnate, and be accumulated in the inguinal Glands, unless it be thicker, and more viscid than usual. It follows, therefore, that the Lymph, which circulates thro' the inguinal Glands, is render'd too

thick and viscid by impure Embraces, and, by being accumulated in those Glands, produces Venereal Buboes.

But nothing new happens to the Body from impure Embraces, except the simple Admission of the Venereal Infection. That Infection, therefore, being admitted into the Body, and blended with the Lymph of the inguinal Glands, renders it too viscid and thick; for the producing of which Effect it is very well adapted, since it is of a salso-acid Nature, and is, for that Reason, effectual in coagulating sulphureous Humours, of which kind the Lymph is.

The infectious Matter, when once receiv'd, can be communicated to the inguinal Glands two ways; the one a long and intricate one, that is, by the Circulation of the Blood; the other much shorter and more expeditious; for Instance, by the Lymphatic Vessels, which are sent to the inguinal Glands. The first we reject, as not fit for resolving this Question, since that being once admitted, all the conglobate Glands in the Body are equally liable to be affected with the inguinal Glands, since they derive their Lymph from the same Mass of Blood. But this contradicts Experience. Therefore, in the present Case, we are of Opinion, that the later Way is only to be admitted.

But since there are three Species of Buboes, as we said above, consider'd with respect to the Manner in which they originally appear, the Diversity of the Manners in which they are contracted, deserves to be farther explain'd.

During the Act of Venereal Commerce, the external Parts of the Pudendum Muliebre, together with the Vagina, are irrigated with the *Liquor Genitale* of the Male. If this, therefore, should be corrupted, the infectious Matter will be imbib'd into the spongy Substance of the Parts, and mix'd with the Lymph which circulates in them; but this is sent by peculiar Lympheducts to the inguinal Glands. The infectious Matter, therefore, which is admitted, will be carried with it, at the same time, to those Glands.

In the same manner the Pudenda Mascula, and Pubes itself, will be affected, by the Communication with the other Sex. Therefore, if the Humours there are corrupted, the infectious Matter, penetrating the Pores of the Parts, will insinuate itself into the Lymph which flows thro' them, but this Lymph continually flows from thence to the inguinal Glands. Therefore the Venereal Matter, which is mix'd with the Lymph, tends to the same Parts.

In a suppress'd Gonorrhea, or a Gonorrhea where the Discharge is too small, the feminary Vesicles, Cowper's Glands, and Testes, in Men, but, in Women, the Prostates, Cowper's Glands, and the Botryform Glands of the Vagina, will be turgid with a corrupted Fluid. Some Particles, therefore, of the virulent Humour exhaling from thence will be taken up by the reflux Lymph, which flows from those Receptacles, or from the Parts which lie very near them in both Sexes, and will be carried with it to the inguinal Glands, where they will produce Buboes, unless a Passage be instantly open'd, by which the putrid Humour, which has been confin'd, may be discharged.

After the same manner the Lymph which returns from the Pudenda in either Sex, when they are affected with chancrous Ulcers, conveys with it several Particles of virulent Matter, from the ulcerated Parts, to the inguinal Glands, which by inspissating the Lymph, and obstructing the Glands in which it is contain'd, frequently occasion Buboes.

Lastly, in a latent Pox, when the Contents of the Testes, Prostates, Vesiculae Seminales, and Cowper's Glands, in Men, but, in Women, of the Prostates, Botryform Glands, and Cowper's Glands, is infected with the Venereal Taint, the Lymph of these Receptacles themselves, and of the Parts adjacent, will be so vitiated by the contagious Matter received from thence, that, being convey'd into the inguinal Glands, and infecting the Lymph collected there with the same Disorder, will produce Buboes, if the Infection has Virulency enough to produce such an Effect. But let the Bubo arise from whatever Cause, either from impure Embraces, a suppress'd Gonorrhea, chancrous Ulcers, or, lastly, from a latent Pox, if it happens, that the Lymph in each Groin be equally infected with the Venereal Poison, a Bubo will certainly arise in each Groin; but if there should be any Disparity in either Part, it will only happen on one Side.

This Disparity may arise from three Causes.

1. From the Disorder of the Part from whence the Poison is convey'd. So it appears, that the Glands of the Right or Left Side receive more Infection, as the Prostates, feminary Vesicles, Cowper's Glands, or the Testes, in the Man, but the Prostates, Cowper's Glands, or the Botryform Glands of the Vagina, in the Woman, shall be more turgid with virulent Humours on either Side, because the Lymph that returns from thence, and is convey'd into the Glands of the same Side, will be more virulent.

2. From the Disorder of the particular Part, to which the Poison is communicated. Thus it appears, that the inguinal Glands

Glands on either Side are more affected, as they are, by their natural Conformation more full of Windings; more intricate, more cellular, in a Word, as they are less pervious, and therefore the more easily obstructed with inspissated Lymph.

3. From external Causes, or, as they term it, from Accidents. Thus it appears, all other Circumstances being alike, and the Glands of either Side equally infected with the Poison, that a Bubo may be raised on either Side by Pressure or Contusion of either Groin, by which the Congestion of the infected Lymph will be promoted; and this will sometimes happen by only lying on one Side, by which means the Regress of the Lymph is rendered slower, and more difficult, the Declivity of its Passage being diminished.

SYMPTOMS attending VENEREAL BUBOES.

1. The Lymph which is convey'd into the inguinal Glands, being inspissated by the Venereal Poison, will be inclin'd to stagnate there, from the Multiplicity of Windings and Cells which communicate with each other, which will be so many Obstacles to its Discharge. From hence, therefore, in the Beginning of the Disease, will arise a small Tumor of the inguinal Glands.

2. The Glands of the Groin cannot swell, without being upon the Stretch; nor can they suffer Distention without Pain, more or less, according to the Degree of the Tumor. Hence, therefore, upon the Increase of the Bubo, Pain will arise in the inguinal Glands.

3. It is impossible to walk, unless the Muscles of the Leg and Thigh pull them forward; but these Muscles cannot act without pressing upon the tumefied Glands of the Groin, and, by this Pressure, Pain will be excited. The Action of Walking, therefore, cannot be perform'd without raising Pain in the Venereal Bubo.

4. The Glands of the Groin, being once obstructed, will daily be more and more swell'd by the continual Accession of fresh Lymph, till, at last, the Force with which the Glands resist farther Dilatation, will be equal to the Force with which the fresh Lymph is impel'd. Therefore the Bubo will daily increase, grow harder, and, becoming prominent, tend to a Point, extending itself obliquely, according to the Situation of the inguinal Glands; more or less, however, in proportion to the Magnitude and Extensibility of these Glands, and the different Impulse of the Lymph which arrives at the Part.

5. Upon the Increase of the Bubo, the Blood-vessels which creep thro' the Middle of the Substance of the indurated Gland, must necessarily be compressed. But the Blood which flows thro' these compressed Vessels, must stagnate and be retarded in them, and, by that means, increase the Heat of the Part, till it has found itself a Passage. Hence, therefore, the Heat of the Bubo will increase.

6. But if the Tumor of the Gland increases exceedingly fast, and suddenly restrains the Course of the Blood; if the Pulsation of the Arteries is very strong, from the natural Make of the Body, or from a Fever coming on; lastly, if the Blood, being naturally hot, rarefies much; several small Drops of Blood will force their Way into the lateral Lymphatic Vessels, from whence a new Circulation of the Blood, deviating from its Course, being begun, the Bubo will increase in Heat, Pain, Pulsation, and Resistance; in a Word, will become a true Phlegmon.

7. But because the Blood-vessels of the Skin, which is free from any Disorder, are not at all, or very little, straiten'd, the Blood flows there as usual, and the Skin is not at all inflamed, and scarcely changes its Colour, but preserves that which is natural to it, or assumes one very little different from it.

8. If the Tumor increases slowly, if the Pulsation of the Arteries is slow and weak, if the Blood of the Patient is naturally aqueous, and inclin'd to Dissolution, the Blood will be driven languidly and slowly into the Vessels of the obstructed Gland, and in them it will flow still slower, and therefore will be less restrain'd; it will not stagnate, therefore, or will stagnate very little, in the neighbouring Vessels; and therefore will bring on but a moderate Degree of Heat and Pain, and a weak Pulsation of the Arteries; but it will, by Degrees, so dilate the Passages thro' which it passes, that the Straightness which was brought on upon the external Parts, will give very little Trouble; or it will open itself a new Passage into the lateral Vessels, leaving only its thinner Serous or lymphatic Parts with which it abounds, in the Substance of the Humour. Hence therefore the Bubo in the inguinal Glands will be attended with moderate Heat, Pain, and Pulsation; and, being soft, at least externally, will easily receive and retain the Print of the Finger upon Pressure; in a Word, it will become cedematous.

9. Lastly, if the Blood is more thick, and inclin'd to Dryness, and secretes a thick and less fluid Lymph; if that Lymph is collected very slowly in the inguinal Glands, the Bubo which arises from thence will be scirrhus, that is, hard and renitent, because it is occasion'd by a Collection of very thick Lymph, indurated by Length of Time; it has neither Heat, Pain, or

Pulsation, as it is attended with no Stagnation of the Blood; because, as the Collection of Lymph in the Glands was form'd very slowly, the neighbouring Vessels were compressed in proportion; by which means the more remote Vessels, with which they communicated, were dilated, by Degrees, sufficiently to keep a free Passage open.

10. The Bubo of the Phlegmon kind, may be easily and perfectly resolv'd; for the Blood, by whose Stagnation it is principally brought on, is easily restor'd to its natural Fluidity; but the Lymph which is retain'd in the obstructed Glands, preserves its Fluidity, and is strongly urged on to a circulatory Motion, by the intense Heat, and violent Vibrations, of the Arteries, which are proper to this kind of Bubo; and therefore it is the more easy to be resolv'd.

11. But if it does not resolve, it is on the same Account not difficult to be brought to Suppuration; for the Blood, by whose Stagnation it is principally supported, is naturally subject to Putrefaction; the Lymph, with which the Glands are stuffed, is easily disposed to Suppuration, by the violent Heat, and by the Pulsation of the Arteries with which it is agitated.

12. The cedematous Bubo is, indeed, easily resolv'd, as far as it relates to the thin Serum which fills the Vessels which surround the Tumor, because it is easily restor'd, by the lymphatic Ducts, to its usual Course of Circulation: but it is imperfectly resolv'd, because the thick Lymph collected in the Cells of the Glands not being supplied with a Degree of Heat sufficient to render it fluid, and not being agitated by the Vibrations of the Arteries, which would urge it forward, both of which natural Assistances are wanting in this kind of Bubo, it is very difficult to be entirely resolv'd, on which Account a hard Nucleus always remains.

13. For the same Reason also, it is not easily brought to Suppuration, because the inspissated Lymph, both from its natural want of saline and active Parts, and from the Defect of an intense Heat, by which it might be rendered fluid, and of the Vibrations of the Arteries by which it might be divided, is very unfit to form a Suppuration.

14. Lastly, The scirrhus Bubo is never either resolv'd, or suppurated, without great Difficulty, but generally grows daily harder; as well because the Lymph which stagnates in the Cells of the Glands, is thicker and more viscid, as because the preternatural Heat and Vibration of the Arteries are wanting, by which it might be brought to Resolution or Suppuration.

DIAGNOSTICS and PROGNOSTICS relative to VENEREAL BUBOES;

Venereal Buboës agree with simple, pestilential, scorbutic, and strumous Buboës, with respect to their Situation and Figure; but are distinguishable from them by peculiar Marks: 1. From simple and pestilential Buboës, because in these the Skin is red and inflamed, different from what it is in the Venereal Bubo. 2. From strumous and scorbutical, because from the known State of the Patient manifest Signs of strumous or scorbutical Disorders are collected. 3. But they are most certainly distinguished from all others by the Relation of the Patients, who confess, that they have been guilty of unclean or suspected Venery; or that they are affected with a Gonorrhea, or chancrous Ulcers.

Venereal Buboës bear no very small Resemblance to the Bubonocoele, or inguinal Hernia; yet we have known them sometimes confounded with it, not with that kind of Bubonocoele which is occasioned by the falling down of the Omentum, and is called Epiplocele, in which the Tumor is softer, but with that which is occasioned by the Intestine, and is called Enterocoele, in which there is greater Resistance, and is for that Reason more like a Bubo: but it cannot readily be mistaken for that Species of Enterocoele, in which the Intestine slips through the oblique Rings of the Epigastric Muscles, because the Place in which the Intestine falls down, and where the Tumor is raised, is at a Distance from the Inguinal Glands, and of Consequence from the Venereal Bubo; but it may be confounded with that Enterocoele, in which the Intestine falls into the Groin through the Foramen in the Peritonæum, through which the crural Vessels pass, which in their Situation differ not much from that of the Inguinal Glands, or Buboës.

But a Bubo may be easily distinguished from an Enterocoele of any kind, by the following Signs.

1. In the Enterocoele the Tumor is smooth upon the Superficies, and pretty nearly of a spherical Figure; the Superficies is pretty broad, but the Basis slender, equal to the Size of the Foramen, from whence the Intestine is fallen, and adheres to the Groin, as it were by a Stalk: the Bubo, on the other Hand, has an unequal Superficies, and is generally of an oblong Figure, and has a wide expanded Basis.

2. In the Enterocoele the Tumor easily yields upon Pressure, but, upon taking off the Finger, it instantly recovers itself: on the contrary, the Bubo resists Pressure, as the Bubo of the Phlegmon and scirrhus kind; or, if it yields to Pressure, it retains

tains the Print of the Body impressed upon it, as the cedematous and suppurated Bubo.

3. In the Enterocoele it appears by its giving Way to Pressure, and easily rising again, that either Flatuluses alone, or mixed with a liquid Matter, are the Contents of the Tumor: But in the Bubo no Flatulency is to be discover'd; or if by any obscure Fluctuation it shall be discover'd, that any Fluid is contained therein, it is but in a very small Quantity, and lies deep, and is only contained in the Middle of the Tumor, as it happens in the suppurated Bubo.

4. The Enterocoele brings on very bad Symptoms, as Fever, colical Pains, total Abstractions of the Bowels, vomiting of the intestinal Feces upwards, and Iliac Passion, which never attend the Bubo. Besides, it is an exceedingly rare Thing, that the Use of impure or suspected Venery, by which the Bubo is produced, shall so aptly coincide with a Fall from on high, a Blow upon the Belly, or violent Motion, by which the Enterocoele is brought on, that it shall make it a Doubt of which kind the Tumor of the Groin is, and to which Cause it ought to be ascribed.

As soon as ever it appears, that there is a Venereal Bubo, it is easy enough to find out the Differences by which it is distinguish'd, by the Signs which we have laid down in its Description. For if the Tumor is intensely hot, painful, has a Pulsation in it, and resists Pressure, it is a Bubo of the Phlegmon kind; but if the Heat, Pain, Pulsation, and Resistance are in a moderate Degree, or if it is of a softer Nature, and retains the Print of the Finger impressed upon it, it is cedematous; lastly, if it is hard, makes great Resistance to Pressure, is quite free from Heat, Pain, or Pulsation; it is manifest, that it is a Bubo of the scirrhus kind.

Lastly, The Causes of Venereal Buboes are to be inquir'd into, either from the Relation of the Patient, or from the Knowledge of what has preceded; from whence it will appear, whether the Venereal Infection was communicated to the Inguinal Glands immediately by impure Coition, or by the Suppression of a Gonorrhœa, or by chancreous Ulcers of the Penis, or from a latent Pox.

As to the Prognostics, the Venereal Bubo, if it is treated with Caution, is attended with no Danger; it is, however, a very troublesome Disorder, since it always requires a tedious Method of Cure, and oftentimes a Chirurgical Operation.

A Bubo may nevertheless be accounted dangerous on this Account, that it frequently brings on the Pox, unless the Poison that it receives is evacuated by Suppuration, or repeated Purging, and the Relicts, if any such should remain in the Blood, are diligently corrected by specific Remedies. But there is less Danger of the Pox to be apprehended from the Bubo which arises from impure Embraces, or from a suppressed Gonorrhœa, or from Ulcers of the Penis, than from the Bubo which arises without any present manifest Cause; for the first arises from the Infection, which is just admitted, and which, as it has not been communicated to the Blood, may be discharg'd or corrected; but the latter depends upon the Infection which has been already conceal'd a long time in the Blood, and therefore has thoroughly tainted it.

The Bubo of the Phlegmon kind admits of a much more easy Cure, than that of the cedematous, or of the scirrhus kind; for as the first may be easily resolv'd, or brought to Suppuration, it in either way, by observing proper Cautions, quickly admits of a perfect Cure: but the latter frequently ends in a truly scirrhus Tumor, which for a considerable time eludes the Force of all Remedies, and at length frequently degenerates into a cancerous Nature.

CURE.

The Cure of the Venereal Bubo may be undertook in three Cases. 1. If it has come on without any manifest Cause. 2. If it is accompanied with a virulent Gonorrhœa, or chancreous Ulcers of the Penis. 3. If it is unattended with any other Disorder, and arises immediately after impure Embraces.

In the first Case, when the Bubo is an Evidence of a latent Pox, it is proper without Delay to have recourse to Mercurial Unction, by which both the Bubo, and the Pox, by which it is occasion'd, may be perfectly cured. But, if the Patient cannot, or will not, make use of this salutary Advice, you may try other specific Remedies, according to the Methods laid down below, cautioning the Patient, as it is the Duty of every ingenuous Physician, that by this Method the Disease will not have a complete, but a palliative Cure only.

In the second Case, the same Remedies in like manner are to be applied after the same Methods, but joined with others which may be proper for the Gonorrhœa or Ulcers, in such a manner, that by the joint Force of the Remedies both Disorders may be perfectly cured at the same time.

Lastly, in the third Case, (which, as it is the most simple, may be a Rule for the rest) the utmost Endeavours should be used to destroy or discharge the Infection which is just admitted; and, if any Relicts remain in the Blood, which may

renew or bring on the Pox, they should be diligently corrected.

Custom has established two Methods, by which all these Effects are equally produced; one by which Venereal Buboes are cured without Suppuration, or any Application of ripening Medicines, that is, only by the Use of Mercurials and Cathartics, till the Tumor, being dispersed, disappears by Degrees.

The other consists in curing Buboes by Suppuration, which is promoted by the Application of ripening Topics to the Part, and is so united with the internal Use of Mercurials, that the morbid Infection is by both destroyed.

The first Method requires no Operation to be perform'd, is shorter, free from Pain, and equally safe, and therefore, in the Judgment of many, seems preferable to the other. But at the same time it has this Inconvenience, that the Patient must be confin'd to his Chamber, during the whole Time of the Cure, if he would avoid the Danger he may incur from the Coldness of the Air. The later Method generally takes up more Time, is very tedious, and, as it requires the Performance of an Operation, is painful; but, as it generally permits the Patient to follow his usual Business, it is not yet quite neglected; but sometimes things come to that Height of themselves, when the Suppuration is once begun, that the Physician is obliged to follow this Method, though it be ever so much against his Will. Therefore, lest I should seem guilty of an Omission, I shall describe both Methods, but as briefly as I can.

1. Therefore first according to the former Method.

1. In the Beginning you should bleed, that the Glands may be unloaded, and the Inflammation of them prevented. The Blood should be drawn freely, if the Bubo is of the Phlegmon kind; but very sparingly, if it is cedematous, or scirrhus. Therefore the Practice of the old Authors is not to be regarded in this Case, who, led by Prejudice, which Experience proves to be false, were afraid of opening a Vein in curing a Bubo, as if the Infection would by this means be thrown into the Blood, and produce a Pox.

2. After this, the Patient should be purged, both that the Way may be prepared for the Use of other Remedies, and that Part of the infectious Matter may be carried off. Mild and cooling Purges should be prescribed, if the Bubo is attended with Inflammation. These may consist of the Pulp of *Cassia*, Decoction of Tamarinds, some purgative Salt, with a moderate Dose of *Mercurius Dulcis*, or *Calomel*. Proper Formulæ of this kind are these following.

Take fifteen Grains of well prepar'd *Mercurius Dulcis*, and of the Pulp of *Cassia* newly extracted, one Ounce; mix up into a Bolus, to be taken with an empty Stomach. Or,

Take of Tamarinds, one Ounce and a half; and of Vegetable Salt, one Dram. Boil them in a Pound and an half of common Water. Let the Liquor, when strain'd, be divided into two Doses, to be taken at three Hours Distance from each other, having first swallow'd a Bolus, consisting of fifteen Grains of *Mercurius Dulcis*, mix'd up with a proper Quantity of Conserve of Roses.

But stronger Purges should be order'd, if the Bubo should be cedematous or scirrhus. These may consist of Jalap, Diagrydium, large Doses of Calomel, adding also, if necessary, the *Trochisci albandal*. Proper Formulæ for answering this Intention are these following.

Take of Calomel, twenty Grains; of Jalap, and sulphurated Diagrydium, each twelve Grains. Make up into a Bolus, with a sufficient Quantity of Conserve of Roses. Or,

Take of Calomel, twenty Grains, or one Scruple; of sulphurated Diagrydium, ten Grains; of the *Trochisci albandal*, four Grains; and of the Oil of Anise, three Drops. Make up into a Bolus, with a sufficient Quantity of Conserve of Roses.

3. Mercurial Preparations, which have no purging Quality in them, are now to be prescribed, because they continue longer in the Blood, and have greater Efficacy in throwing out the Venereal Taint. Of this kind are,

The Mercurial Panacea sublim'd twelve times; the *Mercurius Violaceus*, or Antimonial Flowers of Mercury well wash'd; *Æthiops Mineral*, either triturated with Mercury and Sulphur, or prepar'd by Ignition; or, which is still better, the other *Æthiops Mineral*, triturated with *Peruvian Balsam*, or that of *Canada*. The Dose of these is from fifteen to twenty or thirty Grains, which, being mixed with Conserve of Roses, may be taken twice every Day, Morning and Evening, or only once

every Day, or every other Day, as it shall have a quicker or slower Effect, persisting in this Method, till the Gums begin to swell, the Mouth grows hot, and a Ptyalism seems to be coming on.

4. But then, as soon as a Ptyalism is apprehended, you must immediately have recourse to Purging, after the manner we just now prescribed, that Part of the morbid Venereal Taint may be carried downwards, which otherwise would be discharged by the Salival Glands. That this may succeed the better, you must entirely abstain for some time from the Use of Mercurials; and rest till all is quiet again; if it shall seem proper, the Purging should be frequently repeated, that the Salivation may be the more powerfully restrain'd.

5. The Tendency towards a Salivation being quite remov'd, you must return to the Use of Mercurials after the same Method, and the Ptyalism is to be again provok'd, which, as soon as it appears, is to be again restrain'd, as before, by repeated Purging, and refraining from the Use of Mercurials; repeating this Course alternately till the Bubo, being dispersed, by Degrees disappears.

6. Emollient and resolving Topics conduce much to this End, as the *Emplastrum de Ranis*, either with or without Mercury; the *Emplastrum de Mucilagibus*, and the *Emplastrum de Spermate Ceti*; or, which are still more powerful, gentle Unctions of the Buboes and Groins, with mercurial Ointment, from one Scruple to half a Dram daily, or every other Day, or every third Day, as it shall seem requisite, or as the Danger of a Ptyalism is greater or less. For by this means the Lymph, which from its Thickness stagnates in the Inguinal Glands, is render'd more fluid, and is therefore more easily dispersed.

7. It has been the Practice for some time, to lay aside the internal Use of Mercurials, which load the Stomach, or vitiate the Blood, and in their room to order external Inunctions with the mercurial Ointment, from half a Dram to one Dram, upon the Nates and Inguina, sometimes every other Day, sometimes upon every third Day, according to the different Degree of the Disease, and the different Effects that are produced. But upon the first Signs of a Salivation coming on, you must not only abstain from farther Use of the Ointment, but the Patient must be instantly purged, that the Matter may be diverted downwards, as we have observ'd above. But the Hurry being over, the Frictions are to be repeated, and the Salivation taken down again upon its first Appearance, proceeding in this manner till the Bubo is perfectly dispersed.

8. There is no manner of Danger from this Method, that the Venereal Infection should be sent into the Blood with the reflux Lymph, and produce a Pox; because the Poison which is again mixed with the Blood, is corrected by the Power of the Mercury, and therefore has lost its Virulence; and because, although it should retain its Virulence, it does not remain long enough in the Blood to infect it, since it is carried off by purging Medicines, as fast as it is sent into the Blood.

9. During this whole Course of Cure, the Patient is to be confin'd to his Chamber; otherwise there would be Danger, lest the cutaneous and salivary Glands being suddenly contracted by the Coldness of the Air, and by that means Perspiration and Spitting being suppressed, the Thorax or Brain would be in Danger of being loaded.

10. A thin, diluting, moist Diet should be prescribed, of Puddings, Panadas, Creams of Rice, Jellies, Broths, and at most poached Eggs, forbidding, or very sparingly admitting of, the Use of Flesh, though it be ever so young or light, as Pullets or Chickens. Lastly, Care should be taken, that the Patient should abstain from Venery, Exercise, Passions of the Mind, and especially from Wine, and drink plentifully of Pilsan, that the Particles of Mercury may have the freer Admittance into the Blood, and have the greater Power to divide the inspissated Lymph.

II. Hitherto we have treated of the first Method; but if the Patient shall be better pleased with the other Method, as not being able to absent himself so long from Business as the former Method requires, or if the Physician shall find, as soon as he is called, that the Matter in the Bubo is tending to Suppuration, the later Method may be prosecuted in the following manner.

1. Universals should be premised, that is, Bleeding and Purging, with the same Cautions that we have already laid down.

2. Then, during the whole Course of Cure, mercurial Preparations should be order'd, which are free from any purging Faculty, in a smaller Dose, and at longer Intervals, than in the former Method, but in a sufficient Dose to destroy the Venereal Poison. But if a Ptyalism should be threaten'd by this Method, it should be taken down by Purging, as we advis'd before.

3. Topical Applications are at the same time to be made use of, by which the Matter of the Tumor may be soften'd, and brought to Suppuration. The following Cataplasms are very serviceable to this End.

Take two Ounces of Onions roasted under the Ashes, of black Soap, and Diachylon with the Gums, each an Ounce and a half; and of Basilicon, an Ounce: Beat all together in a Marble Mortar for a Cataplasma. Or,

Take of the Roots of Marsh mallows, Bryony, and white Lily, each an Ounce; cut them all down, and boil them. Add of the Leaves of Mallows and Brank-ursine, each one Handful; boil all to a kind of Mucilage, and let them be bruised in a Mortar, and pass'd through a fine Sieve. To the Pulp thus pass'd through, add of old Leaven and Basilicon, each half an Ounce, or an Ounce; one white Onion roasted under the Ashes, and Oil of Lilies, a sufficient Quantity. Make up into a Cataplasma to be applied to the Part affected, and to be frequently renew'd.

4. In the room of Cataplasms you may order ripening Plaisters, which adhere to the Part, and are therefore more conveniently carried about. Of these the best are,

Simple Diachylum; Diachylum with the Gums, or that which is mix'd up with Galbanum, Gum Ammoniac, Sagapenum, and Opopanax, Diachylum diluted with the Oils of Galbanum and Ammoniac; Diachylum mix'd with an equal Quantity of black Soap; and common Pitch mix'd with an equal Quantity of Burgundy-pitch.

5. Though it should appear by certain Signs, that Matter is found in the Bubo, yet you are not too hastily to open this Bubo, but should wait for some time, till the greatest Part of the Bubo is suppurated, that by this means the callous Parts of the Bubo being destroy'd, the Cure may be perfected with the greater Ease and Safety.

6. The suppurated Bubo may be laid open two different ways, either with an Incision-knife, or by the potential Caustery: If the former way is made use of, the Incision should be deep; if the Bubo is small, one Wound will be sufficient; but if it is large, two Incisions should be made in the Form of a Cross, the Corners of which should be taken off with the Scissors. If you chuse the latter way, the Bubo, according to its Size should have a large Eschar made upon it with the Caustic, guarded by a proper Plaister, which if it does not penetrate as far as the Abscess, another Caustic should be laid on, or what remains should be cut through.

7. It is plain, that, in laying open a Bubo, the Use of the Caustic is preferable to Incision, both because the Caustic makes a larger Opening, by which means it is easier to inspect and dress the internal Parts of the Bubo; and more particularly because the Caustic, by its Cathartic Faculty, destroys the callous Bodies, and harder Parts of the Glands; by which means the Suppuration, Detersion, and Union of the Ulcer, are the more happily brought on.

8. The Pus being discharged, the Cavity of the Bubo is to be instantly filled up with dry Lint; which being removed the next Day, the Wound is to be dressed with common Digestive, prepared of Turpentine, the Yolk of an Egg, and Oil of St. John's-wort; to which, if the Foulness of the Ulcer shall require it, you may add some of the Unguentum Ægyptiacum, or Tincture of Myrrh and Aloes. Lastly, the Suppuration going on, the Ulcer may be cured with the Liniment of *Arcæus*.

9. As soon as ever the Inflammation shall be remov'd by the Suppuration, the Cavity of the Ulcer should be diligently examined; and if any Sinuses should be discovered, they must be laid open by Incision, if possible; or at least dilated in such a manner, that they may easily be deterged and healed. But if any callous Bodies remain, as is commonly the Case, they are to be consumed by Degrees with corrosive Medicines, as some Caustic Powder sprinkled upon a Pledget, or red Precipitate mix'd with Basilicon.

10. Lastly, the hard Basis of the Bubo should be softened and relaxed by the repeated Use of a mercurial Ointment; the Flesh with which the Ulcer is filled, should be made firm with the *Balsamum Viride Metensium*. If it is too luxuriant, it should be taken down by Dressings of dry Lint, or burnt Alum. At length the Tumor of the Glands being quite subsided, the divided Parts are to be united.

11. During this whole Course of Cure the Patient has fewer Restraints laid upon him, as to his manner of Living, than in the former Method, unless a Fever should come on at the time of Suppuration; in this Case it will be necessary to forbid the Patient the Use of Meat for some few Days. Nevertheless it will be proper to abstain from Wine, Venery, Exercise, Salt, or high-season'd Meats; and he should be cautious of exposing himself

himself to the Inclemency of the Air, especially as long as he takes mercurial Preparations.

From what has been said, it will be no hard Task to solve the following Problems :

1. Whether Venereal Buboes arise in any other Parts besides the Groin ?

It appears by Experience, that Venereal Buboes, or Tumors of the same Kind, sometimes appear in the Axillae, the Throat, or upon the Sides of the lower Jaw, which are very like the Inguinal Buboes, come on in the same manner, take the same Course, and are cured by the same Remedies.

2. From what Cause should Venereal Buboes arise in those Parts ?

From a twofold Cause, as we just now said of the Inguinal Buboes: (1). From an old Venereal Infection, which in the Pox infects and inspissates the Lymph; by which means there will be an easy Descent upon these Glands, whenever the external Cold, a Blow, Attrition, or strong Pressure, shall afford an Occasion. (2). From the Venereal Infection just admitted, which being absorbed in certain Parts, is carried with the reflux Lymph into the Glands, to which that Lymph is determined by the Laws of the Circulation. So Nurses who are infected by the Infants which they suckle, have most frequently Buboes either in the conglobate Glands, which are situated at the Basis of their Breasts, to which the Lymph first flows; or else in the Axillary Glands, to which it is afterwards carried. So Children which receive the Infection from their Nurses, or the Lover who receives it from his Mistress, or the Mistress from her Lover, by kissing, are subject to Buboes in the Maxillary or Jugular Glands; whence the Lymph is conveyed that returns from the Tongue, Cheeks, and Gums, and from the internal Parts of the Mouth, into which the first Particles of Infection penetrate, blended with Milk or Saliva.

3. How are these Buboes cured ?

After the same Method by which the Inguinal Buboes themselves are cured, since they agree with them in all Points. Therefore by Bleeding, Purging, and Mercurial Unctions, they are to be dispersed, if possible; but if these Methods do not answer the desired End, they are to be brought to Suppuration, laid open, deterged, and cicatrized, according to Art, as we have advised above.

4. Do Venereal Buboes ever arise in the internal Lymphatic Glands ?

I never observed any Venereal Buboes of this Kind myself, nor do I remember to have read of any one that ever did observe them. But it is common enough for hard and scirrhous Tubercles to be found in the Lungs of pocky Persons; and hard scirrhous Obstructions in the Mesenteric Glands, which if they do not go off in the same manner with Buboes, yet they acknowledge the same Cause.

5. Whence arises this Difference, since, on the other hand, in the Pox, the morbid Matter being equally mixed with the whole Mass of Blood, and in the same manner with all the Lymph, ought to produce the same Disorder in each of the Glands ?

Perhaps, from hence; because as the internal Lymphatic Glands are situated in Places that abound constantly with a great deal of Heat, the native Fluidity of the Lymph is the more easily preserved in them. Thence a Stagnation of the Lymph must be an uncommon Case in them; and if it should by chance happen, it will be less, make a slower Progress, and be more easily dispersed, than in the external Glands, which are subject to the Coldness of the Air. Besides, the internal Glands are guarded from Blows, Attrition, and Pressure, by which the Lymph is frequently invited to stagnate in the external Glands.

6. Lastly, whether Venereal Buboes are formed in Catamites and Pathics; and if they are produced by this means, in what Parts is it usual for them to appear ?

As to the first Question, I never observed myself, nor did I ever meet with any one that ever observed Buboes upon Catamites, which could certainly be determined to arise from the Infection just contracted: For I do not imagine, that there are any Catamites who are so fond of playing the Pathic, that they never attempt to play the Agent; but it is in enough to have once played the Virile Part, to make it Matter of doubt whence the Bubo arises, if it shall follow this Action.

As to the later Question, I scarcely believe, that the Buboes which are formed in Catamites, if such do ever proceed from unnatural Venery, fall upon the Inguinal Glands, to which Parts the Lymph is never carried, or at least in exceeding small Quantities, from the Extremity of the Rectum, and the neighbouring Parts of the Anus; but they will rather arise in those Lymphatic Glands, which are situated in the Cavity of the Abdomen, near the Division of the descending Aorta, to which Glands the Lymph of these Parts is carried: And this, perhaps, is the Occasion that Buboes of this Kind are never, or very rarely, produced; because as these Glands are situated in the Cavity of the Abdomen, the Heat of the neighbouring Parts resists the Inspissation of the Lymph, as was just now observed.

But let not these Wretches congratulate themselves upon this Account, since, besides many very grievous Disorders, which are peculiar to their filthy Vice, they are intitled to Buboes of as bad, if not of a worse Kind, than Inguinal Buboes; for it frequently happens in them, that the Lymph, which returns from the Extremity of the Rectum, and the Parts near the Anus, being inspissated by poisonous Particles, enlarges, distends, and swells the Lymphatic Glands, which are very small, but situated in great Numbers in the Fat about the Podex; whence arises a kind of an annular Bubo, with which the Podex is incircled, attended with Heat, Redness, Hardness, and excessive Pain, especially at the Time of the Excretion of the Fæces. This is to be cured with the same Remedies, and treated after the same manner, with the Inguinal Venereal Buboes.

Thus far Mr. Astruc. But with respect to the Cure of Venereal Buboes, I must remark, that the Method of Cure by Suppuration is preferable on all Accounts to that by Resolution; for the former is much less Trouble to the Patient, supposing the Cure by both Methods to be perfected; and not by far so subject to be followed by other Venereal Symptoms, and those of the very worst Kind, which I have seldom fail'd to see consequent to the Resolution of a Venereal Bubo.

Heister, I am sensible, is of a different Opinion; but I am inclined to believe, that the general Practice of those most concern'd in Venereal Cases will determine it against him. I believe, however, that it is possible to cure a Venereal Bubo by Resolution; but with less Ease and Safety. But as Heister is an Author of Reputation, I shall specify the particular Method of Cure, which he recommends, as follows.

As to the Cure, there are many Physicians who will not admit of resolving this any more than a pestilential Bubo; for by such a Method the Venereal Venom, contrary to the Intention of Nature, would return into the Veins, and, by infecting the Blood, excite a Lues Venerea. For the same Reason they forbid the Use of Cathartics and Phlebotomy; and direct a Suppuration to be forwarded as much as possible. But, for my part, though with due Respect to these Authors, I am for a different Way of Proceeding; for since the Method by Suppuration is not only very slow and tedious, but subjected to several other Inconveniences, it is much the better and safer Way, as I have often found by Experience, to begin immediately with Purging, and other Mercurial Medicines, and Purifiers of the Blood, such as Decoctions of the Woods, and other things of the like Nature. By these means the Venom is expell'd by a far more expeditious Way than by the Method of Suppuration; and the Tumors themselves may also be resolv'd without Fear or Danger of the Lues Venerea, or any other Distemper.

Whether, therefore, the Buboes be attended with a Gonorrhœa, or not, the most proper Way, certainly, is to purge the Patient with large and frequent Doses of Mercurius dulcis, as is usual in a Gonorrhœa; for the internal Cure of a Gonorrhœa is usually the Cure of the Buboes, which can never be perfectly healed before the Venereal Poison be quite expelled from the Body. If there be a considerable Inflammation, it will be necessary, especially if the Patient be young, and of a sanguine Constitution, to take away some Blood, and afterwards administer some mercurial Cathartics, with Essences that purify the Blood, and Decoctions of the Woods. Outwardly, to the Tumor, must be apply'd digestive Plaisters, such as those of Melilot, de Ranis cum Mercurio, Diachylum, and such-like. At the same time the Patient must observe a very strict Regimen in his Diet, and Way of Living, confining himself principally to Liquids, prepared of Water, Barley, Oatmeal, and the like. His common Drink may be Ptisan, prepared of Barley, Liquorice, Anise, or Fennel, or a second Decoction of the Woods, or very small Beer. Wine, Brandy, and all Kinds of generous Liquors, are carefully to be avoided, as exasperating the Inflammation. By observing strictly these Rules, the Venereal Buboes, if not inveterate, may very commodiously be resolv'd without Fear or Danger.

When the Assistance of the Physician is call'd late, or the Buboes are too malignant to be cured by way of Dissolution, or it may be thought proper, for some other Reasons, to attempt the Cure by Suppuration, our chief Care, in order to the expelling and subduing the contagious Matter, is to be directed to the promoting and accelerating as much as possible the Suppuration. And besides suppurative Plaisters, it would not be amiss, either with Linen Cloths, or the Fingers anointed with Butter, or Oil, to rub these Buboes frequently and strongly, till they become red, and then immediately to apply a maturing Plaister; for this is an admirable Means of accelerating the Suppuration. And these Kinds of Plaisters, that is, Diachylum cum Gummi, or a Plaister of Galbanum, and the like, are fittest to be apply'd while the Patient is yet able to walk without much Inconvenience, and may be taken off twice, thrice, or four times a Day, as Occasion requires, that the Bubo may be as often strongly rubb'd. Violent Exercises also, such as Dancing, Fighting, Fencing, and the like, are very proper Means to accelerate the Suppuration. But if the Patient, as it often happens, is no longer able to walk, because of the Pain,

Pain, some maturing Cataplasim, of more Force and Efficacy than the Plaisters before-mentioned, may be apply'd. Cataplasms very convenient for this Purpose are those composed of Onions roasted under hot Ashes, or of Honey and Meal, or of Ferment; or, to mention no more, of Crums of white Bread boiled with Milk and Saffron: These Cataplasms must be applied every now-and-then after Friction.

With the Use of these external Applications, internal Remedies must also be administer'd. Thus the Patient is to take a Draught of eight, ten, or twelve Ounces, of a warm Decoction of the Woods, two or three times every Day, together with thirty or forty Drops of the Essence of those Woods, white Burnet, Fumitory, Germander, and the like, and some Grains of Mercurius dulcis, every Day. These Medicines, by greatly attenuating the Blood, and forcing it towards the Skin, and correcting the Venereal Poison, are very conducive to Dissolution, as well as Suppuration.

This Course must be follow'd till the Matter be either dissolved, or brought to Maturity. In this latter Case the Knife is to be used, and an Incision to be made; but with a great deal of Care and Circumspection, lest the larger Blood-vessels of the Groin or Armpits, which lie near, should be wounded, and a dangerous Hæmorrhage thence occasioned. The best Precaution you can use in this Case, is to take the Head of the Bubo between your Fingers, and pull it upwards. As to the Time when the Incision is to be made, this one Observation is necessary, that it be not too soon nor too late, since both are dangerous. For as too much Haste procures Pains, dangerous Inflammations, and other Mischiefs, so too long a Delay, as *Hildanus* assures us, has almost constantly given Occasion to the Matter of the Bubo to mix again with the Blood; and by corrupting the whole Mass, to induce the Lues Venerea.

If the Patients be timorous, and dread the Knife, the Buboes must be open'd by some corroding Medicine, as the Practice is in Abscesses. When the Pus is evacuated, the Ulcer must be thoroughly cleansed by some Digestive, mixed with a little Venice-treacle, and red precipitate Mercury. After this a Plaister of *Diachylum cum Gummi* must be apply'd, in order to mollify the Margin of the Bubo; and when the Ulcer is sufficiently deterged, it is to be healed up with some vulnerary Balsam and Lint.

Sometimes these Ulcers are so stubborn, as not to be dry'd, nor conglutinated, by the Help of Medicines, but continually run with a plentiful Effusion of Sanies. In such a Case, and when neither the above prescribed Medicines, nor red Precipitate, nor burnt Alum, are of any Effect, there is no other Way, at least in my Opinion, but to cauterize the corrupted Part with a hot Iron, by which means the Lymphatic Vessels by searing are often effectually closed.

From the Premises, if I am not mistaken, it plainly appears, that it is always the best and most commodious Way, if it can be done, to discuss Venereal Buboes as soon as may be; or to attempt the Cure by Resolution, rather than Suppuration. But when the Blood is so far infected and corrupted by the Venereal Poison, as to shew manifest Symptoms of the Lues Venerea, another Way of Treatment, proper to that Disease, is required. *Heister*.

Of the Accidents which sometimes accompany a Venereal Bubo; and, first,

Of the FISTULOUS BUBO.

When a Bubo is once opened, if it is neglected, the Lips uniting, and the Orifice contracting, it degenerates into a Fistula, that is, into a sinuous and callous Ulcer; for both these are implied in the Nature of a Fistula. There are some Differences in this kind of Fistula.

1. With respect to the Aperture, which is sometimes wider, and therefore constantly gaping; sometimes narrower, and then it is sometimes covered with a Crust, or thin Skin.
2. With respect to the Sinuses which are concealed within, which are either wide or narrow, many or few, cutaneous or deep, strait or curve, &c.
3. With respect to the Fluid which is discharged, as it is either in great or small Quantities, purulent, sanious, or only simply ichorous.
4. Lastly, with respect to the callous Bodies which line the Sides of the Sinuses, and greatly differ in Size, Number, and Hardness.

As to the Causes, the Bubo, after it is laid open, may degenerate into a fordid and obstinate Ulcer, by the bad Disposition of the Blood, but more especially if the Venereal Poison should be latent in the Blood, by which the Pus will be render'd more acrimonious; but it will never degenerate into a Fistula, but by the gross Neglect or Ignorance of the Surgeon.

1. For Instance: If an unskilful Surgeon has made too small an Aperture in the suppurated Bubo, either with the Knife or Caustery; for by this means the Bottom of the Ulcer not being open to the View, nor easily reached by Medicine, it will be difficult to discover what Alterations are made within, or to

apply proper Remedies; so the internal Parts of the Ulcer remain foul, whilst the Lips of it, which are more exposed to the Force of the Remedies, and are well deterged, hasten to a Union, by which means a Fistula is necessarily formed.

2. If he unwarily permits the Ulcer (though the Opening be sufficiently large) to tend too soon to a Cicatrix, before the ulcerated Gland be perfectly suppurated, or at least, whilst a small Portion of it at its lower Part, which occupies the Centre of the Ulcer, or several Membranes by which it adheres, and which are so many Pedunculi to it, are left unsuppurated. For we know very well by Experience, that no Ulcer can be ever perfectly cured, unless its Bottom be well deterged; nor can the Bottom be ever well deterged, as long as the least Portion of the ulcerated Gland, or of the Membranes by which it adheres, remain unsuppurated.

3. If from want of due Care he omits taking Notice of Pus being secretly discharged into the Bottom of the Ulcer from any neighbouring suppurated Gland, or from the Parts which lie between the neighbouring Glands; for unless this Fountain of Pus be speedily remov'd by dilating the Passage with the Knife or Caustery, a perfect Union of the Parts will be expected in vain; for though the Lips may seem to tend to a Cicatrix, yet the Ulcer will necessarily end in a Fistula.

As to the Symptoms; whichever of these Errors the Surgeon is guilty of, it will follow from thence,

1. That the Bottom of the ulcerated Bubo, if it is not deterged by proper Remedies; if it is lin'd with putrid Portions of the Gland, or its Membranes; if it is continually kept moist with a purulent Discharge; it will neither be cleaned, nor filled up with good Flesh, nor unite; but being continually eroded with a foul Exulceration, will form a larger or smaller Cavity.

2. But the Lips of the Ulcer, which, as they lie open to the Force of the Remedies which are applied, and are free from the other Inconveniencies which have been related, will be perfectly cleansed, deterged, and filled with new Flesh, which will by Degrees so contract the Mouth of the Ulcer, that there will remain a very small Opening into the Cavity, which will be wider or narrower, or covered with a Crust or thin Skin.

3. In the mean time the Pus, being confined in the Cavity of the Ulcer, and exercising its Force upon the adjacent Parts, by distending their Fibres, and inspissating the Lymph, will, in a short time, produce hard callous Bodies all round, which vary with respect to their Number, Size, and Hardness, in proportion to the different Qualities of the Pus, the different Firmness and Density of the eroded Fibres, or the different Degree of Inspissation of the circulating Lymph.

4. And if it is retained for any time, and is of an acrimonious Nature, the Erosion being by Degrees promoted, it will shortly form itself new Sinuses in several Places, many or few, wide or narrow, in proportion to the Degree of Acrimony which it possesses; strait or curve, deep or cutaneous, as the adjacent Parts afford more or less Resistance to the Force of the acrimonious Pus.

5. The Discharge from the Ulcer will be of a different Nature; ichorous, if pure Lymph flows from the eroded Lymphatic Ducts; but sanious, if Blood be discharged from the wounded Vessels, and mixed with the Lymph in the Cavity of the Fistula; purulent, if by Delay the Lymph and Blood acquire the Form of Pus; lastly, in great or small Quantities, in proportion to the Flux of Humours to the Part.

As to the *Diagnostics*; the State of the Fistula into which an ulcerated Bubo has degenerated, lies open to the Eye; the Sinuses which are form'd, are discover'd by the Probe; callous Bodies are distinguished by the Touch; lastly, the Causes are easily found out, if you are acquainted with the Method in which the Bubo has been treated.

As to the *Prognostic*; a Fistula in the Groin, arising from a Bubo, is a very bad Disorder, and never to be made light of, since it generally supposes the Pox, by which it is brought on or supported; and it always requires a long, difficult, laborious, surgical Treatment. It is attended with Danger, (1.) if it has Sinuses which penetrate deep to the Crural Vessels, or their larger Ramifications. (2.) If some of the callous Bodies, which are concealed in it, are attended with acute Pains, and approach to the Nature of a Cancer.

As to the Method of Cure; if you are certain, or indeed if there are only strong Reasons for Presumption, that the Fistula, into which the ulcerated Bubo has degenerated, is accompanied with the Pox, by which it is aggravated, mercurial Unction should be advised, before the Cure of the Fistula be attempted. Nor are there any Hopes that the Effect shall ever perfectly cease, unless the Cause be first removed. Towards the End of the Ptyalism, when the Blood has now been well depurated, the Fistula is to be cured according to the Rules of Art, that by this means the Cure of the Pox and the Fistula may proceed equally, and at last be completed together.

But if it shall appear, that the Bubo has become fistulous, wholly by the Unskilfulness of the Surgeon, and that there is no Suspicion of a latent Pox; in this Case, if the Season of the Year will permit, you should lay aside all manner of Delay, and

and proceed to the Cure of the Fistula, after the following Method.

1. The Patient should be prepared for the Method of Cure, not only by universal Remedies, that is, Bleeding and Purging, which should be repeated according to the Strength and Constitution of the Patient, and the Nature of the Disease; but, besides, he should drink diluting and cooling Broths, made of Chicken or Veal, with proper Herbs and Roots; chalybeated Whey, Asses or Cows Milk; or, if the Season of the Year renders it proper, he should bathe in warm Water, or drink proper mineral Waters.

2. After this, having first examin'd the Number, Length, and Direction of the Sinuses which communicate with the Mouth of the Fistula, you must lay each of them open; and, if they are cutaneous, and not very callous, you may perform the Operation with the Knife or Scissors, which are to be introduced upon a Director, and the Lips should be carefully taken off, that the Bottom of the Sinuses may be exposed to View; and then, according to Custom, it will be proper to fill up the Wound with dry Lint, in order to stop the Blood; which Dressing being taken off the next Day with a light Hand, the Ulcer should be treated for some time with a simple Digestive, and afterwards with the Liniment of *Arcaus*.

3. But if the Sinuses should be very deep or callous, it will be more advisable to make the Aperture with the Caustery, as we advised above. Therefore, laying a Plaister upon the Fistula, with an Opening in it, in such a manner that the principal Part of the Sinuses may be immediately under the Opening in the Plaister, apply some Pieces of the caustic Stone to the Part, sufficient to procure a deep Eschar. If they do not reach to the Sinuses, scarify the Eschar to the Quick, and apply another Caustic; or, which is the quicker Method, cut away the half-rotten Flesh with which the Sinuses are covered.

After this, promote the Falling off of the Eschar as soon as possible, by emollient and relaxing Applications; as Butter, the Yolk of an Egg, either alone, or beat up with Oil of St. John's-wort, Basilicon, or Turpentine, and laid upon Lint.

The other Eschar being fallen off, the Ulcer is to be treated with common Digestives, till the Decrease of the Pus indicates the Use of the Liniment of *Arcaus*.

5. The Lips, and the neighbouring Parts, of the Ulcer being now relaxed by the Suppuration, it will be proper to examine all the Parts diligently, by pressing them with the Finger, by examining them with the Eye, and with the Probe, to find whether any Sinus, or considerable Callus, be conceal'd anywhere, which will be necessary to be remedied before the Ulcer can be united, and form a Cicatrix, lest the last Error be worse than the first, and another Fistula be brought on.

6. Therefore if any Sinus should be discover'd, but in a Part which will admit of Incision without any Danger, the Aperture should be made according to the whole Length of it, if possible; or, at least, the Mouth of it should be so enlarg'd, by thrusting in an Escharotic, that the Bottom may lie sufficiently open to be freely deterged, and perfectly cured, by the Application of proper Medicines.

7. But if the Sinuses should reach so near to the Crural Vessels, or any of their larger Branches, that an Incision would not be free from Danger, Cathartics alone must be us'd, and those of the milder Sort, which act moderately, and, by a gradual Erosion, dilate the Part in such a manner, that you may daily form a Judgment of their Effects; it will also be worth while diligently to take care, that the Cathartic Medicines may be applied only to that Mouth of the Sinus which is at the greatest Distance from the Crural Vessels, and which may be exposed therefore to their Force with the greater Safety.

8. If the harder Callosities should escape Suppuration, they are to be consum'd, by Degrees, with Cathartics, as the *Lapis Infernalis*, or any other Caustic, or red Precipitate mix'd with some Ointment; and, to render them the more efficacious, it will be convenient to make light Scarifications upon the Surface of the callous Bodies with the Point of a Lancet.

9. The Sinuses being once agglutinated, the callous Bodies consumed and suppured, if the new Flesh, which springs up, is firm, thick, granulated, and rosy-colour'd, the Ulcer is to be brought to a Cicatrix, to which End epulotic Medicines are of Service, which, by drying the Superficies of the Ulcer, bring on a Cicatrix; of this kind are the Green-balsam, Pompholyx, burnt Lead, Cerus, or Plaisters in which these are Ingredients; dry Lint, burnt Alum; or Agglutinants which guard the Rudiments of the Cicatrix, upon its first Formation, from being eroded by the Air; amongst which the best are Turpentine, dry'd and powder'd, Sarcocolla, Frankincense, and Myrrh.

10. Lastly, from the very Beginning of the Cure, a proper Regimen of Diet should be prescrib'd; it should be light, consisting of Pudding, Panadas, Creams of Rice, or, at most, the Flesh of Chickens, when every thing is going on well; but very light, and only of the smallest Broths, if the Patient is afflicted with a Fever, if the Suppuration is in great Plenty, and very fetid, if the Lips of the Ulcer are inflam'd, if the Flesh is spongy, fungous, and luxuriant.

Of the SCIRRHOUS BUBO.

It sometimes happens, that the Venereal Bubo, evading the Force of all Remedies, is neither dispers'd, nor brought to Suppuration; but entirely, or almost entirely, by Degrees, becomes thicken'd and indurated, and turn'd into a hard Scirrhus, which chiefly happens to the cedematous and scirrhus Bubo.

Scirrhuses, form'd in this Manner, differ,

1. With respect to their Figure and Size, in which there is great Difference.

2. With respect to the Number and Situation, of the Glands which they possess; for some occupy only one Gland, and are call'd *Conglobate*; others occupy more, and are dispos'd either in Clusters, or after the manner of Links in a Chain; and are said to be *congested* either *racematim* or *catenatim*.

3. With respect to their State of Mobility, as some adhere loosely to the subjacent Parts, being moveable either to one Side or the other; whilst others adhere so immediately to the Part beneath them; that they can by no means be brought to vary their Situation.

4. Lastly, with respect to their Sensation; as some are without Pain, and truly scirrhus, whilst others produce an obtuse Pain, and approach near to the Nature of a Cancer.

As to the Causes, a Bubo is converted into a Scirrhus, when the Lymph, stagnating in the Cells or Vesicles of the Inguinal Glands, is more than ordinarily inspissated; by which means the Parts being stuffed up, and, by Degrees, brought to a more intimate Contact, it acquires, as it were, a cheezy Hardness. But the Lymph is thicken'd in this manner by several Causes.

1. By its natural vitiated Thickness, by which means, upon the Accession of the Venereal Poison, it is inspissated, *ceteris paribus*, more than it would be otherwise.

2. By the too great Quantity or Energy of the Venereal Poison which is receiv'd; whence it happens, that the Lymph, into which it is admitted, is, *ceteris paribus*, so much the more coagulated.

3. By either of the foregoing Causes concurring with the other; whence it happens, that the Lymph, being naturally too thick, meeting with too great a Quantity, or too virulent a Portion of the Infection, is violently coagulated.

4. By the preposterous Use of topical Repellents, such as are frequently applied upon the first Appearance of the Bubo, but very unadvisedly, since, by this means, the Thickness of the Lymph being increas'd, the Bubo becomes scirrhus, which might otherwise have dispers'd of itself.

5. By the Abuse of topical dispersing or ripening Applications, which, if they are unequal to the Office of rendering the Lymph fluid, increase its Thickness, inasmuch as they dissipate the thinner and more fluid Parts of it.

6. Lastly, by the Abuse of stimulating topical Applications. Of this sort are the ripening Cataplasms, with which bruised Mustard-seed is mix'd, which, by their Irritation, solicit the glandular Texture to frequent systaltic Constrictions; which is useful enough, if the confin'd Matter is fit to be dispers'd; but very hurtful, if it is of a hard Nature; since the finer and thinner Parts being forcibly thrown out, the thick Part which remains will form still a harder Mass.

As to the Symptoms, it appears, that according to the different Nature, Disposition, and Infection of the Lymph in the different Glands of the Groin, or according to the different Tension, Texture, and Permeability of those different Glands, sometimes one Gland only, of a different Size or Figure, is affected; whence,

1. A conglobate Bubo, and so a Scirrhus, different in Figure and Size, is produc'd; sometimes more together disposed in Clusters or Links, whence a Bubo, and so a Scirrhus *congested* *racematim* or *catenatim*.

2. According to the different Situation, of the obstructed Gland, whether it be more or less deep, or according to the different Length, and Degree of Softness, of the tendinous Fibres or Membranes, by which the Gland adheres to the neighbouring Parts, a Bubo, and so a Scirrhus, is produc'd, sometimes moveable, sometimes, on the other hand, fix'd and ty'd down to the subjacent Part.

3. As the Lymph which stagnates in the Gland, is either quiet without Motion, or, from any Cause, is rarefy'd and expanded; the containing Membranes of the Glands will sometimes remain unmov'd, whence the Tumor will be without Pain, and truly scirrhus; sometimes they will be distended painfully, whence the Tumor begins to have an obscure Pain, and so to degenerate into a Cancer.

Lastly, in the former Case, where the Blood and Lymph have either dilated their Vessels by Degrees, or made themselves new Passages into the collateral Vessels, since, by the Matter of the Scirrhus being unmov'd, no new Pressure of the Vessel is brought on, nothing hence will arise new, with relation to the Colour or Heat of the Part; but, in the latter Case, things fall out differently, as will hereafter appear.

As to the Diagnostics, the Presence of the Inguinal Scirrhus, and the Differences into which it is distinguish'd, are sufficiently evident to the Sight and Touch; the Causes by which it was brought on, may be collected from the foregoing Ætiology.

As to the Prognostics; the Prognostic is always bad, since it is no easy thing to disperse or suppurate a Bubo, which is degenerated into a Scirrhus.

But it is worst of all, if it begins to be painful, since by that it is manifest, that, by Degrees, it is becoming cancerous.

As to the Method of Cure, it is exceeding difficult, as we observ'd before, to disperse or suppurate a scirrhus Bubo. Some advise dry Cupping upon the Part, to be daily repeated for a Quarter of an Hour at a time; that, by the Flux of Blood to the Part, the Matter of the Scirrhus may be heated, and, by that means, yield more readily to the Force of topical Discutients or Ripeners. But Experience has taught us, that this Method is almost always fruitless, and frequently even dangerous; since the Scirrhus, being heated by the Conflux of Blood to the Part, at length becomes frequently cancerous.

Others advise the scirrhus Gland to be consum'd, by Degrees, with Cathartics, if it refuses to yield to the Force of Discutients and Ripeners; or making an Incision into the Skin, to extirpate it with the Knife. But I should never advise the undertaking of Operations of this kind, which are tedious, difficult, and full of Danger; as long as the Scirrhus is without Pain, and brings on no Inconvenience: I would have this more particularly understood of Cathartics, since, by the preposterous Use of them, a Scirrhus is frequently converted into a Cancer.

Therefore it is better to have recourse to Mercurial Unction; from which you may expect a happier Event. For, as the Parts of the Mercury, which are convey'd into the Blood by this means, not only very powerfully attenuate and divide the stagnating Lymph, but correct also the Particles of the Venereal Infection which coagulate the Lymph, they are the most efficacious Remedies that can be made use of to disperse gradually the scirrhus Bubo, since it is produced by the too great Viscidity of the Lymph, and the Inspissation of the Venereal Poison.

But two things are diligently to be observ'd in the Administration of the Mercurial Unction.

1. That the Patient be duly prepared with the Use of diluting and relaxing Remedies, as well Universals as Particulars; Universals to liquify the Blood and Lymph, that they may yield with the greater Ease to the Particles of Mercury; Particulars, or Topics, to soften and relax the Texture of the Bubo, that the Lymph may have a more free Passage thro' it.

The first Intention is answer'd by warm Baths of River-water, cooling Broths, or Apozems, chalybeated Whey, Asses Milk, acidulated or chalybeate Mineral Waters; the latter by Cataplasms of the Crums of Bread, or of the Pulps of emollient Roots and Herbs, or by the Mucilage-plaster, or that of Sperma Ceti, the Use of which must be long persisted in.

2. That the Mercurial Unction be us'd in small Quantities at each Friction; that the Frictions be perform'd at long Intervals, in order to permit the Mercury, which is mix'd with the Blood, to be retain'd in it for a long time, to the end that the Particles of Mercury circulating for a considerable time with the Blood, may the more forcibly divide the Lymph which stagnates in the Inguinal Glands, and so procure a perfect Resolution of the scirrhus Bubo.

By this Method, it is certain that the Inguinal Scirrhi, which succeed the Bubo, are, at least, so much lessen'd, if they are not perfectly dissolv'd, (which is rarely the Case) that the remaining Tumor is scarcely equal to the Size of an Almond or Hazel-nut. But I would, by no means promise this as the certain and undoubted Effect of it, since I have known scirrhus Buboes so stubborn sometimes, that they have obstinately remain'd, notwithstanding the utmost Caution has been us'd in administering the Mercurial Unction. If this should be the Case, and the Bubo has not yet acquir'd a stony Hardness, nor is inclin'd to turn cancerous, it will be proper to visit the warm Mineral Springs, and frequently to pump those Waters upon the Part, covering it afterwards with the Slime that remains at the Bottom of those Waters; by which means the coagulated Lymph may, by Degrees, be render'd fluid, and dispers'd.

But here also some Caution is necessary; for if the Bubo begins, by this means, to rarefy, grow hot, and painful, the Patient should instantly leave off the Use of these Waters, lest the Scirrhus should degenerate into a Cancer. In this Case, all Remedies being laid aside, the Whole is to be left to the Strength of Nature, advising a proper Regimen to be observed in Diet, and applying a Plaster to the Tumor, compos'd of equal Parts of the *Emplastrum Diabotani*, and *de Mucilaginis*.

Of a CANCEROUS BUBO.

The scirrhus Bubo, whilst it is becoming cancerous,

1. Grows hot, has an obscure Pain upon Pressure, swells, and grows very hard, sometimes shoots, but seldom; and then it is call'd a beginning Cancer.

2. Then all the Symptoms increase, the shooting Pains are

more frequent and acute, it changes its Figure, and rises to an Apex, which is cover'd by a tense, smooth, shining, reddish Skin; and now it is call'd a confirm'd, but occult, Cancer.

3. Lastly, the Skin dividing upon the Apex, it forms an Ulcer, from whence Blood, Ichor, and Sanies, are discharg'd Drop by Drop; the Ulcer spreads slowly, the cancerous Bodies are expanded and enlarged, the Lips of the Ulcer turn back, fungous Flesh arises, Ichor, Blood, and Sanies, are discharged plentifully, a tearing, shooting, burning Pain comes on in a violent manner, the Parts which are situated near the Tumor grow livid; in a Word, it is now a confirm'd ulcerated Cancer.

But, as was said before of the Scirrhus, the Cancer differs with relation to its being fix'd, or moveable; for sometimes it is moveable, and sometimes it firmly adheres to the subjacent Parts.

The whole Ætiology of the Cancer depends upon one Principle, which has been hitherto unregarded, however true; which is, That the Lymph, stagnating in the scirrhus Body, is rarefiable by Heat; and, being once heated, expands itself with so much the greater Force, as it is increased in Thickness and Inspissation. This is abundantly demonstrated from hence, that a scirrhus Tumor, when it begins to degenerate into a Cancer, swells without any Suppuration; that, upon the Increase of the Swelling, Part of the Scirrhus forms an Apex; lastly, that the Skin being once broke, the cancerous Matter which is conceal'd within, rising up, and, as it were, pouring out as soon as Room is allow'd for its Expansion, by Degrees enlarges the Ulcer, and, as it spreads more and more, turns out the Lips of the Ulcer all round.

From hence it follows, that the preternatural Heat which the Matter, confin'd in the scirrhus Body, conceives, is the proximate Cause by which the Scirrhus is converted into a Cancer. But it appears, that this kind of Heat is conceived by the scirrhus Matters;

1. Whenever the Blood which flows near the Part is render'd too hot, by an acute or hectic Fever; by an acrimonious, salt, piperine Diet; by the immoderate Use of Wine, or spirituous Liquors; by immoderate Venery, Exercise, or Watching.

2. Whenever the Blood, tho' it may not be too hot, is forc'd to stagnate in the neighbouring Parts of the Scirrhus; from the too great Plenty of it, as it happens by too frequent Application of Cupping Glasses, or by a Contusion upon the Scirrhus.

3. Lastly, whenever the scirrhus Tumor is heated beyond measure, by the Application of Topics, which are actually or potentially hot, or by the imprudent Use of Escharotics.

Therefore all these are to be reckon'd as remote or procaccatic Causes of a Cancer.

As to the Symptoms;

1. It appears from what has been said, that a Scirrhus begins to be chang'd into a Cancer, because the contain'd Matter is heated and rarefied. Therefore a Scirrhus, degenerating into a Cancer, ought to increase a little in Heat, Tumor, and Resistance.

2. The Matter in the degenerating Scirrhus enlarges: The containing Cells, therefore, and external Coverings of the scirrhus Gland, are, by this means, strongly distended, and produce Pain.

3. The same Matter still rarefying more, and with greater Force, from any external Cause, presses strongly upon the neighbouring Vessels. The Arteries, by this means, becoming more turgid with Blood which is confin'd in them, will be provok'd to more frequent Vibrations, and shake the neighbouring Parts with the greater Vehemence, from whence will proceed a shooting Pain.

4. In the same Proportion that the Matter of the degenerating Scirrhus increases in Heat and Rarefaction, the Pain, Tumor, Resistance, and Shooting, will increase daily.

5. As the scirrhus Matter is not perfectly homogeneous and uniform, but more or less prepar'd for Expansion in different Cells of the Tumor; and as the Cells in which it is contain'd do not equally resist its expansive Force, so one or other Part of the degenerated Scirrhus, from one or both of these Causes, will enlarge itself beyond the rest, and, changing its Figure, by Degrees protuberate into an Apex.

6. As one or other Part of the Tumor is more enlarg'd into an Apex, the Skin which covers it will be more distended; the Top of the Apex, therefore, will be cover'd with a tense, smooth, shining, thin Skin, of a darkish-red Colour, because the Blood meets with Difficulty in passing thro' its Vessels, which are too much distended.

7. The Skin, being render'd thin by violent Straining, is, at last, divided by the contain'd Matter. Hence, at first, proceeds a small superficial Ulcer, which, by the Continuance of the same Causes, by Degrees increases, and is dilated.

8. Blood flows from the ulcerated Cancer, if any of the larger Blood-vessels are divided; Lymph or Ichor, if the Blood-vessels remain unhurt, and only the Lymphatics are injured; purulent Matter, if the fungous Flesh, with which the Ulcer

is cover'd, putrefies; lastly, Sanies, or Lymph, mixed with Blood or Matter, if any of the foregoing Circumstances concur at the same time: But never true, unmix'd, laudable Pus, since the scirrhous Matter, as well from its lymphatic Nature, as from its too great Inspissation, is render'd unfit to form a perfect Suppuration.

9. The Expansion of the cancerous Matter increasing, as the Circumference of the Skin cannot be extended in the same Degree, the Lips of the Ulcer will, consequently, be turned back, and look very ill.

10. Lastly, the Veins being compressed on every Side, the Blood not only stagnates in the Parts which are situated near the Tumor, but, by this Stagnation, puts off its natural red Colour, and contracts one more black, from whence proceed the livid and varicose Branches of Vessels, with which the Cancer is surrounded.

The Nature, State, and Differences of the cancerous Bubo, readily appear from the Description of it. But the Causes of it may be discover'd, by examining the Way of living which has preceded it.

As to the Prognostics, the cancerous Bubo is a terrible and dangerous Disease, which is seldom cur'd, and never without the Knife, and actual Caution.

If the Bubo strictly adheres to the subjacent Parts, since it can neither be extirpated with the Knife or Cathartics, it is evidently incurable, and can only be treated with Palliatives.

But if it is moveable, and not firmly united with the subjacent Parts, it may be perfectly cur'd by Extirpation, if it is at a sufficient Distance from the Crural Vessels, that the Operation may be perform'd without Danger.

In general, the larger cancerous Bubo is of more dangerous Consequence than the smaller; the painful, than that which is attended with but little Pain; the ulcerated, than the occult.

The Method of Cure is different; according to the different Condition of the Tumor; that is, curatory, if it is moveable; but palliative only, if it is fix'd.

1. In the first Case, the present Indication requires, that the cancerous Tumor be speedily taken out, lest the neighbouring Parts be brought into Consent, or left, by being increased in Size, it should adhere to the neighbouring Parts.

Therefore,

1. The Patient should be prepar'd for the Operation by universal Remedies, as by Bleeding and Purging, by alterative Broths or Apozems, by Asses or Cows Milk, or Whey, by mineral Waters, and by Bathing, which should be varied according to the Constitution, State, and Age, of the Patient, and the Season of the Year. Mercurial Uction should even be premised, if there is any Suspicion of a conceal'd Venereal Infection, as is frequently the Case.

2. In the Opinion of some, Cathartics should be us'd, especially Preparations of Arsenic, corrected, or calcin'd, with which, they assert, the whole cancerous Gland will be mortify'd, as they term it, and fall off with little Trouble. Of this Opinion are *Fallopianus*, *Sennertus*, *Vigierius*, *Faber*, and *Johannes Baptista Alliot*.

3. But this Method, tho' perhaps it may be attempted upon small cutaneous Glands, with a very sparing Hand, yet we think it dangerous, and not safe, in larger or deeper Cancers: (1.) Because Cathartics applied liberally, by Irritating, Stimulating, and Corroding, bring on an Inflammation, attended by a Fever, which is never free from Danger. (2.) Because, by the acute Pain which they occasion, they change the neighbouring Parts, which were sound, into a cancerous Nature, by which means the Cancer increases, and adheres to the subjacent Parts, from whence it was before free. (3.) But principally, because I could never think the Use of Arsenic safe, however prepar'd, calcin'd, or corrected. For it has been known more than once, that a miserable Death has been brought on by the external Use of Arsenic. Concerning this see *Fernsius, Method. Medendi, Lib. 16. Cap. 18.* where he tells you, that Arsenic and Mercury Sublimate being applied to a cancerous Breast, destroy'd the Woman in six Days, in the same manner as if it had been taken by the Mouth.

4. It is better, therefore, to extirpate the moveable Cancer by the Knife instantly. To this End let the cancerous Gland be taken hold of with the Fingers, a Ligature, or a circular Pair of Forceps: then divide the Skin and the Basis of the Tumor all round with a Knife, arm'd half the Way up with Lint wrapt round it, till the Cancer is wholly extirpated, taking great care, that nothing be left which may be suspected to be of a cancerous Nature. The Flux of Blood may be stopp'd either with a Ligature, if the Vessels from whence it flows are large, or only by the Application of a small Piece of Vitriol. The Wound may be fill'd up with dry Lint, which should be pressed down for some time with the Hand, till the Blood is stopp'd. Then, upon the second or third Day, when the Lint falls off, the remaining Ulcer is to be treated with common digestive Balsamum Arcæi, or Balsamum Viride, according to the Rules of Art.

5. But it is necessary, that the Surgeon attend diligently to

the following Circumstances; (1.) That if any small cancerous Gland, or Gland of a cancerous Nature, remain, it should be carefully extirpated; for a Cancer is of the Hydra kind, which will constantly spring up again, unless all its Heads are taken off. (2.) That he should carefully provide for the Regeneration of good Flesh, by treating the Ulcer with the greatest Caution, lest it degenerate into a Fistula, which is too frequent in cancerous Ulcers.

6. Lastly, the Ulcer being healed, or tending to form a Cicatrix, the vitiated State of the Blood, which was brought on by the Cancer, and which afterwards aggravated and kept up the Cancer, is to be corrected by proper Remedies, lest a fresh Cancer should arise in another Part. To this End the palliative Method, which we shall describe below, will be of Service; for all those Remedies which conduce to the Mitigation of the Cancer, are of Use in preventing it.

II. In the other Case, that is, if the cancerous Tumor adheres to the neighbouring Parts, and therefore cannot possibly be extirpated by the Roots, you must refrain from all Operation, as useless, and even pernicious, and only insist upon the Use of palliative Remedies.

1. But there are not wanting those who will promise a perfect Cure, even in this Case, by the Use of Cathartics, those especially of the arsenical Kind; but the Patients, who rashly trust to their great Promises, will suffer a most miserable and cruel Death for their Credulity: For there is no Reason to expect, that this Method of Treatment should be serviceable in a fix'd Cancer, which we just now demonstrated to be prejudicial in one which is moveable.

2. It is best therefore, in this Case, for the Patient to look for no Cure, and, laying aside all vain and dangerous Credulity, only to take all possible Care to prevent the spreading of the Cancer: Let the vitiated State of the Blood be corrected, and the Pains, which cruelly torment the Patient, allwaged: Lastly, let Life be prolong'd as much, and upon as easy Terms, as possible; and to these Ends the palliative Method wholly tends.

3. Therefore let the Patient be every now-and-then purged, not with strong Cathartics, as some rashly advise, but with the milder Sort, as Manna, Cassia, Rhubarb, or Syrup of Peach-flowers, which gently carry off the ill-digested Chyle, and Foulness of the Bile, which lies in the first Passages, without giving any violent Stimulus.

4. A Vein also should be sometimes open'd in either Arm, if the Pain and Heat are violent; for by this Method, like Vessels being emptied, the Arteries which run near the Tumor will be less turgid, and therefore, vibrating with less Force, will bring on less Heat and Pain.

5. The Patient must be forbid the Use of Wine, Venery, immoderate Exercise, vehement Passions of the Mind, salt, spiced, sharp, or preserved Meats of any Kind; and be prescribed a thin, moist, cooling Diet, of Barley, Rice, Pudding, light Broths, or Jellies, or at most Chicken or Veal in Substance.

6. Cooling and diluting Broths or Apozems are to be used at the same time, and light chalybeated mineral Waters; Baths or Semicupia in warm Water, Asses or Cows-milk, or Whey, or, what is better, Cows-milk, for constant Diet, or used very frequently at least; and, lest it should offend the Stomach, you may add to the Morning Dose Lime-water, from one Ounce to three Ounces; or of the bitter Decoction of the Leaves of Wormwood, Centaury, and Germanander, to three, four, or five Ounces; or, before the Morning Dose, you may give a Bolus of red Coral, Crabs-eyes, *Peruvian Bark*, Blood-stone, seal'd Earth, Chalk, or any of this Kind which may be prescribed, of each one Scruple, if you mix two or three of them together.

7. If the Cancer is an occult one, no topical Remedies are to be applied to it; neither warm, sharp, dispersing Medicines, which, by their Heat, aggravate the Disease; nor cooling, anodyne, fatty, softening Medicines, which, by stopping up the Pores, and obstructing insensible Perspiration, increase the Heat of the Tumor, and by that means forward its Progress. It is sufficient therefore to guard it from Cold, or any Injury that it may receive from the Moisture of the external Air; which is no difficult Matter, if you consider the Part which the Tumor occupies.

8. On the other hand, if the Cancer is ulcerated, then it will be necessary to dress the Ulcer daily, to clean it gently with dry Lint, and to wash it with Decoction of Agrimony, or Herb-Robert; and to mitigate the Acrimony and Pierceness of the desluent Humour with Topics, which are possess'd of an anodyne or absorbent Quality, so that they are not of an unctuous Nature. Various kinds of Remedies are recommended to answer this Intention, but the following seem to be preferable to the rest:

Ointment prepared of the fresh-express'd Juice of the Garden Nighthade, beat with a Leaden Pestil, in a Leaden Mortar, with the Sugar, or rather Magistery, of Lead.

Fresh

Fresh Oil of Eggs, beat in a Leaden Mortar till it grows black.

A thin Plate of Lead, either alone, or rubb'd over with Mercury.

The Flesh of common Snails, or of Cray-fish, boil'd much, and rubb'd in a Leaden Mortar.

Slices of Veal, just kill'd; or young Puppies, slit thro' the Middle, and applied hot to the Part.

Oil of green Frogs, distill'd *per Descensum*, with an Addition of powder'd Frogs, Toads, or Craw-fish.

All Preparations of Tutty, Pompholyx, and Lead.

9. If the shooting Pains are very violent, Narcotics should be mix'd with the foregoing Remedies, as Opium, from one Grain to two or three. They should also be given internally in a proper Dose, that the Pain by this means may be more powerfully allwaged; which we would have understood of the moveable Cancer, if it is attended with acute Pains, and also of the occult.

10. Lastly, it will be proper at the same time to restrain the Luxuriance of the fungous Flesh with a mild cathæretic Medicine, of which Sort we have found the *Balsamum Chalybis* to exceed all others; for this kind of Balsam destroys the fungous Flesh by corroding it, but in a very gentle manner; for the corrosive Points of the Spirit of Nitre are rubb'd down by Fermentation, and blunted by the Olive-oil. But, if it shall seem necessary, that Balsam may be render'd still weaker and weaker, and by that means less corrosive, if, by repeated Ablutions, the acid Points of the Spirits of Nitre are wash'd off. *Astruc.*

The BALSAMUM CHALYBIS is thus made.

Take of double Aqua-fortis, three Ounces: Put into this Needles, made of the purest Steel, which may be known by their Brittleness, till a small Ebullition is raised. Then add three or four Ounces of the best Olive-oil. Mix them to the Consistence of a Balsam. When cold, dulcify it, by repeated Washings with Water; by which its corrosive Quality may be taken off to what Degree the Compounder pleases.

BUBONIUM. See **ASTER ATTICUS.**

BUBONOCELE, *Βυβονοχήλη*, from *βουβων*, the Groin, and *χήλη*, a Tumor, is a soft Tumor in the Groin, caused by a Wound or Rupture of the Peritonæum, which was never conglutinated. If it arises about the Navel, the Patient has the Epithet of *Exomphalios* bestow'd upon him by some Physicians.

The Falling down of the Intestines, occasion'd by a Rupture of the Peritonæum, is a difficult Case; but if it be owing to the Thinness of its Contexture only, it is more easy to be cur'd, especially in Children, as they abound with Humidity.

While the Intestine continues above the Groin, the Disease is nam'd *Bubonocèle*; but, when it descends into the Scrotum, it is call'd an *Enterocèle*. *P. Æginet. Lib. 3. Cap. 53.*

An *Enterocèle*, occasion'd by Distention or Stretching of the Part, is preceded by a *Bubonocèle*; for the Peritonæum being distended, the loosen'd Intestine falls upon the Groin, and constitutes a *Bubonocèle*. *P. Æginet. Lib. 6. Cap. 66.*

Dr. Freind has the following Remarks upon the *Bubonocèle*, or Inguinal Hernia, which are too curious to be omitted.

An Inguinal Hernia, according to all Authors, is only the Beginning of an Intestinal; the Gut, they say, must descend by the Groin first, before it can pass into the Scrotum; and therefore *Paulus* says, that a *Bubonocèle* always precedes an *Enterocèle*. Accordingly all Anatomists, as well as Surgeons, have agreed, that in a *Bubonocèle* the Gut comes down thro' the Rings or Perforations of the Abdominal Muscles. But tho', no doubt, this be often the Case, yet perhaps, if we examine the Matter a little more nicely, we shall find, that the Gut may take another Course; hitherto unobserv'd, to produce a *Bubonocèle*. The Cavity in the Thigh between the Muscles *Pectineus* and *Sartorius*, where the Crural Vessels descend, is very remarkable: And the Tendons of the Abdominal Muscles lie so loose, that there is nothing but a little Fat, and some membranous Fibres, which separate it from the Abdomen; so that we see how easy it is for the Peritonæum to be forced down by any Pressure, thro' this Interstice into the Cavity we have describ'd; especially since, considering our erect Posture, it lies in a more direct Line than even the Rings of those Tendons. And if we compare the Accounts of those very Authors, who think that a *Bubonocèle* is always formed in the Processes of the Peritonæum, we shall find them often agree to this Place only.

Aquapendente remarks, that a *Bubonocèle*, and a *Varix* of

the Crural Vein, have often been mistaken for a *Bubo*; in which Case, upon Incision, the Vein or the Gut has been cut, so as to endanger the Person's Life. *Buboes*, we all know, are always in those Glands which lie upon the Crural Vessels; and therefore 'tis plain, he thinks, in many Instances, that a *Bubo* and a *Bubonocèle* are in the same Place, that is, in the Place we have taken Notice of. Upon this Account too it seems to be, that *Celsus* call'd a *Bubonocèle* a *Varix Inguinis*.

The late Mr. Serjeant *Bernard* was concern'd in a Case, where the Gut reach'd under the Skin down to the Middle of the Thigh; in which Instance it must descend through the Interstice, under the Tendons of the Abdominal Muscles; for, if it had come down through the Rings, it must have gone directly into the Scrotum, and not turned down the Thigh. And *Barbette* seems to imply this Way, tho' he has express'd it with the same Obscurity as other Writers do, when he says, *Experimur etiam processum Peritonæi ita posse dirumpi, ut Intestina non in Scrotum, sed inter Cutim & Musculos, versus Femur, sese urgeant.* Where by the Words, *processum Peritonæi*, if he means the Productions which arise from the Vaginal Coat, we have seen, that the Gut cannot get into the Situation he describes. Perhaps it may give us a little more Light into the Matter, if we consider the Inguinal Hernia in Women. *Fallopious* deduces it from the round Ligaments of the Womb, which make the same Perforations in the Tendons of the Abdominal Muscles of that Sex, as are in those of Men. 'Tis very true, they do, but not in the same Place; for these Rings in Women lie just upon the Os Pubis, and the Ligaments, as soon as ever they are pass'd through them, are strongly inserted with the Tendons into the Bone. So that, by the Straightness of the Passage, there seems to be little room for a Hernia here: and if there were, the Gut must lie just forward upon the Os Pubis, as indeed we find sometimes it does, even as far as the very *Labia Pudendi*. But I believe in such Ruptures it will be found generally to take its Course much more aside, towards the Os Ilium. And therefore *Celsus* expressly says, that a Hernia in Women *fit præcipue circa Ilium*. That the Peritonæum may be distended in this Place, is plain from the Account *Nuck* gives us of a Dropsy in this Membrane, which spread itself, he says, and form'd a Sack in the Thigh, *per vacua musculorum spatia*. And *Hildanus*, in explaining the Reason of a *Hernia Uterina*, thinks the Extension of the Peritonæum happen'd *circa foramina illa, circa quæ Bubonocèle fit in Mulieribus*: and if we compare these Words, which are ambiguous enough, and perhaps left so on Purpose, with a Description of the Posture which is given of the Tumor, we shall find them only applicable to the Interstice we speak of. How capable the Peritonæum is of a large Distention, an Ascites alone will sufficiently convince us; and that such a Distention as there is generally in the present Case, without any Rupture, may happen, not only at its Productions in the Groin, or the Navel, we may find sufficient Proof in the Writers of Surgery. *Barbette* gives Instances of such Hernias in the Back, above the Navel, below the Navel, *longe supra Ilium*, he says, which have been by Mistake cut for an Abscess. *Paulus* indeed distinguishes the Intestinal Hernia, as it proceeds either from a Rupture, or a Distention of the Peritonæum; and says expressly, that the Operation by the Knife is only to be attempted in the latter Case. But whoever with Attention considers the Anatomy of these Parts, must, I think, be of a quite contrary Opinion; for in a Rupture of the Peritonæum, if the Operation be perform'd, and the Gut once reduced, we may conceive how all the Parts of the Peritonæum, as well as the rest, may be so healed and united, as not to give way to any Descent of the Gut for the future. But in the Case of Distention, if, after the Operation, the Peritonæum remains distended, as it must, how is the Return of the Hernia prevented? To form a right Notion of such a Distention, one ought to see the curious Preparations of that diligent and accurate Anatomist Dr. *Douglas*, who is the first who has given us any true Idea of the Peritonæum, a Part which is so much concern'd, and whose Structure should be so much consider'd, not only in this Operation, but in the High-way for cutting for the Stone. *Freind's History of Physic.* See the Account of the *Hernia Cruralis*, in the latter Part of this Article.

A Tumor proceeding from the Falling down of the Intestines, or Omentum, or both together, through the Processes of the Peritonæum, towards the Groin, is call'd by Physicians a *Bubonocèle*, taking its Name from *Bubo*, as resembling that Disease. Some, with *Celsus*, have call'd it a Rupture of the Groin, or a *Hernia inguinalis*. Others have nam'd it an *incomplete Hernia*, distinguishing it from that perfect Hernia, which in Men is form'd by the Falling down of the Intestines into the Scrotum; tho', to speak the Truth, the former of these Disorders wants nothing to make it a *complete Hernia*. Commonly there is a Prolapsus, or Falling down, of the small Intestine only; but sometimes it is attended with that of the Colon, and the Cæcum, especially on the Right Side of the Groin, of which I have known some Examples. And not only

only Men, but Women also, are frequently affected with such Ruptures, and that to so great a Degree, that the prolapsed Intestines have sometimes penetrated to the very Labia Pudendi. And not only *Ruyfch*, but *Petit* and *Arnaud*, have observ'd a Prolapsus of part of the Bladder; and *Hildanus*, as well as *Ruyfch*, mention a Falling out of the Uterus into the Groin. We ought therefore to be extremely cautious, lest by mistaking a Bubonocoele for a Bubo, or any other like Tumor or Abscess, we make an Incision in the Part, and so, by perforating the Intestine, destroy the Patient. This is a Caution given by *Fabricius ab Aquapendente*, as well as by many modern Authors.

A Bubonocoele arises from two different Causes; for sometimes the Perforations in the Muscles of the Abdomen, through which the Processus of the Peritonæum, and the spermatic Vessels, pass, or those which transmit the Crural Vein and Artery, are by Degrees, and almost insensibly, by various Causes, relaxed, in such a manner, as to give occasion for the Intestines, together with the internal Membrane of the Peritonæum, to break through. Sometimes on a sudden, and by violent means, as Leaping, a Fall, a Blow, Overstraining in moving or lifting great Weights, or any other way, a Cough, Vociferation, blowing a Wind-instrument, Riding, violent Gestation, eager and immoderate Venery, Vomiting, or any other forcible Way, the Peritonæum, in the Places before described, is either lacerated, or, according to the general Opinion of the Moderns, so far distended, as to make way for a Falling thro' of the Intestines, sometimes with, and sometimes without the Omentum. Sometimes only one Side of the Intestine, opposite to that which joins the Mesentery, is engag'd in the Perforations or Rings, as *Morgagni* and *Ruyfch* observe, and of which *Mr. Littre* relates a History in the Memoirs of the Academy of Sciences for 1700.

When this Disorder comes on slowly, and by Degrees, the Patients for the most part feel no great or frequent Molestations or Inconveniencies; but if they become sensible of the Distemper on a sudden, or, after they have long been afflicted with it, expose themselves too much in the Cold, use violent Motion or Straining, fall into a violent Fit of Anger, as I have observ'd, or make too plentiful a Meal, especially on gross Aliments, and such as are of bad Juice, they commonly suffer very severely from it. For not only the Intestines are miserably distended by the Fæces, but sometimes the Openings or Perforations, through which the Intestines fall, are streighten'd to such a Degree, as to compress the Intestines in an extraordinary manner, so as to hinder them from transmitting any of their Contents, and even to stop the Circulation of the Blood in their Veins. Such a Case must almost necessarily be attended with a great Inflammation of the Intestines, Pains, Inquietude, violent Vomiting, and the Iliac Passion, commonly called the *Miserere mei*, just in the same manner as these Symptoms are excited by an *Omphalocoele*, or *Gastrocœle*; and so there is form'd a sort of *Hernia incarcerata*, as Physicians call it. Here take Notice by the way, that they who labour under a Hernia of the Scrotum, are often exposed to the same Inconveniencies; for which Reason all Persons afflicted with a Hernia, whether it be of the Navel, the Groin, or the Scrotum, ought never to go without a proper Girdle, Fillet, Bandage, Bracers, or Truss; and, after they have worn them, should be very cautious of leaving them off, for fear of exposing themselves to the Danger of a *Hernia incarcerata*, which very often destroys the Patient; tho' it cannot be deny'd, that such Disorders may sometimes happen to those who are secur'd by Bandage or Trusses, on occasion of hard Riding, or any other violent Commotion of the Body, by which the Truss is broken, or mov'd out of its right Place, or loosen'd in such a manner, that the Intestines force a Passage out of the Abdomen. Such an Accident once happen'd to the Duke de Villeroy, a Marshal of France, while he was hunting, as *Dionis* tells us in his Book of Surgery, where he treats of Hernias. Persons therefore under such an Affliction, should either ride not at all, or be very cautious in riding.

A Bubonocoele, or *Hernia Inguinalis*, is commonly known by the following Signs: There is a Tumor in the Groin, which extends itself to the Ring of the Muscles of the Abdomen; and, when it is not incarcerated, is sometimes visible, and then again disappears, according to the different Situations and Motions of the Body. When we apply our Hand, we plainly perceive an equally hard Prominence, not unlike an inflated Intestine. As the Disorder gradually increases, the Tumor, when gently depressed with the Hand, and especially when the Patient lies upon his Back, quite vanishes, retiring into the Abdomen with a sort of rumbling Noise. But when there is only a Prolapsus of the Omentum, the Tumor is commonly softer, and like Fat to the Touch, and not mutable in Bigness, like that of the intestinal Hernia, but, for the most part, constantly appearing the same. When there is a Prolapsus of both the Omentum and Intestines, there is almost constantly a soft kind of Tumor, which remains after the Intestines are replaced. A *Hernia* which happens suddenly,

and an incarcerated *Hernia*, are known by the following Symptoms: The external Tumor, sometimes when only excited by the Omentum, is remarkably red, with a Hardness and Inflammation. The Patients suffer most intense Pains, both internal and external, attended with a vehement Heat, or a Fever; and commonly violent and obstinate Vomiting, quickly succeed, first of the Aliments, and natural Contents, and at last of the Excrements, with extreme Anguish and Agitations, under which the Patients are very much weaken'd, and faint at every Turn, till, falling into a cold Sweat, and Refrigeration of the whole Body, they at last expire, unless seasonably reliev'd.

As *Hernias* in general are accounted shameful Diseases, so especially are those which affect the Pudenda regarded as such, and therefore usually kept secret. The Event also of this Distemper is usually doubtful and dangerous, especially when it is degenerated into an incarcerated *Bubonocœle*. If the Intestines are not as yet intercepted or engag'd, and the *Hernia* comes on gradually, the Disease is the milder, and less dangerous, especially when the Intestines, after being replaced, are secur'd and restrain'd by some proper Truss or Bandage, which must be constantly worn for a long while. The Disorder, however, is very troublesome, and renders the Patient unfit for many kinds of Business; besides, it is to be fear'd, that the *Hernia*, tho' never so favourable, should by too streight a Constriction of the Tumor by the Truss by little and little, or perhaps on a sudden, degenerate into a *Hernia incarcerata*, attended with all the foremention'd dreadful Symptoms. In a *Hernia incarcerata*, if the Intestines be not seasonably replaced, commonly after the second or third Day, and sometimes sooner, a violent Inflammation seizes the Parts, which in a very short time destroys the Patient; for which Reason we must be speedy in our Assistance, and if the Distemper be too stubborn to yield to Medicines, and the Symptoms are very threatening, we are not to delay the Operation, but enter upon it sometimes before the End of four-and-twenty Hours; for when the Strength of the Patient is exhausted, and red and black Spots appear on the Tumor, a Sphacelus is indicated, and a cold Sweat, and total Refrigeration of the Body bring on Death in a very few Hours. In such Circumstances, therefore, not only all Assistance from the Surgeon is useless, but it is greatly to be feared, lest the Patient should expire under an Operation sufficiently dangerous of itself, and so the Cause of his Death, which ought rather to be ascribed to a Sphacelus of the Intestines, should be rashly and inconsiderately imputed to the Operation. But when the Symptoms are more mild, and less urgent, and the Patient is yet sufficiently strong, the Use of the Knife may be deferr'd. When the Omentum falls out with the Intestines, there is commonly less Danger, than when there is an Incarceration or Coarctation of the bare Intestine, tho' sometimes a Prolapsus of the Omentum alone has excited the Symptoms of a *Hernia incarcerata*, as is observ'd by several Authors in Cases where after Section they discover'd nothing but a Prolapsus of the Omentum. But as soon as the Tumor, the Redness and Hardness of it being in some measure diminish'd, begins to grow black, with a kind of Softness, or appears with red, livid, or blackish Spots, as we said before, and has lost the Sense of Feeling, and a continual Vomiting, with a Fever, afflicts the Patient; if the Pulse be weak, and the Eyes look disturb'd, and, as it were corneous, we ought to consider these Symptoms as manifest Indications, that the Intestines are already seiz'd with a Sphacelus. If the Inflammation be communicated to the interior Parts, which is conjectur'd by the Distention of the Belly, and the Elevation of the Navel, there is little or no Hope of Life. And in the last Place, where there is a Coalition of the prolapsed Intestines with the other Parts, the Method of Cure by the Knife usually proves very doubtful and difficult, because the Intestines can very seldom or never be replaced within the Belly, unless by means of the Knife they are separated from the Parts to which they adhere, which is sometimes impossible to be effected, especially in a *Hernia femoralis*, when the Intestines have made a Coalition with the Crural Vein or Artery, as *Garengot* has observ'd. They may therefore be thought to be in the right, who are of Opinion, that the Antients never undertook a Chirurgical Operation of this kind; for neither *Celsus*, nor *Paulus Egineta*, nor any other of the Antients, as far as I know, have mention'd it. However, because this Method of Cure has been often found to be of Service, tho' attended with many and great Difficulties, we think that in due Season it ought by no means to be neglected.

There are, in general, three Methods of Cure, which are to be chosen according to the Degrees and Age of the Distemper. Where the prolapsed Intestines may be commodiously restor'd, the Method of Treatment may be as follows: The Patient being laid upon his Back, with his Thighs somewhat bended, that the stretched Skin may have Liberty to relax, the prolapsed Intestines, with all that belongs to them, are to be taken with the Hand in the softest manner imaginable, and repressed

repressed into their proper Situation with all possible Gentleness; after which a glutinous Plaster, with a Bolster, must be laid on the Part which transmitted the Intestines, and fasten'd and secured by a fit Bandage, or Truss, furnished with its Bolster, or Escutcheon, various Sorts of which are represented *Tab. 46.*

This Instrument by keeping the Belly, and the relaxed Parts, in a firm and proper Constriction for several Months together, if the Patient be a Child, and oftentimes in adult Persons, effects a Conglutination, and a perfect Cure, or at least so contracts and streightens the Aperture, that the Intestines no more falling out, the Abdomen, and the relaxed Part, are in a great measure restored to their former Tone and Vigour. It is certain, that Infants, Children, and young Persons, or such as are not much above twenty Years of Age, may for the most Part by this Method, with the greatest Ease and Success, be restored to a perfect Soundness; and consequently, there is no Necessity of immediately subjecting them to a cruel Section under the Hands of strolling Quacks and Mountebanks, since a much milder Treatment would have done the Business; besides which it ought to be consider'd, that the sole Aim of these Pretenders is to extort as much Money as they can for the Cure, which costs the Patient a Testicle, and oftentimes his Life. Elder Persons, who have once experienced the Method of Cure by Trusses, ought to be very cautious how they leave them off during their Lives, unless they have a Mind to run over a new Course of Pain and Trouble; and they ought no less to avoid all violent Agitations of the Body. Numbers of Persons, who have formerly labour'd under a Hernia, with due Caution, and the Help of a proper Bandage, have been enabled to follow Business, and live to a good old Age. As for young Persons of twenty Years of Age, or more, if the Disease be but newly contracted, I have very often known them to be happily cured by wearing proper Bracers (*Bracheria*). *Heister. Chirurg.*

BUBONOCLE, or HERNIA INGUINALIS, INCARCERATA.

If the Hernia be incarcerated, or intercepted, whether it be by the Ring of the Muscle of the Abdomen, or, as *Le Dran* observes, by the upper Part of the Sack itself, which contains the prolapsed Intestines; and the Circumstance is such, that not only the Patient suffers most acute Pains, but the Intestines cannot conveniently be reduc'd; some immediately betake themselves to the Knife, for enlarging the Opening thro' which the Intestines are thrust out, in the same manner as is directed for the *Omphalocele*. However, because the Cure of a *Hernia incarcerata* principally consists in restoring the prolapsed Intestines, or Omentum, with all that belongs to them, to their former Situation, it is the Part of a prudent Physician first to try milder Remedies, before he proceeds to so painful and dangerous an Operation. Therefore, besides Phlebotomy, which is often of very great Service in this Case, and the same, if necessary, repeated, there ought to be frequent Applications of mollifying Oils, Ointments, or Cataplasms; and the Belly is to be evacuated by Clysters, till both the Intestines, and the Openings thro' which they burst, being sufficiently mollify'd, all that is removed from its proper Situation may, by means of the Fingers, be reduced to their proper Place within the Abdomen; and the most convenient Way of Operation for this Purpose is as follows: The Patient, having first made Water, is to lie on his Back, with his Head depressed, his Hips pretty much erected, and the Thigh of the affected Side a little bent: then the Intestines, by Application of the Fingers upon the Tumor, and, as it were, circularly agitating the same, are to be repressed towards the Os Ileum, and restor'd to their proper Situation. This done, that Part of the Abdomen whence the Intestines burst forth, is to be very carefully held by an Assistant, that the reduc'd Parts may not break out again; and, in the last Place, a proper Bandage is to be made, by applying a glutinous Plaster, with a thick simple or double triangular Bolster, upon the defective Part, and securing their firm Adherence, bringing over them a kind of Fillet, which they call *Spica Inguinis*, or Straps of Leather. This Bandage must not be left off without the utmost Caution, but must be worn for a long while, and, if the Age of the Patient requires it, during Life. But if the Intestines cannot be reduc'd by the foregoing Method, it will not be amiss to attempt the Cure by means of a Clyster of the Smoke of very strong Tobacco, continually injected into the Anus for a sufficient Time; by Help of a peculiar Machine, represented in *Tab. 55. Fig. 13.* By Help of this Instrument I have cured several, and, among the rest, a Man upon whom all other Clysters had no Effect, and who, for three Days, had suffer'd the most tormenting Pains from an *Hernia incarcerata*; and, on account of the intolerable Fœtor of his stercoraceous Vomitings, and the extreme Weakness of his Body, was given over by all who attended him. And I have since restor'd several others by means of this Fume of Tobacco, so that hitherto I have had no Occasion to make use of the Knife in these Cases. *Gladius* supposes, that the prolapsed Intestines may very commodiously be restored, by means of frequent

Applications of Linen Cloths, dipt in cold Water, to the Tumor. This Method, while the Disease is recent, I believe, may not be altogether ineffectual; but, where the Intestines have contracted any Corruption, I am of the contrary Opinion.

When the prolapsed Intestines cannot be reduced by the foregoing Method, which is sometimes the Case, as when the Tumor is grown too hard, and the Inflammation, with the Pains, and stercoraceous Vomitings, are come to a great Height, it is the Part of a prudent Physician to inform the Friends and Relations of the Patient, of the great Danger of the Case, and of the Necessity of having recourse to the Knife, not forgetting to represent also the Difficulty of an Operation of this kind. And this is to be done in Season, before the Patient be grown too weak, or the Intestine corrupted, and the dubious Hopes of Life, by Delay, converted into Fear of present Death; that the Destruction of the Patient may not be imputed to the Surgeon, when it was impossible to save him. When, therefore, the Patient, with the Consent of his Friends, is willing to submit himself to the Operation, he is, first of all, to empty his Bladder, lest, being distended with Urine, it should hinder the Regress of the Intestines, or be hurt with the Knife. The Urine, then, being discharg'd, the Patient is to be laid on his Back, on a Table, or the Side of a Bed, and the Groin, if hairy, shav'd, that the Hairs may not be an Impediment to the Operator. Then, the Head being depress'd, and the Hips rais'd, the Patient is to be firmly held by some of the strongest Assistants, the Thigh adjacent to the diseas'd Part being a little bent, in order to avoid too great a Distention of the Skin. After this, the Surgeon takes up the Skin, together with all the Fat, on one Side of the Tumor, whilst an Assistant does the same on the other, and, raising it as much as possible, makes a strait Incision with the Knife thro' the Middle of the Tumor, and afterwards widens the Wound, both upwards and downwards, as much as he thinks sufficient. But if, by reason of the Violence of the Inflammation, the Skin cannot be taken up in the manner aforesaid, as it sometimes happens, the Operator takes hold of the Tumor with the Thumb and middle Finger of his Left Hand, and, with the greatest Caution, and Steadiness of Hand, drawing the Knife downwards, makes a strait Incision over the Middle of the Tumor; but so slight a one, as only to divide the Skin, which, in these sorts of Tumors, is usually very thin, for fear of cutting the Intestines, which sometimes happens, and endangering the Life of the Patient. The Skin being a little divided, in the manner directed, a groov'd Probe is to be introduc'd between the Skin thus divided and the Tumor, and the Wound enlarg'd, with the Knife or Scissars, above and below. After this, the Lips of the Wound being kept asunder, by Hooks, on each Side, and the Knife laid aside, to avoid injuring the Intestines, whatever Portion of Fat, or of the Membrana Cellulosa, may be found cohering, must be carefully separated, by means of the Probe, the Spathula, the Handle of a Knife, or the Nails of the Fingers, till the Intestines, or, what more frequently happens, their Integument, which is a Dilatation of the Peritonæum, and call'd the *Bag*, appears in View. The modern *French* Surgeons, as *Garengot* assures us, gently and warily divide the Laminæ of the Membrana Cellulosa, that this Part of the Operation may the sooner be over, not with a blunt Instrument, but with the Incision-knife, which they draw along, not in a perpendicular, but oblique, Direction, till they come to the Bag before-mention'd, when the utmost Circumspection is requir'd, in order to avoid wounding the Intestines with the Knife. While we are cutting this Integument, or Bag, it seems necessary, for the Security of the subjacent Intestines, to pinch it up a little between the Thumb and fore Finger of the Left Hand, and, with the Knife, or Scissars, warily applied, make a very slight Incision, or only a small Perforation. While this is doing, the Surgeon ought not to be terrify'd, if any thing like Serum, or Water, should happen to gush out, as if he had wounded an Intestine, (for some sort of aqueous Liquor almost constantly occurs) but must go on with the Operation, in cutting up the Bag, till he comes to the Perforation, or Annulus of the Abdomen, which is done by means of a Pair of Probe-scissars, or a Knife, either strait or crooked, introduc'd by Help of a groov'd Probe, or a Knife arm'd with a Button, (see *Tab. 26. Fig. 3. 4. and 5.*) which *Garengot* prefers before all other Instruments, or by the Scissars, or Knife, introduc'd upon the Finger. If, during this Incision, any little Blood-vessel should happen to be cut, and, by bleeding plentifully, hinder the Operation, it must be compress'd, by an Assistant, with his Fingers alone, or a Bolster under them; or a Ligature may be made on the Vessel with a Needle and Thread, and the Blood must be absterge'd with a Sponge, or Linen Rags. This being done according to Art, the next thing is, by a gentle Compression of the Fingers, to force back the Intestines, if they have escaped sound, thro' the Ring of the Muscles of the Abdomen. In this Attempt, if the Surgeon be hinder'd by the included Fœces or Flatus, he must first try to remove them by gentle means; but, if such a Method prove ineffectual, the Place of the Prolapsus, that is,

the Opening, or Ring of the Muscles of the Abdomen, must be enlarg'd to a sufficient Breadth with the Knife, but with Caution, and inwardly, or towards the Linea Alba, for fear of cutting the Epigastric Artery, which runs along the Outside, and thereby causing an immoderate Effusion of Blood. But if this should happen, the Blood must be stop'd by a Pledget of Lint, arm'd with a styptic Liquor, and by Compression against the Os Ileum. If there be an Adhesion of the prolapsed Parts externally, they must be loos'd with the greatest Caution. The Instruments proper for dilating the Annulus are the Knife, or the before-mention'd Instruments; and, for Defence of the Intestines, are the Probe, with a Plate in the Figure of a Heart, (Tab. 45. Fig. 8.) or *Morandus's* Knife, (Tab. 45. Fig. 9.) or that of *Le Dran*, (Tab. 45. Fig. 10.) inclosed in a Sheath, as in a sort of hollow Probe. For some time those Knives, which are delineated, (Tab. 46. Fig. 1. and 2.) and are inclosed in Sheaths, were very much in Request for this Purpose. The first of these is here represented, (Fig. 1.) conceal'd within its Capsula (A. C.), which, after its being introduc'd into the Place of the Prolapsus, by pressing the Plate (B.), comes out of its Capsula, as is shewn, (Fig. 2. A.) and makes an Incision in the Place of the Prolapsus, whether it be the Ring of the Muscles of the Abdomen, or the upper Part of the Bag, in which the Intestines suffer a Strangulation. But, because the interior Parts are more subject to be cut and wounded, when the Point of the Instrument first comes forth and cuts, than the Part which compresses the Intestines, the former Instruments are now justly look'd upon as the most convenient. But lest the Intestines, as being remarkably lubricous, should happen to rush out, and fall upon the Knife, while we are busy in using the simple groov'd Probe, or *Morandus's* Knife, (Tab. 45. Fig. 9.) they ought to be carefully repressed, and held down by an Assistant. For the same Purpose, under the Instrument represented (Tab. 46. Fig. 2.) is a Plate (D.), which afterwards *Messieurs Petit* and *Le Dran* imitated, and endeavour'd to correct; the first in a Probe, represented (Tab. 45. Fig. 8.), and the other is figur'd (Tab. 45. Fig. 10.). The Place of the Prolapsus being dilated, the Intestines are to be replac'd, and secur'd with Linen Compresses, triangular Bolsters, and the Bandage call'd the *Spica* (see FASCIA). Some first scarify the Annulus, in order to raise a firmer Cicatrix, by which the Return of the Hernia is the more easily prevented. This Practice I judge not to be altogether amiss, especially in a lax State of those Parts. And some there are who introduce a long Tent into the Opening of the Abdomen, and apply Bolsters upon it; which Method, in a recent and simple Disorder, I think is needless, or rather hurtful; as, on the other hand, in an inveterate and complicated Disease, where the Humours are vitiated and putrefy'd, and there is an inward Abscess, it may be convenient to use a Tent.

Tho' the prolapsed Intestines may be successfully replac'd by the Methods before propos'd, it will not be amiss to give a Description of other Ways, which some eminent Surgeons have try'd. Some, in Imitation, and by the Advice, of *M. Arnaud*, a famous Surgeon of *Paris*, having perforated the Skin, gently introduce a groov'd Probe, shut at the Extremity, as is represented (Tab. 22. M. and N.), under the Skin, and, cutting upon it with blunt-pointed Scissars, enlarge the Wound to a sufficient Wideness. Then taking hold of the Lips of the Wound with the Fingers of either Hand, with one Finger of the other they gently separate the Skin from the subjacent Tumor; and then cutting with the Knife, or Scissars, upon the Finger, divide the same as the Bulk of the prolapsed Intestines requires. After this, putting the middle Finger and Thumb of the Left Hand upon the Tumor, they take a sharp crooked Knife in their Right Hand, and, holding it a little on one Side, for the sake of better Light, and the more easily to avoid wounding the Intestines, or their Bag, they very cautiously cut thro' all the Tunics which inclose the Bag, which are sometimes more, sometimes fewer in Number, in proportion to the Inveteracy of the Tumor. If any Blood-vessels occur, they tie them in two Places before they cut them, that they may have no Impediment from an Hæmorrhage; and whatever Blood happens to flow from the Wound, is carefully wip'd away with Linen Cloths. Whatever Pieces or Scales of the Tunics adhere, on either Side, to the Bag, they are either pull'd off with the Fingers, or cut away by the Probe-scissars, introduc'd upon a groov'd Probe. This done according to Art in every Particular, the next thing is, with the Thumb and fore Finger, to take firm hold of the upper Part of the Coat of the Tumor, or the Bag of the Intestines, and distend it upwards. Near this Bag, separated from whatever adheres to it, and left entirely imperforated, the famous *M. Petit* introduces his groov'd Probe with a sheathed Point, under the Annulus, by which the Intestines fall out, and enlarges the Passages by the Method before prescrib'd. Then, taking hold of the lower Part of the Bag with his Hands, he gently depresses the Intestines therein contain'd towards the Os Ileum, and so, by Degrees, reduces them to their former Situation. The Intestines being thus reduced, for their better Security against a future Hernia, he represses

also the Bag, being first doubled, thro' the same Opening; (in which, as he assures us, it afterwards hardens by Degrees, and firmly closes it up) applying upon it a Linen Ball, made of Linen Thread, and cover'd with Linen Cloth, call'd by the *French M. Petit's* Pellet, which is first well moisten'd with the White and Yolk of an Egg, beaten up with a little Spirit of Wine, and afterwards squeez'd, and roll'd within the Hands into a cylindrical or oval Figure. By the Sides of this Ball, and also upon it, are plac'd other very small Linen Balls, or Lint; and, in order to their firm supporting and keeping in the diseas'd Parts, they are cover'd with three or four triangular Bolsters, one larger than another, moisten'd with Spirit of Wine; and the Whole is very exactly secur'd with the Bandage call'd *Spica inguinalis*.

But, if we may speak the Truth, this last Method of Cure, which does not permit the Bag to be open'd, is not approv'd of by me, nor by those who are better Surgeons than myself; and that, first, Because there is commonly a Coalescence on all Sides of this Bag with the Spermatic Vessels, which are easily injur'd in their Separation from it. (2.) Because the prolapsed Omentum, or Intestines, frequently contract a Corruption, which, if the Bag be left closed within the Abdomen, can neither be known, nor conveniently remedy'd, and, consequently, may be the Cause of the Patient's Death. (3.) Sometimes the Bag includes a large Quantity of fetid Ichor, which cannot be repell'd into the Abdomen without most manifest Injury; for *Chefelden*, a modern and very celebrated *British* Surgeon, writes, that he has found about two Pints of fetid Matter, like Lees of Oil (*Amurca*), in a Hernia of this kind, which, if repell'd, and clos'd within the Belly, would doubtless have prov'd mortal. (4.) The Intestines, and Omentum, in these Cases, often grow to the external Parts, and, if the Bag be not open'd, can neither be separated, nor reduced within the Belly. (5.) The Bag left entire, especially if it be large, may easily give Occasion to a new Hernia, and be a fit Receptacle for it. (6.) This Method, in case of a Rupture of the Peritonæum, is altogether unsuccessful. These, and other Reasons, were very fitly objected to *M. Petit* by *Manchartus*, Professor of Physic in the University of *Tubingen*, and formerly a Pupil of ours. And *Le Dran*, so often quoted, a Surgeon of *Paris*, does not at all approve of this Method; first, because no particular Advantage can be perceiv'd to attend it; and, secondly, because, if the Hernia be incarcerated for several Days, the Intestine is often corrupted with a Sphacelus, in which Case the vitiated Parts of the Intestine are separated, and fall off, as it often happens, or at least ought to happen, if the Patient recover; and the Chyle and Excrements would then be discharg'd into the Cavity of the Abdomen, and so necessarily destroy the Patient. For these Reasons I think it a better Way, for the most part, especially if the Disease be inveterate, and the Tumor large, to open the Bag, than to leave it entire; and I am of Opinion, that *Petit's* Method can safely be used only when the Disease is recent, and where there is no Corruption of the Intestines, no Concretion; and no Abscess; and *Garengeot* himself, in the second Edition of his *Chirurgical Works*, confines this Method of Cure within the Limits of these Observations.

Cyprianus, an eminent *Dutch* Physician and Surgeon, who spent the last Part of his Life in *England*, and to whom I am oblig'd in Gratitude, for what I there learn'd of him, practis'd much in the same manner as I have directed above for this Distemper, by opening the Skin, and Bag of the Peritonæum; but, instead of a Probe, or Conductor, he us'd his Finger as the best Conductor, in order to enlarge the Wound in the Bag and the Skin. But when the Opening, or Ring of the Muscles of the Abdomen, was not large enough for reducing the prolapsed Intestines, he first introduc'd a groov'd Probe, with a Knife, for dilating the Ring; and then cutting upon his Finger with the Scissars, divided the Skin, Fat, Muscles, and Peritonæum, till he had made a Passage wide enough for reducing the Intestines without any manner of Violence. For he much recommended wide Incisions in this Case, so far as were sufficient for restoring the Intestines without much Trouble, and almost without any Pressure; since, if the Dilatation were too narrow, there would be too great a Compression and Collision of the Intestines, in our endeavouring to reduce them; which might easily give Occasion for dangerous Inflammations, Gangrenes, and Death itself. Whenever he discover'd a Coalition of the great and small Intestines with the external Parts, he very dexterously separated them with the Knife, and then replac'd them in the Belly; after which he closed and conglutinated the Wound, by means of the knotted Suture, as is practis'd in *Gastrostomy*. And not only *Celsus* has recommended this Suture in the Cure of this Disease, but the famous *Rouset* has directed it in a Hernia incarcerated; and the very learned *German* Physician and Surgeon *Roalsfincius*, a hundred Years ago, practis'd the same with Success, in the like Disease.

That celebrated *British* Surgeon, *Chefelden*, after the Example of *Rouset*, in curing an *Hernia incarcerata*, where the Intestines and Omentum were fallen out, open'd the Belly, that

is, the Skin, Fat, Muscles of the Abdomen, and the Peritonæum, with the Knife, by making a great and strait Incision above the Ring of the Muscles of the Abdomen, as far as the Place of the Prolapsus, and thro' this Wound introduc'd the prolapsed Intestines with his Finger. As for the Omentum which adher'd, he perforated it with a Needle carrying a double Thread; then ty'd it, and cut it off; and, by these means, happily restor'd the Patient. He has publish'd the whole Process in his Book of Anatomy, and illustrated it with Cuts; but whether he conglutinated the Wound by a Suture, as I suspect, or by any other Way, he does not inform us; and it were to be wish'd, for the sake of the Public, that he had given a fuller Description of so extraordinary an Operation and Cure, for the Improvement of the Art of Surgery.

The Intestines being, by some way or other, restor'd to their former Situation, as was directed, some use to make frequent Incisions and Scarification with the Knife, or Scissars, in the upper Part of the Ring, with this View, that a more firm and solid Cicatrix may be rais'd upon the Wound, in order to prevent a new Hernia; but a great deal of Care is to be taken, during this Operation, that the Intestines do not fall out afresh, or be cut. For avoiding these Accidents, they ought, in the first place, to be carefully held, and kept in with a warm Towel; after this, the Remains of the Tunic of the Bag are to be separated, then ty'd with a Thread near the Ring, and cut off below the Ligature; what is superfluous in the Skin must also be taken away. The Wound is then to be dress'd with Pledgets of Lint, and particularly the Ball or Pellet of *Petit*; and these are to be secur'd with thick triangular Compresses, and the Bandage call'd *Spica inguinalis*. When the Wound is thus dress'd, the Patient should be put to Bed, and some Hours after he should lose some Blood, unless already very weak. During the whole Course of the Cure, the Patient should lie very still, with his Head somewhat low, and his Diet should be spare, and easy of Digestion, as in other large Wounds. Then, if the Patient should not have sufficient Stools naturally, they should be every Day procur'd by emollient Clysters; and, if the Patient should continue without any bad Symptom for four or five Days after the Operation, we may reasonably expect a Cure will succeed; to promote which, it will be prudent to purge the replaced Intestines of all vicious Humours, by some proper laxative Medicine, administer'd during the first Days; but if Hiccoughs, and a Fever, supervene, we may be certain, that the Patient is in imminent Danger, and, perhaps, not to be sav'd by the most effectual Remedies, tho' immediately apply'd.

With respect to the Dressings, the following Cautions are to be observ'd: First, the Dressings should not be remov'd, without urgent Necessity, during the two or three first Days, unless any noxious Humours contain'd within, or any other sufficient Cause, render it proper to open it the second Day; but when the Wound is open'd, it may be cleansed of its Sordes with warm Wine, or Spirit of Wine; and the Remainder of the Cure is to be perform'd as in other Wounds: But care should be taken at every Dressing, which ought to be but once a Day, or once every other Day, to place the Patient with his Hips elevated, and his Head depressed, whilst an Assistant compresses the upper Part of the Wound, to prevent the Intestine from falling out again, and this till the Cure is perfected. When the Wound is heal'd, if the Patient be young, he should wear a proper Truss for a Year or two; but if an Adult, or old Person, the Truss should be wore during Life. But I must not omit taking Notice, that some think fit, immediately after the Operation, before the Wound is dress'd up, to anoint the whole Abdomen with warm Oil of Roses, and then to cover it with warm Linen Cloths, which does not appear to be absolutely necessary.

Many of the most considerable Surgeons of *Paris*, as *Dionis*, *Mery*, *Arnaud*, *Thibot*, and others, advise the Use of a large Linen Tent, after the Operation and Reduction of the Intestine, which being of a considerable Length and Thickness, and fasten'd to a Thread, is to be introduced into the Abdomen, to keep open a Passage for the Vent of such Humours as may be contain'd within. *Widenman*, a modern German Surgeon, and *Dionis*, direct the Tent to be made about an Inch and a half long, and an Inch thick; and tell us, that it ought not to be extract'd, but to be left in till it falls out spontaneously by Suppuration; but *Petit* condemns the Use of them as pernicious, by irritating the Parts, and admitting the external Air, which may do Injury in the Abdomen: Yet I cannot forbear thinking the Use of them very proper, when there is, as it frequently happens, a Discharge of putrid Humours to be made from the Abdomen, in which Case *Le Dran* also approves them; otherwise the Tent may be omitted, and it may be sufficient to apply, according to *Petit's* Method, a thick Pallet or Ball only, for the more speedy Agglutination of the Wound, together with the above-mention'd Bolsters and Bandage.

If in the Operation, upon opening the Bag, the Omentum appears to be suppurated or enlarged, so that it cannot be replaced, a Needle, with a double Thread, is to be pass'd round the sound Part, and tied on each Side, and the vitiated Part afterwards is to be cut off; but the sound is to be returned,

leaving the Thread hanging out of the Wound. The rest of the Treatment must be the same as in other Wounds of the Abdomen, attended with a Suppuration of the Omentum. But if the Omentum is only corrupted, but not thicken'd, the corrupted Part may be left out of the Wound without a Ligature, and the sound return'd; and the corrupted Part will separate, and fall off spontaneously by Suppuration.

But if the prolapsed Intestine itself be found already mortified or corrupted, as sometimes happens when the Operation has been too long delay'd, the Patient is then in the utmost Danger; for, under these Circumstances, the Patients generally die either under the Operation, or soon after. For this Reason they are usually deserted by the Surgeon, upon a Supposition of the Impossibility of doing any Service, and the Apprehension of putting them to farther unnecessary Pain: But as it is better to attempt a doubtful Cure, than abandon the Patient to certain Destruction, and as replacing the Intestine in this mortified State would be attended with certain Death, the Surgeon should cut off the mortified from the sound Part of the Intestine, and stitch the superior Part of the latter to the Edge of the Wound, in the manner specified for Wounds of the Abdomen; by which means many have been known to survive the Disorder, and regain Health, tho' there was little or no Hope of their Recovery. We are encouraged to this Practice, not only by our own Experience, but also that of others: Besides, we are told by *Mery*, that a Man was happily cured, who had four or five Feet of his Intestine cut off, which was mortified in this kind of Rupture, and the sound Part joined to the Lips of the Wound in the abdominal Muscles. *Garengot* also takes Notice of a Man, whose Intestine being found mortified upon opening the Sack, and return'd by the Surgeon, in that Condition, into the Abdomen, he had soon after a Discharge of his Excrement by the Wound; and a Month afterwards the Flux, by the Wound, not only lessen'd, but the Lips of the Wound itself, being stopp'd with a Pellet or Ball, tied with a Thread, gradually heal'd in such a manner, that by untying the same, when there was Occasion, the Man survived, and had the natural Function of the Parts perform'd as usual, with but little more Trouble.

Le Dran observes, that it is a common Calamity among poor People, who have had the Misfortune of an incarcerated Rupture, to mistake it for an Abscess, and to treat it accordingly, without calling in the Assistance of any Physician or Surgeon; by which means they bring the Part to Suppuration, after intolerable Pains; and upon its discharging Fœces or Worms, which I have sometimes observed, they then implore the Help of the Surgeon. These, he says, generally require nothing more than the Ulcer to be cleansed daily, and treated with some vulnerary Medicine, cover'd with a Plaister of the same Kind; by which means many such Patients have been recover'd, more by Nature than Art, the Ulcer being entirely agglutinated and heal'd; whereas in others it has left an Aperture in the Groin, through which the Fœces, and sometimes Worms, are discharged, as it were, by a new Anus. In Imitation of Nature therefore, who, in this Case, often produces a happy Effect of her own Accord, *Le Dran* (*Obs. 60.*) does not return the corrupted Intestine into the Abdomen; since by this means the corrupted Parts, and the Fœces, falling into the Abdomen, would bring on the most dreadful Symptoms, and perhaps Death itself: Nor does he cut it off, but only, by Incision, dilates the Place, whose Narrowness occasions the Strangulation, that the Blood may have a free Course; and opens the corrupted Part of the Intestine, that the contain'd Sordes may have a free Discharge. Thus having applied vulnerary Medicines, Cloths dipp'd in camphorated Spirits of Wine, and proper Bandages, to the Parts, he waits a Separation of the corrupted Parts, and spontaneous Agglutination of the sound Intestine with the Lips of the Ulcer, since by this means a great deal of needless Labour may be avoided; but if the Surgeon should have injured the sound Intestine in the Operation, he then thinks it necessary to stitch the Intestine to the Lips of the Wound, which, inflaming, will more intimately unite with each other.

That the Parts will thus agglutinate, or join together, is confirm'd by a late Observation of *Ramdohr*, present Surgeon to his Serene Highness the Duke of *Brunswick*, who, some Years ago, cut off a large Part of a mortified Intestine in a Woman, who had an incarcerated Rupture, which broke of itself; and, joining the two sound Parts of the Intestine together, he inserted one into the other, and tied them together loosely with a String; and, replacing them in the Abdomen, drew them by the String to the Mouth of the Wound; by which means the divided Intestine inflamed, and surprisngly united, the Woman discharging her Fœces afterwards not thro' the Wound, but by the Anus, as before. The Woman afterwards lived in a State of Health, till, in about a Year's time, she died of a Pleurisy; and, upon opening her, the divided Intestines appear'd to be united with each other, of which he made a Present to me, together with Part of the Abdomen, to which they adhered; and I now keep them in Spirits, to convince such as are incredulous, and of a different Opinion.

If the Intestine should be prolapsed into the Scrotum, and so contorted or intercepted, that it cannot be reduced or return'd into the Abdomen, the Surgeon must, in this Case, have recourse to the Operation. The Reader may be furnish'd with more useful Observations upon this Subject in *Saviard, Obs. Chir.* 19. and 20. *Courtial, Obs. Pag.* 150. also in *Le Dran, Obs. Chir.* and three other Dissertations or Descriptions of Cases, in *Commere. Literar. Norimb. Ann.* 1735. *Pag.* 3. by *Werlhof*, Physician to the King of Great Britain, which are very learned, and worthy of the Reader's Perusal. *Heister.*

Mr. Sharp informs us, that the *Hernia Inguinalis*, and *Hernia Scrotalis*, are both call'd by the common Name of *Bubonocoele*, tho' this Appellation is only proper to the first. As this Author makes some Observations not taken Notice of above, and as the Opinion of our own Country Surgeons, whose Judgment is, I believe, inferior to none, will have some Weight in so nice an Operation as that now treated of, I shall give his Sentiments; and am persuaded, that the few Repetitions of what has been said before will be of no Diservice to whoever reads this with a View of being inform'd.

The Rupture of the Groin, or Scrotum, is the most common Species of Hernia, and in young Children is very frequent; but it rarely happens in Infancy that any Mischief arises from it. For the most part, the Intestine returns of itself into the Cavity of the Abdomen, whenever the Person lies down; at least, a small Degree of Compression will make it. To secure the Intestine, when return'd into its proper Place, there are Steel Trusses now so artfully made, that, by being accommodated exactly to the Part, they perform the Office of a Bolster, without galling, or even sitting uneasy on the Patient. These Instruments are of so great Service, that were People who are subject to Ruptures always to wear them, I believe very few would die of this Distemper; since it often appears, upon Inquiry, when we perform the Operation for the *Bubonocoele*, that the Necessity of the Operation is owing to the Neglect of wearing a Truss.

In the Application of a Truss to these kinds of Swellings, a great deal of Judgment is sometimes necessary; and for want of it we daily see Trusses put even on Buboes, indurated Testicles, Hydroceles, &c. But, for the Hernias, I shall endeavour to lay down two or three Rules, in order to guide more positively to the Propriety of applying or forbearing them.

If there is a Rupture of the Intestine only, it is easily, when return'd into the Abdomen, supported by an Instrument; but if of the Omentum, notwithstanding it may be return'd, yet I have never found the Reduction to be of much Relief; for the Omentum will lie uneasy in a Lump at the Bottom of the Belly, and, upon Removal of the Instrument, drop down again immediately; upon which Account, seeing the little Danger and Pain there is in this kind of Hernia, I never recommend any thing but a Bag-truss to suspend the Scrotum, and prevent, possibly by that means, the Increase of the Tumor. The Difference of these Tumors will be distinguish'd by the Feel; that of the Omentum feeling flaccid and rumpled, the other more even, flatulent, and springy.

Sometimes, in a Rupture of both the Intestine and Omentum, the Gut may be reduced; but the Omentum will still remain in the Scrotum, and, when thus circumstanced, most Surgeons advise a Bag-truss only, upon a Supposition, that the Pressure of a Steel one, by stopping the Circulation of the Blood in the Vessels of the Omentum, would bring on a Mortification: But I have learnt, from a Multitude of these Cases, that, if the Instrument be nicely fitted to the Part, it will be a Compression sufficient to sustain the Bowel, and at the same time not hard enough to injure the Omentum; so that, when a great Quantity of Intestine falls down, tho' it is complicated with a Descent of the Omentum, the Rupture will conveniently and safely admit of this Remedy.

I have, as yet, consider'd the Rupture as moveable; but it happens frequently, that the Intestine, after it has pass'd the Rings of the Muscles, becomes inflamed; which, enlarging the Tumor, prevents the Return of it into the Abdomen; and, becoming every Moment more and more strangled, it soon tends to a Mortification, unless we dilate the Passages, through which it is fallen, with some Instrument, to make room for its Return; which Dilatation is the Operation for the *Bubonocoele*.

It rarely happens, that Patients submit to this Incision before the Gut is mortified, and it is too late to do Service; not but that there are Instances of People surviving small Gangrenes, and even perfectly recovering afterwards. I myself have been an Eye-witness of the Cure of two Patients, who, some time after the Operation, when the Eschar separated, discharged their Fæces through the Wound, and continued to do so for a few Weeks in small Quantities; when, at length, the Intestine adher'd to the external Wound, and then was fairly heal'd.

In Mortifications of the Bowels, when fallen out of the Abdomen into the Navel, it is not very uncommon for the whole gangrened Intestine to separate from the sound one; so that the Excrement must necessarily, ever after, be discharged at

that Orifice: There are likewise a few Instances where the Rupture of the Scrotum has mortified, and become the Anus, the Patient doing well in every other respect. These Cases, however, are only mention'd to furnish Surgeons with the Knowledge of the Possibility of such Events, and not to mislead them so far as to make favourable Inferences with regard to Gangrenes of the Bowels, which generally are mortal.

Before the Performance of the Operation for the *Bubonocoele*, which is always to be done in Extremity of Danger, the milder Methods are to be tried; these are, such as will conduce to soothe the Inflammation; for, as to the other Intent of softening the Excrements, I believe it is much to be question'd, whether there can be any of that Degree of Hardness in the Ileum, which is the Bowel diseased, as to form the Obstruction: And, in Fact, those Operators who have unluckily wounded the Intestine, have proved, by the thin Discharge of Fæces which has follow'd upon the Incision, that the Induration we feel is the Tension of the Parts, and not the harden'd Lumps of Excrement.

Perhaps, except the Pleurisy, no Disorder is more immediately relieved by plentiful Bleeding than this. Clysters, repeated one after another, three or four times, if the first or second are either retain'd too long, or immediately return'd, prove very efficacious: These are serviceable, not only as they empty the great Intestines of their Excrements and Flatulencies, which last are very dangerous, but they likewise prove a comfortable Fomentation, by passing through the Colon, all around the Abdomen. The Scrotum and Groin must, during the Stay of the Clyster, be bathed with warm Stoops wrung out of a Fomentation, and with these on the Part you must attempt to reduce the Rupture: For this Purpose let your Patient be laid on his Back, so that his Buttocks may be considerably above his Head; the Bowels will then retire towards the Diaphragm, and give way to those which are to be push'd in. If, after endeavouring two or three Minutes, you do not find Success, you may still repeat the Trial. I have sometimes, at the End of a Quarter of an Hour, return'd such as I thought desperate, and which did not seem to give way in the least, till the Moment they went up; however, this must be practis'd with Caution, for too much rough Handling will be pernicious.

If, notwithstanding these Means, the Patient continues in very great Torture, tho' not so bad as to threaten an immediate Mortification, we must apply some sort of Pultice to the Scrotum: That which I use, in this Case, is equal Parts of Oil and Vinegar, made into a proper Consistence with Oat-meal: After some few Hours the Fomentation is to be repeated, and the other Directions put in Practice; and if these do not succeed, I am inclin'd to think it advisable to prick the Intestine in five or six Places with a Needle, as recommended by *Peter Lowe*, an old English Writer, who says, he has often experienced the good Effects of this Method in the Inguinal Hernia, when all other Means have fail'd.

After all, should the Pain and Tenseness of the Part continue, and Hiccoughs and Vomitings of the Excrements succeed, the Operation must take place; for if you wait till a languid Pulse, cold Sweats, subsiding of the Tumor, and emphysematous Feel come on, it will be most likely too late, as they are pretty sure Symptoms of a Mortification.

To conceive rightly of the Occurrences in this Operation, it must be remember'd, that in every Species of Rupture the Peritonæum falls down with whatever makes the Hernia; for the Contents of the Abdomen being immediately enveloped in this Membrane, they cannot push thro' any Orifice, but they must likewise carry a Part of it along with them: So that, in the *Bubonocoele*, the Situation of the Tumor will be in the Cavity of the Scrotum, upon the Tunica Vaginalis, and Spermatic Cord.

The best way of laying your Patient will be on a Table of about three Foot four Inches high, letting his Legs hang down; then properly securing him, you begin your Incision above the Rings of the Muscles, beyond the Extremity of the Tumor, and bring it down about half the Length of the Scrotum, thro' the *Membrana Adiposa*, which will require very little Trouble to separate from the Peritonæum (call'd the Sack of the Hernia), and consequently will expose the Rupture for the farther Processes of the Operation; but I cannot help, once more, recommending it as a thing of great Consequence, to begin the external Incision high enough above the Rings, since there is no Danger in that Part of the Wound; and for want of the Room this Incision allows, the most expert Operators are sometimes tedious in making the Dilatation. If a large Vessel be open'd by the Incision, it must be taken up before you proceed further.

When the Peritonæum is laid bare, you must cut thro' it carefully, to avoid pricking the Intestines; though, to say the Truth, there is not quite so much Danger of this Accident as is represented; for, generally speaking, the Quantity of Water separated in the Sack of the Peritonæum raises it from the Intestine, and prevents any such Mischief. This Discharge of Water, which follows upon wounding the Peritonæum, and the

the Ignorance of the Structure of the Tunica Vaginalis, have made it so generally thought, that Ruptures were received into the Cavity of that Tunic.

It has lately been consider'd by some as an Improvement in the Operation, to forbear wounding the Peritonæum, and to return the Sack entire into the Abdomen, thinking by this means to make a firmer Cicatrix, and more surely to prevent a Relapse for the future: But, besides that this Practice is not founded on Reason, in the very Particular it is recommended for, the seeming Necessity there is of letting out the Waters, that are frequently fetid, of taking away the mortified Part of the Omentum, which we cannot come at without the Incision; and lastly, to leave an Opening for the Issue of the Excrements out of the Wound, in case an Eschar should drop from the Intestine; put out of Dispute, in my Opinion, the Impropriety of this new Method.

The Peritonæum being cut thro', we arrive to its Contents, the Nature of which will determine the next Process; for, if they be Intestine only, it must directly be reduced; but if there be any mortified Omentum, it must be cut off; in order to which, it is advised to make a Ligature above the Part wounded, to prevent an Hæmorrhage; but it is quite needless, and in some measure pernicious, as it puckers up the Intestine, and disorders its Situation, if made close to it. For my Part, I am very jealous, that Wounds of the Omentum are dangerous; on which Account I cannot pass over this Part of the Operation without cautioning against cutting any of it away, unless it is certainly gangrened; and, when that happens, I think it advisable to cut off only some of the mortified Part, and leave the rest to separate in the Abdomen, which may be done with as much Safety as leaving the same Quantity below a Ligature.

When the Omentum is removed, we next dilate the Wound; to do which with Safety, an infinite Number of Instruments have been invented; but, in my Opinion, there is none we can use, in this Case, with so good Management as a Knife; and I have found my Finger, in the Operation, a much better Defence against pricking the Bowels, than a Director which I intended to employ: The Knife must be a little crooked, and blunt at its Extremity, like the End of a Probe. Some Surgeons, perhaps, may not be steady enough to cut dexterously with a Knife, and may therefore perform the Incision with Probe-scissars, carefully introducing one Blade between the Intestine and Circumference of the Rings, and dilating upwards. When the Finger and Knife only are employ'd, the manner of doing the Operation will be by pressing the Gut down with the fore Finger, and carrying the Knife between it and the Muscles, so as to dilate upwards about an Inch, which will be a Wound large enough.

The Opening being made, the Intestine is gradually to be push'd into the Abdomen, and the Wound is to be sitch'd up; for this Purpose some advise the quill'd, and others the interrupted Suture, to be pass'd thro' the Skin and Muscles; but as there is not so much Danger of the Bowels falling out when a Dressing and Bandage are applied, and the Patient all the while kept upon his Back, but that it may be prevented by one or two slight Stitches thro' the Skin only, I think it by all means advisable to follow this Method, since the Stricture of a Ligature in these tendinous Parts cannot but be dangerous.

Hitherto, in the Description of the Bubonocèle, I have supposed it loose or separate in the Sack and Scrotum; but it happens sometimes in an Operation, that we find not only an Adhesion of the Outside of the Peritonæum to the Tunica Vaginalis, and Spermatic Vessels, but likewise of some Part of the Intestines to its internal Surface; and in this Case there is so much Confusion, that the Operator is often obliged to extirpate the Testicle, in order to dissect away and disentangle the Gut; tho', if it can be done without Castration, it ought. I believe, however, this Accident happens rarely, except in those Ruptures that have been a long time in the Scrotum without returning; in which Case the Difficulty and Hazard of the Operation are so great, that, unless urged by the Symptoms of an inflamed Intestine, I would not have it undertaken. I have known two Instances of Persons so uneasy under the Circumstance of such a Load in their Scrotum, tho' not otherwise in Pain, as to desire the Operation, but the Event in both proved fatal; which, I think, should make us cautious how we expose a Life for the sake of a Convenience only, and teach our Patients to content themselves with a Bag-truss, when in this Condition.

The Operation of the Bubonocèle in Women so exactly resembles that perform'd on Men, that it requires no particular Description; only in them the Rupture is form'd by the Intestine or Omentum falling down thro' the Passage of the Ligamentum Rotundum into the Groin, or one of the Labia Pudendi, where causing the same Symptoms as when obstructed in the Scrotum, it is to be return'd by the Dilatation of that Passage. Sharp.

Of the HERNIA CRURALIS.

What bears a very near Resemblance to the *Bubonocèle*, is the Disease which modern Physicians usually call a *Hernia Cruralis*, or *Femoralis*; for it is seated in the upper and exterior Part of the Thigh, near the Groin, where the Crural Vein and Artery descend from the Belly to the Thigh. And tho' this Disorder be pretty common, especially to the weaker Sex; yet, which is strange, very few have taken the Pains to examine or describe it; but it has almost universally pass'd, without Distinction, for a *Bubonocèle*, or *Hernia Inguinalis*. Verheyen was the first, that I can find, who wrote any thing about a *Hernia Cruralis*; tho' *Barbette* has some obscure Indications of the same thing. After *Verheyen*, *Palsyn* treated this Subject in a more explicit and copious manner; as did also, after him, *Garengot*, in his Chirurgical Works, Chapter of the *Hernia*; *Koch*, in his Dissertation on the *Hernia Cruralis*; and *Le Dron*, in his Chirurgical Observations, Tome the second. *Garengot* pretends, that *Paulus* was long ago acquainted with this Disorder, but does not tell us the Place in that Author where it is described; and, for my Part, I could never find any thing in him about it. On the same Occasion he adds some Words, as taken from *Barbette*, which yet I do not find in that Author's Chapter of an *Hernia*.

For the better understanding the genuine Nature and Properties of this Disease, it will not be amiss briefly to remark, from Writers of Anatomy, that the Place where the *Musculus Psoas* and *Iliacus*, and over them the Crural Vein and Artery, pass from the Abdomen to the Thigh, is not sufficiently fortified to sustain the Renitency of the Intestines, being inclosed only with the Peritonæum, the Fascia Lata, and with the Fat and Skin. Moreover, in viewing a Skeleton, we may observe in the Os Ileum, above the Acetabulum, a small Depressure, which is cover'd by the lower Part of the *Musculus Obliquus Descendens*, in manner of a Ligament extended archwise, which some call the Ligament of *Vesalius*, others the Ligament of *Poupart*. Thro' this small Opening, or Arch, the Intestines or Omentum sometimes force their Way, and so excite a peculiar Kind of *Hernia*. *Garengot* is of Opinion, that this Species of *Hernia* happens more frequently than others; but, for my Part, I have seen and cured Multitudes of *Hernias* of all kinds, but scarce ever met with two Instances of a *Hernia Cruralis*.

Tho' there be a very considerable Agreement between the *Hernia Inguinalis* and the *Hernia Cruralis*, it is easy enough to distinguish them by a careful Inspection of the peculiar Places in which they are situated: For a *Hernia Inguinalis* is form'd not far from the Pudenda, where the Ring of the Muscles of the Abdomen, and the Process of the Peritonæum, the Anatomy of which Parts is necessary to be known, descend to the Scrotum, and the Tumor extends itself from the Ring towards the Scrotum. But a *Hernia Cruralis* affects the outer Parts of the Groin, usually arising in the uppermost, outer, and fore Part of the Thigh, above the Acetabulum, or at the Juncture of the Thigh with the Acetabulum. This Species of *Hernia* is also, for the most part, lesser and rounder than the *Inguinalis*, and consequently far more subject to be confounded with a Bubo; for the *Inguinalis* is usually somewhat oblong in Figure. However, since the *Hernia Cruralis* has yet no peculiar Word, that I know of, in *Germany* to express it, I think it would not be amiss to constitute two Species of *Hernia Inguinalis*, one of which should be the *Hernia Inguinalis interior*, and the other, which would be the same with the *Hernia Cruralis*, should be call'd the *Hernia Inguinalis exterior*.

As to what respects the Event and Cure of this Disorder, it very little differs from what has been before observed and directed concerning the *Hernia Inguinalis*; only take Notice, that those who labour under a *Hernia Cruralis* sometimes run a far greater Hazard of their Lives than under the *Hernia Inguinalis*. It is to be observed also, in the Cure of the *Hernia Cruralis*, that in restoring the prolapsed Intestines we take care to force them gently back more towards the Linea Alba, but by no means towards the Os Ileum, as in the Case of the *Hernia Inguinalis*. If the prolapsed Intestines can be replaced by the Hands, the best Method to establish them in their proper Situation is by applying a convenient Plaster, with a bandage over it, as we directed for the *Hernia Inguinalis*: But if the Intestines are incarcerated, or intercepted, in such a manner, that neither Oils, nor Ointments, nor Cataplasms, nor Clysters, nor the Fumes of the strongest Tobacco injected, nor any other Medicines of this Kind, which have been before recommended, are of any Effect, but dreadful Symptoms begin to appear, we must next have recourse to the surgical Operation, as directed for the Bubonocèle. The Bag being laid open, in the manner above described, the Passage by which the Intestines burst forth is to be somewhat enlarged; and if the Disease be recent, the Bag itself, according to the Example and Advice of *Petit*, is to be replaced whole and untouched; together with the prolapsed Intestines and Omentum, as gently as possible. It is not difficult, for the most part, to force back and restore the Intestines, because,

because, as *Verheyen* in his Anatomy rightly observes, most commonly a very small Portion of them, and sometimes only the outer Side, or even but a sort of *Appendicula*, appear prolapsed about the Thigh. The Intestines being thus replaced; the Wound must be very exactly bound up, in the same manner as after the Operation for the *Bubonocoele*, which is the ready way to have it happily and speedily conglutinated. If a more considerable Part of the Intestines be fallen out, if there be a Coarctation of the prolapsed Intestines with the next adjacent Parts, or if there be any other Circumstance which hinders the convenient Restitution of the prolapsed Parts, without Incision of the Bag; or if the Disorder, by its long Continuance, has occasion'd a Corruption of the Intestines; in these Cases we must proceed, but with the greatest Caution, to cut the Bag in the manner above directed; then, if the Intestines are sound, they must be gently put back in their proper Place; and if they are connected with the adjacent Parts, a Separation must be made, tho' with great Circumspection, for fear of wounding the subjacent Crural Vein and Artery, and so exposing the Patient to the Danger of present Death. When the Intestines or Omentum are found to be corrupted, you are to proceed in the manner above directed in that Case. *Heister, Chirurgi.* See *HERNIA*.

BUBULA is used as a Substantive, that is, without *Caro*, by *Scribonius Largus*, N^o. 188, 189. and by *Celsus* in several Places, particularly, *Lib. 2. Cap. 18.* where he says, *Inter domesticas Quadrupedes levissima Suilla est, gravissima Bubula*: "Of tame Quadrupeds, Swines Flesh is the lightest, and Beef the heaviest."

Sir Theodore Mayence recommends the following Preparation of the Flesh of the Ox, in Cases where obstinate Gonorrheas have degenerated into habitual Stillicidiurns.

Take, says he, Beef indurated by the Smoak of a Fire; and after having taken off the external black Part, divide it into Filaments, which must be carefully freed from the Salt by repeated Washings. Then cleansing them well with a Towel, let them be put into an Oven, when the Bread is taken out of it, and dried till they are capable of being reduced to a Powder; of which let two Parts be intimately mix'd with one Part of the Powder of ripe Ivy-berries. Let one Dram of this Powder be taken for many Mornings successively, drinking a Glass of simple Hydromel, or a Draught of the Decoction of Eryngo-root. For Constitutions abounding with Phlegm, it is sufficient to dry the Beef without washing it at all.

BUBULCA, in *French*, *Bouvier*, or *Peteuse*, is a small River-fish, three or four Fingers-breadth in Length, and one and a half in Breadth, flat, and of the Colour of Silver. It commonly keeps in the Mud, and is always dirty when taken. It is cover'd with large broad Scales, has a small Mouth, and no Teeth, and has a forked Tail.

The Flesh is aperitive. *Lemery des Drogues.*

BUCCA, *γράβω*. The Part that lies under the Ball of the Cheek. *Galen, Com. 2. de Artic.*

It is also taken for the Cheek itself, and sometimes for the Mouth.

BUCCACRATON, *βυζακράτων*. A *Bucca*, or *Buccella*, that is, *Morsel*, of Bread sop'd in Wine, which served, in old Times, for a Breakfast. *Castellus.*

BUCCATUM, *Glased*. *Ruland.*

BUCEA, **BUCELLA**, *βύζα, βύζος*. A *Græco-barbarous* Word, signifying such a Fragment of any thing as a Man can put in his *Bucca*, or *Mouth*, and eat at one Time. *Castellus.* See *BOLUS*.

Paracelsus calls by the Name of *Buccella* the carneous Excrescence of a Polypus in the Nose; because he supposes it to be a Portion of Flesh parting from the *Bucca*, insinuating itself into the Nose. *Lib. de Apostem. Cap. 20.*

Buccellare, in *Rulandus* and *Johnson*, is to feed or cram with Bits and Morsels.

BUCCELATON, *Buccella purgatoria*, *Buccellatus purgatorius*, *βυζέλατον*. A purging Medicine, made up in Form of a Loaf, consisting of Scammony prepared, with its Correctives, and put in fermented Flour, and so baked in an Oven, according to *Actius, Tetrab. 1. Serm. 3. Cap. 100.* But *Paulus Aegineta* directs it to be made into a solid Kind of Electuary with Honey, or like a Cheesecake, after it is baked, consisting of roasted Scammony, with the Seeds of Smallage, Anise, Fenel, and Pepper, *Lib. 7. Cap. 5.*

BUCELLA. See *BUCEA*.

BUCELLARE. See under *BUCEA*.

BUCELLATUS. See *BUCCELATON*.

BUCCINA, *χύψ*. The same as *BUCCINUM*, which see.

BUCCINATOR. The Name of a Muscle, which, by its Substance, constitutes the *Buccæ* or Cheeks.

This Muscle is so call'd, because, in Trumpeters, it forces the Breath. This Muscle does not spring from the Gums of the upper, and end in those of the nether Jaw; nor is it of

that Figure which vulgar Anatomists would persuade us; or interwoven with various Orders of Fibres, as others pretend. It arises broad and fleshy, from the fore Part of the *Processus Coronæ* of the lower Jaw-bone; from hence proceeding with direct Fibres, it adheres to the Gums of both Jaws, and is so inserted to the Angle of the Lips.

Through the Middle of this Muscle passes the *Ductus Salivaris superior*, which *Placentinus* observed, and call'd *Vinculum robustum* (as *Caspar Bauhine* writes). Besides the Use Trumpeters make of this Muscle, it also pulls the Lips or Mouth to one Side. *Crotopar.*

BUCCINUM, *Offic. Buccinum album larvæ maximum, septem minimum spirarum*, *List. Hist. A. A. 135.* *Buccinum rostratum majus crassum, orbibus paululum pulvinatis*, *Ejusd. Hist. Conch. 4. Sect. 14. N. 4.* **THE WHELK.** *Dale.*

Whelks, calcin'd, work the same Effects as the Purple-fish, but are of a more caustic Quality. Fill'd with Salt, and then burnt in a crude earthen Pot, they make a good Dentifrice, and are applied with Success in Compositions, where it must be left alone to harden like a Shell; for, as soon as the burnt Place is brought to a Cicatrix, this Medicine falls off of itself. A Quicklime is made of them. *Dioscorides, Lib. 2. Cap. 5.*

The Whelk is a Sea Shell-fish, of which there are many Sorts; but they all seem to agree exactly as to their Medicinal Virtues, being Alcalies and Absorbents; and, by Calcination, they are converted into Lime; and these Properties they possess in common with all other Shell-fish.

BUCCULA. The fleshy Part under the Chin. *Castellus.*

BUCELLATIO. A way of stopping the Blood, by applying Lint upon the Vein or Artery. *Castellus.*

BUCERAS, **BUCEROS**, *βυκράς, βυκέρως*. See *BOUCÉRAS*.

BUCRANION, *βυκράνιον*, from *βύς*, an Ox, and *κράνιον*, a Head. The Herb *Antirrhinum*, so call'd because the outer Face of the Flower resembles an Ox's Head. *Blancard.*

BUCTON. A Name in *Severinus Pinæus, de Notis Virginitatis, Lib. 1. Cap. 5.* for that Part in Virgins, otherwise call'd *HYMEN*, which see.

BUFFELL. A Ring made of the Horn of a Buffalo, which, being worn upon the Ring-finger, is said to cure the Cramp. *Johnson.*

BUFO. The Toad. A well-known Animal, thus distinguished.

BUFO, *Offic. Schrod. 5. 272. Mær. Pin. 169. Rondel de Aquat. 2. 221. Aldrov. de Quad. Ovip. 609. Jonst. de Quad. 131. Charlt. Exer. 27. Bufo sive Rubeta, Raii Synop. A. 252. Ind. Med. 23. Bufo terrestris major, Schw. Rept. 159. Rana rubeta, tum palustris, tum terrestris, Gefn. de Quad. Ovip. 64. THE TOAD.* *Dale.*

This Animal was by the *Latins* also called *Rubeta*, by the *Greeks* *ρεῦρον* and *ρούσαλον*; and by the *English* a *Toad*. It is among the Number of those Animals which have only one Ventricle in their Heart, and is of the Frog-kind, tho' somewhat larger; for which Reason it is by some called *Rana terrestris, omnium maxima, & venenosa*. Its Body is thick, its Back flat and broad, its Belly turgid and inflated. Its Skin is full of Tubercles of an unequal Bulk; and so strong and tough, that it can hardly be pierced with a sharp-pointed Piece of Wood. It is of a cineritious Colour, with brown, blackish, and yellowish Spots intermixed. This Animal moves slowly, is of the amphibious Kind, copulates and disposes of its Eggs in the same Manner with other Frogs, if we except that *American* Species of *Surinam*, call'd the *Pipa*, the Female of which lays her Eggs on the Back of the Male, in order to be nourish'd. The Toad lives upon Insects and Vegetables, but not Earth. It does not croak like the Frog, but makes an indistinct, obscure kind of Noise, somewhat resembling the Word *Gru*, or rather *Bu*; from which Circumstance, some are of Opinion, it received the Name *Bufo*. In the Winter, and in the Day-time, especially when the Sun shines, it is found lurking in shady Places, Fens, Stables, Collections of Stones, and in Garden-beds, especially under Sage. It is also sometimes found in the Hearts of Stones, but these are Circumstances which come more properly under the Consideration of the Natural Historian, than of the Physician. The Toad is by some affirmed to be a very long-liv'd Animal. Some are of Opinion, that the Toad is called *Rubeta*, from *Rubus*; because they are found among the Bramble-bushes in Nurseries and Hedges. Others think it receiv'd the Name *Rubeta* from the reddish Spots sometimes found on its Belly. But these are Controversies of too trifling a Nature to deserve our Attention or Regard.

The Toad is killed by being covered over with Tar, by sprinkling Salt of Tartar upon it, or by being laid upon common Salt; see *Oligerus Jacobæus de Rânis, Eph. N. C. D.* or by the Juice of Tobacco. *Etmuller* observes, that Toads, upon having Oil of Tartar per Deliquium apply'd to them, express the most exquisite Sense of Pain by their Gesticulations, and soon after die. Gardeners commonly banish Toads from their Ground,

Ground, by burning old Leather upon it; see *Jo. Baptista Ferrarius, de Florum Cultura*. Concerning the Antipathy between Toads and Serpents; see *Eph. N. C. D. 1. a. 1. o. 137*. The Antipathy between them and Spiders is so commonly known, that it is sufficient only to mention it; but it will not be improper to add a Circumstance mentioned by *Helmont*, which is, that when the Toad perceives itself wounded by the Spider, and begins to swell, it has immediate Recourse to the narrow-leav'd Plantain, in order to prevent its own Death. But *Valsinerus* seems to doubt of the Truth of this Observation. See *ARANEAE*.

Whether it is owing to this Antipathy, that the Toad, in dry Weather, and when the Sun shines, does not come Abroad without being arm'd with Rue, for fear of meeting with the Spider, as *Kircherus, Mund. Subt. T. 2.* asserts, I leave others to determine; only of this we are certain, that most Gardeners think Rue disagreeable to the Toad, since they plant their Sage in alternate Rows with Rue, in order to save it from the Poison of that Animal. It is repugnant to Experience, that Toads are produc'd from the Bodies of Ducks when buried, as is reported; because, when alive, they were fond of eating Toads; see *Kircherus*. From this Circumstance, however, we learn, that Toads devour'd by Ducks do not prove poisonous to them. Neither do Ants sustain any Harm from them, since, according to the same Author, a Toad thrown into a Nest of these Insects is soon consumed and eat up by them. Now 'tis certain, that neither Ducks Flesh, nor Ants, are possess'd of a poisonous Quality; but that the Toad proves hurtful and poisonous to Mankind is sufficiently plain, from numberless Instances; and the Toad which lives in dry Places is said to be more hurtful and poisonous than that found in moist and marshy Places; and those found in dark and cold Places are thought to be more noxious than others. Authors inform us, that Strawberries, and other Vegetables, contaminated by the Saliva or Urine of the Toad, have, if used in Food without being wash'd, produced very bad Consequences by their poisonous Quality; see *Francisci Joelis Opera Medica*. Concerning the poisonous Effects produc'd by frequently handling a Stone, with which a Toad had been struck, see *Eph. N. C. D. 2. a. 1. o. 134. a. 5. App. p. 29. a. 6. o. 113*.

That the Water in which Toads live, when warm'd, produces poisonous Effects on the Persons who bathe in it, we are told in *Eph. N. C. Cent. 3. p. 256*. That the Air also in Places much frequented by Toads, does Harm to the Lungs, we are told by *Valentinus*, in his *Pandecta Medico-legales*. When the Toad is enraged, he is said to discharge his Urine in the Eyes of his Persecutor; and by that means make Reprisals for the Injury done him, since it is thought to be possess'd of a Quality highly prejudicial to the Eyes. But *Brown* doubts of the Truth of this Fact, and is of Opinion, that the Toad cannot properly be said to piss, but, like Birds, discharges its Urine and Feces from one and the same Passage; *Brown's Vulgar Errors*. According to *Vallisnerus*, the Toad discharges its Urine, which is yellow and oleous, from a Passage allotted solely for that Purpose. But 'tis known from incontestable Facts, that this Urine is not of a poisonous Quality, whether exhibited internally, or apply'd externally. Besides, an Ophthalmic Virtue is ascrib'd to the Urine of the Toad; and this a certain Physician informs us he experienc'd on himself; for, whilst he look'd at a large Toad, which he had run through with his Sword, the Toad, with a violent Impetus, discharged his Urine in his Face and Right Eye, by which Accident a troublesome Itching was excited for about the Space of half an Hour; after which his Eye was not only as well as it was before, but rather clearer, and its Sight stronger; for it had formerly been subject to Redness and Dimness; see *Eph. N. C. D. 3. a. 7. o. 59*. Another Physician calls the Ophthalmic Virtue of the Toad's Urine in Question; because the Quack at *Venice*, who provok'd a Toad to piss in his Mouth, paid for his Folly, by losing his Life half an Hour after, though he immediately made use of his boasted Antidote, in order to prevent the fatal Consequences that might ensue; and this Physician is of Opinion, that the Liquor discharged by Toads, when attack'd by Men, is not their Urine, but a Liquor darted from their Eyes, which, when a certain Person who had struck a Toad, receiv'd into his Left Eye, he immediately felt an Itching in that Eye, which was soon after seiz'd with a burning Heat, an Inflammation, a Swelling, and a kind of Blindness, accompany'd with a darting Pain. But these Symptoms were at last removed by repeated Infiltrations of the express'd Juices of the greater Houseleek, and the broad-leav'd Plantain; see *Eph. N. C. Cent. 4. o. 107*. Others ascribe a venomous Quality both to the Blood, and to the Saliva, of the Toad, but more especially to the latter; see *Foresti, Obs. Med. L. 30. Obs. 6. & 7. in Schol.* Some are of Opinion, that Nature herself has wisely distinguish'd venomous Animals by their ghastly and horrid Colour. Some have also asserted, that the Person who gazes long on an ill-colour'd Toad of an horrid Aspect, becomes pale, and assumes an icteritious Colour. If 'tis true, that this Circumstance really happens, I am of Opinion, that it is not to be accounted for from

any Effluvia passing from the Animal to the Person, but from his being struck with Terror upon reflecting on the poisonous Nature of the Toad, and his entertaining a Notion, that it can exert its hurtful Qualities at a Distance; for a Toad is commonly call'd the *Magnetic Purse* of Poison, and contagious Virulence. *Dioscorides, L. 6. C. 31.* says, that a Toad swallow'd excites Tumors; and that by such a Misfortune the Skin becomes pale, and at last as yellow as Box-wood; the Patient is rack'd with a Difficulty of Breathing, his Breath becomes ill-scented, he is afflicted with the Hiccough, and sometimes an involuntary Effusion of the Semen ensues. The Patient is reliev'd by Vomiting, by liberal Draughts of Wine, and by taking two Drams of the Root of common Reed, or an equal Quantity of the Cyperus. By-and-by the Patient must be forc'd to walk hard, or run, in order to carry off the Torpor with which he is seiz'd. He must also be wash'd every Day.

Paulus Aegineta, L. 5. C. 36. says the same things. *Caspar Caldera* affirms, that the Eggs of the Toad, swallow'd, kill very suddenly, and produce most violent Pains of the Stomach; and that such as have the Misfortune to swallow them die, with their Bellies prodigiously inflated. According to *Bartholine*, in *Aet. Haffn.* a Toad held in the Hand cures it, after it has been hurt by another Toad. *Boerhaave*, in his *Institutiones Medicae*, § 1144. classes Toads among the heteroclit Poisons, destructive of Life, whose Virtues are not as yet sufficiently understood, which kill in a manner not easily to be accounted for; and which, besides the general Antidotes, such as Vomits, aqueous, emollient, laxative and oleous Substances, call for spirituous Acids, saline Substances, and such as resist Putrefaction. Among the Poisons most remarkably possess'd of a deleterious Quality, is the *American Toad*, by the *Brasilians* call'd *Cururu*, and by the *Portuguese* *Capo*, which has Excrescences from both Sides of its Head, resembling large Warts. This Species is very large, and swell'd as big again as the *European Toad*. It is of a cineritious or bay Colour: Its Urine and Saliva produce dismal Consequences, whether internally used, or externally applied; but still more terrible Effects are brought about by swallow'd its Blood, its Fat, and especially its Gall. The most wicked and abandon'd of the Inhabitants, and some others after their Example, torrify these Toads, and reduce them to a Powder, of which they prepare poisonous Draughts, which, exhibited in the smallest Quantity, immediately bring on Inflammations, and Dryness of the Fauces and Throat, Difficulty of Breathing, Hiccoughs, Vomiting, Dysenteries, Faintings, Dimness of Sight, Convulsions, Deliriums, and Paleness. If there is room left to hope any thing from Medicines, Evacuations are to be made by Vomit and Stool; and the Remains of the Poison are to be eliminated by Exercise and the Bath, and by putting the Patient into an hot Oven, or into the Belly of a fresh-kill'd Animal. The general compound Alexipharmics are to be exhibited for some Days, and the Patient order'd to drink Infusions or Decoctions of such Roots as are produced in the Country, and look'd upon as Antidotes against Poison. But above all, the Herb by them call'd *Nhambi* is to be exhibited, since it seems to have received from bountiful Nature a Quality capable of curing, or at least allaying and mitigating, so formidable a Disorder. The most profligate and wicked of these *Barbarians* hang up this Species of Toad in the Sun, collect its Spume and Gall, and keep them as secret and slow-killing Poisons, *Piso, L. 5. C. 15*. The Figures of the *American Toads* may be seen in *Albinus Seba*.

Turner gives the following Account of the Toad.

Among us, some believe, we are more afraid of them than there is Occasion for; and there have been found those who have been very familiar with them; and that upon some Wager or Frolick have eat them, and commend them for as great Dainties as the Frog. But let not Peoples foolish Presumption, who have by some singular Accident, as a full Stomach beforehand, or some Idiosyncrasy, escaped freed, induce others to take the like Freedom, lest they pay dearly for their Folly, as did a Person I knew many Years ago, who putting the Head of one of them into his Mouth for some time, whether by the Bite, or Slaver only, of the Creature, communicated to his Tongue and Lips, had that Night, and the next Day, both so swelled, that he could not pronounce any Word plain for several Days after, and was in no small Danger of being famish'd, by reason of the said Tumor affecting the back Parts of his Throat, with the Muscles subservient to Deglutition.

Redi, instancing in some who eat these Creatures without Harm, subjoins, that though the Toad may happen to prove no Poison in the Whole, yet may it envenom outwardly; an Example whereof he gives in a Boy, who stumbling on a Toad, and after throwing Stones at it, some Juice from the bruised Toad chanced to light upon his Lips, whereupon they swelled each to about the Thickness of two Thumbs; and he neglecting to use what might be proper to restore them, they have continued in that mis-shapen Size ever since, *Philos. Trans. Abr. Vol. 2.*

Ardoynus observes, that as he came from the University of *Bologna in Italy*, (where he had newly taken his Doctor's Degree)

gree) to *Pefaro*, he saw a young Man, who having killed a large Toad with his Lance, he fell into an absolute Stupor of his whole Body, and lay snorting for two Days together without Pulse. Had I known, says he, as much then as now, I make no doubt, but I could have recovered him. From whence we may suppose the young Man dy'd.

As remarkable is that of *Ferdinandus Pontellus*, of a Person going over his Grounds with a Reed in his Hand, and therewith transfixing all the Toads he met with, throwing them out into the Highway: When, on his Return home to Dinner, he threw up all he eat; nor did his Vomiting leave him 'till he fed himself with the other Hand, that had not held the same Instrument. But more tragical yet is the Story which *Mizaldus*, in his first Century of Remarkables, recites, of a Gentleman sporting with his Sweetheart in the Garden, near a large Bed of Sage, who, inadvertently pulling off some Leaves, fell to rubbing of his Gums and Teeth; which so soon as he had done, he dropt down dead. The young Gentlewoman, being carry'd before the Magistrate, upon Suspicion of poisoning the Man, told the Judge he had only rubb'd his Teeth with such a Leaf as she had brought with her, and desperately in the Court began to use the same, with the like Event, she dying also thereupon, that she might not be thought to have deprived him of Life, without whom she could not live herself. Upon which, by Order of the Magistrate, the Sage was order'd to be dug up and burnt; when, turning the Ground, behold, a large and ghastly Toad appears; which Creature is said to be much delighted with this Plant; and which he, says our Author, should have first consider'd, who compil'd that Verse;

Cui moriatur Homo, cui Salvia crescit in Horto?

This Effect of Sage is however more rationally attributed to the poisonous Eggs of Insects lodg'd on the Leaves.

Though Toads want Teeth, saith *Parey*, yet with their hard and rough Gums they so streightly press the Part they take hold on, that they will force their Poison thereinto, and so over the whole Body, by the Pores of the pressed Part. Moreover they cast forth their Venom by Urine, Spittle, Vomit, or Slaver, upon Herbs; but chiefly upon Strawberries, which they are reported greatly to affect. Hence many have suddenly and ignorantly caught their Deaths. A sad Instance whereof he lays down, in the Cases of two Merchants near *Thoulouse*, who, whilst the Dinner was getting ready, walking into the Garden belonging to their Inn, and gathering some Sage-leaves, put them unwash'd into their Wine. After which, before they had fully din'd, they were seized with a Vertigo, and lost their Sight, fainted, and had Convulsions; they stammer'd with their Lips, and their Tongues appeared black, looking frightfully, continually vomiting, with cold Sweats, the Forerunners of Death, which quickly ensued; their Bodies becoming afterwards exceedingly swell'd, by reason whereof there was just Suspicion, that they had been poison'd; and the Host, with all the Servants and Guests at that Time in the House, were apprehended; and, being examin'd, they all constantly, and with one Voice, asserted their Innocence; affirming, that they had all the same Provision with the dead Parties, of which they had eat and drank, only the Deceased had put Sage into their Wine. A Physician was ask'd the Question, whether Sage might be poisoned: He answered affirmatively. But, to come to the Purpose, it must appear whether any venomous Creature hath poisoned the Plant with her Spittle or Sanies. This, which was lightly pronounced, and only by Conjecture, was by the Eye found true; for, at the Root of this Bed of Sage was found a Hole in the Ground, full of Toads, who coming out upon pouring in hot Water, made it credible, that the Herb was poisoned by their Slaver, or venomous Urine. Whereby you are to understand how indiscreetly they act, who devour either Herbs or Fruits fresh gather'd, without well washing or rinsing of them.

Parey, amongst the Symptoms consequent upon receiving the Poison of a Toad, reckons the turning Yellow, Swelling, difficult Breathing, Vertigo, Convulsions, cold Sweats, Syncope, &c. to which *Sennertus* joins a growing pale and wan, Vomiting, involuntary Discharges of the Semen, falling of the Hair, and sometimes dropping out of the Teeth, with great Stupor, saith *Haffenreffer*, which she communicates not only by her Urine, Spittle, or Vomit, but her very Breath or Halitus emitted will affect those who stand too near her.

As to the Cure, if the Poison was receiv'd inwardly, Vomiting is propos'd for the immediate Discharge of the same, together with proper Clysters; and afterwards the common Alexipharmacs, such as Venice-treacle dissolved in a Glass of good Wine, whereby the Patient may be disposed to sweat; for which others propose some brisk Exercise, or the Use of warm Baths. *Sennertus* treats the Hurt outwardly much the same way with *Parey*, ordering the Part to be well washed with Man's Urine, Water, and Salt, after anointing with Oil of the Yolks of Eggs, or Oil of Roses. The reputed Antidotes are Juice of Betony, of Plantain, and Mugwort. *Pliny* writeth, that their Heart and Spleen resist Poison; but the bruised Toad,

or some Preparation thereof, like those of other venomous Animals, rightly apply'd, will sympathetically (as reported) extract their own Poison.

Rondeletius, in his *Traët. de Piscibus*, affirms the same things of the deleterious Property of this Creature, with others; yet he says they seldom bite, but cast forth either their Urine, which they gather in a large Quantity in a great Bladder, or else their venomous Spittle, or even Breath, against those they meet with, or assail. Besides, the Herbs which they taint with their said Breath, but much more such as are imbued with the Slaver or Urine, are sufficient to destroy those who eat them.

The aforesaid *Haffenreffer* asserts, in general, that the Bites and Stings of the *Reptilia* are to be treated much alike with those of the Viper, and serpentine Kind. The Spittle, Urine, or Sanies of the Toad, says he, must be cleansed well away with Urine, or Salt-water; or if the Poison was taken inwardly, you are to procure Vomiting; and farther, to take off all the Symptoms, he extols the *Confectio Diasulphuris*, thus describ'd by *Serapio*:

Take of yellow Sulphur, of the Seeds of white Henbane, of Cardamoms, Storax, and Myrrh, each one Ounce; of Opium, and Saffron, each two Drams; of Cassia Lignea, six Drams; and of white Pepper, two Ounces: Let them be tritured, pass'd through a Sierce, and made up into a Confection with Honey.

For this Use he also takes Notice of the *Cray-fish*, and *Gen-tian-root*, exhibited internally, whilst the Place is dress'd externally with the following Medicine:

Take three Heads of Garlick; and of Castor, one Dram: Let them be tritured, mixed with old Oil, and apply'd by way of Plaister: Or,

Take of Gum Sagapernum, Castor, Asa foetida, Pigeon's Dung, Calamint, and Penyroyal, each three Drams; Oil of Olives, and Pitch, each a sufficient Quantity: Make up into a Plaister.

Squills also boiled with Meal, and Meal of the Orobis mix'd with Vinegar, are properly apply'd to the Part: Or,

Take Nitre, Mustard, common Salt, and Sal Ammoniac; make into a Liniment, with strong Vinegar: Or,

Take Garlick, Salt, and Pigeon's Dung, each equal Parts: Mix all together, and apply by way of Plaister. *Turner, de Morbis Cutaneis.*

Since from what has been said 'tis obvious, that in all Nations Toads are look'd upon as poisonous Animals, it now remains, that we take Notice of some other Circumstances relative to this Animal. That Toads, then, may be safely eaten, provided their Sweat, Spit, or Urine, are not swallow'd, is asserted by *Borelli, Cent. 2. Obs. 37*. People who have had the Misfortune to eat boil'd Toads instead of Frogs, have felt no more terrible Consequences from the Use of such a disagreeable Food, than a gentle Excoriation of the Lips, Palate, Tongue, and Fauces; from which Circumstance *Vallisneri* concludes, that the Flesh of Toads is by no means of a poisonous Quality, but abounds with a volatile diuretic Salt, which, when reduc'd to Powder, may be of excellent Service in the Dropsy. *Mundius* affirms, that the Toad, that hated Animal, has Flesh not altogether useless; for, says he, by eating Toads, and by the natural Salubrity of the Air, the *Lues Venerea* is in some *American* Islands most infallibly cured. In *Eph. N. C. D. 2. a. 7. o. 167*. we have an Account of a certain Quack, who affirm'd, that the Whole of a Toad's Body might safely be eaten, provided the Head was only thrown away, assigning this Reason for his Assertion, that the Toad, at once enrag'd and terrify'd at the Sight of any Person, calls together the Force of his Poison to his Eyes, and the anterior Parts of his Head, by which means no Parts of the Poison are left in the rest of his Body. If this is true, Impostors and Strollers have no occasion to counterfeit Toads, by filling the Skins of these Animals with Wine, in order to make the gazing Croud believe they have devour'd real Toads, as we are inform'd they do by *Borelli, in Cent. 2. Obs. 74*. *Vallisneri* also informs us, that the Excrements of this Animal are not of a poisonous Nature, but endow'd with a highly diuretic Quality. Upon the Whole, *Etmuller* concludes, that the poisonous Quality consists entirely in its Fury, or in its Excrements, especially the Urine, which is impregnated with an acrid, caustic, volatile Salt, whose acrimonious Quality seems to be deriv'd from the Aliments on which the Animal lives, that is, the small Beetles found in its Stomach and Throat. If instead of the Urine, which, from the Circumstances already mention'd, does not seem to be poisonous, we substitute the venomous Liquor deriv'd from the Body to the Head,

Head, and especially the Eyes, this Conclusion does not seem improbable. But the Toad does not for this Reason cease to be properly classed among the venomous Animals; for tho' the Viper is not only eaten, but applied to medicinal Purposes, when the Head, which about the Teeth contains a Bag filled with a deleterious Liquor, is thrown away, yet the Viper does not on this account cease to be a poisonous Animal.

In what Cases the Toad is used for medicinal Purposes, I now come to consider. *Etmuller*, then, informs us, that a live Toad, bruised, proves an effectual Medicine for the Bite of the Viper, and other poisonous Serpents, when applied to the wounded Part. In *Velsch. Hecat. 1. Obs. 53.* we have an Account of a Country-man bit by a Serpent, and that in so violent a manner, that his Hand and Arm immediately swell'd to a prodigious Bulk; and the Poison reaching his Heart, he was seized with frequent Faintings, so that he seem'd to be on the very Brink of Death. But, after having tried all the ordinary Methods to no Purpose, he was speedily restored by the Application of entire Toads dried, which swelled wonderfully by the Poison they extracted. The Patient in the mean time had internal Alexipharmics exhibited to him. Some Authors, as *Helmont* informs us, order live Toads to be applied over both Kidneys, for removing the Dropsy, by a plentiful Discharge of Urine. *Paracelsus* affirms, that Toads are of singular Service in the Cure of pestilential Buboes in the Groin, and such as Women are afflicted with. His Method of preparing them is, to thrust a Piece of Wood thro' their Heads, to hang them up till dry, and then to macerate and mollify them in Rose-water, after which they must be applied to the Bubo; and he affirms, that they extract the pestilential Venom, since by applying four or five of them successively they all become wonderfully tumid by the Poison they have imbib'd. *Helmont*, when making mention of these Circumstances, confesses, that he has applied Toads to Buboes and Eschars in the Heads, Breasts, and other Parts of Men and Women, and that he always found they afforded a speedy Relief and Mitigation of the Pain; but could never observe, that a Toad applied in this manner became in the least tumid. I shall here enumerate the anti-pestilential Virtues of the Toad, in the Words of the learned *Kramerus*: "I know, says he, several Country-people, as also Mr. *Steikarte*, a Physician at Vienna, who, by attending People infected with the Plague, have, if we except Carbuncles, been seized with all the Symptoms of that Disorder, especially beginning Buboes. And for a Cure they used no other Means than covering themselves lightly with Bed-cloaths, and applying whole Toads dried in the Air, and wrapt up in Cloths, to both Arm-pits, to the Thighs, and to the Perinaeum between the Scrotum and the Anus. They kept themselves easy also during the Transpiration of the Matter, and, for carrying it on more effectually, they kept the Toads at the above-mention'd Parts till they would swell no more by the Poison they extracted. After which they remov'd them, and in their stead put other Toads three or four times successively, till they felt themselves reliev'd."

Franciscus Joel affirms, that a Toad run thro' with a sharp Probe, dried in the Air, and moistened in Vinegar, if applied to pestilential Carbuncles, extracts all the Poison from the Body. *Helmont* also from the Toad prepared an Amulet for the Plague; and others, as *Etmuller* informs us, prepare Amulets for the same Purpose of the Bones of Toads, or whole Toads mixed up with Iling-glass, which they say extract the Poison, and prove a Preservative, if hung about the Neck. Others bruise whole Toads, boil them in Vinegar of Roses or Rue, and with Mucilage of Tragacanth make them up into Troches, which they wear about the Neck. Others order the Toad itself, thrust thro' in June or July, and hung up till dry, to be hung on the Region of the Heart, as an Amulet against the Plague. But the last Author immediately subjoins, that he was told by a certain skilful Physician, that in the Application of Toads there was a Necessity for distinguishing Plagues: That if the Plague arises from a terrestrial and incoercible Gas, exhaling from the Mines and Caverns of the Earth, in such a Case Amulets prepared of Toads were proper, because the Toad attracts such a Gas as a proper Aliment: But that, when the Plague arises from an unlucky Influx of the Stars, the most proper Amulet was prepared from Spiders, since they attracted the Poison of the Air. See *ETMULLER*.

The learned *Vallisneri* thinks it probable, that a Toad, or its Skin, applied to Buboes, or other hard Tumors, may contribute considerably to their Resolution, and also to the deterring sordid Ulcers; but he does not believe, that it can defend the Person who wears it against the Plague. Besides, by *Etmuller* we are told, that a dried Toad hung about the Neck, or in the Pit of the Stomach, or applied to the Arm-pits, or even held in the Hand, most effectually stops and cures all kinds of Hæmorrhages, and more especially such as happen in malignant Fevers, Small-pox, and some other Disorders of a like Nature.

Willis in his *Pharmaceutice Rationalis*, has these Words:

"A Silken Bag, in which a dried Toad is contained, seems to be an empirical and foolish Medicine, when wore on the Pit of the Stomach in order to stop Hæmorrhages, and prevent their Return: unless perhaps, according to the Theory of *Helmont*, that Application so frights the *Archæus*, that the Blood shall forthwith be forced to recoil, or altogether desist from flowing." The *Pulvis Bufonum siccatorum*, or the Powder of Toads dry'd in the Sun, directed in the *Brandenburg Dispensatory*, when carefully preserv'd in a dry and temperate Place, is, according to the Testimonies of a great Number of celebrated Authors, an excellent Remedy in several Disorders, whether exhibited internally, but cautiously, and in some proper Vehicle; or externally used when inclosed in Bags, or mixed with proper Plaisters, Ointments, or Cataplasms. Thus the Powder of dry'd Toads was the celebrated Secret of *Kyperus*, for the Cure of the Ascites. He prepar'd them in this manner.

Take Toads, and after having cut off their Heads, and pulled out their Intestines, dry them in the Sun, and reduce them to a fine Powder; of which the Patient is to take ten or fifteen Grains, in an equal Quantity of Sugar. This Medicine may be exhibited three or four different times, but in such a manner, that three or four Days may intervene betwixt each time; for it is a very drastic Preparation.

These Toads may also be dry'd in an Oven, and reduc'd to a fine Powder. *Etmuller*, that the Medicines may produce its Effects the more infallibly, advises, that the Toads should be killed in the Month of July. A dry'd Toad inclosed in a Silken Bag, with a proper Quantity of the Moss of the Sloe-tree, when applied to the Navel of a Woman afflicted with a terrible Hæmorrhage of the Uterus, stopp'd the Flux as soon as it was warm on the Part, as we are told in *Eph. N. C. D. 1. a. 9. p. 366.*

The *Bufonum Cinis* of the *Brandenburg Dispensatory*, the *Bufo preparatus* in that of *Edinburgh*, and the *Pulvis Æthiopicus* of *Bates*, which he calls so on account of its Blackness, are no more but large live Toads burn'd to Ashes, in a new earthen Vessel. The Dose, according to *Bates*, is half a Dram and upwards, in the Small-pox. He affirms of it, that it relieves the Patients, tho' at the Point of Death; and says, that some highly extol it for the Cure of the Dropsy.

It is by other Authors recommended to be put into a Silken or Linen Bag, and hung upon the Breast for Incontinencies of Urine, arising from a Violence done to any of the Parts. *Eph. N. C. vol. 1. c. 227.* *Musitanus* prescribes a Toad put into the Oven alive, that it may become dry gradually as it dies, to be reduc'd to Powder, and form'd into a Poultice, with Barley-meal and human Saliva or Urine. This Poultice he orders to be laid on a Cloth, and applied to pestilential Carbuncles or Buboes. In a Quarter of an Hour after the Application, he says, the Pain will be entirely remov'd, and in two Hours a perfect Suppuration will be brought about.

The same Author proposes another very singular Benefit, which would accrue to the Inhabitants of *Naples* from the Use of this Cataplasm, which was, that by its means they might know whether Disorders that appear'd like the Plague were really pestilential or not. "In dubious Cases, says he, let it be applied to the Carbuncles, the Buboes, or any other Tumors which shall happen to appear; and, if they are really of the pestilential kind, the Pain of them will be remov'd in a Quarter of an Hour; within two Hours a perfect Suppuration will be form'd, and the Bubo or Carbuncle being open'd, all the pestilential Venom diffused thro' the whole Body will be drawn forth, if the Physician be duly careful. On the contrary, if the Tumor is not pestilential, but malignant, tho' not of the contagious kind, the Application of the Plaister will produce no Remission of the Pain, neither will any Suppuration appear; but the Tumor will remain in its former State, and be attended with the same Symptoms that generally accompany other malignant Tumors, which are not of the contagious kind."

With regard to the Preparation of this Cataplasm, *Kramerus* affirms, that the Urine of the Person to whom it is to be apply'd, is most properly used in its Composition. Afterwards he goes on to inform us, 1st, That he was induc'd to make Trial of the Cataplasm of *Musitanus*, by observing, that pestilential Buboes with Difficulty yielded to other Topics. 2dly, That this Cataplasm immediately on its first Application to Buboes, produced such intolerable Pains, that many Patients entirely refused to bear them. 3dly, That this Cataplasm, as it becomes dry, adheres so strongly to the Buboes, and Parts adjacent, that it can scarce be torn from them with the Finger. 4thly, That when it is once become dry, it ceases to produce any further Pain. 5thly, That the Buboes do not suppurate by its means in twenty-four Hours. 6thly, That they require three or four Days for that Purpose, whereas by other Topics the very same Buboes could not be soften'd, and brought to a Suppuration, in less than a Fort-night.

night, or perhaps three or four Weeks. 7thly, That as soon as the Cataplasma becomes dry upon the Buboës, and ceases to produce burning Heats, it is to be immediately renew'd, and its Renovation continued, till the Buboës are soften'd, at which time they are to be laid open. 8thly, That by the same Cataplasma, as *Kramerus* once observ'd in a robust old Man, of a thick Skin, tho' the pestilential Buboës were not soften'd, and brought to a Suppuration, yet their Surfaces were so corroded, as to give a free Discharge to a certain Ichor. 9thly, That this Cataplasma, in Venereal and other Buboës, neither excites the above-mention'd Pains, nor brings on a Suppuration. From all these Circumstances *Kramerus* thinks he has just Reason to declare in Favour of the specific antipestilential Virtues of the Toad. He recommends this Affair to the diligent Consideration of other Physicians, and refers his Reader to an Appendix he wrote to *Behren's Treatise* on the Plague, published in the German Language in 1713, in which Work he from his own Experience warmly recommends a topical Preservative prepar'd of Toads, and Roots of the Carline-thistle reduc'd to a Powder, and inclosed in a proper Bag.

In the Cure of a Cancer, says *Etmuller*, and more particularly unexulcerated Cancers in the Breasts of Women, Toads are of singular Service, either calcin'd alone, or dry'd to such a Degree, that they may be reduc'd to a Powder. The Method of applying this Powder is to sprinkle it on the Part affected. This Powder may also be mix'd with Orpiment and Soot, and apply'd, when spread, upon a Pledget moisten'd with *Saliva*. We are also told, that many Patients labouring under epidemical Dysenteries have been happily recover'd by the Use of this Powder, which operates as a Sudorific. Some prescribe half a Dram of it and upwards in the Small-pox. *D. Carlius* recommends the Powder of calcin'd Toads, mixed with the Powder of blue Linen Cloth burnt, in Epilepsies of adult Persons attended with an Infiltration of the Juices; and affirms, that as much of it as may be taken at twice upon the Point of a small Knife, has in some epileptic Patients produc'd the most happy and surprising Effects. He also informs us, that a Dose from ten to twenty Grains of the Powder of calcin'd Toads, exhibited internally, wonderfully mitigates arthritic Pains, and more especially those with which Wounds are attended. *Com. Lit.* for the Year 1733. p. 210.

In the same Work for the Year 1735, we have an Account of two Boys, who towards the latter End of a pestilential Disorder, in which they had been long afflicted with Carbuncles and Buboës, together with an universal Anasarca and Dropsy, were cured by a plentiful Diuresis excited by the Powder of Toads, mixed with Salt of Wormwood daily exhibited.

The diaphoretic Virtue of this Powder, by which it must of course contribute to the Cure of a Dropsy, was accidentally discover'd, as *Boecler* from *Solenander* informs us in the following History. At Rome a certain Man had the Misfortune to be afflicted with a Dropsy, and his Wife, thinking much of the Expences laid out for his Cure, maliciously resolv'd to poison him; for which Purpose she gave him a Dose of the Powder of a Toad calcin'd in an earthen Vessel, by which means a very plentiful Discharge of Urine was occasion'd. But the Wife, heartily wearied of so useless and expensive a Husband, was exceedingly desirous to put an End to his miserable Life by a sudden Death. With this View she exhibited the same Powder a second time, by which means the Waters were plentifully discharg'd by Urine, and the Patient cured. Thus the Views of Lust and Avarice were disappointed, and what was hellishly intended for a Poison, happily prov'd a noble and efficacious Medicine.

As for the Powder and Ashes of the Toad, 'tis highly probable, that the Effects they produce in the Constitution, are to be ascribed to an acrid Stimulus of a resolvent Quality, and of a salino-alkaline Nature. Hence Discharges of Urine or Sweat are excited according to the Constitution of the Patient, or the particular Regimen he uses. For this Reason many prescribe two Drams of the Powder of Toads to be taken by those who have the Misfortune to be seized with pestilential Disorders. Some Authors of undoubted Learning and Veracity also affirm, that the same Powder is an excellent Medicine for expelling Poison. Hence the Powder of incinerated Toads is by *Helvetius* called the Sudorific Powder. The sudorific Quality of the Toad is sufficiently confirm'd by the Case of a certain Countryman, who, when seized with the Plague, boiled a Toad with all its Intestines in Vinegar; and, after he had boiled it, he eat the Whole of it, and drank the Broth. However terrible this Medicine might appear, it was followed with very happy Effects; for by its means incredible Discharges of Sweat and Urine were excited; and these continuing for a whole Day, the Cause of the Pestilence was expelled, and the Patient's Strength gradually returning, a thorough Cure was brought about.

From these Qualities, I think, we are also to account for the Efficacy of the Toad's Heart, which, when dry'd, reduc'd

to Powder, and exhibited an Hour before the Paroxysm, has in some Cases cured quartan Agues. I must not on this Occasion forget to mention another Cure of the said Fever, which is said to be an infallible one, and consists in drinking the Milk in which a dry'd Toad has been boil'd. By this Medicine the febrile Matter is powerfully evacuated by Vomit, Urine, and Sweat. *Eph. N. C. D.* 2. a. 8. o. 104. a. 5. app. p. 40. The small Bones either of the fore or hind Legs of the Toad, which, when exhibited internally, produce, according to *Etmuller*, so surprising and happy Effects in the Cure of the Epilepsy, seem also to act by means of their resolvent Quality. To this Quality it is also probably owing, that dry'd Toads are by some applied to the Soles of the Feet, by way of Epispastics in Fevers, and Disorders of the Head. In *Eph. N. C. D.* 2. a. 5. o. 114. a dry'd Toad, applied to the Crown of the Head, is said to have allay'd the Violence of Madness, and at last to have cured the Patient. But how the Ashes of the Toad, used as an Amulet, can cure Incontinence of Urine, I must with *Schulzius*, in his *Prælectiones*, frankly acknowledge to be far beyond my Comprehension, I am equally in the Dark, and equally incredulous, with regard to an Effect of which *Helmont* affirms that he was an Eye-witness, and which is, that the Bone of the fore Leg of a Toad removes the Tooth-ach, immediately upon its touching the Part affected. Neither can I give an implicit Assent to a Story of *Etmuller's*, who tells us, that the same Bone, apply'd to the Pulse in the Wrist of a Child seized with an Epilepsy, in consequence of having suck'd the Milk of its Mother after she had receiv'd a terrible Fright, instantaneously allay'd and mitigated the Paroxysm. The medicinal Efficacy of the same Bone, apply'd in the same manner in intermittent Fevers, is also what I do not well comprehend.

The *Oleum Bufonum*, in the *Brandenburg Dispensatory*, is prepar'd of Toads infused and boiled in Oil of Olives, or Oil of sweet Almonds. 'Tis generally believ'd, that Toads, by a kind of magnetic Quality, attract and draw the Poison out of the Body; for which Reason the now-mention'd Oil is made an Ingredient in Cataplasms, intended for the Maturation of pestilential Buboës. The *Oleum Bufonum* in *Bates's Dispensatory* is thus prepar'd.

Boil four live Toads in two Pounds of Oil of Olives, for the Space of an Hour, or till they burst; then, straining off the Oil, keep it for Use.

This Oil is of great Service in Pustles of the Lips, and Cancers of the Breast. In Dropsies it is of singular Service, by exciting a plentiful Discharge of Urine, if the Region of the Kidneys be anointed with it. According to *Schulzius*, in his *Prælectiones*, this Oil is highly beneficial in the Cure of poisonous Wounds. *Musitanus* asserts, that it is a singular Secret in curing the Falling-off of the Hair, and other Disorders to which it is subject. The Method of using it is to anoint the Head often with it, having first purged the Body, and cut off the Hair. *Jacobæus* asserts, that it cleanses old Ulcers, removes Spots of the Face, and, more effectually than any other Medicines, carries off strumous Swellings. Concerning the Use of this Oil, in strumous Cases, *Borelli* writes thus: "The Scrophulæ are first to be excoriated by the Application of Arsenic; after which they must be corroded with Sublimate; and, last of all, this Oil must be used, which will become still more efficacious by an Addition of the Salt of Toads. Hence, perhaps, it was, that, according to many Authors, the ancient Arms of France were three Toads, since the Kings of that Nation undertook the Cure of the King's-evil, for which Toads are accounted so efficacious and powerful a Remedy." Others warmly recommend this Oil in Leprosies, and cutaneous Foulnesses. *Etmuller* gives us the following Account of it: Some, says he, prepare an excellent anodyne Oil, by infusing Toads in common Oil. Such an anodyne Oil is also prepared by putting live Toads into Water, in which sea Salt, or common Salt, has been dissolved, and allowing them to remain in it till they are dead. The Liquor is strain'd off, and then coagulated; but the Toads themselves are to be calcin'd with Salt, and fused with Lime; and, after the Fusion, the Lime is to be dissolved in Water, that the Fæces may be carried off. After this it is to be mix'd with Oil of sweet Almonds; this wonderfully removes Tumors, and mitigates Pains of every Kind, if the Parts affected are anointed with it. The *Oleum Bufonum Compositum*, also recommended for discharging Tumors, and removing Dropsies, is, in *Schroder's Pharmacop.* directed to be prepared thus:

Take of the Oil of Sheeps Feet, any Quantity at Pleasure; boil it with Sulphur reduced to Powder, till the Oil assume a reddish Colour: Then separate the Sulphur from the Oil, in which, whilst as yet warm, let Toads be immersed and suffocated; and, after Expression, subject to Distillation.

B U F

The *Emplastrum ex Bufonibus* of *Knoffelius* is prepared thus:

Take of the Powder of the best Amber, half an Ounce; and of Toads dried, and reduced to a Powder, one Ounce: Mix these together in an Alembic, and add as much Spirit of Wine as rises a Finger's Breadth above them. Draw off the Spirit in *Balneo Mariæ*, till what is left in the Alembic acquires the Consistence of a Magma. Fresh Spirit of Wine must be added three different times; and the Quantity remaining is most commodiously reduced to the Consistence of a Plaster, by being mix'd with Melilot-plaster.

This Medicine is of singular Service, when applied in proper Cases to any of the Emunctories. When applied to the Throat, it also contributes to the Cure of spurious Quinsys. Others prepare a *Cerate of Toads*, for curing Incontinence of Urine. Their Method of preparing it is thus:

Take one Pound of Toads, half a Pound of Oil of Olives, and three Ounces of Wax; let them boil, in a Pot, to the Consumption of half, or till it is of the Consistence of a Cerate, which is to be spread upon a Linen Cloth, and applied to the Region of the Kidneys.

Some suffocate live Toads in Spirit of Wine, or in *Malmsey* Wine; after which they take them out of the Liquor, put them into a Retort, in order to obtain a Spirit, a volatile Salt, and an Oil. This Spirit, rectified with the volatile Salt, is an excellent Sudorific and Diuretic, and a Medicine highly commended in the Plague. The Spirit of Wine, on the other hand, or the *Malmsey* Wine, in which the Toads have been drowned, is accounted an excellent Alexipharmic, if used internally. The volatile, and not rectified, Spirit of Toads, applied tepid, twice or thrice a Day, with two or three Folds of a Linen Cloth, to cancerous Tumors, is, in *Eph. N. C. Cent. 4. o. 179*, said to have cured many of that Disorder. *Faber*, in his *Myrothecium*, recommends

One Dram of the Salt of Toad-ashes, calcined to Whiteness, extracted either with the Water of *Cardus Benedictus*, or Scabious, or that of Lemon-peel, and mix'd with Treacle-water; to be taken in the Morning fasting, with Cinnamon-water, as an Antidote against all Poisons, whether convey'd into the Constitution by poison'd Draughts, or owing to the Impurity of the Air. Externally used, this Preparation is said safely to cure pestilential Carbuncles and Cancers, if anointed with it.

As for the volatile Salt obtain'd by Distillation, I can't think, that, when it is duly depurated, it differs from the Salts of other Animals of a like Class and Nature; but that a Salt can possibly be elixiated from the Ashes of Toads, is what I very much doubt. As for the Salt of Toads, and other Secrets prepared from them, *Daniel Ludovicus*, in his *Treatise de Pharmacia*, thinks, that such Preparations are, for the most part, handed down by Tradition, without having the Countenance and Sanction of Experiment to support them.

There is an anatomical Description of a Toad in *Valentinus's Amphitheatrum Zootomicum*. It is much disputed, whether Toads can be form'd in the Stomachs of Men: Some maintain the Affirmative, and assert, that they are generated from the Sperm or Eggs of Toads drank in Water; or rather, that they are enlarged and nourish'd in the Stomach, and afterwards thrown up by Vomit, or discharged by Stool. But *Vallisneri* not only calls these Relations in Question, but openly pronounces, that Animals cannot be generated in the Stomachs of Men, by the Sperm of these Animals being convey'd into them; for thus, says he, according to *Aristotle*, the *Primordia Geniturae*, or first *Stamina of Generation*, would be concocted. However curious and subtle the several Reasonings on this Subject may appear, 'tis yet certain, that the Eggs of Animals, laid and impregnated with their Embryos, may be farther perfected without the concurring Care and Nourishment of the Mother; as is obvious not only from oviparous Fishes, but from most Insects, from whose Eggs, nourish'd in a proper Place, perfect Animals are brought into the World, without the Help and Assistance of the Mother. That Worms are generated in our Intestines, in consequence of the Eggs or Sperm of these Animals being convey'd into the Stomach, is an Opinion universally received in our Days: Neither, if we argue from Analogy, shall we find it improbable, that the Eggs of Toads, swallow'd in impure and marshy Water, have proved the original and immediate Cause of those Toads which have been generated in the Stomachs and Intestines of Men, and afterwards discharged; unless, with *Vallisneri*, we assert, that the Worms found in human Bodies are nourish'd and propagated in us by the Worms communicated to us in the Uterus. The Observations concerning a live Toad, found in an Abscess of the human

B U G

Body; would not only favour, but absolutely confirm, this Opinion; unless we had Histories of some Parts of Vegetables, and other Substances formerly swallow'd, being found in Abscesses of the Body. See *Eph. N. C. D. 1. a. 2. o. 103*. There are Cases of live Toads swallow'd during Sleep, and Accounts of the Symptoms arising thence, in *Eph. N. C. Cent. 3. o. 163*, and *Cent. 8. o. 84*.

BUFONITES, or *Bufonius Lapis*. It is also call'd *Lapis Rubetæ*, and *Myxolithus*, and *Batrachites*; but the *English* have no other Name for it than the Toad-stone.

Some affirm, that these Stones are found in the Heads of old Toads, which have lived in dry Places; and that the Stone is far more valuable when taken from the Toad immediately kill'd, than when it has been dead for a great while. The common People affirm, that an old Toad, if laid upon a red Cloth, will vomit up this Stone. Others, for obtaining the Stone; order a Toad to be exposed to the Heat of the Sun till it be parch'd with Thirst; upon which they maintain it will vomit its Stone, as too great a Burden to its Head. Others, in order to procure the Stone, order a very large live Toad to be put into an earthen Vessel, full of small Holes; and the Vessel, when close stopp'd; is to be buried among a large Collection of Ants, for the Space of a Month; for then they affirm, that the Flesh of the Toad being destroy'd by the Ants, nothing remains but the Bones, and the Stone which was lodged in the Head: I cannot forbear looking upon these Accounts as so many Lyes, too palpable and glaring to deserve our Attention, much less our Assent. Our learned Countryman, Mr. *Brown*, in his *Vulgar Errors*, thinks; that People have some Reason to seek for Stones in the Heads of Toads, because stony Concretions are often form'd in the Heads of many other Animals, but more especially Fishes and Snails; but he doubts whether such a Stone is really found in the Head of the Toad; and, if it is really there, he thinks it is the Cranium indurated or petrified: Others have asserted, that this Stone was produced from the viscid Spume deposited upon the Head of a large Toad by a Collection of Toads, lodged in a Cave in the Winter Season: Hence *Christophorus Salveldensis* informs us, that in *France* and *Spain* this Stone is only produced by a certain Species of horned Toad call'd *Borax*; and mark'd with Saffron-colour'd Spots, and blackish livid Streaks: *Lanxonus*, from *Alb. Seba*, informs us, that the Origin of the Toad-stone is very uncertain, and involved in a kind of impenetrable Obscurity; since, notwithstanding the large Number of Authors who have wrote concerning them, and endeavour'd by Examination to discover their Natures, not one has hitherto dar'd to assert, that he has, with his own Hands, extracted a Stone of this kind from the Head of a Toad, or even pretended to shew one obtain'd in that manner; for *Vallisneri*, after all the Pains he could take, could by no means obtain any Stone from the Toad; from which Circumstance, he thinks, he has Reason to conclude, that this Stone being found in the Toad is a Story, which, like some other Pieces of Imposture, has met with a kindly Welcome from the Credulity of Mankind. *Merret*, in his *Pinax Rerum Naturalium*, affirms, that the Stones call'd Toad-stones, and accounted Gems, are only certain Teeth, call'd the Grinders, in the *Lupus marinus*, or Sea-wolf.

Schroder, as *Dale* informs us, recommends the Toad-stone as a most valuable Medicine against the Plague, and all kinds of Poisons.

Some affirm, that the *Bufonites*, or Toad-stone, carried about any Person, preserves him against all kinds of Poison, and changes its Colour upon its coming near to a poison'd Cup. But, as these things are not found to hold in Fact, I think it enough just to have mention'd them; only I must observe, with *Boerhaave*, that the *Bufonites*, in consequence of its being an alkaline Substance, may absorb Acids, and contribute to the Cure of Fluxes.

BUGANTIAE, Chilblains. *Castellus*. See PERNIO.

BUGLOSSUM, Offic. Park. Parad. 249. *Buglossum vulgare*, Raii Hist. 1. 495. Chab. 515. *Buglossum vulgare majus*, J. B. 3. 578. *Buglossum angustifolium majus*, C. B. Pin. 256. Tourn. Inst. 134. Boerh. Ind. A. 188. *Buglossum perenne majus sativum*, Hist. Oxon. 3. 438. *Buglossa vulgaris*, Ger. 655. Emac. 798. BUGLOSS. *Dale*.

Bugloss is like Mullein, but has a rough and blacker Leaf, like the Tongue of an Ox, spread on the Ground. This, put into Wine, is supposed to promote Chearfulness. *Dioscorides*, Lib. 4. Cap. 128.

Bugloss, from a long, thick, brown Root, sends forth large, rough, hairy Leaves, less prickly than *Borrag*, half a Foot long, narrow, and sharp-pointed. The Stalks arise to the Height of two or three Feet; full of short stiff Hairs, on which grow long narrow Leaves, set on without Foot-stalks. The Flowers grow several together, at the Top of the Branches, in long rough Calyces, of a single Leaf, cut into five round Partitions, of a purple Colour at their first appearing, and turning to a bright Blue as they stand, and are succeeded by four-corner'd rough Seed.

Bugloss is usually planted in Gardens, and flowers in June and July. The Leaves, Flowers, and sometimes the Root, are used.

Bugloss is much of the Nature of *Borago*, being accounted cordial, and good to exhilarate the Spirits, and drive away Melancholy; and is useful against Hypochondriac and Hysterical Disorders.

The Flowers are among the Number of the Four Cordial Flowers. *Miller's Bot. Off.*

The Roots are very glutinous, and give a deep Tincture of Red to blue Paper; the Flowers give it but very little, and the Leaves hardly any at all: So that probably the Sal Ammoniac in this Plant is involved in a glutinous Juice, in which the Earth and Sulphur predominate. The *Bugloss* moistens, cools, and gives great Relief to melancholy Persons; it is good to dissipate the Defluxions of the Breast, and an obstinate Cough. The Juice is drank from three Ounces to six. The Pitsan is taken by Glassfuls. The Roots and Leaves are used in cooling Broths, and this Plant cools no otherwise than by restoring the Motion of the Blood, which stagnates and heats the Parts wherein its Circulation is retarded. *Bugloss* Flowers are used after the manner of Tea. A Conserve is made of the Flowers. The Syrup made with the Juice of the Leaves of *Bugloss* gives great Relief to melancholy Persons: This Juice is employ'd in the simple *Byzantine* Syrup, and the compound one of *Mesue*. It enters also as an Ingredient in *Fernelius's* Syrup of Spleenwort. *Martyn's Tournefort.*

The Conserve, Syrup, and distill'd Water of *Bugloss*, are all highly extol'd by *Faber* in his *Myrothecium*. *Etmuller* is of Opinion, that, from the Leaves or Flowers of *Bugloss*, an ophthalmic Liqueur may be prepared, not inferior to that obtain'd from the Flowers of the Blue-bottle, or any other Liqueur of the same Intention. *Forestus* tells us, from *Augerius*, that People who have used a Decoction of *Bugloss* for thirty Days, purging off the Superfluities, every seventh Day, with Cassia sometimes alone, and sometimes with an Addition of the *Confectio Hamech*, have been cured of the *Lues Venerea*. The *Pulvis Diabuglossi Mynsichti*, in *Lemery's Pharmacop.* is prepared of Stimulants and Absorbents, the Aurum Potabile of *Mynsicht*, and Sugar, mix'd with the Bark of *Bugloss*-root. This Powder is said to be possess'd of a cordial and cheering Quality, and may be exhibited to the Quantity of a Dram.

BUGLOSSUM SYLVESTRE, *Offic.* *Buglossum sylvestre minus*, C. B. Pin. 256. Park. Theat. 765. Tourn. Init. 134. Boerh. Ind. A. 188. Elem. Bot. 110. *Buglossum sylvestre asperum minus annuum, foliis undulatis*, Hist. Oxon. 3. 439. *Buglossa sylvestris minor*, or, SMALL WILD BUGLOSS, Ger. Emac. 799. Raii Hist. 1. 494. Synop. 3. 227. Merc. Bot. 1. 24. Phyt. Brit. 17. Mer. Pin. 17. *Echium Fuchsii seu Borago sylvestris*, J. B. 3. 581. WILD BUGLOSS. *Dale.*

This is a much less Plant than the Garden Kind, growing not above a Foot high, with a small whitish Root, which dies yearly: The Leaves are long and narrow, but broader, and roundish-pointed at the End, rough and prickly, like *Borago*. The Stalks are thick, succulent, and prickly, clothed with narrow and sharp-pointed Leaves, set on without Foot-stalks. The Flowers grow on the Tops of the Stalks, in Shape like the Flowers of *Garden Bugloss*, but less, and of a light-blue Colour; the Seeds are also like the Seeds of that. It grows by Hedges and Way-sides, and among the Corn; and flowers in May.

This *Wild Bugloss* is but seldom used, tho' it is said to have the same Virtue with the Garden, but in a lower Degree, and, for want of that, may serve to supply its Place. *Miller's Bot. Off.*

Tragus made use of this Plant instead of *Borago*; and the Apothecaries of *Antwerp* use it (according to *Label*) in the room of *Bugloss*. *Martyn's Tournefort.*

The other Species of *Bugloss*, taken Notice of by Authors, are,

The *Buglossum latifolium sempervirens*, B. *Buglossum folio Boraginis, Hispanicum: Borago sempervirens*, or the ever-green *Borago*.

This Plant is said to be possess'd of an astringent Quality, which is stronger in the Root than in the Leaves, which, if drank in Wine, stop Fluxes.

Buglossum radice rubra.

Buglossum sylvestre, cauliculis procumbentibus.

Buglossum orientale, flore luteo, T. Cor. The Eastern *Bugloss*, with yellow Flowers.

Buglossum Creticum verrucosum perlatum quibusdam, H. R. Par. Warty *Bugloss* from *Crete*.

Buglossum sylvestre majus nigrum, C. B. P. Greater wild black *Bugloss*.

Buglossum Creticum majus, flore caeruleo purpurante, H. R. P. Greater *Bugloss* of *Gandy*, with a blue Flower, inclining to a purple Colour.

Buglossum Lusitanicum, Echii folio undulato, Inst. R. H. Portugal *Bugloss*, with an undulated *Viper's Bugloss*-leaf.

Buglossum Creticum minimum odoratum, flore vario elegantis, H. R. Par. The least sweet-scented *Candy Bugloss*, with an elegant Flower of various Colours.

Buglossum Creticum humifusum acaulon perenne, Echii folio angustissimo, Tourn. Cor. Perennial *Candy Bugloss*, lying spread upon the Ground, without Stalks, and with a very narrow *Viper's Bugloss*-leaf.

Buglossum Samium frutescens, foliis rorismarini obscure virentibus, lucide hirsutis, Tourn. Cor. Shrubby *Bugloss* from the Island of *Samos*, with *Rosemary*-leaves, of a shining dark-green Colour, and hairy.

Buglossum orientale erectum, foliis undulatis, flore amarae caeruleo, Tourn. Cor. Upright Eastern *Bugloss*, with undulated Leaves, and a Flower of a beautiful blue Colour.

Buglossum orientale angustifolium altissimum, Tourn. Cor. The tallest Eastern *Bugloss*, with narrow Leaves.

BUGLOSSUS. A kind of Fish. The same with the Sole. e SOLEA.

BUGONES, βυγόνες, βυγώνες, from βύς, an Ox, and γίνομαι, to be bred or generated of. An Epithet for Bees, in Use among the Antients, who supposed these Insects to be bred of the Putrefaction of an Ox. *Varro de Re Rustica, Lib. 2. Cap. 5.*

BUGULA, CONSOLIDA MEDIA, *Offic.* *Bugula*, MIDDLE CONSOUND, Ger. 500. Emac. 631. Merc. Bot. 1. 24. Phyt. Brit. 17. Raii Hist. 1. 575. Synop. 3. 245. Mer. Pin. 17. Dill. Cat. Giff. 49. Buxb. 46. Rupp. Flor. Jen. 187. Tourn. Init. 208. Elem. Bot. 177. Boerh. Ind. A. 184. Rivin. Irr. Mon. *Bugula vulgaris sylvatica caerulea*, Hist. Oxon. 3. 391. *Bugula vulgaris, flore caeruleo*, Park. Theat. 525. *Bugula Consolida media pratensis caerulea*, C. B. Pin. 260. *Consolida media, quibusdam Bugula*, J. B. 3. 430. *Consolida media, symphytum medium, Bugula*, Chab. 474. **BUGLE**, *Dale.*

Bugle has a small stringy Root, sending forth several Stalks of different Forms; some roundish, and lying along, and creeping on the Ground, sending out fibrous Roots from the Joints; the other, which grow erect, and bear the Flowers, are square, beset with but few Leaves, standing in Pairs opposite to one another; the lower on long Foot-stalks, the upper on very short ones; they are oblong, somewhat crenated about the Edges, an Inch and half long, and an Inch broad, of a dull-green Colour, and oftentimes with a Dash of Purple: The Stalks are eight or nine Inches high, having the Flowers growing at the Top, in loose Spikes, whorle-fashion, with two small brownish Leaves under each Whorle. They are of a blue Colour, and labiated, but have the Galea so small, that it is hardly discernible. When the Flowers are past, they are succeeded by small longish Seeds, in five-pointed Calyces. It grows in Woods and Hedges, and flowers in May.

Bugle is a noted vulnerary Plant, and us'd inwardly and outwardly for all kind of Bruises, Wounds, and Contusions, as likewise for Sores and Ulcers, for spitting of Blood, and Hemorrhages from any Part. It is also aperitive and diuretic, and good to open Obstructions of the Kidneys, and provoke Urine. *Miller's Bot. Off.*

This Plant is bitter, deterfive, and gives a faint-red Colour to blue Paper. It is employ'd in vulnerary Potions, Pitsans, and Apozems; the Dysentery, Fluor Albus, and Diseases of the Throat, Ulcers and Thrushes in the Mouth. The clarify'd Juice of *Bugle* has the same Virtues; it is us'd in Plaisters. *Camerarius* and *Dodonæus* prescrib'd it for Obstructions of the Liver. It contains some Sal Ammoniac involv'd in Sulphur. *Martyn's Tournefort.*

On account of its abstergent Qualities, it is accounted an excellent Vulnerary, and is very much us'd not only in vulnerary Potions, but also in Plaisters, particularly among the *French*, with whom it is a Proverb, that the Person who has *Bugle* and *Sanicle* has no Occasion for a Surgeon. In consequence of its abstergent Virtue, it is also said to be a present Remedy in spreading Aphthæ, and Ulcers of the Mouth: That an Ointment made of the Leaves of *Bugle*, *Scabious*, and *Sanicle*, bruised, boil'd in Lard till they become dry, and then express'd, is excellent for the Cure of all Ulcers, Contusions, and Wounds, we are told by *Parkinson*, who recommended the Use of it to those charitable Ladies, whose Compassion for their Fellow-creatures prompts them to relieve the Disorders of the Neceffitous. *Konigs* affirms, that, by means of its Bitterness, he has known it to heal scrophulous Ulcers in the Neck. From what has been advanc'd, we may easily perceive the Reason why this Plant is said to be diuretic, and why it is recommended in Spittings of Blood, Dysenteries, and the Fluor Albus; for, when coarse, tenacious, and viscid Substances are attenuated,

attenuated, and Obstructions remov'd, in order to make way for a free Circulation of the Juices, the Emunctories are not only open'd, but the spasmodic Contractions, which are the immediate Cause of the morbid Fluxions, being remov'd, these Disorders are cur'd. The Herb Bugle is most properly us'd in Decoctions, or its express'd Juice may be us'd, which is highly saponaceous and opening. The distill'd Water is not possess'd of very eminent Medicinal Qualities.

Potterius recommends a Decoction of Bugle, made with Mutton-broth, as an excellent Medicine in a Phthisis, and internal Ulcers; affirming that it gently relaxes the Belly, wonderfully recruits the Liver, and fortifies other Parts. *Et-muller* informs us, that the *Italians*, in the Spring, cleanse the Root and Leaves of Bugle, and use them as a Salad, which is not only grateful to the Palate, but acceptable on another Account, which is, that it seems calculated to prevent Cachexies. The same Author also informs us, that its Juice is an excellent Medicine in malignant Ulcers. *Rieger*.

The several Species of Bugle mention'd by Authors, besides the preceding, are

Bugula flore cinereo vel albo, *Inf. R. H.* Bugle with a white or ash-colour'd Flower.

Bugula Alpina maxima, *Inf. R. H.* The greatest Bugle of the Alps.

Bugula sylvestris villosa, flore caeruleo, *Inf. R. H.* Hairy Wood-bugle, with a blue Flower.

Bugula sylvestris villosa, flore suaverubente, *Inf. R. H.* Hairy Wood-bugle, with a fine red Flower.

Bugula sylvestris villosa, flore albo, *Inf. R. H.* Hairy Wood-bugle, with a white Flower.

Bugula Samia verna, boraginis folio, flore inverso, & caeruleo flavescente, *Tourn. Cor.* Samian Spring Bugle, with a Borrage-leaf, and an inverted Flower of a yellowish-blue Colour.

Bugula orientalis villosa, flore inverso caeruleo, alba maculata, *Tourn. Cor.* Hairy Eastern Bugle, with an inverted blue Flower, spotted with White.

Bugula orientalis villosa, flore inverso candido, cum oris purpureis, *Tourn. Cor.* Hairy Eastern Bugle, with an inverted white Flower, edg'd with Purple.

Bugula orientalis, flore ex violaceo purpurascente, *Tourn. Cor.* Eastern Bugle, with a purplish violet-colour'd Flower.

Bugula orientalis longifolia, flore majore intense caeruleo, *Tourn. Cor.* Eastern Bugle, with a long Leaf, and a larger Flower of an intense blue Colour.

BULAPATHUM, βυλάπαθον, from the intensive Particle βύ, and πάθω, a Dock. A Species of Dock. See **LAPATHUM**.

BULBASPHODELUS. An Asphodel with a bulbous Root. See **ASPHODELUS**.

BULBINA, BULBINE. Diminutives from **BULBUS**, which see.

BULBOCASTANUM, *Offic. J. B. 3. 30. Ger. 906. Phyt. Brit. 17. Buxb. 47. Raii Hist. 1. 440. Synop. 3. 209. Chab. 385. Mor. Umb. 5. Bulbocastanum majus & minus. SMALL AND GREAT EARTH-NUT, Ger. Emac. 1065. Bulbocastanum minus, Mer. Pin. 17. Bulbocastanum majus, folio Apii, C. B. Pin. 162. Hist. Oxon. 3. 274. Boerh. Ind. A. 70. Tourn. Inf. 307. Elem. Bot. 257. Nucula terrestris major & minor, Park. Theat. 893. EARTH-NUT, KIPPER-NUT, PIG-NUT, and HAWK-NUT. Dale.*

This Plant has a Root as big as a large Nutmeg, hard and tuberous, of a whitish Colour, shooting out Fibres from the Bottom and Sides; the lower Leaves are wing'd, cut into several Divisions of Leaves, finer and smaller than those of Meadow-saxifrage; the Stalk grows to be more than a Foot high, having one Leaf about the Middle, which is as fine and slender as Fennel, having the like Leaves at every Division of the Branches; on the Tops of which grow thin Umbels of small white Flowers, each of which is succeeded by two smooth long Seeds. It grows in sandy gravelly Places, and flowers in May.

The Root, which is only us'd, and either roasted or raw, is of a pleasant sweetish Taste, and is accounted nourishing, and to be a Provocative to Venery. It is likewise commended against the Strangury and bloody Urine. *Miller's Bot. Off.*

The Root of this Plant, when the Skin of it is taken off, proves a nourishing Food, but is subject to produce Crudities and Flatulences, in consequence of its being with some Difficulty concocted. It is also emollient, and inspissates the Juices; for which Reason the Use of it is often recommended to those whose Fluids are too thin, and to such as are phthical, consumptive, and extenuated. *Alexander Trallianus, L. 7. C. 2.* informs us, that the Bulbocastanum, or Earth-nut, is of great Service, prepar'd in the Food of those who are afflicted with a Spitting of Blood. *Baubine*, from *Tragus*, tells us, that the excoriated Root of the Earth-nut, boil'd in Flesh-broth, with a little Pepper, is a Food which is not only sweet and nourishing, but also proves a Stimulus to Venery. The Seeds of this Plant are said to be possess'd of a diuretic Quality.

Miller enumerates six Species of the *Bulbocastanum*.

BULBOCODIUM vulgatum, *J. B. Bulbocodium*, *Theophr. Codium vel Codiaminum flore codii, i. e. Campanulae, Gesn. Hor. Bulbus sylvestris et Codiaminum, Gesn. Hor. Narcissus luteus sylvestris, Dod. Pseudo-narcissus, Offic. Et Anglicus, Ger. 115. Emac. 113. Pseudo-narcissus Anglicus vulgaris, Park. Parad. 100. Narcissus luteus, Merc. Bot. 1. 53. Phyt. Brit. 79. Narcissus seu Pseudo-narcissus Anglicus, Mer. Pin. 83. Narcissus sylvestris pallidus, calyce luteo, C. B. Pin. 52. Raii Hist. 2. 1131. Synop. 3. 371. Dil. Cat. Giff. 40. Tourn. Inf. 356. Bulbocodium, Chab. 2. 2. WILD DAFFODIL. Lemery. Dale.*

Bulbocodium is a Species of wild Narcissus, about half a Foot high, with long strait Leaves, bearing on the Top of its Stalk a beautiful, monopetalous, bell-shap'd, pale Flower, in a yellow, gold-colour'd, shining Calyx, which is inclosed in a membranaceous Sheath, and surrounded with six pale pointed Leaves. The Flower is succeeded by a round Fruit, with three Eminences; and its Inside divided into three Capsules, which contain black, and almost round, Seeds. The Root is bulbous, and viscid to the Taste and Touch, with a kind of Sweetness, mix'd with a little Acrimony. It grows by the Sides of Fields, in Meadows and moist Places, and in Woods and Gardens. The Plant abounds with Oil, and essential Salt.

The Root is purgative and aperitive, and evacuates viscid Phlegm. The Dose is two Drains in an Infusion. *Lemery des Drogues*.

It has the same Virtues as the Narcissus, or common pale Daffodil. *Dale*.

The Root is emetic, and hurtful to the Nerves; but, outwardly, is said to be good for Ambuissions, Wounds, and Hernias. *Clusius* assures us, that the Root of every Species of Narcissus excites Vomiting, as he has often experienc'd; and *Lobel* says, that the Peasants use to vomit themselves with the Root of *Bulbocodium*. *M. Herman* says, the bruis'd Leaves are good for an Erysipelas. *Raii Hist. Plant.*

BULBONACH, *Offic. Phyt. Brit. 18. Bulbonac annum, siliqua rotundiore, Rupp. Flor. Jen. 70. Bulbonac vulgatissime, viola lunaris, viola latifolia, Phyt. Brit. 129. Viola lunaris seu Bulbonach, Ger. 377. Emac. 464. Park. Theat. 1366. Viola lunaris vulgaris, Ejuld. Parad. 265. Viola lunaria major, siliqua rotunda, C. B. Pin. 203. Raii Hist. 1. 787. Lunaria major, siliqua rotundiore, J. B. 2. 881. Tourn. Inf. 218. Elem. Bot. 187. Boerh. Ind. A. 2. 5. Leucoium lunatum, seu Lunarium latifolium majus annum, siliqua rotunda, flore violaceo seu subcaeruleo, Hist. Oxon. 2. 245. Herm. Cat. 368. SATIDN or HONESTY. Dale.*

The Stalk of it grows to the Height of a Cubit and a half, or more, and sometimes to the Thickness of the little Finger, of an azure or dark-red Colour, and hairy. The Leaves are like the Nettle, but sometimes twice or thrice as large, hairy, serrated, situated sometimes opposite, and sometimes single, where the Branches divide, and tasting like Pot-herbs. The Branches, and the Summit of the Stalk, are laden with Flowers, disposed almost in the same Order as in the Cabbage, of a purplish or carnation Colour, of the Size of those of the common Cabbage, and less than those of the *Leucoium*, but like them in other respects, of a faint Smell, with a whitish and remarkable Unguis on the Inside. Four greenish Stamina, with yellow or pale Apices, but just emerge out of the Calyx, which is of an oblong Form, red, and composed of two larger and two smaller Leaves, being like the Calyx of the *Leucoium*. The Pods are wide, roundish, flat, bivalv'd, a silver-colour'd Rim passing between the exterior Laminæ on both Sides. They shoot forth a Filament at the upper End, and contain a double Row of flat orbicular Seeds. The Root is frumous, or glandulous, whence it takes its Name, *Bulbonach*. The Seed is of a dark Red, and very large for the Kind, and of a very acrid Taste, mix'd with some Bitterness. It keeps its Leaves during Winter. The second Year of its Planting, the Stalk drops, and falls to the Ground, and, when the Seed is ripe, perishes. It grows plentifully in several Parts of *Germany* and *Hungary*; in *England* it is cultivated in Gardens.

It is of a hot, bitter, and acrimonious Taste, especially the Seeds, tho' the Roots are eaten in Salads. It absterges, moderately heats, and provokes Urine, like the *Rapunculus*. The Powder of the bitterest Seed is given, in a Water appropriated to the Distemper, for the Epilepsy. A Surgeon of *Switzerland*, with the bruis'd Leaves of the perennial *Lunaria*, or *Bulbonach*, and Sanicle, prepar'd a vulnerary Ointment of no contemptible Virtue. *Raii Hist. Plant.*

BULBUS.

The *Bulbus esculentus*, being commonly eaten, is known to every Body. The reddish Sort, which is brought from *Africa*, is agreeable to the Stomach and Belly; but the bitter and squillaceous Kind is more friendly to the Stomach, and helps Concoction.

The *Bulbi* are all acrimonious and heating, stimulating to Venery, inducing a Roughness on the Tongue and Tonfils, nutritive,

nutritive, and increasing the Flesh, but they generate Inflammations. They are effectual, in Cataplasms, for Luxations, Contusions, Darts, or other such Weapons, lodg'd in the Flesh, and for Pains of the Joints. They are good also in a Gangrene, and for the Gout, either alone, or mix'd with Honey. A Cataplasm of Bulbi, with Honey and pounded Pepper, is successfully apply'd to the cedematous Tumors of hydropical Persons, and to the Bite of a Dog. They restrain Sweating, and mitigate the Pain of the Stomach. Mix'd with roasted Nitre, they absterge the Scurf and *Acheres* of the Head. Alone, or mix'd with Egg-shells, they take off the Marks of Blows, or Spots (*irides*) in the Face; and, with Honey or Vinegar, they clear the same Part of Freckles. Mix'd with *Potentilla*, they heal Fractures (*hæmorrhage*) about the Ears, and Contusions of the Nails. Roasted in hot Cinders, and apply'd, with the Ashes of the calcin'd Heads of Mæxæ, (the Cackarel Fifth, *Dale*) they remove a Ficus. Burnt, and mix'd with *Alcyonium*, it clears the Skin of Sun-burning, and black Cicatrices, if rubb'd on the Parts exposed to the Sun. Boil'd in Vinegar, and eaten, they are effectual in Ruptures. It is advisable to abstain from a plentiful Use of them, because they affect the nervous System. *Dioscorides*, Lib. 2. Cap. 200.

There is a Plant of the bulbous Kind, which, as *Alpagus*, in his *Lexicon*, observes, is call'd, by the *Arabians*, *Arzi Anil*, or *Arz Arnil*. What it is, he explains from some *Arabian* Expositors, who say it is a Bulb of the Onion-kind, of a sweet Taste, grows in the Mountains, and is call'd, by the People of *Damascus*, *Arzi Anil*, or *Hafnil*; and that it is eaten in the Spring, on account of its Sweetness. *Alpagus* adds, That this Bulb was of the Shape and Size of the Pear commonly call'd the Muscadell, and was surrounded with a fine hairy Tegument, in manner of a Net, from which proceeded many long and fine Leaves; that it grows on Mountains, and was call'd by the *Arabian* Naturalists *Bulbus*. This is the *Bulbus* which *Avicenna* call'd by that Name, and says is the same as the *Bulbus esculentus* of the *Greeks*, and that it is of the Shape and Size of the Bulb of the Narcissus, has a Leaf like a Leek, and a Flower like a Violet.

Dioscorides has given no Description of the *Bulbus esculentus*, and, by that means, has put all our Botanists to the Trouble of searching it out, and they have not yet found it. *Avicenna* takes it for what we have said above; tho' he shews, at the same time, that the Matter is no less doubtful among the *Arabians*. Some, he says, think it to be the *Azzir*, which is a kind of Onion, which has the same Virtues, he tells us, as another Onion call'd *Basal Alfar*, that is, the *Mousse-onion*. Others, he says, take it for the *Cepe Althalcair*; for so *Alpagus*, in his *Lexicon*, reads the Words, and expounds them of a small oblong Species of Onion, which the *Venetians* commonly call *Scalogna*, and is the *Cepa Ascalonica* of the *Antients*.

Since there are so many Species of Bulbs, it is no wonder that the *Arabians* are not certain on which to fix for the *βολβος ἐσθλός*, "*Bulbus esculentus*," of the *Greeks*. *Avicenna* takes it as above, and calls it also *Basal Macul*. *Basal* is a Name common to all the cepaceous Kinds, from the *Hebrew* *בצל*, which signifies an Onion. *Serapio* takes the *Basal Azzir* for the *Bulbus*, and quotes the Place of *Dioscorides*, concerning the *Bulbus*, under that Head, which he expounds by an Onion without Coats. But the *Arabian* Interpreters, whose Opinion is given us by *Alpagus*, have confounded the Bulb of the *Egyptian* Lotus, or *Nymphæa* of *Nile*, which was call'd *Arz Elmil*, or *Hafnil*, with that eatable Bulb, which was call'd by the *Arabians* absolutely *Bulbus*.

Dioscorides seems to make two Sorts of the *Bulbus esculentus*; one sweet, and the other bitter, and favouring of the Sea-onion, or Squilla. *Avicenna*, in his Chapter of the *Bulbus esculentus*, towards the End, quotes the Words of *Dioscorides*, and, in like manner, makes two Kinds, the sweet, and the bitter; the sweet, which is red, is good for the Stomach, but the bitter Kind is better. *Pliny* tells us, that the *Bulbi* differ in Bigness, Colour, and Sweetness. Some Sorts are eaten raw, which, for that Reason, must be sweet; these grow, he says, in the *Taurica Chersonesus*. Next in Goodness, of the same kind, are the *African*; and, after them, the *Apulian*. The *African*, therefore, must be sweet. *Dioscorides* makes the *African* Bulbi red and sweet; on the contrary, *Heraclides Tarentinus*, in *Athenæus*, says they were white and bitter. These are Contradictions; yet *Dioscorides* mentions *Heraclides Tarentinus* as one of his Authors. The *antient Greeks* highly commend the *Bulbus* of *Megara*. *Theophrastus* writes, that Bulbs, in some Places, are so sweet, that they are eaten raw, as in the *Taurica Chersonesus*. At present we are ignorant of the *Bulbus esculentus* of the *Antients*, as well of the sweet as the bitter Kind; nor have our Botanists observ'd, that *Dioscorides* makes two Sorts of *Bulbs*, besides the *Bulbus vomitorius*, which are the sweet and red, brought out of *Africa*, and the common bitter Sort, which were known to every body.

There was also a sweet *Bulbine*, which *Theophrastus* does not reckon among the *βολβοι*, (*Bulbi*) but the *βολβωδον* (*Bulbodea*). And, indeed, the *βολβωδον* is so call'd, from its Similitude to

the *βολβος*. Thus we meet with *καρδαμύνη, ἐλλεβορίνη*, (*Cardamine, Helleborine*) and the like. *Heraclides Tarentinus*, before quoted in *Athenæus*, says, that what we call the *Bulbine* is of better Juice than the *Bulbus*, but not so agreeable to the Stomach, because it had somewhat of a pinguious Sweetness. Perhaps this *Bulbine* was the sweet *Bulbus* of *Dioscorides*, which, he says, was less agreeable to the Stomach than the bitter Sort.

Pliny, Lib. 20. Cap. 9. writes, that the *Greeks* call'd by the Name of *Bulbine* an Herb which had the Leaves of a Leek, and a red Bulb. On the contrary, *Matron*, in *Athenæus*, makes it have a Bulb whiter than Snow; and *Theophrastus* reckons the *Bulbine* among those bulbaceous Plants which were white, and not inclos'd within several Coats; such, he says, grew in the *Taurica Chersonesus*.

They who take the *Cepa Ascalonica* for the *Bulbus* of the *Antients*, are utterly in the wrong. The *Antients* plainly distinguish between what was properly call'd *βολβος*, and every thing of the cepaceous Kind; and *Theophrastus* even reckons among the *βολβωδον* some things which were different from the *βολβοι*, properly so call'd. He calls them *Bulbodea*, from the Similitude, because they had a round Root like the *Bulbus*, tho' not inclos'd in Scales or Coats. The *Bulbus*, therefore, consists of several Coats, one within another. In another Place he says, of the Root of the *Narcissus*, that it was much like the *Bulbus*, *πλὴν ἔχει σκαλῶδους*, "but not consisting of Scales or Coats." The *Arabians* knew no more of the *Bulbus* than the *Moderns*, as appears from the Chapter of *Avicenna* on the *Bulbus esculentus*; and they retain'd the *Greek* Term *βολβος*, because they knew not how to give a Name to a thing of which they were wholly ignorant. *Salmasius de Homonym. Hyl. latr.* Cap. 114.

Paulus Aegineta, L. 1. C. 76. informs us, that the "*Bulbs* are of an astringent abstergent Quality, and procure an Appetite; that they strengthen the Stomach, and promote the Expectoration of viscid Humours; that, when twice boil'd, they become more nourishing, but lose their emollient Quality, since, by that means, their Bitterness is destroy'd; that they increase the Quantity of the femoral Fluid, and, consequently, prove a Stimulus to Venery, if us'd in large Quantities; that they excite Inflammations and Gripes; but that, if eaten with Oil, Garum, and Vinegar, they are very grateful to the Palate, easily digested by the Stomach, cease to prove flatulent, and nourish very much."

Matthioli informs us, that *Galen* accounted the *Bulbus esculentus* cold; and thought that it render'd the Juices viscid, was with Difficulty concocted, produc'd Flatulences, and prov'd a Stimulus to Venery; but that, when it was apply'd by way of Ointment, it cleansed and agglutinated, in consequence of its Bitterness, and astringent Qualities. *Celsus*, L. 2. C. 18. reckons all the *Bulbi* among the Pot-herbs *valentissimi generis*, by which, in all Probability, he means such as afford a great deal of Nourishment; and, in the twenty-third Chapter of the same Book, he asserts that they generate a thick Phlegm. 'Tis no difficult Task to assign a Reason for the *Bulbi* being thought of hard Digestion, and calculated to inspissate the Humours, since they themselves abound with a tough and viscid Juice. That they were us'd by the *Antients* in Food, as a Stimulus to Venery, is a Circumstance not to be doubted. Accordingly *Martial*, in the seventy-fifth Epigram of his third Book, gives them the Epithet *Salaces*, in consequence of the Effects they produc'd in the Constitution; and, in the thirty-fourth Epigram of the same Book, he gives the following Advice:

*Cum sit anus conjux, & sint tibi mortua membra,
Nil aliud bulbis quam satur esse potes.*

And *Ovid*, when prescribing for the Cure of Love, he enumerates such things as are to be abstain'd from, he sings thus:

*Daunius an Libycis bulbus tibi missus ab oris,
An veniat Megaris, noxius omnis erit.*

BULBUS VOMITORIUS, Off. *Muscari Clusii*, ASH-COLOUR'D GRAPE-FLOWER, Ger. 105. Emac. 120. *Muscari obsoletiore flore*, Tourn. Inst. 348. *Muscari majus, obsoletiore flore*, Elem. Bot. 288. *Muscari obsoletiore flore ex purpurea virente*, Boerh. Ind. A. 2. 114. *Hyacinthus racemosus moschatatus*, C. B. Pin. 43. Raii Hist. 2. 1162. *Hyacinthus racemosus seu botryoides major, seu Muscari majus, obsoletiore albo flore*, Hist. Oxon. 2. 372. *Hyacinthus botryoides major moschatatus, seu Muscari flore cinericeo*, Park. Parad. 112. *Hyacinthus odoratissimus, dictus Tibcadi & Muscari*, J. B. 2. 578. *Hyacinthus odoratissimus, Dipeadi & Muscari dictus*, Chab. 207. **MUSK-GRAPE-FLOWER**, Dale.

The *Bulbus* called vomitorius has a Leaf as flexible as Leather, and much longer than those of the *Bulbus esculentus*; its Root indeed is like the Root of that *Bulbus*, but cover'd with a black Rind.

This Root eaten alone, or a Decoction thereof drank, is a Remedy for Defects of the Bladder, and provokes Vomiting. *Dioscorides, Lib. 2. Cap. 201.*

It produces five or six oblong Leaves, which spread themselves on the Ground in a disorderly manner, and are obliquely inflected, channelled, and sufficiently substantial and juicy, being very like the Leaves of the larger tufted Hyacinth, and shewing their fine Stamina, even when they are broken, but not so abundantly as the Leaves of the *Hyacinthus Eriophorus*, which, when first they bud, turn purple or whitish, and sometimes become of a very beautiful Red. From the midst of the Leaves in the Spring-time shoots up a pretty thick, round, and naked Stalk, very weak in proportion to its Thickness, and surrounded with Clusters of Flowers, from the Middle almost to the Top. These Flowers pretty well resemble a small Drinking-cup, and are at first purplish or green, afterwards of a Purple inclining to Green, or of a whitish-green, sometimes of a sort of Sea-green Colour; sometimes they are black in the Beginning, or of a deep Purple, and afterwards turn pale or yellowish; or they are pale at first, and grow yellow afterwards, and, when they begin to wither, turn black, or dark-colour'd; and this kind are more bluntly mucronated than others. Sometimes, when they begin to wither, they emit a most grateful Odour, almost like that of Musk or Spices. There are some found of a Snow-white Colour, and of a most lively Red, but I had never the Fortune to meet with any such. They are all succeeded by very large, triangular, and as it were pinnated Heads, containing black round Seed, of the Size of the *Orobis*. The Root is large, whitish, perennial, and composed of many Coats like the Onion, and strengthen'd with many thick Fibres, which proceed from its Base, and are perennial, not withering and perishing every Year, like the Fibres of the Hyacinths, Narcissuses, Tulips, Lilies, and many other bulbous Plants. The Flowers being to unfold from the Base, as in other Plants of the bulbous kind, which bear their Flowers in Spikes or Clusters.

It grows in the Gardens about Constantinople plentifully, and beyond the Bosphorus in Asia, from whence according to *Clusius*, it was originally imported into Europe. *Raii Hist. Plant.*

It flowers in the Month of April, and its Root is only in Use. When chew'd, or drank by way of Decoction, it cures Disorders of the Bladder.

See BULBUS, in the Explication of Botanical Terms in BOTANY.

BULEUMA, βύλευμα. The same as *Consilium*, which see.

BULIMIA, BULIMIASIS, BULIMUS. The same as BOULIMOS, which see.

BULITHOS, βύλιθος, from βύς, an Ox, and λίθος, a Stone. A Stone often found not only in the Gall-bladder, but also in the Kidneys and Bladder of an Ox; so that *Aristotle* seems to be mistaken, *Seet. 10. Prob. 42.* where he labours to give a Reason, why Man only is afflicted with the Stone. *Castellus*. See Bos.

BULLA, πομφόλυξ. A Bubble. It is generated, according to *Galen, Com. in Lib. 7. Aph. 34.* "by a Flatus included within a humid Substance." This happens most frequently when this Humid has something of Tenacity, which renders the Bubble more stable, and less liable to Diffolution. Πομφόλυγες (Bubbles) in *Hesychius* are expounded διὰ τῆς ὕδατος γινόμεναι ὑδατοεῖς, ἢ φυσήματα ὕδατος, "Tumors generated in the Water, or flatulent Swellings of the Water." In *Hippocrates, Lib. 7. Aph. 34.* οὐκίστοι δ' ἐπὶ τοῖσιν οὐρεσὶν ἐξίσανται πομφόλυγες, νεφρὶκά σημαίνουσι, καὶ μακρὴν ἀρρώστιν ἐκείνου. "Bubbles arising in the Urine indicate Nephritic Disorders, and a long Disease."

Bulle is used to signify Pustules arising in the Eye, or proceeding from Combustions in any Part. *Galen, de Simp. Fac. Lib. 6. & 9.*

BULLIMENTA. A Word used by some Chymists to signify Gold and Silver Vessels, as they appear after Washing and Scouring, that is, with a glittering Brightness. *Castellus*.

BUMELIA, βυμελία, from βύς, a Particle adding Greatness, and μελία, an Ash. A Species of Ash. See FRAXINUS. *Blancard*.

BUNA. See COFFEE.

BUNIAS, *Napus dulcis*, Offic. *Napus*, J. B. 2. 842. Chab. 272. *Raii Hist.* 1. 801. *Park. Parad.* 509. *Napus sativa*, C. B. Pin. 95. *Hist. Oxon.* 2. 114. *Rupp. Flor. Jen.* 65. *Buxb.* 231. *Bunias*, Ger. 185. *Emac.* 235. NA-VEW-GENTLE. *Dale*.

The boiled Root of the Bunias generates Inflatons, and affords but little Nourishment. The Seed drank prevents the ill Effects of Poisons, for which Purpose it is mixed in Antidotes. The Root is preserv'd as a Pickle. *Dioscorides, Lib. 2. Cap. 136.*

Those Leaves of the Garden-naveu, which lie on the Ground, are long and large, deeply cut in, and in Shape like a Turnep-leaf, but less, and very little hairy. The Stalks

grow to be two or three Foot high, beset with smaller Leaves, smooth as well as the Stalk, and little or nothing jagged, especially those which grow higher upon the Branches, which are round and broad at Bottom, and encompass the Stalk, ending in a narrow Point of a bluish-green Colour. The Flowers grow many together on the Tops of the Stalks, made of four bright yellow Leaves, and are succeeded by long cylindrical Pods, containing small round black Seed; the Root is white, longer and slenderer than a Turnep, but much like it in Taste. It is sown in Gardens, and flowers in April; the Root is used in Food, and the Seed in Physic.

The Seed is commended by the Antients as good against all kinds of Poisons, and the Bites of venomous Creatures, to provoke Urine, and the Menses. *Matthiolus* extols it against all kinds of infectious Distempers, to expel Malignity, and cheer the Heart, as also to drive out the Small-pox and Measles. It is an Ingredient in the *Theriaca Andromachi*. *Miller's Bot. Off.*

These Seeds are said to be heating, drying, absterging, aperitive, and digestive; and to be Enemies to Venery.

NAPUS SYLVESTRIS, Offic. C. B. Pin. 95. *Raii Hist.* 1. 802. *Synop.* 3. 295. J. B. 2. 843. Chab. 272. *Hist. Oxon.* 2. 114. *Rupp. Flor. Jen.* 65. *Dill. Cat. Giff.* 51. *Buxb.* 232. *Napus, Bunias*, Merc. Bot. 1. 52. *Phyt. Brit.* 79. *Bunias sylvestris Lobelio*, Ger. 181. *Emac.* 235. *Bunias sive Napus sylvestris*, Park. Theat. 865. Mer. Pin. 17. RAPE.

It grows amongst Corn, and on the Sides of Ditches. It flowers in Summer. The Seed is in Use. It agrees with the former in Virtues, but is somewhat more acrid. *Dale*.

This is a much less Plant than the Garden Naveu, having a long, slender, whitish, sticky Root, full of Fibres at the Bottom; the lower Leaves are less, and much jagged, and round at the Ends. The Stalks are smooth, and beset with the like smaller Leaves; the Flowers and Seed are much alike. *Miller's Bot. Off.*

PSEUDO-BUNUM, Offic. *Napus sylvestris Cretica*, C. B. Pin. 95. Park. Theat. 865. CANDY WILD NAVEW.

The Herb is only in Use, and is found in the Island of Crete. According to *Dioscorides* it cures Gripes, Stranguries, and Pains of the Sides. It also dissolves scrophulous Tumors, if mix'd with Salt and Wine, and apply'd to them by way of Ointment.

'Tis a Controversy hotly agitated among the Literati, whether the Seeds of the *Napus dulcis*, or those of the *Napus sylvestris*, ought to be used in the Composition of the Venice Treacle. The Seeds of the former are for this Purpose used in our Shops. In this they imitate the Greeks; for *Dioscorides* makes not the least mention of any of the *Napus sylvestris*. *Andromachus* the elder, also, orders the Seeds of the *Napus dulcis*; and *Matthiolus*, in the fifth Book of his Epistles to *Balthaserus*, affirms, that the Seeds of the *Napus dulcis* resist Poison more powerfully than those of the *Napus sylvestris*. *Andromachus* the younger, when enumerating the several Simples which enter the Composition of the *Theriaca*, commends the Seeds of the *Napus sylvestris*, as being more acrid, and of Consequence more efficacious in promoting the Intention of the Medicine. But *Galen*, in his first Book *de Antidotis*, differs from both these Opinions, and recommends the Seeds of the *Pseudo-Bunium*, as most proper for composing the *Theriaca*. *Dale*.

BUNITES Vinum, βυνίτης δίνος, Wine of Bunium; is made by putting two Drams of Bunium into two Quarts of Must, and letting it stand for a Quarter of a Year, and then straining it off.

It is good in Disorders of the Stomach, and relieves such as are fatigued with Riding or Fencing. *Dioscorides, Lib. 5. Cap. 56.*

BUNUM, βύνιον. Wild Parsley. See APIUM.

BUPEINA, βύπεινα, from βύ the augmentative Particle, and πεινάω, to hunger. The same as BOULIMOS, which see.

BUPHAGOS, βύφαγος. The Name of an Antidote in *Marcellus Empiricus, Cap. 29.* against the Colic.

BUPHTHALMUM, Offic. Chab. 364. *Buphtthalmum cotula folio*, C. B. 134. *Raii Hist.* 1. 341. *Buphtthalmum peregrinum*, Alp. Exot. 221. *Buphtthalmum alterum, cotula folio*, Park. 1371. *Buphtthalmum peregrinum Alpino*, Ejusd. 1371. *Buphtthalmum verum*, Ger. 607. *Emac.* 746. *Buphtthalmum tenuifolium, folio Millefolii fere*, J. B. 3. 124. *Hist. Oxon.* 3. 16. *Chrysanthemum cotula folio*, Her. Cat. 145. *Chrysanthemum folio cotula*, Flor. 2. 46. *Chrysanthemum alterum, cotula latiori folio*, P. Al. *Cotula flore luteo radiato*, Elem. Bot. 396. *Tourn. Inst.* 495. OX-EYE.

The *Buphtthalmum*, by some called *Cachlan*, sends forth tender, and somewhat slender Stalks, with Leaves like those of Fennel, and yellow Flowers, larger than those of the *Anthemis*, and resembling an Eye, whence it took its Name. It grows in Fields, and about Cities and Towns.

The bruised Flowers with Cerate discuss cedematous Tumors and Hardnesses. They say, that *Bupthalmum*, drank after coming out of the Bath, restores, after some time using it, a good Complexion to those who are discoloured with the yellow Jaundice. *Dioscorides, Lib. 3. Cap. 156.*

Ox-eye is a Plant which has a great many shrubby Branches, whereon grow fine winged Leaves, like Yarrow, but shorter, stiffer, and somewhat white and hoary: Each Stalk is terminated by one pretty large corymbiferous Flower, of a deep yellow Colour like a Marigold, but that the middle Thrum is larger in proportion, and the Petala are much shorter and firmer. The Root is small and fibrous. It grows wild in some Parts of the North of England, and flowers in June or July. It is seldom or never used: But that which is called the Ox-eye in the Shops, is the *Bellis major*. *Miller's Bot. Off.*

There is another Sort of *Bupthalmum* thus distinguish'd.

BUPHTHALMUM GERMANICUM. Offic. *Bupthalmum vulgare*, Raii Hist. 1. 341. Synop. 3. 18. Ger. Emac. 747. *Bupthalmum tanacetum minoris folio*, C. B. Pin. 134. Chomel. 2. 692. Boerh. Ind. A. 106. Tourn. Inst. 49. Elem. Bot. 396. Rupp. Flor. Jen. 136. Dill. Cat. Giff. 159. Buxb. 47. *Bupthalmum Matthioli sive vulgare, millefolii foliis*, Park. Theat. 1370. *Chamamelum Chrysanthemum quorundam*, J. B. 3. 122. *Chamamelum Chrysanthemum quorundam: Bupthalmum multis*, Chab. 363. *Chrysanthemum perenne, brevioribus et incanis foliis tanacetum instar alatis*, Hist. Oxon. 3. 20. **COMMON OX-EYE.**

This Herb is said to be aperitive, vulnerary, and to be good for a Jaundice; but it is seldom met with in our Shops.

Miller takes Notice of five Species of this Plant.

BUPLEUROIDES, βupleuroidης, from βupleuron, Bupleuron, and εἶδος, a Form or Shape, that is, a Plant much of the Figure of the *Bupleuron*. It is thus described.

The Leaves grow together by Twos and Threes in the same Place. The End of the Foot-stalk bears an oblong Ovary, the Apex of which is crown'd with a naked, herbaceous, pentapetalous Flower, the Petals being rolled up, inclosing five Stamina. The Ovary has a Tube cleft in two, the Apices of which are backwards, and rough. When ripe, it passes into two longish Seeds; the Flowers are disposed in the Form of an Umbel or Umbrella. It is an Evergreen. *Miller's Dict.*

I find no Medicinal Virtues ascrib'd to it.

BUPLEURON, βupleuron, from βῆς, an Ox, and πλευρον, a Side, because it is said to cause a Crepitation of the Side of an Ox, but more probably, because it affords the Ox a Bed: Or it may be supposed to be so called, because the Leaves bear some Resemblance to the Ribs of an Ox; or of βῆς, great, and πλευρον, Side, as the large Rib. *Miller's Dict.*

The Plant usually understood by this Name is thus distinguished.

BUPLEURUM, Offic. Ind. Med. 23. *Bupleurum folio subrotundo, sive vulgatissimum*, C. B. Pin. 278. Rupp. Flor. Jen. 226. Raii Hist. 1. 473. Tourn. Inst. 309. *Bupleurum angustifolium herbariorum*, Elem. Bot. 259. *Bupleurum angustifolium*, Buxb. 47. *Bupleurum perenne angustifolium*, Mor. Umb. 26. *Bupleurum perenne, longis et angustis foliis incurvis*, Hist. Oxon. 3. 300. *Auricula leporis umbella lutea*, J. B. 3. 200. Chab. 409. **HARES-EAR.**

It grows in hilly Places; flowers in July and August. The Herb is in Use. It is accounted a good Drier, Aperitive, and Discutient; it expels Urine and Sweat, and mundifies Wounds. *Zwing. Theat. Dale.*

Its under Leaves are sometimes oval, and much larger than the others: Both they and the Root are well drawn in *Tragus's* Figure. This Plant is very well described in *Cordus*, who calls it *Hysophyllon*, and makes use of *Tragus's* Figure. The Figures of other Authors represent only the Leaves which accompany the Stalk of this *Bupleurum*, and resemble those of Dogs-grass: Which is the Reason, that they very well express another Plant also of the same Family, which grows in *Provence* and *Languedoc*, but is annual. *M. Magnol* has named it *Bupleuron annuum angustifolium* Bot. *Monsp.* He observes, that it is the *Auricula Leporis Monspelienfium*, Plantaginifolius. *Gesn. Dodonæus's* Figure represents it not amiss.

C. Bauhine has confounded *Gesner's* Plant with that of which we are speaking. *Martyn's Tournefort.*

BUPRESTIS, Offic. Aldrov. de Insect. 487. Jonf. de Insect. 78. Mouff. Insect. 141. Charlt. Exer. 48. **THE BURN-COW.** Dale.

The Buprestes, which are a kind of Cantharides, are cured for Use like Cantharides, and so are the *Eruca* of Pine-trees. But these last must be roasted a little while in a Sieve hung over hot Ashes, before they are reposit.

They are all, in common, of a septic, exulcerating, and heating Quality; for which Reason they are mix'd up with Medicines adapted to the Cure of a Carcinoma, Lepra, and malignant Lichen. Mix'd in emollient Pessaries, they provoke the Menfes. Some affirm, that Cantharides mix'd with Antidotes help the Dropsy, because they provoke Urine; and

others have written, that their Wings and Legs taken internally are an Antidote. *Dioscorides, Lib. 2. Cap. 66.*

Buprestis, βῆρης, is deriv'd from the intensive Particle βῆς, and πῆσις, a Burner, from πῆσις, to burn, because it is an Insect of a very inflammatory Quality; or, as some will have it, from βῆς, an Ox, and the aforesaid Word; for if an Ox, they say, swallow this Insect, he dies of an Inflammation and Tumor of the Abdomen. *Castellus. Blancard.*

Pliny, Lib. 30. Cap. 4. says, "It is rarely found in Italy, and is like a long-legged Beetle, and is most pernicious to Black Cattle, who devour it among the Grass, whence it takes its Name; for it so affects their Gall, as to cause an Inflammation and Rupture of the Bladder." And the same Author, *Lib. 22. Cap. 22.* says, "that the Greeks by a strange Inconsistency commend it in Food, and prescribe Remedies against it as a Poison, which its very Name shews it to be at least to Black Cattle, which, they confess, will burst upon eating of it." *Vegetius, Artis Veterinariae Lib. 3. Cap. 78.* says, "That if a Horse chance to eat a *Buprestis* in his Hay, or at Grass, his Belly becomes inflated, he starts back from his Fodder, he dungs little and often, in which Case you must immediately saddle him, and put him upon a Course."

Bῆρης is in *Galen's* Exegesis expounded, τὸ τε ζῶον τὸ τῇ καθάρσει παραπλήσιον, ἔστι δὲ καὶ τὴν λαχάνων ἀγρίων, ἢ μέμνηςαι Δισκορίδης ἐν τῷ πρῶτῳ τῶν ὑγίωνων, καὶ ἐν τῷ περὶ λαχάνων. "The *Buprestis* is an Animal much like Cantharides, and also to a wild Green, mention'd by *Dioscorides*, in his Book of wholesome Things, and in his Book of Greens." The *Buprestis*, Animal, is often used by *Hippocrates, Lib. 1. περὶ γυναικ.* and *Lib. περὶ γυναικ. φύσ.* in Pessaries, for a Strangulation of the Uterus, and to provoke the Menfes. *Theophrastus* mentions the *Buprestis* among Greens. *Hist. Plant. Lib. 7. Cap. 8.*

The *Buprestis*, βῆρης, is a kind of little Animal like the Cantharis, which if an Ox happens to eat, he immediately swells and dies; and from this Effect it takes its Name. *Bῆρης* is also a kind of Green. *Hesychius, βῆρης λαχάνων εἶδος*, "The *Buprestis*, &c." This Green took that Name not from causing Inflammations in Black Cattle, but because it was a large Sort of *Pressis*, a Green so called, for what Reason I know not. So βελάπαθον (*Bulapathum*) is a great *Lapathum*; and βουέλιον (*Buselinum*) is a large Sort of *Apium*; and βύσυνα (*Busyca*) large Figs. *Pliny* did not imagine, that *Buprestis* was a common Name for two different Things; and therefore says, *Lib. 22. Cap. 22. Buprestim magna inconstantia Græci in laudibus ciborum etiam habuere, iidemque remedia tanquam contra venenum prodiderunt. Et ipsum nomen indicio est boum certe venenum esse, quos dissilire degustata fatentur.* "The Greeks with great Inconsistency, &c." (See before). Here the want of Consideration in *Pliny* is much to be admir'd for blaming the Inconsistency of the Greeks with respect to the *Buprestis*; for the *Buprestis*, which is Poison to Black Cattle, is quite another thing from the *Buprestis*, which the Greeks commend in Food: This is a Green, that a poisonous Animal. When they therefore prescribe Remedies against the *Buprestis*, it is against the Animal; when they commend it in Food, they mean the Herb or Green of that Name; so that there is the same Name, but not the same thing, nor perhaps the same Etymology of that Name. But the Greeks very clearly distinguish the *Buprestis* by the Words following, βῆρης τὸ τε ζῶον, &c. (See before). But *Pliny* confounds together not only Things which are really homonymous, but sometimes such as have some Similitude of Names, or where they differ only in Accent. Thus he makes ἀδίασιν (*Adiantum*) a Topiarian Plant, when he intended ἀκανθα (or *Acanthum*); and the Herb ἐξίμν to be the same with the ἐξίμν of *Theophrastus*, with an infinite Number of other such Mistakes. *Salmasii Prolegom. in Homonym. Hyl. Iatr. p. 3.*

It seems to belong to the kind of Cantharides, but it is more oblong in Body; and the crustaceous Integument of its Wings appears outwardly of a green, inclining to yellow, or rather is of a Gold-colour; it has also longer Legs, and somewhat thicker. The Eyes are globous and prominent, and from the Forehead, near the Eyes, proceed two oblong articulated Horns. The Head is but small, but the Mouth wide, hard, strong, forcipated, and armed with Teeth, with which it wounds and bites cruelly; the Belly is not round, but runs out in Length. Dale.

BUR. A Term in *Helmont*, the Meaning of which may be best known by giving the entire Passage in which it occurs, which runs thus. "Water putrefying (*frascens*) in the Earth acquires either a local or a native (*insitum*) Seed; for which Reason it either passes into a Liquor, which I call *Leffas*, for the furnishing of all Plants, or into a mineral Juice called *Bur*, according to the Species chosen by the Direction of the Seeds." *Elementa, 13.*

BURAC. All kinds of Salts; but some distinguish them into *Baurac*, *Denequat*, *Borago*, *Borax*, *Uritar*, and *Angar*. *Rulandus.*

BUR

BURDO, *Burdus*. A Colt, or young Mule, the Liver and Testicles of which last are recommended by *Aldrovandus*, de *Quad. L. 1. C. 4.* for their Medicinal Virtues. *Castellus*.

BURDUNCULUS. The Name of an Herb in *Marcellus Empiricus*, otherwise, as he says, called *Lingua Bovis*.

BURINA. Pitch. *Rulandus*.

BURIS. A Name given by *Avicenna* to a scirrhous Hernia, caused by the Lapidosity of a hard Abscess. *Castellus*.

BURNEA. Pitch. *Johnson*. I suppose he means *BURINA*.

BURRHI SPIRITUS MATRICALIS, or *Burrhus Spirit* for Disorders of the Matrix, is thus prepar'd:

Take of Mastich, Myrrh, Olibanum, and Amber, each two Ounces: Bruise them together, and add twenty-four Ounces of rectify'd Spirit of Wine: Digest for four Days, and afterwards distil to three Fourth-parts. *Pharmacop. Leydens.*

Boerhaave us'd this much in his Prescriptions.

BURSA PASTORIS, Offic. Ger. 214. Emac. 276. Mer. Pin. 17. *Bursa pastoris major vulgaris*, Park. Theat. 866. *Bursa pastoris major*, Merc. Bot. 1. 24. Phyt. Brit. 18. *Bursa pastoris major, folio sinuato*, C. B. Pin. 108. Rupp. Flor. Jen. 68. Tourm. Inst. 216. Elem. Bot. 185. Boerh. Ind. A. 2. 3. Buxb. 48. *Bursa pastoris major, capsula cordata, foliis laciniatis*, Hist. Oxon. 2. 304. *Bursa pastoria*, J. B. 2. 936. Chab. 295. Raii Synop. 3. 306. Dill. Cat. Giff. 45. *Thlapsi fatuum*, *Bursa pastoris dictum*, Raii Hist. 1. 838. Synop. 2. 176. **SHEPHERD'S-PURSE**. *Dale*.

The lower Leaves of *Shepherd's-purse* lie flat on the Ground, in a round Compass, three or four Inches long, narrow, and cut into several Gashes, a little hairy. The Stalk is slender, about a Foot high, branch'd towards the Top, beset with a few whole Leaves, which are sharp-pointed, and set close on, without Foot-stalks. The Flowers are small, white, and four-leav'd, and are succeeded by three square Seed-vessels, in Shape of a Purse, containing very small reddish Seed. The Root is whitish, woody, and full of Fibres, of but little Taste. It grows every-where among Rubbish, Banks and Walls, and flowers all the Summer. *Miller's Bot. Off.*

It is of an herby Taste, a little saltish, and deterfive. The Juice of its Leaves gives a faint-red Colour to blue Paper, which gives us Reason to imagine, that, in this Plant, the Sal Ammoniac, which is natural in the Salt of the Earth, predominates over the other Principles; this Sal Ammoniac is dissolv'd in a considerable Quantity of Phlegm, and is temper'd by a good deal of Earth, and a little Sulphur.

This Plant does not yield much Acid, by a Chymical Analysis; almost all that is extracted from it is Alkaline.

There are but few Plants which yield more concrete volatile Salt, fix'd lixivial Salt, and Earth. These Principles, mix'd together, render the *Shepherd's-purse* proper to dissolve the Blood, when it is thicken'd by foreign Acids, which hinder it from passing, with its ordinary Velocity, from the Arteries into the Veins; to which we may refer the greatest Part of Defluxions. Besides, the Earth, which is in this Plant, easily imbibes the Serosities, which occasion a Relaxation of the Fibres; thus, by the Consent of all Authors, it is vulnerary and astringent; it is also believ'd to be febrifugous and lenitive. The Juice of its Leaves drank, from four Ounces to six, is an excellent Remedy in all Losses of Blood, and in Defluxions attended with an Inflammation. They boil a Handful of it in lean Broth, and employ it in Pustians, Glysters, and Cataplasms. Its distil'd Water has little or no Virtue; it is nothing but the Phlegm separated from the other Principles.

It is found almost all the Year; for it propagates itself by Seed towards the End of the Summer. *Martyn's Tournefort*.

Those People are mistaken, who imagine that the styptic and astringent Qualities of the *Shepherd's-purse* are owing to its Coldness; for, like *Alcohol* of Wine, it acts by a hot and acrid Quality, either strengthening and constricting the Vessels, by burning them, or coagulating the Juices by its Heat; when it is either bruised, and apply'd to Wounds in the Surface of the Body, or when, in Hemorrhages of the Nose, its expressed Juice is drawn up the Nostrials, or a Tent dip'd in it put up, and retain'd in them. In dissolving Cataplasms, and in febrifuge Preparations, to be apply'd to the Wrists, the *Shepherd's-purse* is used in the same Manner, and with the same Intention, that other hot and stimulating Medicines are. When *Borelli*, Cent. 3. Obs. 27. affirms that the Bulk of a common Nut of bruised *Shepherd's-purse*, put into the Ears, is an excellent Medicine for removing the Tooth-ach, I should think, that this Effect was not to be ascrib'd to the Coldness, but rather to the Heat of the Plant, which stimulates the Nerves, and dissipates the Cause of the Disorder. But whether, when apply'd to the Nape of the Neck, or to both Arm-pits, or pressed pretty hard in the Patient's Hand till it becomes warm, or put under the Tongue, it stops Hemorrhages of the Nose, are Points which can only be determin'd by Experience. The learned *Pauli* tells us he knew a Man cur'd of a Spitting of Blood by

BUS

means of this Plant, which, during the Paroxysm, he used to grasp hard, and afterwards putting it between the Soles of his Feet and his Stockings, he walk'd upon it. But 'tis to be observ'd, that, at the same time, the Patient receiv'd the Fume of the best native Sulphur into his Mouth and Throat. *Shepherd's-purse*, apply'd to the Soles of the Feet, is said to be an approv'd Remedy for Head-achs. According to *Etmuller*, its Juice, put into Ears from which purulent Discharges are made, heals them; and, when mix'd with Vinegar and Houfleeck, it allays Inflammations of all kinds, the Gout arising from a hot Cause, inflammatory Tumors of the *Pudenda*, and *Erysipelas*. Four or six Ounces of its express'd Juice are recommended as a Medicine to be taken internally in Spittings of Blood, immoderate Fluxes of the Menfes, Discharges of bloody Urine, Diarrheas, Dysenteries, Lienteries, and Gonorrheas. Decoctions of it are also us'd, made with Red-wine, or common Water in which red-hot Steel has been extinguish'd; as also with lean Flesh-broth. Clysters of the above Decoctions are also said to contribute to the Cure of Fluxes. In Gonorrheas *Etmuller* recommends one Ounce of the expressed Juice, or two Ounces of the Decoction of *Shepherd's-purse*, to be drank, with three or four Grains of Camphire. The *Aqua bursa pastoris styptica*, so much extol'd in Fluxes, and Hemorrhages of the Uterus, Mouth, and Nostrials, as also for cleansing Ulcers, and allaying Heat, is, by *le Mort*, L. 2. 37. prepar'd thus:

Take of the Herb *Shepherd's-purse*, as much as you will; cut it small, and to each Pound of it add of crude Alum, and Vitriol of Mars, each half an Ounce; and of Water, a sufficient Quantity: Infuse for ten or twelve Days, and then distil in the common Manner.

The *Bursa pastoris major, folio non sinuato*, agrees with the former in its Medicinal Virtues.

BURSA TESTIUM. The Purse or Bag of the Testes. See **SCROTUM**.

BURSALIS MUSCULUS, *μὲν βοσκειδής*. The purse-like Muscle, a Name given to the *Musculus obturator internus femoris*. *Castellus*. See **MARSUPIALIS**.

BUSELINUM, *βουσελίον*. The common Daucus so call'd, the Word importing a large kind of *Apium*. *Blancard*.

BUSII SPIRITUS BEZOARTICUS. Bezoartic Spirit of *Busius*.

This Spirit takes its Name from its Inventor, *Busius*, an eminent Physician of *Dresden*; and the Medicine itself is of universal Use in *Saxony*, and well deserves our Notice; for it is a powerful Sudorific and Diuretic, with due Management; and is an excellent Antispasmodic, especially when mix'd with our anodyne Liquor (See **VITÆ BALSAMUM**). Besides, it recommends itself on account of its grateful Flavour, having nothing of a nauseous empyreumatic Smell.

The Foundation of the Preparation consists in mixing the volatile, urinous, and oily Spirits of Animals with highly rectify'd Spirits of Wine, and, with an Addition of balsamic Species, distilling them over a proper Fire; by which means we obtain a Spirit well impregnated with a volatile Salt, an empyreumatic Oil, and refinous, sulphureous, balsamic Particles, and of no unpleasant Smell and Taste. Tho' there are many different Preparations of this Spirit, our way of making it is as follows:

We take of Spirit of Ivory, saturated with a subtile Oil, and volatile Salt, about two Ounces; Sal Ammoniac, four Ounces; Pot-ash, first dissolv'd in Water, eleven Ounces; Amber, finely pulveriz'd, half a Pound; genuine Oil of Cedar, or of Juniper, half an Ounce: All these Ingredients, being exquisitely mix'd in a Glass Cucurbit, are to be distil'd in a Sand-heat, by which we extract a Spirit, endu'd with the aforesaid Virtues. A volatile Salt first rises in the Alembic, which is afterwards successively dissolv'd by the Spirit.

It is here to be observ'd, that the *Peruvian Balfam*, or the fresh Peel of Lemons or Oranges, or Juniper-berries, or any other balsamic and aromatic Powders, may be us'd instead of the Ingredients before-mention'd.

In the Process, a limpid Spirit, like Water, comes over; but the longer it is kept in a Vessel exposed to the Air, the more yellow it turns, till its Colour be heighten'd almost to a Redness. If the Glass be filled with this Spirit, and covered with the Stopple, it will continue clear, and suffer no Alteration of Colour; whence we are plainly taught, that the Cause of this Change is in the Air. And I am of Opinion, that the original, and most simple, Acid of the Air, which is of wonderful Virtue in exalting the Colour of Sulphur and Oil, concurs in this Alteration.

This Spirit abounds with an oily volatile Salt; for the more a volatile Salt is impregnated and intimately mix'd with an Oil, the more easily and readily it unites with highly rectify'd Spirit of Wine; and that Salt may immediately be precipitated from

BUT

from this Spirit, by mixing a few Drops of Oil of Vitriol with it, which produce a Coagulation and Precipitation of the Salt to the Bottom, where it firmly adheres to the Sides of the Glass. It is worthy our Observation, that this volatile Spirit of *Bussius* is endu'd with an almost incredible Virtue, in subverting and expelling all kinds of Acids, tho' never so strong; and these Effects are attended with different Circumstances and Events. Thus, if one Part of Spirit of Nitre, or Aqua-fortis, be pour'd to three Parts of this Spirit, all the Acidity is soon taken off, without any remarkable Ebullition, and nothing is precipitated to the Bottom; the Mixture acquires a mild nitrous Taste, and, being put into a Silver Spoon, and evaporated by the Heat of a Candle, leaves a Salt of an exquisitely nitrous Flavour. This Mixture also, on account of the volatile Nitre which it contains, is endu'd with excellent Medicinal Virtues; for, in acute Distempers, where volatile Medicines are of no Effect, because of the violent Motion and Effervescence of the Blood, this Spirit, mix'd with Spirit of Nitre, and render'd more temperate, gives all the Relief that can be wish'd, by gently carrying off the morbid Matter.

If this Spirit of *Bussius* be mix'd with Spirit of Salt strongly concentrated, there arises a greater Ebullition than in the former Case; but all the Acid is, in like manner, in a very short time, subdu'd, and the Liquor turns salt, which, in Disorders of the Stomach, where the Appetite is lost, may be given with Success, for dissolving viscid Crudities. When this Spirit is mix'd with distill'd Oil of Vitriol, there immediately arises an Effervescence, the Mixture becomes turbid, and all the volatile Salt is precipitated to the Bottom; the Taste of the Mixture has nothing of Acidity, but has a grateful Smell.

The Reason why there is a Concretion and Precipitation of the volatile Salt at the Mixture of concentrated Oil of Vitriol, but not with other Acids, seems to be as follows.

Oil of Vitriol, as being a very strong Acid, unites with inflammable Spirit of Wine, which is an oily Substance; hence the volatile Salt, which it contains, is precipitated; but, from other acid Spirits, which are weaker, and incapable of so intimate a Combination with the inflammable Spirit of Wine, there follows no Precipitation.

From these Experiments we may draw this Conclusion, which is very useful in Practice: That this Spirit, which abounds with an oily volatile Salt, may be given in large Doses, without Inconvenience, in Distempers, especially chronical ones, where a strong and copious Acid is lodg'd in the Sinuses of the Stomach and Intestines, and creates Disturbances in those Parts, as it does more remarkably in Hypochondriacal Affections. *Fred. Hoffman, Observ. Physico-chy.*

BUTLER, an *Irishman*, the Inventor of a Stone of wonderful Efficacy in the Cure of very dangerous Diseases, in a very speedy Manner; he is also said to have been excellent at making Gold out of Lead and Quicksilver. However, it is certain, that he was in great Esteem with our King *James I.* and *Van Helmont* did him the Honour to intitle one of his Tracts BUTLER, in which he relates several strange Cures perform'd, in all Appearance, by means of his Stone; particularly, that when Butler was a Prisoner in the Castle of *Vilvorden* in *Brabant*, he took Notice, one Evening, of one *Bailly*, a *Franciscan* Monk, and a very celebrated Preacher of *Bretagne* in *France*, who was his Fellow-prisoner, and had his Arm affected with a terrible Erysipelas; and, taking Pity of the Man, he took a small Stone, and hastily dip'd it in a Spoonful of Almond-milk, immediately taking it out again; then said to the Keeper, "Give this to that Monk, and, whether he takes more or less of it, within the Space of one Hour, at farthest, he shall be a sound Man." This actually came to pass, to the Astonishment of the Keeper, the Sick not knowing by what means he came to be so suddenly restor'd to his Health, or that he had taken any thing for that Purpose; but his Left Arm, which was swell'd to an immense Degree, immediately fell to such a Pitch as scarce to be distinguish'd from the other. The next Day, says *Helmont*, I came to *Vilvorden*, at the Request of some Persons of Quality, that I might be a Witness of these Actions, where I contracted a Friendship with Butler; and, soon after, observ'd an old Washer-woman, who, for about sixteen Years, had labour'd under an intolerable Hemicrania, cur'd in an Instant, while I was present. For he took the same

BUT

Stone, and carelessly dipp'd it in a Spoonful of Oil of Olives; then taking it out immediately, lick'd it dry, and put it into his Breast-pocket; the Spoonful of Oil he pour'd into a little Flaggon of the same Liquor, and then order'd only one Drop of it to be put upon the Head of the old Woman, who recover'd her Health that Moment, and has remain'd well from that Time, which is some Years ago. I could not help being vastly surpris'd; but he look'd at me with a smiling Countenance, and said, "My dear Friend, unless you can arrive to such a Degree as to be able to cure all Diseases with only one Remedy, you are still but a Novice in the Art, how many Years soever may have pass'd over your Head." I easily acquiesced in what he said, because I had learn'd as much from the *Arcana* of *Paracelsus*, and was further convinc'd of it by what I now saw, and expected to see; but this new Method of Curing, I freely confess'd, was utterly strange and unknown to me. I told him then, that there was a young Prince in our Court, Viscount *Ghent* by Title, and Brother to the Prince of *Episnoy*, who was so over-run with the Gout, that he was able to lie only on one Side, and was quite miserable, and deform'd with a Multitude of nodous Swellings. Says he, taking me by the Right Hand, "Are you willing that I should cure this young Prince? I will cure him for your sake." "But, said I, he is so stubborn, that he will rather die than take one Dose of Physic." "No matter, answer'd Butler; all I require of him is, only every Morning to touch this little Stone, which you see, with the Tip of his Tongue; for, after three Weeks from that Time, let him but wash the painful, and the not-painful Nodes with his own Urine, and, in a very short time, you shall see him upon his Feet, and a sound Man. Go, and tell him with Joy what I say." So I returned to *Brussels* with these glad Tidings, and told what Butler had said. The Nobleman answer'd, "Go tell Butler, that if he makes me sound, he shall have whatever he will ask; let him but name his Price, and I will freely deposit the same in Pledge for his Security." When I return'd to Butler the next Day with this News, it put him in a great Heat, and he said, "Your Prince is mad and miserable, for which Reason I shall never do him any Good; for I do not want his Money, but am as good as himself." Nor could I ever afterwards prevail with him to perform what he had promis'd. Wherefore I began to doubt whether what I had seen before ought not to be regarded as Things pass'd in a Dream. But it happen'd, some time after, that a Friend of Butler's, who was Master and Overseer of a Glass-house in *Antwerp*, and of a very gross Habit of Body, earnestly begg'd of Butler to be freed from the Burden of his Fat. Butler offer'd him a little Bit of his Stone to lick once; that is, to give it one quick Touch with the Tip of his Tongue every Morning; and, within three Weeks, I saw him shrunk a full Span at the Breast, and yet never the worse in Health. This Event inclin'd me to believe, that he could have made good his Promise, and perform'd a Cure upon the gouty Person before spoken of. But, in the mean time, finding myself poison'd by some secret Enemy, I sent to Butler, at *Vilvorden*, for a Remedy. I was in a very languishing Condition, pained in all my Joints, my Pulse beat double, (*dicrotus*) and, at last, was intermittent, attended with a Lipothymy, and an utter Decay of Strength. Butler, who was still a Prisoner, immediately order'd the Messenger, my Servant, to bring him a little Pot of Oil of Olives, and, dipping his Stone therein, as usual, sent the Oil to me, with Directions to put only one Drop of Oil upon one, at least, of the pained Parts, or one Drop upon each of them, if I pleas'd. I did according to his Orders, but receiv'd no Benefit thereby. In the mean time, my Enemy, being taken sick, and upon his Death-bed, sent to ask my Pardon for the Injury he had done me, and so confirm'd my Suspicion, that I was poison'd. I had then no more to do but to use the best means I could to put a Stop to the Operations of this slow-working Poison, and wholly to subdue it; and, by the Grace of God, I escap'd. But my Wife, for some Months, had been afflicted with a Pain in her Right Arm, so that she could not so much as lift her Hand, much less lift up a Weight, and, with Sorrow and Concern on my Account, contract'd at last a dangerous oedematous Tumor in both her Legs, which, by Degrees, extended itself from the Foot as high as the Groin, as appear'd from the Pits left by the Impression of the Fingers; and, because her Distemper was owing to Grief and Concern for my Troubles, she would take no Physic while her Sorrow lasted. In this Condition, my Wife finding that Butler's Oil had no Effect upon me, and being willing to pass a Joke upon my Credulity before some Ladies, put only one Drop of this Oil upon her Right Arm; the immediate Consequence of which was, contrary to all Hope, the Restoration of that Arm to its free Motion, and former Soundness. We were all struck with Wonder at so sudden and miraculous an Event, and she was encourag'd to anoint her Ankle-bones with the same Oil, on each of which she put only one Drop, drawing it round the Eminence of the Bone, and, within a Quarter of an Hour, the

the Œdema quite vanish'd, and she is still living in good Health, tho' nineteen Years are past since this extraordinary Event.

Van Helmont proceeds to relate two more such prodigious Cures; one perform'd on a Maid-servant of his, who, from an Erysipelas, which had thrice afflicted her, and been as often ill cur'd, had her Right Leg of a leaden Colour, and swell'd from the Knee to the Toes; the other was on a Widow Gentlewoman, who, for some Months, had not been able to lift her Hand.

After this, says *Helmont*, I ask'd *Butler* why so many Women could be suddenly cur'd, and I, who lay even at Death's Door, oppress'd with Pains in every Limb and Joint, could not receive the least Relief. He desir'd to know what was my Distemper, and, when he understood, that it was the Effect of Poison, he said, "That, since the Cause had betaken itself from the inward to the outward Parts, the Oil should have been taken, or the Stone dip'd; that Pain, internally confin'd and nourish'd, could not be topical or external." I observ'd also, says *Helmont*, that this Oil, by Degrees, lost its Efficacy; because the Stone, which was slightly dip'd therein, did not make a thorough Alteration in its Substance, but only imparted to it a Fragrancy, which in time went off. For this Stone, to the Sight, and on the Tongue, was like melted Sea-salt; and it is well known, that Salt cannot be intimately mix'd with Oil. *Butler* also cur'd an Abbess of sufficient Note, who, for eighteen Years, had her Right Arm swell'd, with a deprav'd Motion, with the Fingers extended and immoveable; and this only with a Touch of the Tongue upon the Stone. Multitudes of those who were Witnesses of these strange Events, presently suspected there must be some Witchcraft, or diabolical-Compact, in the Case; for it is usual with the Vulgar, and has been so of old, to refer those Events, in which they think it shameful to confess their Ignorance, to the cunning Wiles of evil Spirits. But I am not inclin'd to their Opinion, because the Remedies are supposed to be natural, and have nothing unusual besides the Quantity; for no Ceremonies, Words, nor any other suspected Thing, was requir'd. Nor, indeed, is it lawful, as far as human Understanding can perceive, to transfer the Glory of God, manifested in Nature, to an evil Spirit. For none of the Women, who were thus cur'd, ever consulted *Butler*, as one in the least suspected of Necromancy; and even his first Essays met with Laughter, instead of Faith and Confidence. However, the Facility and Celerity of such a way of Curing will, I know, remain suspected by many; for the fickle and lazy Disposition of the Vulgar, in arduous and unusual Events, prompts them to judge of all alike, because it is the easiest Way; and they had rather ascribe the Benefit of so great Cures to diabolical Deceit, than to the Divine Goodness, to the Author, Lover, Saviour, and Restorer of human Nature, and the Father of the Poor. And, in this vain and weak Opinion, they are follow'd by those among the Learned, who take a wrong Method of investigating the first Principles of curing Diseases, who are not yet instructed, or observe the common foolish Rules. *Helmont*.

These Relations, strange as they are, Mr. *Boyle* seems not to disbelieve. He tells us, That a Gentleman in France was reported to have some Portion of this Stone, and to have cured several inveterate Diseases, by suffering the Patients to lick it; and Sir *Kenelm Digby*, upon Inquiry when in France, found no Reason to disbelieve these Reports. He farther says, That *Helmont's* Widow, many Years after her Husband's Decease, confirm'd to a Friend of his the Story told above relating to herself. These Particulars, adds he, receive Confirmation from two remarkable Circumstances; for, first, *Helmont* is the more to be credited here, because he mentions Cures not perform'd by himself, but by a second Person, and that too with Remedies unknown to him. Secondly, our famous Countryman Dr. *Higgins*, who lived familiarly in the same House with *Butler*, gives a strange Attestation to his Secrets.

It has two Roots; the more slender and black of which descends, whilst the thicker spreads itself transversely almost at the Surface of the Earth, with some Shoots, and many Fibres, adhering to it. The Roots have a sweetish Taste, and are glutinous in the Mouth. The thicker Root is, in my Opinion, the last formed Part of the Root, and of one Year's Growth only. As this Root grows, it sends out Leaves above, and thrusts large white Fibres downwards. It raises many soft Leaves with a spongy or porous Medulla; and these Leaves are triangular, long, concave at their Origins, and embracing some

Part of the Stalk with membranous Appendices; but they are more flat towards their Points. The Stalk is two Cubits and more in Length. It is round, smooth, and spongy, but not concave; bare of Leaves; and on its Top bears several Flowers disposed in the Form of an Umbel, and supported by slender naked Pedicles, about half a Handbreadth in Length. The Flowers are hexapetalous, and of a carnation Colour, somewhat inclining to Purple. The three exterior Petals are carinated and largest, and seem to belong to the Calyx; but the three interior ones are less. The small seminal Vessel consists of six purple-coloured Capsulas, corniculated at the Top, and containing within them very small Seed. About nine Stamina surround this Seed-vessel in the Middle of the Flower. These Stamina are furnished sometimes with long purple Apices, and sometimes with shorter. They stain the Fingers of those who handle them with a yellowish Kind of Powder. Three remarkable acute small Leaves stand round the Basis of the Umbel.

- According to *Cordus*, it grows in fat, slimy, and moist Places, which are overflow'd by Rivers. With us it is, for the most part, found in the Channels of Rivers among the Mud near the Edges. *Raii Hist. Plant.*

It flowers in June, and the Herb is only in Use.

It is of an aperient and deobstruent Quality. *Dale*, from *Josephus Monti*.

BUTYRUM, βούτυρον, or βούτυρον. Butter, from βύς, an Ox, or Cow; and τυρός, Coagulation of Milk, or Cheese.

Good Butter is made of the fattest Milk, such as that of Sheep; it is also made of Goat's-milk, by stirring it in a Vessel, till the pinguious Part be separated.

It is of a mollifying Nature, and has the Qualities of Oil; hence taken in large Quantities it loosens the Belly, and is used as an Antidote against Poison, where Oil cannot be had. Mixed with Honey for a Litus it promotes Breeding of Teeth, and cures Itching of the Gums, and the Aphthæ of Infants. Outwardly used it renders the Body smooth and florid, and free from Psudraeia [little pustulous Eminences]. Provided it be neither old, nor contract a rank Smell, it is effectual also in Inflammations and Hardnesses of the Uterus. It is also administer'd in Clysters for a Dysentery, and Ulcerations of the Colon. It is an useful Ingredient in suppuratory Medicines, and especially in Wounds of the Nerves, Meninx, Bladder, and Neck. Moreover it fills, cleanses, and incarns; and is apply'd with Success to the Bite of an Asp. While recent, it serves with Meats instead of Oil, and for Pastry instead of Fat.

They collect the Soot from Butter in the following manner:

They pour Butter into a new Lamp, and setting it on Fire, cover it with an earthen Vessel, made like a Tube, which is narrow in its upper Part, and perforated at the Bottom with Holes like an Oven [καίσαρον]; there they let it burn; and as soon as it is consumed pour more Butter, and continue so to do, till they have obtained as much Soot as they please; after which they take it off with a Feather, and apply it to a proper Use.

It is a serviceable Ingredient in Medicines for the Eyes, being of a drying and astringent Quality. It stops Defluxions, and brings Ulcers speedily to cicatrize. *Dioscorides*, Lib. 2. Cap. 81.

Hippocrates, in his fourth Book de Morbis, informs us, that the Scythians make Butter of Mares Milk.

There are as many Sorts of Butter, as there are different Milks of Animals whereof to make it; that of the Cow is most in Use. You are to make Choice of that which is fresh, of a good and pleasant Taste, such as has been well made; but May Butter is esteem'd the best.

Butter is nourishing and pectoral; it opens the Body, allays the Sharpness of corrosive Poisons, is of a dissolving and digesting Nature, and good to ease Pains, and remove Inflammations. It is used in Clysters against bloody Stools, and the Dysentery. They rub the Gums of Children with it, in order to their Breeding of Teeth the easier.

The too frequent Use of Butter relaxes and debilitates the Stomach, takes away the Appetite, provokes Reachings to Vomit, and heats much, especially if it be old.

Butter contains much Oil, and a little volatile Salt.

It agrees at all times with any Age and Constitution; those, however, who have a weak Stomach, ought to use it moderately, as well as young People of a hot and bilious Nature, because it inflames, and in these last easily turns into Choler.

Butter is nothing but the Cream of Milk, or the fattest and most oily Part thereof, which is separated from the Serum or Whey by Churning; the more fat or oily Parts the Milk contains, the more Butter it yields; and therefore you have more from Cows Milk than any other.

Every body knows, that Butter is used every-where; and there is hardly any Sauce made without it. The Northern People make more use of it than any; and 'tis pretended, that 'tis Butter which makes them look so fresh and well.

BUT

The newer Butter is, the more pleasant and wholesome you will find it; and the Reason is, because its oily and saline Principles are then strictly united together; whereas, on the other hand, when Butter is a little too old, it has undergone a sort of internal Fermentation; which has exalted and disengaged these same Principles, which makes it a little sharp, and, at the same time, oily and unpleasant. Now, in order to prevent this Fermentation, and the better to make the Butter keep, they salt it; and the Acid of the Salt preserves its Texture.

The good Effects produced by Butter proceed from its oily and balsamic Principles, which are proper to restore the solid Parts of the Body, by sticking to them; to qualify and embarrass the sharp Humours they meet with, and several other the like Uses. When they use Butter to Excess, these same Principles so much moisten the Fibres of the Stomach, that they lose their elastic Virtue.

Lastly, it is observed, that Butter used immoderately heats much; and the Reason is, because the oily and fat Parts where-with it abounds are easily inflamed; and therefore this is not good Food for bilious Constitutions.

Buttermilk is a kind of Serum that remains behind, after the Butter is made. It is very cool and moistening. *Lemery on Foods.*

Butter, by the Texture and Nature of its Substance, tends to relax the Solids, and supplies the Juices with Particles light and adhesive. Upon the first Account it may be good in dry and costive Constitutions; but must be hurtful in lax, moist, and corpulent ones. By the Levity and Tenacity of its Parts, it is also very subject to stop in the Glands and Capillaries, whereby it fouls the Viscera, but particularly the small Glands of the Skin; hence it is subject to produce Blotches, and all cutaneous Deformities. And this Opinion is much confirm'd by the Experience of all whose Business has made them conversant with young Children, they having much of this in their Diet, whereby they have been observ'd to grow weakly, corpulent, big-belly'd, and very subject to Breakings-out, and to breed Lice, and such-like Uncleanlinesses; but upon restraining them from it, without any other visible Means, they have outgrown all those Inconveniences. *Quincy.*

Boerhaave, speaking of express'd Vegetable Oils, thus mentions their bad Qualities, and compares them with Butter.

These Oils have one strange Property, whereby, with the Heat only of seventy Degrees, they presently degenerate, without any foreign Body being mixed with them, and thus become thin, sharp, bitter, rancid, yellow, corrosive, and inflammatory; whereas they were before thick, mild, sweet, almost insipid, white, anodyne, and relaxing. And these surprising Changes happen in a few Days in the Summer's Heat. Is it not therefore strange, that fresh-drawn Oil of Almonds should prove healing and suppling to the parched rough Mouth and Jaws in the Quinsy, and the same Oil in a few Days afterwards suddenly inflame the Jaws of a Person in Health? And the sweeter it was when fresh, the sharper it proves when old and rancid. Hence Almonds, Walnuts, and Pistachos, become exceedingly nauseous when rancid, and subject to occasion a sudden Quinsy in the Throat, and excite a Fever, through the burning Effect they have upon the Mouth, Throat, Stomach, and Intestines. Physicians, therefore, should be cautious when they order Oil of Almonds in acute Distempers, that it be fresh-drawn from Almonds that were not rancid; and, in the Heat of Summer, not kept above twenty-four Hours. The same thing is also found in Butter, Animal Fat, Bacon, Marrow, and the more perfect Oils hereof; all which, though innocent when fresh, become highly nauseous by standing unsalted in a hot Air, where they turn yellow, blue, or green, become rank, corrosive, and fatal in the Plague. Thus a great Acrimony is sometimes found in Cheese that has been long kept, whereby I have seen the whole Mouth violently inflamed. Whence we may easily conceive what Effects it may have upon the Viscera. It is an obvious Experiment, that Oil, by boiling, will soon turn yellow, red, black, bitter, sharp, and unwholesome. And this shews us how Oils may in six Hours time become extremely bitter in the Stomach; and, when vomited up, be erroneously taken for the Bile; for this Matter takes Flame at the Fire. These Observations upon the Nature of Oil may lead us to understand many Particulars in Natural, Medicinal, Pharmaceutical, and Culinary History. *Boerhaave.*

Buttermilk is esteemed an excellent Food, in the Spring especially, and is particularly recommended for Hectic Fevers.

Butter has been recommended as an excellent Application for the Teeth, in order to make them white.

In the Edition of *Schookins de Aversatione Casei*, printed at Groningen 1664. 12mo. there is a Treatise expressly upon Butter.

The Chymists have several Preparations which they style Butters; as the Butter of Antimony, the Butter of Arsenic, the Butter of Wax, the Butter of Lead, and the Butter of Tin.

The Process for making the Butter of Antimony is describ'd under the Article ANTIMONIUM.

VOL. I.

BUX

BUTYRUM ARSENICI, *Butter of Arsenic*, is thus prepar'd:

Take of Arsenic, and corrosive Sublimate, equal Parts; reduce them to a Powder; and after mixing them, put them into a Glass Retort plac'd in a Sand-heat; adapt a proper Receiver to the Retort; and having luted the Joins, distil by a small Fire a Butter-like Liquor resembling the Butter of Antimony. When no more of this Liquor can be obtained, take away the Receiver, and in its Place put another full of Water; augment the Fire, and you will see the Mercury descend in the Water, Drop by Drop. Continue the Distillation till no more can be obtained.

This Mercury, when sufficiently wash'd and dry'd, may be used for all the Purposes to which other Mercury is apply'd.

The *Butter of Arsenic* is a very strong Caustic, and produces an Eschar sooner than the *Butter of Antimony*.

REMARKS.

In this Operation the same thing happens as in the Operation for obtaining the Butter of Antimony; which is, that the Spirits of the corrosive Sublimate quit the Mercury, in order to unite with the Arsenic, which they carry along with them in a gummy Liquor. The Mercury being afterwards disengaged, and not finding Sulphur for fixing itself, it comes over in Vapour, and is condensed in the Water. *Lemery Cours de Chymie.*

BUTYRUM STANNI is thus made.

Put a Mixture of one Part of Tin, and three Parts of corrosive Sublimate, both reduc'd to Powder, into a Retort; and by the same Process used for obtaining the Butter of Antimony, we shall have the Butter of Tin, which is a thick Liquor, and has this peculiar to it, that it fumes perpetually. *Lemery Cours de Chymie.*

BUTYRUM CERÆ. See CERA.

BUTYRUM SATURNI. See SATURNUS.

BUXTON. A Place in the Peak of *Derbyshire*, celebrated for warm Medicinal Waters, the hottest in *England* next to *Bath*. As I have not had an Opportunity of examining these Waters accurately myself, I must give the fullest Account I can meet with, which is that of *Dr. Short*, who begins properly enough with an Account of the usual Strata of Earth and Minerals, in the adjacent Parts.

In the Coal-pits, a Mile and an half South-west of *Buxton*, the Strata of Earth lie thus: First, Peat-moss; then blue Clay; then Shale full of Marcasites of Iron, and Iron-stone; then sundry Beds of Iron-stone; last of all a Seam of Coal, five Feet thick, mixt with much Sulphur and Brasil, several Lumps of Ocre and Rubric; this Seam of Coal dips a Yard in three; its upper Part is very soft, open in its Texture, and fit only for burning of Lime-stone; its lowest Part is harder, though still a very indifferent Coal, which melts on the Fire, and is form'd into a Cake; sometimes a Vein of Lead an Inch thick crosses the Coal. It is more beautiful than other Ore, and sparkles like fined Silver; but bring it to the smelting Furnace, and you have little besides Sulphur; the Acid of the Coal having consumed the Lead till it reach its kindly Soil the Lime-stone and Greet-stone below the Coal. Fifty Yards below the Surface of the Ground is a strong thick Bed of blue Clay, whose upper Part is of a deep Ocre, or reddish Colour, full of black Lumps like rusty Iron, which, put into Aqua fortis, raise neither Heat nor Fermentation; but in a little time several small Bubbles rise, and the Liquor turns green, which is occasioned by a Dissolution of the Copper contained in it; all the Water in the Coal-pits is very cold; nor can Lime-stone and Coal consist together.

The Strata of Earths in the Lead Mines next to *Buxton* are first a thick-set fine Turf, a Foot and an half deep; then betwixt a Sand and a red Clay, or a reddish sandy Clay, or a hard Soil, half a Yard thick; thirdly, brown Clay, from half a Yard to two Yards thick; fourthly, fine white Sand, half a Yard thick; fifthly, a very hard Rock of white Lime-stone, two Fathoms thick; sixthly, redder Sand, from ten to twenty Fathoms; this is of a hard Substance, and accompanies the Ore; seventhly, a black Lime-stone, from six to eight Yards thick; then they come to the same Sand as before, if there is Ore; but if no Ore, there is a reddish-yellow Bed of Clay, of the Nature of Marl. If they pursue this through the Clay, they come to a yellow Sand with Ore. These Strata lying in several degrees of Thickness, are from sixteen to eighty Fathoms deep: Here is very much white Spar, but none of the green nor yellow; it breaks into Rhomboids. If this be without a Lime-stone, there is very little or no Ore. But if under the Lime-stone Clay appears, the Vein is said to be out, and there remain no more Hopes of Ore, except they soon find the Lime-stone again below the Clay. Most of the Ore lies in Cauce-stone three or four

Feet thick. Here is very little Shale or *Brasils*: Where a Chink happens between the Greet-stone and Lime-stone, it is fill'd up with Petrefactions, between a yellow and a white Colour, and very hard, as Spar. The Workmen, afraid of Damps, are always well provided with Drifts or Levels, that they may be supplied with fresh Air, which, causing a free Ventilation, prevents both the Stagnation of the Air, and a Collection of Sulphur, which might be fired with the Candles. The Lime-stone, in working, smells strong of Sulphur; and their Blasts, (which are Bores made in the Stones, fill'd with Powder, and blown up) being so very strong of Sulphur, extinguish the Smell of the Gun-powder. They have here Spar-ore and Cauke-ore; the last is much the richest. In digging for Stone near the warm Waters, you find several surprising Masses of mix'd Minerals, as tho' they had been artfully melted together, as of Lime-stone, Iron-stone, and Copper-ore, of Sulphur, Iron-ore, of Lead-ore, Iron-sulphur, and Lime-stone.

The warm Waters, which I have observed there at present, are, first, the Bath, which takes in several warm Springs. Thirty-two Yards and a half North-east of it, is *St. Anne's Well*, which is chiefly supplied from a Spring on its North-side, rising out of a Rock of black Lime-stone, or Bastard Marble, under a shelving Stone laid so on Purpose. Twenty Yards South-east of *St. Anne's*, in another Close, is a hot and cold Spring, both rising up into the same Receptacle. About sixty-three Yards, South and South-east of *St. Anne's*, in the same Close with the hot and cold Spring, is *Bingham Well*, ordinarily call'd *Mr. Leigh's Water*, a worthy Gentleman seven Miles distant, who has made this Spring his Favourite for several Years, and reap'd great Benefit by it. A little Way, East of this, on the East-side of a Stone Wall, is another small flow hot Spring, which mixes with a beautiful purling cold Spring, that rises up close by it. Another plentiful warm Spring rises up in the Stream of the Level, that carries the Water from the Bath: This is thirty-four Yards East of *St. Anne's*. Four Yards farther East, on the South-side of this Stream, rise two or three other warm Springs.

Bingham, or *Mr. Leigh's*, Well is a very strong Spring, rising out of the black Lime-stone, in a very dry Ground; sometimes it throws forth six times more Water than at other times. October 6. 1732. after much Rain, both on that and the preceding Day, this Spring threw forth a prodigious Quantity of Water, whose Warmth raised the Spirits in the Thermometer only four Inches and six Eighths in the Forenoon; but it fell yet half an Inch lower in the Afternoon. But *St. Anne's Well* raised the Spirits five Inches above *Bingham Well*; but the small Spring beyond the last, lost very little of its Heat: So that *Bingham Well* is rather an uncertain than perennial Spring. But the above two Springs never alter by Vicissitudes of Weather, or Seasons; nor yet that Spring which rises up in the Canal from the Bath, all which three boil up with an impetuous Force in large Bubbles of heated Air, which break on the Surface. I tried these Waters with the Hydrostatical Balance, by immersing the Glass Bubble, whose Bulk was equal to the Bulk of fifteen Drams and a half of common Water, that is, one eighth Part of fifteen Ounces and a half. I found several Variations; for, certainly, to try the Weight of Water, is the most difficult and uncertain Experiment that attends a strict Examination of Waters; it is never a whole Day the same exactly, but differs according to the Expansion or Condensation of the Air in them, the Quantity of Water contain'd in the subterraneous Channels, the Rapidity or Slowness of its Motion, whereby it brings more or less foreign Matters along with it, its Stagnation, and some other Circumstances. September 15. being a very clear hot Day, with a small Breeze of Wind, till Two o'Clock of the Afternoon, then, at Three o'Clock, Thunder, Lightning, and a prodigious hot sultry Air, *St. Anne's* and *Bingham Well* weigh'd three Grains and a half lighter than the River-water; that is, near twenty-nine Grains in a Pint; the Bath was four Grains lighter than these, that is, thirty-three Grains in a Pint. I put some of each of those Waters into three different Glasses, set them into the Air-pump, exhausted the Air out of the Receiver; but scarce had we the least Bubble, only it was whitish, as if a little Flour had been mix'd with it; and tho' I made what haste I could, lest the Water should cool in the Bath-room, yet it weigh'd two Grains heavier when I had done, that is, sixteen Grains in a Pint. March 17. early in the Morning, being a hard Frost, strong East Wind, and some Hail, I made a fresh Trial, and the Bath was seven Grains lighter than the River-water, that is, near fifty-eight Grains in a Pint. *St. Anne's* and *Bingham* were each six Grains lighter than the River, that is, about forty-nine Grains lighter than common Water, and nine Grains in a Pint heavier than the Bath.

April 17. the Air being pretty temperate, the last two weighed only four Grains and a half lighter than common Water, that is, thirty-six Grains in a Pint. I took up a Pot of each of those Waters, and a Pot of common Water, set them upon a Table in my Room, that they might be of an exact

Temperature; next Morning all three weighed a Grain and a half lighter; the last, when taken up, and allow'd to stand still, it settled, and let fall all its grosser Parts; being heated to the same Degree of Warmth with the Bath, both were nearly of the same Weight.

As to the Warmth of these Waters, I took a Thermometer whose Tube was fifteen Inches long, and the Diameter of its Bore one Twenty-third of an Inch, and fill'd it only so high with Spirits, that on the fifteenth of September, (as above) when the Thermometer was set in *Buxton River*, the Spirits were two Inches and one Fourth above the Ball. This Tube being set in the Bath one Quarter of an Hour, the Spirits rose four Inches and six Eighths higher, that is, to seven Inches. *St. Anne's Well* brought the Spirits down one Fourth of an Inch in the Tube; *Bingham Well* brought them still five Eighths of an Inch lower. On the same Evening the Sky clear'd again, and all East, North-east, and North-west, up to the Zenith, was cover'd with *Aurora Boreales*, or Streamers, the Air at the same time being very calm: Next Morning there was a gentle Frost, and the Spirits in the Thermometer were only one Inch above the Ball, that is, one Inch and one Fourth lower in the Tube than they were the Day before. I set the Thermometer in the Bath-room for half an Hour, and the Steam raised the Spirits one Inch and seven Eighths higher: Then I set them in the Bath-room for half an Hour, upon which the Steam raised the Spirits one Inch and seven Eighths higher: Then I set them in the Bath for thirty-five Minutes, and they mounted up to the same Height they were the Day before. December 27. 1733. being, perhaps, the coldest Day that has been known in England this Age, (for a strong North Wind blow'd, and the clear Frost was so violent, that in seven Hours time the Ice bore Horse and Rider, tho' it rain'd and snow'd the Night before, till Two o'Clock in the Morning) the Spirits in the common Thermometers were at excessive Cold, tho' the Glass, I observed, hung in a Stair-case between two Rooms, with continual great Fires, and the Door of one Room was never shut, nor was there any outer Door near. The Spirits in my small Thermometer were more, within the Ball, than would fill an Inch of the Tube: Both Thermometers being set in a Pitcher of River-water that Moment taken up where the River was most frozen, the Spirits in the first Thermometer presently rose six Minutes or Degrees, and those in mine just fill'd the Ball. Three Fourths of a Pint of boiling Water, put to three Pints of this River-water, raised the Spirits in my Thermometer to the exact Height that *Buxton River* did, on September 15. and one Pint and a Quarter more of boiling Water, being added, brought it just to the Warmth of *Buxton Bath*; that is, it raised the Spirits in the Thermometer to the very same Height. So that I take these two for the great Extremes of Cold and Heat, all the rest being intermediate Degrees. January 10. being cloudy Weather, sharp Frost, and some Snow, the Spirits in my Thermometer fill'd not the Ball: I put it into *Bingham Well*, and the Spirits rose a little above the sixth Inch; but being removed thence into *St. Anne's Well*, they ascended one Eighth above the seventh Inch; and when carried thence, and set in the Bath, they rose to seven Inches five Eighths, and there stopp'd. May 27. being a very stormy Day, with a raging Wind, and great Rain, I tried two new Thermometers with fresh Spirits; the Bore of the larger Tube was one Twenty-third of an Inch, that of the lesser was one Twenty-seventh of an Inch: I put both in the River, which was then in a Flood; the Spirits in the smaller were hid within the Ball, those in the larger were one Inch and three Eighths above the Ball: I removed both into the small Spring beyond *Bingham Well*; upon which the Spirits in the small Tube rose eight Inches, and those in the larger Bore seven Inches, that is, to eight Inches three Eighths. When both were taken out of this, and put in *Bingham Well*, the Spirits in the smaller Bore rose to eleven Inches, and those in the larger to nine Inches; but when both of them were set in *St. Anne's Well*, the Spirits in the smaller Tube rose to fourteen Inches five Eighths; and when both were put into the Spring beyond the hot Bed, which rises up in the Level that carries the Water from the Bath, the Spirits in both Thermometers rose one Eighth. I carried them thence, and set them in the Bath; upon which the small Bore rose to fourteen Inches three Eighths; with this last I stripp'd, and went into the Bath, and put it upon the Spring at Bottom, next the Pump, and it rose to fourteen and a half: Then I removed it into the second Spring, which rises out of the black Rock, and it yet ascended one Sixth of an Inch higher; but here the Tube being but sixteen Inches long, the Air above the Spirits was compress'd into so narrow a Compass, that its Resistance was too forcible for the Ascent of the Spirits. Then I suspended the Spirits upon the Surface of the Bath, and the Spirits fell down to fourteen Inches one Tenth; so that, when the Bath is full, the second Spring is a one hundred and seventeenth Part warmer than the first, even in this whole Mixture of Water; and the Bottom of the Bath is one fifty-sixth Part warmer than its Surface. It is pleasantly surprising to stand in the full Bath, and see the Ex-

halation

halation of the compress'd and rarefied Air, and sulphureous Steam, continually playing on the Surface of the Water; like the Transition of the fiery Particles in scalding Water before it boil, and is yet calm and clear; or just as if a Cloud of small Flies were rising up, whose Feet raised a small, but general, turbid Motion on the Top of the Water: Common Water, when made of the same Warmth with that of the Bath, during the first thirty Minutes, cool'd faster than that of the Bath by an hundred and twelfth Part; but, after that, the Bath-water cool'd sooner by an hundred and eleventh Part.

Neither Dr. Lister, Sir John Floyer, Dr. Leigh, nor Allen, in their treating of these Waters, have once attempted to give us the Quantity of Water these Springs throw out in any given Time. This I endeavour'd to satisfy myself in, and I find it as follows: St. Anne's Well throws out three hundred and ninety Gallons of Water in an Hour, or nine thousand three hundred and sixty Gallons in a natural Day and Night, or three millions four hundred sixteen thousand and four hundred Gallons in a Year.

Bingham Well varies in its Stream, being sometimes higher, sometimes lower; but when I examin'd it, in a great Drought, it discharged seventeen hundred and fifty-eight Gallons of Water in an Hour. Six Quarts of this Water, exhaled, left thirty-three Grains of Sediment, twenty whereof were salt: So that this Spring sends out thirteen millions six hundred and forty-seven thousand one hundred and eighty Gallons of Water in a Year, which carries in it forty-eight thousand three hundred and sixty-eight Pound of fix'd Sediment; near two Thirds of which being salt, it must of course afford thirty-two thousand two hundred forty-five Pounds five Ounces two Drams and two Scruples of Salt in that Time; the rest is Earth, besides a Fragment of twelve Ounces and a half of Sediment. The little Well of warm Water, thirteen Yards East of Bingham Well, affords seventy-eight Gallons and a half of warm Water in an Hour, or six hundred eighty-seven thousand six hundred and sixty in a Year.

All these four warm Springs together throw forth, in a Year, ninety-seven millions six hundred and eighty-one thousand eight hundred and sixty Gallons of Water; besides the waste Water that gets out of the Bath, and the strong Spring rising up in the Middle of the Bath-level, beyond St. Anne's Well, and the warm Water which rises up in the hot and cold Spring; and lastly, the two small warm Springs which rise up in the low Ground, between the hot and cold Spring, and the large Spring in the *Sough*, with several other Outings of warm Water in sundry other Places; so that the Whole, added together, will be near double this Computation.

All these Waters brighten the Solution of Gold; and first make the Solution of Silver white, then turbid; after which it lets fall a large white Sediment. They turn Solution of Iron and Mercury yellow. Solution of Sublimate turns them first of a faint Pearl Colour, and clear; but, by long standing, they become muddy and blackish. They presently become white by Solution of Sugar of Lead, and then let fall a large Sediment. Oil of Tartar makes them first of a bluish White; and, in one Night and a Day, you have a Sediment of the same Colour, half an Inch high. Spirit of Vitriol, and the Oils of Salt and Sulphur, turn the Water rather clearer and finer, tho' they raise a visible intestine Commotion, and the Sides of the Glasses hang full of Air-bubbles. Spirits of Hartshorn, or Sal Ammoniac, change it to a whitish Clear; and, upon standing twenty-four Hours, leave a small Sediment like Wool or Cotton. Syrup of Violets made it first blue, then greenish. Syrup of Cloves made it of a whitish Blue, and muddy; Tincture of Fustic, of a pale Sack Colour; Tincture of Logwood, of a beautiful Red; Tincture of Galls, of a muddy yellowish Colour, which in four Days time turn'd green. Green Tea alter'd it not. Tincture of red Roses gave it a Brandy Colour. Rum, Brandy, Balaustian Flowers, Pomegranate-peel, and Oak-leaves, produced no Change in it.

The Water of Bingham Well, upon being mix'd with the aforesaid Ingredients separately, in sundry Glasses, and allow'd to stand all Night, next Morning that Portion mix'd with Solution of Silver was of a Pearl Colour, clear at Top, and let fall a large Sediment. With Tincture of Rhubarb it assumed a yellowish-brown Colour. With Solution of Sublimate the Liquor remain'd clear, but the Sides and Bottom of the Glass were blackish. With Spirits of Hartshorn it was changed into a bluish Green. With Tincture of Fustic it became yellowish. With Tincture of Brazil it was changed into a light faint Red. With Tincture of Logwood it assumed a deep reddish-brown Colour. With Tincture of Galls a deep purple Scum appear'd on its Surface; it was yellowish in the Middle, and of a bluish Pearl Colour at Top and Bottom. With French Brandy it was clear, but darker than common Water.

The Differences between this and St. Anne's Well were very small; the former made Solution of Silver of a bluer White, and afterwards of a more purple Colour, than the latter. It also retain'd its reddish Colour longer with Syrup of Cloves; it let fall more Sediment with Solution of Lead; and its Sedi-

ment, left after Exhalation, was more pungent and saline, and at the same time very white. Eleven Quarts of it, at another time, left thirty-three Grains of Sediment; twenty-four of which were a white Salt, which changed Syrup of Violets to a beautiful light-green Colour; but the Salt of St. Anne's Well made little Alteration upon it. The former also turn'd Solution of Sublimate a little Orange-colour'd; and, mix'd with Sal Ammoniac, sent forth an urinous Smell. It crackled a little on a red-hot Iron, but did not swell much. It fermented strongly with Acids, but not with Alkalies.

Bingham Well-water being fetch'd sixteen Miles, and kept five Nights, I compar'd it with common Pipe-water, which had stood two Nights in a Leaden Cistern. Tincture of Rhubarb turn'd common Water of a light-yellow Colour; but Bingham Water was by it changed into a reddish, or reddish-brown Colour. Solution of Sublimate changed not common Water, but produced a Pellicle on its Surface of a Red, Blue, and Yellow, according to the various Directions of the Rays of Light. Bingham Water became whitish, and had a Scum of Yellow, Red, Green, and Blue. Oil of Tartar made no Alteration on this common Water; but the other was first white, then curdled, and deposited large and whiter Flakes at the Sides and Bottom of the Glass. The acid Spirits raised a greater intestine Motion, and more Bubbles, in the Mineral Water than in the other. Spirits of Hartshorn had no Effect on the latter, but changed the other white, which became also greener with Syrup of Violets than the common Water. After standing four Days longer, Tincture of Brazil Wood had turn'd the Bingham Water of a deeper Red than the other; and Tincture of Galls and Sumach had changed the former green throughout. Solution of Silver had made it of a light Purple, but the common Water was a pale Pearl Colour.

When I had kept the Bath-water, that of Bingham Well, and that of the hot and cold Spring, for a long time, then, with Tincture of Nephritic Wood, they all became whitish first, then pale, lastly curdled, and became green. The second of these, with Solution of Silver, was reddish; but soon chang'd to a Pearl Colour. With Tincture of Galls, both it and the third were first of a muddy Clay Colour, then of a Leaden Colour, and cover'd with a variegated Scum; but that of the Bath, with Tincture of Sumach, became wholly green in five Days. Syrup of Violets turn'd Bingham Well very green in two Days.

I exhaled each of those Waters several times, and always found some Difference in the Quantity, but never in the Nature of their Sediments, which was always the same: The former, that is, the Quantity, was varied, sometimes by the Water, sometimes by the Fire, and sometimes by the Vessel. Not only the Sediment, but also the Salts, fermented with Oil of Vitriol; they also crackled in the Fire, and swell'd a little. But, finally, to be satisfied of both their Kind and Proportions, I set them to crystallize: The Bath-water afforded both Sea-salt and Nitre, but most of the former. The Salts of St. Anne's Well were the same in Kind, only they yielded more Nitre than that of the Bath. Bingham Well-water contains most Nitre of any of them, and less Marine-salt. I took the Crystals of Nitre from the Marine-salt, dissolved them, and set them to project into regular Crystals, that I might obtain their true Figures.

From the preceding History we draw the following Observations:

That tho' there is Plenty of Ocre, Iron-stone, and Sulphur, in the Coal-pits here, which are generally reputed the Cause of hot Springs; yet the Water is so far from being warm, that it is intensely cold; so that, in order to cause Warmth, there must either be some other Materials, or there is a Mixture of other Ingredients, which prevent their Effect in warming the Water; or these Ingredients are mix'd in undue Proportions.

Again, since we find the Veins of Lead, crossing the Coal, corroded, it is plain, that Vitriol acts upon and consumes Lead as well as other Metals.

Since Lime-stone and Coal cannot agree, we see, that the alkaline Earth of the former is as hurtful to the Acid of the latter, as this Acid is prejudicial to Lime-stone; for, that it is not the Nitre in the Lime-stone that is hurtful to the Coal, appears from this, that most of the Chalybeate or Vitriolic Waters contain also a fix'd Nitre.

However homogeneous Buxton Waters may appear, or however similar in their Nature to common Water, in all other respects, besides their greater Heat; yet seeing several of the above-mention'd tincturing Ingredients, produced in them Phenomena differing from those produced in common Water by them, it must therefore contain some other Principles than those of common Water.

Tho' it cannot be denied, that this Water has a Mixture of different Principles; yet seeing it is still eight or ten Grains in a Pint lighter, when cold, than common Water, this shews, that it has fewer earthy or other gross Parts in it than River-water.

Since common Water, made equally hot with *Buxton* Bath-water, cools sooner at first, but slower than it toward the latter End, *Buxton* Mineral Water must of course either have less gross and foreign Matter in it, or this Matter must exist in smaller Particles in the Water, and so give less Resistance to the flying off of the less rarefied Particles of Heat.

Seeing *Buxton* Water is so much lighter and warmer than common Water, before it has received any culinary or artificial Fire into its Pores, to rarefy the Air contain'd in it, it is plain, it brings something along with it, which is equivalent to the fiery Particles in heated Water; which being occasion'd by this Water's washing Mixtures of several Minerals in its Course, we shall therefore call that a Mineral Vapour.

Since this Water washes so many Ingredients abounding with Sulphur, and since we find, that even gross Sulphur, by the Mediation of Lime-stone, communicates some of its Parts to Water; and also seeing there is constantly such a visible sulphureous Halitus upon the Surface of *Buxton* Water; it is reasonable to think, that this Water, whilst warm, is impregnated with a sulphureous Steam or Vapour, as one Part of its Mineral Spirit.

From the whole Processes and Experiments made on *Buxton* Waters, it is plain, that the Minerals, warming and impregnating these several Springs, are the same; only differing somewhat in the Proportion of their Ingredients.

These Minerals lie in a Stratum, or Bed, from West to East.

Since *Bingham* Well increases or decreases upon Vicissitudes of Weather or Seasons, 'tis hence probable, that its Spring is not supplied from any great Depth in the Earth, but chiefly from the Surface of the Ground, and the small Hill above; and seeing both it, and the small warm Spring beyond it, (which I have seen quite dry) are so superficially provided, and yet warm, the impregnating Ingredients seem not to lie very deep in the Earth.

Since these Waters continually bring up so large and numerous Bubbles, with an impetuous Force, from the Bowels of the Earth, then must their Interstices be richly stored with a fine Air, which produces this Effect.

Seeing *St. Anne's* was known to be of the same Nature, and threw forth the same Quantity of Water before the Bath-level was made, that it does since; and since, from this Well to the Bath, there is a continued Rock of firm black Lime-stone, or a Substance between Marble and Lime-stone; and especially, seeing the main Spring, which supplies this Well, rises up thro' a black Lime-stone on that Side next the River, and not on that next the Bath; and, in the last place, since we find two considerable Differences in its Contents from those of the Bath-water; it is ridiculous to suggest, that this Spring has any Communication with the Bath.

Since there is such a Difference at sundry times in the Weight of these Waters, it follows, that there is no certain Standard for determining their specific Gravities; only this, in the general, is certain, that they are lighter than other common Water, and that the lighter they are, so much the more are they impregnated with the Mineral Spirit, and the fewer extraneous Bodies they bring along with them; and the lighter they are, the warmer; and the warmer, the more medicinal.

The more the Pores of the Earth are lock'd up by Frost, or fill'd with Water, provided these affect not the Springs, the warmer and lighter is the Water; and the warmer it is, so much stronger is its Mineral Vapour, and therefore the more powerful are its Virtues.

From the Use of the Thermometer we see, first, The different Degrees of Heat contain'd in the several Waters. Secondly, We find that there are different Degrees of Heat contain'd in the same Water in the several Seasons of the Year, and according to the various Temperatures of the Air. Thirdly, That these Waters are not relatively, but absolutely, warmer in Winter than in Summer, in Frost than when there is none, in a cold than in a hot Season, the Bath at least being one twentieth Part warmer in Frost or Winter, than in warm Weather. Fourthly, That, in a great Frost, four Fifths of the coldest Water not frozen, and one Fifth of boiling Water mix'd, make the just Warmth of common River-water in hot Weather about the Autumnal Equinox. Fifthly, That a Quart of boiling Water added to three Pints of such cold Water, in an earthen Vessel, at two sundry times, about seven Minutes Distance from each other, gives the true Warmth of *Buxton*.

Or five Eighths of a Quart of boiling Water, added to three Pints of common River-water in Summer, gives the exact Heat of *Buxton* Bath in that Season; and then whatever raises such a Thermometer five Eighths of an Inch higher, shews you the Warmth of *Buxton* Water, in a strong Winter Frost.

By these Experiments we have the Quantity of Water each Spring sends forth in a given time. Secondly, The Proportion that the Vehicle and fix'd Parts have to each other. Thirdly, The Proportions of the Earth and Salts separately,

And, lastly, Which of the different Salts exceeds the others in Quantity.

From the small Proportion of the fix'd Parts in those Waters to their Vehicle, especially considering the small Quantity that should be drank, it is plain, these Parts can do little to the Removal of any obstinate Chronical Disease. Suppose, for Example, a Man daily drinks four Pints of Water, at most he swallows not, with this Dose, above five Grains of Lime-stone Powder, which we shall call an Alkali or Absorbent, and two Grains and an half of Marine-salt, and as much Nitre, which let us suppose stimulant: What can these do? If he should drink half that Quantity of common Water that comes from the white Lime-stone Hills, he shall have as much alkaline Earth, if not some fix'd Salt, besides a vegetable Salt: Yet who would call these Medicinal Waters? Hence it is plain, that the Virtues of our Waters consist, first, In the pure, smooth, fine, common Vehicle; and, secondly, In their Warmth and Mineral Spirit.

Is the Bath, when its Doors and Windows are shut, warmer than when open'd? Is the Bath that is shut up on all Sides, warmer than *St. Anne's* Well, which is only shut up on three Sides? Is this warmer again than *Bingham* Water, that is wholly exposed to the open Air above and on all Sides? Then it is plain, that were these Waters kept close cover'd, and their Heat reverberated, they might still be much warmer.

From the Experiments made with the Mixtures, we see first, from the intestine Motion excited by the acid Spirits, That the Water contains an Alkali. Secondly, That this Alkali being precipitated by a Solution of Sugar of Lead, or the Water thrown into an Alembic and distilled, and that which comes over with a slow Fire tried, neither of these Waters ferment with Acids. Thirdly, Not only the alkaline Nature of this Earth, but its Whiteness, shew it to be Lime-stone Powder, tho' it warm not the Water after Calcination. Fourthly, This Earth being calcined in a Furnace, which quickly melts Iron, and then applied to the Load-stone, it attracted this Dust or Powder briskly; therefore I conclude it contains also Iron-stone. Fifthly, Seeing the Water precipitates the Solution of Silver, and a Part of its Salts runs into Crystals of a cubic Figure, like a Dye, a Part of its Salt must be Marine-salt. Sixthly, Since it lets fall a Sediment with Oil of Tartar, and Spirit of Hartshorn, and also affords some long Crystals with six unequal Sides, terminating at each End in a Pyramid under several Triangles; we conclude, it contains also Nitre. Seventhly, Seeing neither Galls nor other Astringents alter'd this warm Water, we cannot trace any Vitriol, either volatile or fix'd, in it, nor does it taste chalybeate; however the Credulity of some People may impose upon their Tastes, and tho' the Load-stone attracts some of its calcined Earth, it does the same with most other Earths, which never afforded any Solution of Vitriol, nor any Appearance of it. Eighthly, Did *Bingham* Well, when putrified, and its Sulphur spent, become red with Galls, and purple with Solution of Silver? Then it must not only partake more eminently of Nitre, but also have more of the Chalybeate Principle in it, than any of the rest.

Did these Waters afford sundry Proportions of Sediment at different times? Then they are not alike fraught with their fix'd mineral Principles at all times. Secondly, We may hereby observe, that when their fix'd Contents are least, their volatile Principles are most, as in Winter and very cold Weather; and when their volatile Spirit is smallest or weakest, their fix'd Parts are proportionably increased, as in very dry and hot Weather. Thirdly, Have several Authors examin'd the same Waters at several times, and found their Contents to differ in Quantity, but not in Kind? Then are they not to be arraigned and accused about small Differences, as is too ordinary.

Does Dr. *Lister* tell us, that *St. Anne's* Water proves emetic upon swilling down large Quantities of it? This is nothing peculiar, but what it has in common with all other Water. Secondly, Does he assert a Quantity of Pit-coal to lie immediately under the Lime-stone, out of which this Water springs? It is surprising how so good a Naturalist could make such a Blunder; for, first, Lime-stone and Coal are found inconsistent with each other in the Peak-country. Secondly, Who ever found warm Water in Coal? Thirdly, Tho' the Sediment of those Waters be very small, yet it at least affords a Scruple to a Gallon; tho' he obtained but one Scruple or two, out of four Gallons, this must have been owing to some Neglect or Mismanagement. Fourthly, He says the Sediment was all Salt, and no Stone Powder, whereas the Bath yields above one Half, and sometimes two Thirds of Stone Powder to one of Salt. Fifthly, The Salt, he says, is chiefly marine. Tho' this be true of the Bath, yet *St. Anne's* Well contains as much Nitre as Marine-salt, and *Bingham* Well more than either of them. Nor, sixthly, Can I here overlook *Allen's* Account of this Water. For, first, He will have but three warm Springs here, viz. two for Bathing, and one for drinking: Now

Now the outer Bath is no Spring, but supplied from the inner Bath. Secondly, He says, that it is as warm as Blood newly let out of the Veins; but, had he used a Thermometer in examining both, he would have found the former much short of the Heat of the latter. Thirdly, He will have Lead, Iron, and Sulphur to be the Principles that mediate this Water; but how can Lead communicate any of its Parts to the Water, without it be dissolved? Where is the Solvent and Menstruum? And, if it had a Solvent, it would be Vitriol, which would long ago have corroded and consumed the Lead, and left only a bright Sulphur; and since Lead is the chief medicating Principle, the Springs would now be no more than other common Springs. But allowing (contrary to Reason and Experience) that the Lead did still impregnate this Water, it would be Poison instead of Physic, as we see from the Accidents that happen to those who smell, and to the Animals that drink the Waters wherein there is Lead, how soon they are seized with a *Bellon*, and from the Effects of Sugar of Lead taken inwardly. Nor, thirdly, Has the Water a sulphureous Taste or Smell, as he alleges. Nor, fourthly, Do Galls give this the same Colour as they do the *Bath Waters*, nor a Lead colour, which he will have to arise from Lead. The Sulphur he will have to be that of Lead. *Jones* is much more in the Right, when he thinks the Water is too pure, delicious, and fine, for any such Principles as Lead, Copper, or Alum; and contents himself with an impalpable Sulphur.

Now let us see what Medicinal Uses these Experiments and Observations will help us to make of these Waters: In this we shall receive some Assistance from Mr. *Martin's* Account of the Effects of warm Bathing, whereby it is plain, first, That, by the Waters penetrating the Pores of the Skin, it gets into, and mixes with, the Blood, and other Juices, on the Surface of the Body, and thereby increases its Weight. Secondly, That, by this Insinuation of the tepid Steam into the Pores, the Skin is relaxed, its Pores dilated, the Fluids in the Capillary Vessels thinned, their Motion made easier, and their Evacuation promoted. Thirdly, Tho' the Addition to the Weight of the Body by Bathing may seem small, yet we must allow a considerable Discharge by Perspiration during Bathing, both from the Pressure of the Water, added to that of the Air, upon the Body, and the warming relaxing Nature of the Water. But to proceed.

Since these Waters contain so much Air in their Interstices, they must greatly promote Digestion, except they be drank too long; and then, from their very Warmth and Nature, they must relax the Stomach, and retard all the Digestions, unless the Use of them is left off. But the Waters being warmed by Bodies of a different Nature, either brought together, dissolved, or set in Action, by the Water, this Action cannot be without the Communication of some of their Parts, which little Parts must be lodged, together with the Air, in the Interstices of the Water; then not only does the Air (consider'd as a simple Ether) promote Digestion and Attenuation; but being springy, and full of those subtle, invisible, intractable Particles of Mineral Bodies, or Substances, of what a diluting, opening Nature must they be in Animal Bodies? How near in Smallness and Subtlety do they approach to the Particles of Light and Heat, since we have no Vessels that retain one more than the other? And since they are not retainable in the cold Water, wherein we suppose the Air in a stagnant, compressed State, how trifling is it to imagine or attempt procuring of them by Force of Fire in Distillation, whereby the Air is heated, rarefied, and expanded, and even their Vehicle, the Water, so rarefied, that it rises up in a Smoak, in both which they are at greater Liberty than before to make their Escape!

Since these Particles are so much less, and more-subtle, than the most volatile Spirits obtainable by Art, such as those of Hartshorn and Sal Ammoniac, which may be shut up and preserved in so porous a Body as Glass, how impossible is it, that the smallest Vessels in human Bodies, tho' never so much obstructed, (if not grown up, and become tendinous) should hinder their progressive Motion! Will they not even find a Passage between the Interstices of the Fibres that constitute the Sides of the Vessels, and, *a fortiori*, much more in their Cavities? How well then must such a Water at the Spring-head, thus fraught with its subtle mineral Principle, be disposed to carry on the Work of opening and clearing the minutest Vessels in the remotest Extremities of Animal Bodies, or in the smallest Vessels of the Periosteum, in either of the Coats of the Brain, or Spinal Marrow, or in the Brain or Marrow itself, which contain the smallest Vessels comprehensible by human Conception? From this it follows, that these Waters are better adapted to Obstructions from the twentieth-rate Vessels, to the smallest in the whole Body, than to those of the larger and first-rate: No Wonder then, if they produce such surprising Effects in Gouty, Rheumatic, Arthritic, and Scorbutic Pains, all which have their Seat in Vessels so small, as scarce to be come at by Medicines. Again, if we consider this Spirit as wrapt up in Air, it is not only subtle and pene-

trating, but also elastic or springy, so that, when the Heat of the Body is added to its Warmth, it will be so much the more springy, and expand the smallest Vessels, relaxing them, and so making room for the obstructing Matter either to be expelled from the Body, or so attenuated as to be thrown back into the larger Vessels, till it is more attenuated, digested, and fitted for Evacuation by some of the common Outlets. But is the Water attenuating, and the Spirit elastic? Then, not only does the former dissolve the gross Humours, but the Particles of the latter being got between them, and dilating themselves like a springy Wedge, will turn the attractive Force of these Humours into a Repulsive, whereby they are gradually separated, broken, and mix'd with the intercurrent Fluid; but as the Humours cannot be attenuated, and divided into smaller Particles without increasing their Bulk, especially when at the same time there is a Quantity of this Water thrown into the Body, and mix'd with them, this Fusion of the Blood disposes some of its Parts to get into improper Vessels; for one Globule being hereby divided into two or three, they are then capable of entering Vessels that before would not admit nor receive them when only one; and these Vessels being conical, the globular Parts thus divided must stop, before they can reach the Extremity of the Vessel; hence new Obstructions of another kind must be produc'd by this powerful Diluter, which must remain, except either the Vessel relax, and give way, or the stopp'd Globule must be split into two or three others; but, by this necessary Force, the Action of the Vessel is increased, whereby the Blood's Motion becomes brisker: And now both the Quantity and Velocity of the Blood are increased, but the Coats of the Vessels not being hereby strengthen'd, but weaken'd, according to their greater Dilatation or Stretch, if they were weak before, and full of Blood, then Hæmorrhages must necessarily follow, except prevented by due and timely Evacuation, or Reduction of the Humours to their former Standard, that the Vessels may again be restor'd to their natural Dimensions, Strength, and Resistance. But if we are assur'd from Fact and Experience, that there is a mineral Spirit in these Waters, and want to know the Nature of this mineral Spirit, let us get acquainted with the Minerals wash'd by the Water, and consider which of them are capable of having some of their Parts separated by the Water, and which these Minerals are that can neither have their Parts separated nor dissolved; and we are sure, that this Spirit must be from the former, and not from the latter of these: But what these Materials are, we have seen before; therefore the Spirit must be of the same Nature, as its Effects, as well as Theory, prove.

From the Whole we see, that the Intention and Effects of those Waters are Relaxation and Dilution; and where-ever these are indicated, this Water will be of the greatest Service; which is, when the natural and necessary Secretions are lessen'd, from whence arise Obstructions in the small Vessels; but it is of the greatest Benefit in those Obstructions which arise from a Sharpness, Saltiness, or Earthiness of the Blood and Lymph, or from an accidental (where there is no natural) Disposition to a Rarefaction of the Blood, some of whose Parts have mistaken their common Road, in all which Cases we suppose a Stimulus in the Vessels from Pain; since it is impossible the fix'd Parts of this Water should prove a powerful Stimulus. Its Efficacy extends particularly to all Contractions, Stiffness, or Crispation of the Solids and Vessels, when their Parts are so close, that the Fibres are inflexible by such Causes as in a natural and healthy State should bend them: Or where there is a Difficulty and Indisposition sometimes in the Fibres and Vessels, preventing their ready and easy Distention and Contraction, as is mostly the Fate of old Age, and hard Labourers; which is evident from a more difficult bending and contracting of their Joints and Muscles, and from their greater Liability to Rheumatic and Arthritic Pains; and if young People be hard plied betimes in Life, their Fibres are sooner stiffened, become stronger, and are at their Growth, or prevented of their full Growth, sooner; for by whatever means Growth is hastened and finished, the Period of Life is so much shorten'd. Hence such as are of the slowest Growth, provided they live regularly, and escape Accidents, live longest, for the same Space of Time they take to Growth, they stand still as long, and decline the like Time; for should one Man grow till thirty Years of Age, from that he is at a Stand to sixty, and grows back again or declines to ninety; then dies: If we suppose another, who has unnaturally hastened his Growth at sixteen, he cannot outlive forty-eight or fifty at most: Hence it is plain, that such as rejoice at their Childrens early Growth, and such as are uneasy at their slow Growth, are equally foolish. It is judiciously observed by *Sanctorius*, that from the time Men begin to decline and grow old, Perspiration is diminished, and the gross Parts of the Blood are retain'd; which, being gathered to the Thorax or Breast, are expectorated by Coughing, or they are heaped up at the Extremities of the Vessels, the increasing Stiffness of the Parts still occasioning a Waste of the more subtle Parts, and a Collection of the grosser: Hence Diseases from mucous or sily Humours, laid up in one

Part or other of the Body, as Catarrhs, Rheumatisms, Pains of the Joints, Atrophies, Marasmus, and a gradual diminishing of the Actions depending on the small Fibres, as Hearing, Seeing, Memory and Judgment; for the Vessels of the Brain being then partly shut up, and partly become callous, so as to be unfit for the more noble and elevated Actions, then the Person becomes childish, and wears out of Life without much Pain or Uneasiness, and all from a Stiffness induced on the Fibres, and diminished Perspiration.

Upon the Whole, *Buxton* Water being warm, highly impregnated with a mineral Steam, Vapour, or Spirit, containing a most subtle and impalpable Sulphur, and being the Product of Lime-stone, it is therefore rarefying, heating, relaxing, attenuating, sweetening, and a little drying; hence it is signal-ly beneficial, and surprisingly successful, in the Gout, Rheumatism, scorbutic and arthritic Pains, wandering or fix'd Pains inveterate or recent; Cramps, Convulsions, dry Asthmata without a Fever or quick Pulse, bilious Colic, want of Appetite, and Indigestion from Intemperance and Hard-drinking, as also in Contractions, Stiffness and Lameness arising therefrom in any Part, Barrenness from a Constriction and Indilability of the Fallopian Tubes and Uterus; Painfulness, a total Want or other Irregularities of the Menfes from the same Cause; in all Stoppages, and beginning Obstructions, and in preternatural Rigidities of the Vessels, or where external Tumors compress the small Vessels, or where there is an Over-growth, or too great Strength, of the Vessels resisting the Fluids; in St. Antony's Fire, Tetters, Ring-worms, Scab, Itch, and Morpew; it is also useful in the Beginning of the Swellings on the Bones or Periosteum, which are soft, yielding to the Touch, or of the Consistence of soft Wax called Gummata and Tophi, as also in Nodes, in chalky Tumors in any Part of the Body, inward or outward. In all hard callous Swellings it eases the Pain, and softens considerably; in old Strains or Pains afflicting People upon Change of Weather, whether they be originally from broken or disjointed Bones, Distortion of the Parts, or pulling them out of their natural Position; in any Withering or Pining of the Parts; in want of Perspiration from Cold, without a Fever, or Load of Humours; for Heat, Stranguries, and Stoppage of Urine; in too great a Contraction of the Urinary Passages and Strainers; for scouring off Sand, Gravel, and Mucus, out of the Kidneys; in Hiccoughs and Vomiting, from a saline Matter, stimulating and contracting the Stomach or Midriff; in a Dysentery, from salt Humours, raising violent Gripes, and convulsive Pains.

I might here subjoin several secondary Uses of this Water; but the common Vehicle being the only Physic in them, in this Case I shall advise both drinking and bathing; but by no means the last in a Fit of the Gout, inward Inflammations, Fevers, Dysentery, large inward Tumors, Vomiting or Purging of Blood, or where-ever an outward Pressure of the Body may do Mischief.

As to the Age, Sex, and Constitution of the Patient, the particular Lightness and Purity of those Waters recommend their Use, as safe and successful, to all Ages and Sexes, Children, Youth, Men, Women with or not with Child, except in the first and last Months. No Caution or Difference is here to be regarded; only I would not advise young Persons, very full of Blood and Juices, which run with a rapid Course in their Vessels, to be too free with them, from the twenty-third Year of their Age, till the thirtieth. Bilious or choleric Constitutions, phlegmatic, and melancholic, may use them at Discretion, provided they do not overdo the Matter; but the Sanguine must be a little more upon the Watch; for, since they rarefy the Blood, and increase both its Bulk and Motion, as well as add somewhat to its Quantity by bathing; so that their Vessels, being pretty well fill'd already, as often appears from their low brisk Pulse, and florid Countenance, here the Waters may distend the Vessels more, drive the Blood forward till it cause Obstructions, Stagnation, Inflammations, Fevers, or a Discharge of Blood, by some Evacuation, from a Rupture of the stretch'd and weaken'd Vessels. Neither should I be fond of advising phlegmatic gross Bodies, after the Meridian of Life, to continue it long, except for a few Days bathing, to open the Pores of the Skin, attenuate the fizy Humours in its small Vessels, and discharge a Part of them, and so fit them for a colder Bath, of greater Pressure and Stimulus; not that I am fond of Cold-bathing in old Age, when the Spring of the Fibres is almost worn out, but I mean between the Meridian of Life, and old Age. As to the Season of the Year for using these Waters, after so strict an Examination and Investigation of their Parts, excuse me if I differ from the common Opinion, and prefer early in the Spring, and late in the Autumn: For, if we consider, first, the Luxury of the Age in Eating and Drinking, simple plain Food, that was the delicate Dish of our long-liv'd healthy Ancestors, is no longer relish'd; our Meat must be higher season'd; we cannot dine but upon several Dishes; weak plain Liquors are no longer us'd for Drink; we must have Wine, or, which is worse, (as it is more viscid) strong Ale, or perhaps Brandy and Water. Do not all these heat and inflame

the Body? Secondly, Does not the Water of itself rarefy the Blood, and relax the Vessels? And, thirdly, Are not the Juices of the Body more rarefied? Take they not up more Bulk, and are not the Vessels more relaxed, in Summer than in Winter? Is this then a fit Season to send young People of plethoric and sanguine Constitutions to those Waters? Either they must use them for some time, or not; if the latter, why come they to them? What Design will a mere complimenting Visit of the Waters, and, perhaps, tasting them, or going into them, answer? Sure no valuable End. If they use them for any considerable Time, are they not exposed to the Mercy of Inflammations, Faintness, Palpitations, and Fevers, especially of the hectic Kind? And will not the Waters answer the same Intention, with much greater Safety, from the latter End of *March* to the Middle of *May*, and from the first of *September* to the first of *November*? It is true, the Coldness of the Place may be objected; but is there not a good House, dry warm Rooms, Plenty of Coals, for the most part some Company, and a pleasant dry Country? Where then is the Harm, even in the Middle of Winter, upon urgent and necessary Occasions? Are not the Waters considerably warmer? Does not their Efficacy chiefly depend upon their Warmth; and what causes it? And, the warmer they are, are not they the more efficacious and successful? Nor is the Blood so apt to be rarefied, seeing the Air contain'd in it must be in *æquilibrio* with the external Air. This is not Speculation; I mention it from Experience, having order'd Patients there in *March* in great Frost and Snow, and never observ'd better Success than the Water had upon them all.

As to the Method of using the Waters, except the Body be costive, and the first Passages furred up with gross Humours, I declare myself a profess'd Enemy to what is call'd preparing the Body for them, by strong Purging; which often causes Pain in the Bowels, Windiness, Looseness, and Dejection of the Appetite, the chief thing to be regarded, and kept up, in a Course of Mineral Waters, especially of the warm Kind. Therefore I content myself with simple plain Laxatives; which unload the Intestines without Sickness, Pain, Confinement, or Prostration of Strength or Appetite, as Lenitive Electuary, Rhubarb, Manna, and Cream of Tartar: Or, if the Stomach is loaded with Phlegm, pall'd and relax'd, to prevent this being sent down, and carry'd into the Body with the Water, and there doing a great deal of Mischief, I would give a gentle Vomit, as of the Infusion of *Ipecacuanha*, or that in Substance to strong Bodies, and neither order Drinking nor Bathing for thirty Hours after at least. Young People, full of Blood, or who have a meagre and quick Pulse, I would order to be blooded before they begin. Such as are liable to the Gout should neither be blooded nor vomited, except there were strong Indications to the contrary; but let them have *Tinctura Sacra*, or *Elixir Salutis*, for a Purge. When they begin to drink the Waters, a Pint before Breakfast, and as much after, is sufficient for the first two or three Days; then half a Pint more for the two Days following, and, at most, three Pints in a Forenoon; for this Water, not being an Evacuant, but an Alterative, must not be thrown into the Body in large Quantities, whereby a great deal more Hurt may be done than the Good we expect. At best, we thereby turn it to an Evacuant by Urine, or receive certain Mischief. As to Diet, if it be seasonable, healthy, and temperate before, I would have no great Change to be made in it, from what was the Person's ordinary way of Life; only, as the Water heats and rarefies, beware of Pepper, Mustard, Onions, Shallots, Horse-radish, and all aromatic and hot Seasoning, and of all inflaming Liquors; Claret, or White-wine, and Water, for Drink, are best; and, when the Design is to relax, I would allow Fish, but no salt Meats, especially those dry'd in the Smoak, nor salt Fish, Goose, nor Duck. Take Breakfast between Eight and Nine o'Clock in the Morning, Dinner at one, and Supper at Seven; let the Supper be light, and easy of Digestion. Go to Bed at Ten, rise at Five or Six in the Morning. Go into the Bath, continue there from seven Minutes to half an Hour, according to the Strength and Case of the Patient. When you come out, if you go not to Bed to sweat, (which is seldom us'd) dry the Body well, and dress presently; and, if the Weather is cold, go to a warm Room, use gentle Exercise, walking about, and drink your Water. Beware of ungovernable Passions, Moroseness, sitting up late, Revelling, and unseasonable Hours; shun violent Exercise and Intemperance; be cheerful. If the Body is costive, drink Tamarind-broth, or take a Clyster. If the Stomach is weak, raw, and belching, take a little bitter aromatic Wine before you begin your Water-drinking; and, when you have drank ten or twelve Days, intermit for four or five Days. Let me add, once for all, that, as this Water is of such a Nature as I have mention'd, so it is not to be trifled with; for, if it be unnecessarily us'd, it will certainly do harm.

But it may, with Justice, be objected, if these Waters are bad for nothing, they are good for nothing. We shall, therefore, give not only their Advantages, but Disadvantages. Their Use, therefore, is unsafe and unadvisable, where there is too great an Impulse

Impulse of the Fluids into the lateral Vessels; as they relax the latter, and make more way for the former, and rarefy them: Nor are they to be meddled with in Tumors from an Impulse of the Fluids, with a Dilatability of the Solids beyond all Recovery of their natural Tone, and in Swellings from an Extravasation of Blood, Serum, or Lymph, into any of the Cavities of the Body, or Interstices of the Muscles or Membranes; nor are they safe in a natural Fulness of Juices, and a Disposition of the Body to generate Blood too quickly; nor are they adviseable in any inward Inflammations, as of the Stomach, Liver, Lungs, Kidneys, or Pleura; nor ought they to be drank in large outward Inflammations of the Glands, since they both increase the Motion and Quantity of the Blood, and dispose it to run more impetuously upon those Parts, whose Spring and Resistance is impaired or lost; nor is it to be liberally us'd in outward Impostumes. They are of no Effect in those Tumors call'd Meliceris, Steatoma, Atheroma, and Talpa. They are also mischievous in Consumptions attended with a rapid Motion of the Blood, and weak pulmonary Vessels, and in too copious Perspiration. Or, in a Word, where-ever strengthening and bracing up the Solids, and thickening and cooling the Fluids, are indicated, these Waters must be refrain'd from, or where the animal Secretions are to be lessen'd.

Hence observe the following Mistakes in the Use of these Waters: First, Does their chief Efficacy depend on their volatile Parts, which only consist of a Steam or Vapour; and are they better adapted to Diseases of the smaller than of the larger Vessels? Then it is an Error to imagine, that all the Business is done by drinking large Quantities of them, and so turning them to Evacuants, at least powerful Diuretics; whereby they are hurry'd out of the Body before they have done their Work, which lies in much smaller Vessels, and requires longer Retention. Secondly, Is Evacuation inconsistent with all the Intentions of the Waters? Then how imprudent are those who use evacuant Medicines along with the Waters, whether Purgatives or Diuretics, which expeditiously carry off the Waters, and, together with them, the thinner Parts of the Blood, out of the larger Vessels, and the Lymph, which is pour'd into the chylopoetic Organs for diluting the Chyle! But allow they should drink so much more Water in proportion to the Increase of the Drains: In this mending the Matter, and not making it worse! For hereby there is a greater Pressure and Quantity of Water laid upon the Intestines, or Organs destin'd for the Secretion of the Urine, the Fluids in these Glands thinn'd, and their excretory Ducts widen'd and laid more open, and all every way fitted for a larger and freer Vent of the more ferous Parts of the Blood, which should dilute the grosser in the smallest Vessels. Hence Obstructions are more riveted there, or at least not removed,

Thirdly, Does the Water heat and rarefy the Blood? Is it then rational to send young Persons thither, especially in the Heat of Summer, whose Blood is capable of Rarefaction, when the Warmth of the Water, by the Presence of its mineral Principle, join'd to the Heat of the Blood, and the hot Season, has relax'd the Solids, and widen'd the Vessels, and the Blood is in its greatest natural Rarefaction? One would think this Caution needless, to such especially as consider the fatal Consequences of a very rarefied State of the Air, by Lightning, to animal Bodies; for the Atmosphere being suddenly rarefy'd by the Flash, the sudden Expansion of the Air in the Blood, to a Balance with this Atmosphere, quickly bursts the Vessels, mingles Solids and Fluids together, as in a Mortification; and the hardest Parts, which give the greatest Resistance to this violent Expansion, are burst into a thousand Pieces, the Spring of the Air being so much superior to the Cohesion of the Parts. Fourthly, Does the Water rarefy the Blood? Then how inconsistent is violent Exercise with their Use, as Dancing and Revelling to unreasonable Hours, strong Bowling in the Heat of the Day, galloping on Horseback, instead of an easy Trot, or an ambling Pace! These violent Exercises heat the Blood too much, and are often of bad Consequences. Fifthly, Is the Design of this Water Relaxation and Dilution? Then how do such promote those Ends, who deal all the while in Drams, Spirits, and Punch, all which contract and shrivel up the Solids, as the first two very remarkably coagulate the Fluids! Sixthly, Do the Waters rarefy the Blood, and increase its Bulk and Motion? And is it safe and adviseable for those who have a natural Fulness or Superfluity of the Juices, or for such as have naturally a quick Pulse, large Secretions, thin Bodies, and weak Vessels? For once more give me Leave to say, that these Waters are not to be trifled with; since, if their Use is not wanted, and does no Good, they certainly do Mischief; and whoever says the contrary, votes these Waters good for little or nothing; and, if he understands the Waters rightly, may as well advise the Peruvian Bark in continual Fevers, or during the Fit of Intermittents, or Steel Medicines in a Plethora, or Sugar of Lead in a Dropsy or Palsy, or Camphire in the Declination of a hot Fever, which has parched up and dried the Body, and almost worn out the Spring of the Vessels. But, seventhly, Are these Waters warm, and impregnated with a

very volatile penetrating Part, wherein lies their chiefest Efficacy? And is this Principle gone when they are cold? Then they must be drank warm at the Spring to answer any End; for, when they are cold, they only serve instead of common Water, being purer and better than that. Eighthly, Is the Nature of these Waters relaxing and attenuating? Then special Care must be taken, that a suitable Diet, both in Meat and Drink, be observ'd, and that the Patient refrain from every thing that is opposite to their Use, and gave Birth to his Distemper, tho' never so much his Favourite, and seemingly opposite to Nature. Ninthly, Is the chief Design of these Waters Relaxation and Dilution? Then are they improper in Obstructions from a Sickness of the Juices, and a Relaxation of the Vessels, as in Cachexies and Dropsies. Tenthly, But, say some prejudic'd Persons, if you can find out the Nature of this Mineral Spirit, in which you assert the Efficacy of these Waters to consist, why may they not be imitated, and so People sav'd much Labour, and Loss of Time, and Expences? Answer. First, Imitate it with what? Whether with fix'd or volatile Bodies? Where will you furnish me with Matter divided into, and existing in, such small, subtle, incoercible Particles? Or where is the Art that can reduce Mineral Substances to such a volatile, fugitive, Mineral Spirit, a Spirit that cannot be retain'd? A Substance of almost as minute Parts as those of Light and Heat? A Steam fitted to pass the smallest Crannies in Nature? But, secondly, So exquisite is the Mixture, and so great the Difference between divine and human Compositions, that the former are inimitable. What Anatomist, that knows the Structure of a human Body the best, will undertake to make another like it? Or what Chymist, that can separate the Principles of a Plant to the greatest Exactness, will yet have Assurance to boast of his Capacity so far, as to reunite even the same Parts again, in the same Form and Condition, with a vegetable Life? Even so different are the Compositions of God and Man. Hence we see, that he who made these Bodies and Vessels at first, is best able to judge of their Diameters, and knows best how to prepare Substances suited to their Dimensions and Diseases. Therefore, could we pretend to mimic these Waters, yet the Counterfeit would be so much inferior to the Natural, as a Piece of Painting, tho' never so fine, is to the original Life. *Short's History of Mineral Waters.*

BUXUS, Offic. Ger. 1226. Emac. 1410. J. B. 1. 496. Raii Hist. 2. 1693. Synop. 3. 445. Chab. 38. Mer. Pin. 18. Merc. Bot. 1. 25. Phyt. Brit. 18. *Buxus arborescens*, C. B. Pin. 471. Tourn. Inst. 578. Elem. Bot. 450. Boerh. Ind. A. 2. 172. Rupp. Flor. Jen. 264. *Buxus arbor vulgaris*, Park. Theat. 1428. THE BOX-TREE. Dale.

Box seldom grows to be a Tree of any great Bigness in England; the Wood is hard, solid, and ponderous, of a yellow Colour, cover'd with a whitish Bark. The Leaves are small and roundish, of a firm Texture, and a shining green Colour; it is perennial, keeping always green: The Flowers are small, of a yellowish Colour, each composed of five Leaves. The Fruit is small, roundish, and tricapular, with three Points or Horns on the Top. It grows wild in some Parts of Kent and Surry, as about Boxhill near Dorking. *Miller's Bot. Off.*

The Leaves of the Box are bitter, have an ill Smell, and give a faint Red to blue Paper. We obtain from the Wood a little acid Spirit, and a fetid Oil. *Quercetan* esteems this Oil very much for the Epilepsy, the Vapours, and the Tooth-ach. Being rectified, and circulated afterwards with a third Part of good Spirit of Wine, it is very sweetening and aperitive. They give fifteen or twenty Drops of it, mix'd with Sugar or Liqueur-powder. They mix this Oil, unrectified, with melted Butter, to anoint Cancers. A Liniment is made of it, with Oil of St. John's-wort, for the Rheumatism and Gout. *Etmuller*, and several other Authors, maintain, that one may substitute the Box in the room of the Guaiacum, Juniper, or Sassafras, and the Roots of Butterbur and Bennet, in the room of the Sarsaparilla. *Martyn's Fournesort*.

Blegny, in his *Zodiacus Medico-Gallicus*, An. 2. tells us, that he knew three Persons, who, from their own Experience, had found, that a large Quantity of tender Box-leaves, infused in three Quarters of a Pint of White-wine, proved an infallible Cure for pituitous and flatulent Colics, if the strain'd Liquor was drank warm. Dale, in his *Pharmacologia*, informs us, that it is at present little used in Medicine; but that, according to *Schroder*, some from the Wood distil an Oil, which is highly narcotic, and which they wonderfully extol in Epilepsies, Tooth-achs, and Rottenness of the Teeth. He also tells us, that *Fernelius* classes the Leaves of the Box among the Purgatives. In *Eph. N. C. D.* 2. a. 2. o. 155. we are told, that a Lotion, prepared of a Lixivium in which the Leaves and Branches of Box have been boil'd, not only makes the Hairs grow, but also gives them a yellowish Colour. A Decoction of the Flowers of Box is by some said to be sudorific; and others inform us, that one Dram of them proves a violent Purge. *Rondelitus*, in *Forest. Obs. Med.* says, he by no means doubts, but that the Shavings of Box, in consequence of their sudorific Quality, would cure the *Lues Venerea*; but that they are not used for that

that Purpose, because they excite Head-achs, and are of a fetid Smell, and disagreeable Taste. However, *Amatus Lusitanus* used a Decoction of this Wood, more than once, with wonderful Success. The same Author, *Cent. 3. Cur. 36.* by a Decoction of Box-wood, after all other Medicines had proved ineffectual, in the Space of twenty Days cured an *Hemicrania*, brought on by a Consent of the Parts. A Decoction of the Wood, in Red-wine, has by some been found to do great Service in Tooth-achs arising from cold Defluxions. Besides, a singular anodyne Quality is ascribed to the Wood, for which Reason many recommend Tooth-pickers made of it. The Oil also, distilled from the Box-wood, is accounted excellent against the Tooth-ach, Fevers, Vertigoes, the Falling-sickness, and the Hemorrhoids. *Schulzii Praelectiones*, and *Simon Paulli's Quadripartitum Botanicum*. The Wood alone, subjected to Distillation from a Retort in a Sand-heat, yields an acid Spirit, and a fetid empyreumatic Oil; just like those yielded by Guaiac-wood, when treated in a like manner. That this acid Spirit, when rectified, dissolves Coral, and produces other Effects, which prove the Similarity of its Nature to that of penetrating Acids, may be seen in *Boyle's Chymista Scepticus*. If this empyreumatic Oil, which is by some thought to be the *Oleum Heracleum* of *Rulandus*, is put into the Hollow of a carious Tooth, and applied immediately to the Nerves, it removes the Tooth-ach, by burning them, just like Oil of Cloves, or any other acrid and caustic Oils. When mix'd with melted Butter, it is recommended to be used by way of Liniment in Cancers; and, when mix'd with Oil of St. John's Wort, it is used in the same Form in the Rheumatism and Gout. But if it is rectified, and digested for some time, with a third Part of good Spirit of Wine, it affords an anodyne and aperient Medicine for internal Uses, of which fifteen or twenty Drops may be exhibited with Sugar or Liquorice-powder. The Smoak of the kindled Box-wood seems to be justly recommended against the Plague, not so much on account of its highly fetid Smell, which at once induced *Bauhine* to the Affirmative, as because it abounds with an acid Salt, which, when drawn in with the Air, resists that Putrefaction of the Juices, to which, during the Time of the Plague, they are always disposed. It is worth while to inquire into the Origin of the Persuasion of some, that the Virtues of the Box-tree may not only contribute to extinguish the Sense of Venereal Pleasures, but also to banish the Devil himself. All fetid Substances, then, possess a Power of stimulating the Nerves into Motion, removing the disorderly Sallies of the animal Spirits, and consequently of curing those hysteric Indispositions produced by such a Cause. Now, hypochondriac and hysteric Passions are generally attended with surprising spasmodic Motions, by ignorant People ascribed to the Devil, and his Influence on the human Body; but the Box-tree is possess'd of a Quality capable of removing these Disorders, and their concomitant Symptoms. Therefore, say they, it banishes the Devil, whom they as falsely as foolishly suppose to be the immediate Author of these Symptoms.

It is also possible, that this Persuasion of the Power of the Box-wood to banish the Devil may have been owing to a Custom of consecrating its Leaves on *Palm-sunday* in some Countries; where, at that Season, no other Leaves are to be found: Whether it is really so or not, 'tis nevertheless certain, that, from this Circumstance, the Dutch call the Box-tree *Palm-boom*, and its Wood *Palm-hout*. I must not, on this Occasion, forget a Story told by *Levinus Lemnius* in these Words: "I am acquainted, says he, with a certain Priest in our own Country, who has the Misfortune of a weak Judgment, and a whimsical Mind, who exhibited the Ashes of burnt Box-wood, consecrated on *Palm-sunday*, a Ceremony used in the Roman Church, to a young Boy, to be drank in holy Water, performing at the same time a certain ridiculous Exorcism. All this Apparatus, as he told the By-standers, was to remove the Fever, and dislodge the Worms with which the Boy was afflicted. Soon after, indeed, the Fever was carried off, but the Patient unluckily died; upon which I advised my Countryman to beware of the like Practice for the future; since the Leaves of the Box-tree are possess'd of a deleterious Quality, highly prejudicial to the human Constitution, as is obvious from their rank and disagreeable Smell, and their harsh and bitter Taste, so ungrateful to the Palate."

Miller enumerates seven Species of the *Buxus*, of which the

Buxus humilis is possess'd of the same Medicinal Virtues with the *Buxus arborescens*.

BUYO BUYO. The Name of a sort of Pepper, so call'd in the *Philippine Island*. Ray calls it *Piper Longum Molnardi*.

BYNE, βυνή, Malt, which *Aetius* thus describes.

Barley moisten'd with Water, then suffer'd to germinate, and afterwards dried in a Kiln, with the Shoots upon it, is call'd *Byne*.

BYRETHRUM. An arbitrary Word coin'd by *Forestus*, to express a sort of *Cucupha*, or Cap, prepared with Cephalic Ingredients.

BYRSA, βύρσα. A Skin of Leather, frequently used to spread Plaisters upon.

BYRSODEPSICON; βυρσοδεψικόν, from βύρσα, a Skin, and δέψω, to curry Leather. *Caelius Aurelianus, Chronic. L. 4. C. 3.* recommends, for those Persons whom he calls *Ventriculosi*, or *Celiaci*, amongst other Applications to the middle Parts of the Body, Wool sprinkled with *Rutherginarium*, which the Greeks call βυρσοδεψικόν, meaning SUMACH, which see.

BYSAUCHEN; βυσάχην, from βύα, to hide, and αὐχην, the Neck. People are properly call'd by this Name, who hide, as it were, their Necks, by elevating their *Scapulae*, Shoulder-blades. But it is used, in general, to express a Person who labours under a morbid Stiffness of his Neck.

BYSMA. See BYZEN.

BYSSUS, in Botany, is the lowest Species of Moss, of which twelve different Sorts are mention'd in the last Edition of *Ray's Synopsis*. See the Explication of Terms under the Article BOTANY.

Byssus also signifies the *Pudendum Muliebre*.

Byssus, moreover, imports a fine sort of Linen, wore by People of Condition among the Antients; but applied to no Medicinal Purposes that I know of. Some are of Opinion, that our fine Cotton, imported from the *East Indies*, is the true *Byssus* of the Antients.

BYSTINI ANTIDOTUS. An Antidote frequently mention'd by *Arctaeus*, of much the same Virtues, as it should seem, with the *Mithridate*.

BYTHOS, βυθός, Depth, Profundity. Thus it signifies in that Passage of *Hippocrates* (ἐν παρρηγυλ.) ἐν βυθῷ ἀτεχνῶς ἐβίβη: " (Physicians) who are in the Depth of Ignorance of the Art." And thus, in several Places of his Epistles, particularly in that from *Democritus* to *Hippocrates*, περὶ φύσεως ἀνθρώπου, or concerning the Nature of Man. (Βεβύχθη) εἰς βυθὸν καλῆς τέχνης περὶ μύτης " (The Oesophagus) conveys the Aliment to the Depth or Bottom of the Stomach."

BYZEN, βύζην, in *Galen's Exegesis*, is expounded ἀθρόως ἢ πυκνῶς, " in a Heap, in a Crowd, or Throng." The Word is used by *Hippocrates, Lib. 1. περὶ γυναικ.* speaking of the Catamenia, χροῖον βύζην, " flowing in abundance," or, as it were, thronging for Passage. Again, (*Lib. περὶ φύσ. παιδ.*) αἷμα βύζην ἀπὸν κατὰ μῆνα ἕκαστον, " flowing abundantly every Month;" for βύζην, in *Hesychius*, is expounded also by ἰκανῶς, and δαδιλῶς, " abundantly, plentifully." The Word βύζην is derived from the Verb βύζω, or βύω, which is, to fill by stuffing, to condense. Thus, (*Lib. 1. περὶ γυναικ.*) εἷμα καθαρὸν καὶ βεβυσμένον, is a clean Garment of a dense or close Contexture; to which are there opposed τὰ εἰσα ἀγγία τε καὶ μαλακά, " thin and soft Woollen Cloaths." And in the same Book, εἷμα παλῆς ἐὼν καὶ βεβυσμένον, is a full well-stuffed Garment.

From βύω also, or βύω, which signifies to stop up, to obstruct, fill up, stuff, constipate, comes the Word βύσμα, *Bysma*, in the Expression βύσματα ἐκ ἐλασίων κεραμίων, " the Covers or Stopples of Oil-vessels." These *Bysmata* are order'd to be mix'd with the Sordes, or Filth, collected from Fullers Shops, in order to make a Suffumigation in a particular sort of Hemorrhage mention'd, *Lib. 2. περὶ γυναικ.* Some take the *Bysma* to be the same with the *Amurca*, which is recommended by *Dioscorides, Lib. 1. Cap. 135.* as useful in an Infusion for Exulcerations of the Anus, Pudenda, and Uterus. The *Bysmata*, before quoted, are probably such things as, by Intrusion, stop, fill, or close up Oil-vessels, as appears from those Expressions of *Hippocrates, (Lib. περὶ ἐπιζυήσεως) ὀδυσσάσας τὸν δάκτυλον*, " thrusting in the Finger," and διαβύσας τὸ στόμα, " intruding it into the Mouth."

C in the Chymical Alphabet, signifies Salt-petre.

CAA-APIA.

Some People having imagined, that our grey Ipecacuanha was the same with the *Caa-apia* of *Piso*, Mr. *Geoffroy*, as the most natural way of deciding the Question, and removing the Doubt, compares these two Roots with the Descriptions Authors have given of them.

The *Caa-apia Pisonis*, *Hist. Brasiliens.* *Caa-api Brasiliensibus dicta*, G. *Marcgravi*, is a small low Plant, with a Root about a Finger's Breadth or two long, as thick as a Swan's Quill, and sometimes as large as one's little Finger. This Root is knotty, and has its Sides, and its Extremity, furnish'd with Filaments three or four Fingers Breadths in Length. It is of a yellowish-grey Colour externally, but white internally. It is insipid when first put into the Mouth, but afterwards discovers a Taste somewhat acrid and pungent.

From this Root arise three or four Stalks or Pedicles, which are slender, round, and three or four Finger-breadths in Length. Each of these Pedicles bears a Leaf, about a Finger-breadth in Breadth, and three or four Finger-breadths in Length. This Leaf is of a shining-green Colour on the superior, but a little whitish on the inferior Side. It is furnish'd with a Nerve throughout its whole Length, and intersected with small rising Veins on its inferior Side.

The Flower has a Pedicle peculiar to itself, and is round, radiated, and resembling that of the Bellis. It is composed of several Stamina, and bears round Seeds smaller than those of Mustard.

The Root of this Plant is possess'd almost of the same Virtues with the Ipecacuanha, which has induced some to call it by that Name, tho' without any Ground, as *Piso* himself informs us in these Words: "It is, says he, of the same Worth and Efficacy with the *Pecacuanha*, for which Reason it is by some "falsly call'd *Pecacuanha*." It stops Fluxes, and is as good an Emetic as Ipecacuanha, tho' not so strong; for which Reason it may be exhibited in larger Doses. The Dose is from half a Dram to one Dram, in Powder, in Wine, Broth, or any other proper Liquor.

The *Brasilians* bruise the whole Plant, express its Juice, and eat it. This Juice they also use with Success in the Cure of Wounds, made by poison'd Darts, and the Bites of Serpents. Their Method of applying it is to pour it into the Wounds.

Piso adds, that there is another Species of the *Caa-apia*, very like this, excepting that its Leaves are somewhat denticulated about their Edges, and villous as well as the Stalks.

From this Description of the *Caa-apia*, from the Descriptions of the white and brown Ipecacuanhas, which *Piso* and *Markgrave* gives us in their natural History of *Brasil*, and from the express Observation of *Piso*, that some call'd the *Caa-apia* Ipecacuanha, it is obvious, that *Piso* did not intend to describe the *Caa-apia* under the Name of Ipecacuanha. It is much more probable, that what he calls white Ipecacuanha is a Species resembling the grey Kind brought by the *Spaniards* from *Peru*, under the Name of *Bazuquilli*; and that the Ipecacuanha Fusca is that Species of brown Ipecacuanha which is at present so common, and comes from *Brasil* by the Way of *Portugal*. *Memoir. de l'Acad. R. des Sciences, A. 1700.*

CAA-ATAYA *Brasiliensibus*, *Marggr.* *Euphrasie affinis*, *Brasiliensis siliquosa*.

From a slender white Root it shoots up a square Stalk a Foot in-Height, of a pale Green, slender, geniculated, partly erect, and partly incumbent on the Ground, and taking Root where it touches it at the Joints. At every Joint grow two small Leaves, opposite to one another, of the Size and Shape of those of the *Nummularia*, (Moneywort) or rather of *German-der*, or *Male Speedwel*, of a pale Green, and serrated at the Edges. At every Pair of Leaves comes forth a very small white Flower, in a manner galeated, which is succeeded by a Pod, of the Size and Figure of the Grain of Oats, which, opening spontaneously, sheds a very small round Seed, of a dark-yellow Colour, and less than the Seed of the smallest Poppy. The Plant has no Smell, but a bitter Taste.

The Plant bruised, and boil'd in Water, and the Decoction drank, purges much, both upwards and downwards.

In its opposite serrated Leaves, its galeated Flowers, and its Seed inclosed in Vessels, it agrees with the *Euphrasia*, whither it might have been refer'd. *Raii Hist. Plant.*

CAACHIRA. See ANIL.

CAACICA *Brasiliensis*, *Herba Colubrina Lusitanis*, *Marggrave*.

From a small Root, and full of Filaments, it sends forth numerous Stalks, near to one another, half a Foot, and some-

times a Foot in Length, of a reddish Green, a little hairy, geniculated at Intervals, of a Finger's Breadth, and having at each Joint two Leaves finely serrated; much of the Size and Shape of those of the *Veronica*, (Male Speedwel) somewhat hairy, green above, and whitish underneath. At the Joints between the Leaves proceed Multitudes of little Flowers, of a green Colour, mix'd with a very little Red, and disposed in the Form of an Umbella. The whole Plant is full of a milky Juice.

The Herb bruised, and applied, is a most effectual Remedy against the Bites of Serpents; and is good also for other Wounds. *Raii Hist.*

CAACO: A Sort of æschynomenous Plant, which grows in *Brasil*, of which Mr. *Ray* mentions two. The first is the *Caaco Brasiliensibus*, *Herba Viva vulgo*, *Marggr.* *Æschynomene spinosa 2. seu foliolis Acaciae latioribus, siliquis longis birsutis*, *Breyn.* An *Mimosa spinosa Fernambucensis*, *Zanoni*. THE SENSITIVE PLANT.

The second is the *Caaco seu Herba Viva tertia species*, *Margg.* *Æschynomene spinosa tertia, seu foliolis Acaciae angustioribus, siliquis parvis echinatis*, *Breynii*.

I find no Virtues attributed to either of them.

CAÆTIMAY *Brasiliensibus*, *Marggr.* *Senecio Brasiliensis, folio angusto serrato*.

It grows to the Height of three Feet, with a green Stalk, full of a medullary Substance, and, at its first springing up, surrounded with numerous Leaves, four or five Fingers Breadth in Length, narrow, jagged at the Edges, somewhat hairy, as is also the Stalk, and a little hoary, with a soft Down. The upper Part of the Stalk spreads itself into four, five, six, or seven Branches, cover'd with small Leaves, like those of Hyssop. The small Branches bear Multitudes of Flowers, like those of Groundsel, and ending in Down, which is blown away with the Wind.

The Leaves of this Plant have a hot and acrimonious Taste; and being boiled, or bruised, and the Part rubb'd or wash'd with the same, cure the Itch, where-ever it breaks forth. *Raii Hist. Plant.*

CAAGHIYUYO *Brasiliensibus*, *Marggr.* *Pif. Frutex baccifer Brasiliensis, fructu racemato congesto Myrtilli*.

It is an Under-shrub, of the Bigness of the Raspberry-bush. The Stalk is quite woody and hairy; the Leaves grow in Pairs, and always opposite, are hairy, soft to the Touch, slightly serrated, distinguish'd by three eminent Fibres running lengthwise, and interwoven with many small Veins, which run across, are greener above than underneath, and are also set with Tubercles over the whole upper Surface, but underneath are full of little Pits; every Tubercle has a whitish Hair. It bears two, three, four, or five white pentapetalous Flowers, which cluster together, and, falling off, are succeeded by black Berries of the Bigness of Juniper-berries, of a sweet Taste, which are eaten by the Negroes, and yield a Juice much like Myrtle-berries. It grows in several Parts of *Brasil*.

The Leaves pulverized, and sprinkled upon Ulcers proceeding from a hot Cause, are an excellent Cure for them. *Raii Hist. Plant.*

CAAGUA-CUBA *Brasiliensibus*, *Marggr.* *Arbor baccifera Brasiliensis, floribus umbellatis lilæ*.

It is a small Tree, with an upright Trunk, not thick, but without Branches, and having its Top cover'd with numerous large Leaves, a Foot and half in Length, and above a Foot in Breadth; and conspicuous for Fibres, which are soft to the Touch, and hairy, and greener above than underneath. It bears small Flowers, disposed in the Form of an Umbella, resembling the Flowers of the Lime-tree, white, pentapetalous, with a yellow Umbilicus in the Middle, and smelling also like the Flowers of the Lime-tree. The Bark of the Tree is of an Ash Colour, and the Wood brittle: The Fruit is black when ripe, and is eaten by the Birds.

I have met with no physical Virtues ascribed to this Tree. *Raii Hist. Plant.*

CAA-OPIA, *Marggr.* *Pison.* *Pao de Laca. Lusitanis.* *Arbustula gummifera Brasiliensis, fructu cerasi magnitudinis gummi, Gutta femou, simili*.

It is a Tree of no great Bigness, with a Bark of an Ash Colour, inclining to Red, with brown Striæ, of a tough kind of Wood, and spreading itself into many Branches. The Leaves are solid, of a Green, inclining to reddish in the under Part, and of a paler shining Green above. The Flowers, which form an Umbella, take their Beginning from brown Globules of the Size of Lentils, which, in Process of Time, protrude Flowers

composed of five Petals, of a Green inclining to yellow, cover'd on the Inside with a white woolly Substance, and well stock'd with fine yellow Stamina. The Flowers are succeeded by Berries, which are first green, of the Size of a Cherry, round, cover'd with a soft Shell, out of which, being cut, they discharge, by Exsudation, a liquid Substance of an elegant yellow Colour. Within the Bark it contains a white Pulp, composed merely of cylindrical Bodies, placed near, and adhering to one another. At the Extremity of the fructiferous Branches there are always two acuminate brown Leaves, which are compacted, and, as it were, half glued together, in such a manner as to represent the Figure of a Spear or Hunting-pole, and, being cropt from their Pedicle, emit a Saffron-coloured Juice.

It generally flowers in November and December, and the Fruit is ripe in January and February.

If an Incision be made in the Bark of this Tree, especially when it begins to blossom, and let alone for a Day or two, it will discharge a Tear of a Saffron-colour, inclining to Red, which coagulates at first into a soft Mass, which hardens by Degrees. It agrees in Colour and Consistence with the *Gutta Gamba*, and dissolves and purges in the same manner; it is a little redder, almost of a Saffron-colour, and gives a Tincture of a little deeper Gold-colour. It is dissolved in Spirit of Wine, and gives it a Saffron-colour'd Tincture.

Formerly they cured the *Impetigo* by rubbing the Part with this Resin, dissolved in Water. Tho' it be not so effectual as *Gutta Gamba*, which *Piso* knows not whether to impute to its natural Want of Virtue, or to the Way of preparing it, yet from half a Dram to a Dram of it, macerated a whole Night in Vinegar of Squills, or Spirit of Wine, and given in Wine, is a strong Purge. It is better taken in Pills than in a liquid Form, because it is very difficult to be dissolved, on account of its Tenacity. *Raii Hist. Plant.*

CAAPÉEA. A Name for the PAREIRA BRAVA, which see.

CAAPOMONGA. The Name of a Plant which grows in *Brasil*. Mr. Ray calls it *Caapomonga Brasiliensis dicta, Lusitanis Erva de Vina*, Marggr. *Campanula Brasiliana, floribus minimis*.

I find no medicinal Virtues attributed to it.

CAAPONGA. The *Brasilian* Name for a sort of Samphire, call'd also *Trifolii Spica Crithmum maritimum non spinosum Brasiliense*, Pison. *Perexyl Lusitanis*, Marcgrav.

The Leaves and young Stalks of this Plant are boil'd, and pickled with Vinegar, and eat with Flesh or Fish. They are said to excite an Appetite, to provoke Urine, and to open Obstructions of the Viscera.

Piso also mentions another *Caa-ponga*, which is a sort of *Brasilian* Purslane, which is used, like Samphire, for a Pickle.

CAAPO-TIRAGUA *Brasilianis*, Marcgr. *Rubia Brasiliensis, floribus verticillatis albis*.

Ray informs us, that this Plant agrees with the *Rubia* in some respects, but is not a true and genuine Species of *Rubia*.

CAAROBÁ, *Pison*. A Tree very common in *Brasil*.

It is found, in the greatest Perfection, in the richer Soils about *Parnambuc*; but where it grows in less fertile Ground, it scarce exceeds a small Shrub in Bulk. Its Flower, which it sends forth in the Month of June, is of an azure-blue Colour, with a purple Cast. Its Seeds, which are ripe in the Month of September, are of a blackish Colour. Its Pod, tho' rare, is yet of no Use. It resembles the largest Species of the *Kidney-bean*, and, when ripe, it opens, and remains empty.

Its Leaves are oblong, shaped like a Tongue, and of a faint-green Colour: They have a Nerve running thro' all their Length, with oblique prominent Ribs distributed from it.

They are of a bitter Taste; and, when dried and bruised, are said to be highly proper for Fomentations and Baths. The Medicines prepared of them, when exhibited internally, are of a drying, cleansing, and healing Nature; which *Piso* says, he has happily experienced in the Cure of many chronic and arthritic Disorders, but more particularly in that of the *Lues Venerea*. The Leaves, when triturated, form'd into a Plaister, and applied to Ulcers, are of singular Service, and often remove them entirely; especially if, after due Purgation, a Decoction of them is drank for some Days, and a Diaphoresis promoted. Of the Flowers a Conserve is also prepared for answering the same Intention. Ray from *Piso*.

CAB signifies Gold. *Rulandus*.

CABALA, or CABBALA; call'd also Kabbala, Kabala, Cabalia, Cabalistica Ars, Cabula, and Gaballa.

This is deriv'd from a Hebrew Word, which signifies to receive by Tradition. It signifies a Science which consists in the mysterious Explication of the Scripture, either receiv'd by Tradition, communicated by Angels, or learn'd from some imaginary Import of Words or Letters. This is the Jewish Cabala; but the Word, from this Original, has been apply'd to any sort of mysterious or magical Knowledge or Explication of Things. Thus the Medicinal or Hermetical Cabala is a Science which discovers the most conceal'd Knowledge of Bodies, and

Mysteries of Nature, either by a Communication with incorporeal Beings more knowing than ourselves, or by their mystical Characters. In this *Paracelsus* seems to repose a great deal of Faith.

CABALATOR, or CABULATOR. Nitre. *Rulandus*.

CABALLI, CABALES. I take these to be the incorporeal Beings, mention'd under the Article CABALA. *Rulandus* says, they are the astral Bodies of Men, who come to an immature Death before their predestin'd Period, and which are suppos'd to wander about the Earth, as incorporeal Spirits, so long as they were to have liv'd upon it embody'd. As these, probably, only exist in the Imaginations of the Mad or Whimsical, and as the Doctrine which depends upon a Supposition of their Existence is highly extravagant, a farther Account of them would be superfluous.

CABBALLICA Ars, καβαλλική, according to the *Lacedaemonian* Dialect, for καβαλατική, from καβαλλω, to throw down. This is a Term in Gymnastics, importing, amongst Wrestlers, the Art of foiling, or throwing down an Adversary. *Galen, Lib. ad Thrasibulum*.

CABEBI, or CABEB. Scales of Iron. *Rulandus*.

CABELIANUS. A Sort of Fish, of the Cod or Pike Species. *Castellus*.

CABULATOR. See CABALATOR.

CABUREIBA PISON. This Mr. Ray thinks the Tree which affords the Balsam of Peru.

CACAGOGA, χαζαγόνα. Ointments, which, apply'd to the Fundament, procure Stools. *Paulus Aegineta, Lib. 7. C. 9.* directs to take Alum, mix it with Honey, and boil till they acquire a tawny Colour. With this, says he, anoint the Fundament; it procures a great many Stools, but not without Pain.

CACALIA, Offic. κακαλία, Dios. *Cacalia quibusdam, J. B. 3. 569. Cacalia incano folio, Ger. Emac. 815. Raii Hist. 1. 291. Cacalia folio retundo incano, Park. 1221. Cacalia foliis crassis hirsutis, C. B. 198. Hist. Oxon. 3. 94. Tourn. Inst. 452. Cacalia sive Leontice veterum quibusdam; aliis vero Tussilaginis species, Chab. 513. STRANGE COLTSFOOT. Dale.*

The Characters are;

It hath a sterculous Flower, consisting of many Petals, divided into four Parts, fitting on the Embryo, and contain'd in an almost cylindrical Empalement. The Embryo afterward becomes a Seed, furnish'd with Down.

It grows by the Sides of Woods, and amongst Shrubs in shady Places.

Cacalia, which some call *Leontice*, has very large white Leaves, from the Middle of which there shoots up a strait white Stalk, bearing a Flower like that of Bryony; it grows on Hills.

The Root macerated in Wine, like *Tragacanth*, and made into an Eclegma, or chew'd by itself, cures Coughs, and Roughness of the *Astera Arteria*. The Berries, which succeed the falling off of the Flowers, pulveriz'd, and made into a Cerate, and the Face anointed therewith, renders the Skin smooth, and free from Wrinkles. *Dioscorides, Lib. 4. Cap. 123.*

I find no other Virtues attributed to it by the Moderns.

Miller takes Notice of seven Species of this Plant.

CACALIANthemum. A Plant originally brought from the *Canary Islands*, but now common in the Gardens of the Curious. It has been call'd the Cabbage-tree, and Carnation-tree, and Dr. *Dillenius* gave it the Name of *Cacalianthemum*, because the Flower and Seeds nearly agree with the *Cacalia*. Miller has added a second Species.

The Characters are;

It hath a sterculous Flower, consisting of many Florets, like those of Groundsel; but the Florets are cut into four Segments, whereas those of Groundsel are divided into five Parts: The Cup of the Flower is also slenderer than that of the Groundsel.

The first of them is call'd the

Cacalianthemum folio nerii glauco, Hort. Eith. *Cacalianthemum* with a glaucous Oleander-leaf, commonly call'd the Cabbage-tree.

Cacalianthemum Africanum, ficoidis folio. African Cacalianthemum, with a Ficoides-leaf.

This Sort was originally imported from the Cape of Good Hope into Holland.

The Leaves, when broken, emit a strong Scent, somewhat like Turpentine; from whence some Persons have given it the Name of Balm of Gilead, tho' very improperly.

It has been commonly known by the Name of *Senecio*. *Miller's Dictionary*.

CACAMOTIC TLANOQUILONI, seu Battata Peregrina, Hernandez. The Cathartic Potato.

This grows spontaneously in the warmer Countries of America.

The Roots, taken in the Quantity of two Ounces going to Bed, purge with great Gentleness and Safety. It is said to be sweet, and of a very agreeable Taste, not inferior to our Pears.

CACA-

CACANGELIA, κακαγγελία, and, in *Hippocrates*, κακαγγελία. This, according to the Derivation, should signify a Message conveying bad News; but, by *Hippocrates*, it is us'd in a different Sense, in his Treatise *περί τέχνης*.

“There are some, says he, who make it their Business to speak ill of Sciences, without any other View than that of making a Parade of their Knowledge. But, in my Opinion, the Tendency and Use of Knowledge is to discover things of some Use, when found out; or to perfect Discoveries already made; to which those do not in the least contribute, who endeavour to traduce the Discoveries of the Skilful before the Ignorant, without making the least Amendment. These, instead of acquiring the Reputation they aim at, only betray their own Malevolence (*κακαγγελία*) and Ignorance.”

This, amongst many other Passages, shews *Hippocrates* to have been a Gentleman, and an honest Man; for Candor is one of the Characteristics of these, as the Malevolence here spoken of is that of a Scoundrel and a Villain.

I must remark, that in all the Copies I have seen of *Hippocrates*, this Word is printed κακαγγελία but *Galen*, in his Exegesis, explains κακαγγελία by κακολογία and most of the Commentators are of Opinion he has a View to this Passage.

CACANUM, κακάνιον. The Name of a Plant mention'd by *Paulus Aegineta*, in his Catalogue of simple Medicines, L. 7. C. 3. As he ascribes the very same Virtues to the Root, which *Dioscorides* attributes to the *Cacalia*, I suppose he means the same Plant.

CACAO, Offic. Ger. 1364. Emac. 1550. Raii Hist. 2. 1670. Cat. Jam. 134. Hist. 2. 15. Ind. Med. 24. Mont. Exot. 9. *Cacao frve Cacaoate*, THE PEAR-BEARING WHOLSOME ALMOND-TREE, Park. Theat. 1642. *Cacao America*, frve *Avellana Mexicana*, J. B. 291. *Amygdalis similis Guatimalensis*, C. B. Pin. 442. *Arbor Cacaoera*, Pif. Mant. A. 197. *Cacava Quahuil frve Arbor Cacar Cacarifera*, Hern. 79. *Cacava seu Arbor Cacar*, Nieremberg. seu *Arbor cacarifera Mexicanorum*, Jons. Dendr. 124. *Cacava Quahuil*, frve *Arbor Cacar*, Nieremb. 344. *Arbor cacarifera*, Camell. Syllab. *Cacao America*, seu *Avellana Mexicana*, *Cacavata quorundam*, Chab. 19. *Cacao fructus*, Calceol. Mus. 606. Worm. 191. *Arbor cacarifera Americana*, cujus fructus folliculo inclusus *amygdalorum speciem refert*, Pluk. Almag. 40. Phytog. 268. f. 3. **THE CACAO-TREE**. Dale.

The Tree which bears the Chocolate-nut, grows to be pretty big, full of large Leaves, standing on long Foot-stalks, broad and round next the Stalk, growing narrower, and ending in a Point, among which grow large five-leaved yellow Flowers, follow'd by a roundish Capsula, or Pod, of the Bigness of a small Melon, but growing narrower at the End, which terminates in a long sharp Papilla. It is pretty tough, of a reddish-brown Colour, and incloses about twenty or thirty of the *Cacao-nuts*, closely compacted together.

This Tree grows in several Parts of the *West-Indies*, as *Martinico*, *Jamaica*, and some others; but the best come from *Caraccas* in *New-Spain*.

The Nuts are of a brownish Colour on the Outside, about as big as an Almond, but rounder and thicker, cover'd with a thin Shell, under which lies the Nut, of a dark reddish-brown Colour, easily crumbling into several Parts, of an oily and somewhat bitterish Taste. Of these, roasted, and separated from the Shells, is made Chocolate, so much us'd of late, and which is made either with, or without, Sugar; some adding Vanelloes, or what else they like. *Miller's Bot. Off.*

The Juice, express'd from the mucilaginous Pulp contain'd in the Husk of the *Cacao-nuts*, is a Substance resembling Cream, of a grateful Taste, and cordial Quality. It is of a detergent Nature, and, when us'd externally, very proper for removing cutaneous Spots and Roughnesses. The Nuts themselves, included in the Husk or Shell, are said to be of so nutritive a Quality, that one Ounce of them contains more real Nourishment than a whole Pound of Beef. But, that we may at once receive the greater Light, with regard to the Truth of this Assertion, and be enabled to form a juster Judgment of the Medicinal Virtues of *Chocolate*, of which this Nut is the Basis, we must inquire what Substances it yields, and of what Principles it seems to be compos'd, when subjected to a Chymical Analysis.

Two Pounds, then, of crude *Cacao* yielded various Liquors, mix'd with an acid and acrid Salt; that is, fourteen Ounces and an half, and half a Dram of Oil, and half an Ounce and ten Grains of a lixivial Salt. *Du Hamel Hist. and Hist. Ac. R. Sc. T. 2. p. 26.* The pinguious and oleous Part of the *Cacao* was, by Mr. *Hornberg*, separated from the rest, in three different Manners: First, by Distillation, he obtain'd from one Pound of *Cacao* three Ounces and a Quarter of Oil, which is much about the fifth Part of a Pound. Secondly, from one Pound of the *Cacao*, made hot, and bruis'd in the ordinary Manner, he obtain'd, by Expression, two Ounces of Oil; and from the Fœces, afterwards, boil'd in Water, he express'd half an Ounce of a like Oil; from the same Fœces, mix'd with common Water, and subjected to Distillation, he obtain'd two

Ounces and an half more; so that the whole Oil, obtained, amounted to five Ounces and an half. Lastly, grinding the *Cacao* with a warm Stone, as when the Chocolate is prepar'd of it, he mix'd thirteen Ounces of this subdu'd Mass with eight Pounds of boiling Water, which, when cold, exhibited no kind of pinguious Substance on its Surface. But after this Matter, put into the Water, was boil'd, and inspissated to the Consistence of a thick Poulitis, then a pinguious Substance was observ'd to float on the Surface, which, being collected by little and little, till no more appear'd, became gradually so thick and tenacious, that it could not commodiously be handled with a Spoon, and was, at last, indurated like Tallow, but retain'd the Smell of the *Cacao*. Six Ounces and somewhat more of this Fat were taken off, and, by Distillation, the Fœces yielded an Ounce and three Drams more; so that from thirteen Ounces of the Mass seven Ounces and three Drams of Oil and Fat were, by this Method, extracted. The Reason of this Difference, according to the Conjecture of Mr. *Hornberg*, is, that the *Cacao* brought from the *Indies*, being much dry'd, and long kept, loses much of that native Humour, from which Part of the Fat is obtain'd. For this Reason, when put into the Retort dry, in the first Analysis, by a simple Distillation, it yields little Oil; but, in the second Operation, the Fat being separated by Expression, and the Fœces being impregnated with warm Water, the pinguious Matter remaining in the Fœces, and which had, by being too much dry'd, lost a Part of its Moisture, recovers it again, and then yields as much Oil by Distillation, as it had before done by Expression. In the third Process, after a large Quantity of Water had been added to the *Cacao*, reduc'd to a kind of Mass, and, after they had boil'd together, on a gentle Fire, for five or six Hours, the pinguious Particles being, by this time, sufficiently impregnated with Moisture, united, and thus, by this Method, more than three times as much Oil was extracted, as was obtain'd by the first Distillation. *Hamel Hist.*

Ray gives us the following Analysis of *Cacao-nuts*: Eight Ounces, says he, of undecorticated *Cacao-nuts*, reduc'd to a Powder, and committed to the Retort, discover'd themselves to be of a Substance so fix'd and difficultly resolvable, that, by a moderate Fire, they yielded nothing but a small Quantity of a certain whitish Liquor, clear and transparent like Water, and which was taken for Phlegm. Then, increasing the Fire to that Degree which is requisite for extracting the Spirit of Vitriol, in the Space of seventeen Hours, there was a Spirit rais'd in the Form of Exhalations, of a milky Whiteness. This Spirit, contrary to the Custom of all others, subsided in Phlegm to the Bottom of the Receiver. At last, upon the Application of the most violent reverberating Heat, a Practice not usual in the Distillation of Vegetables, there ascended an Oil highly red, and, as it were, of a Blood-colour, but, at the same time, pretty transparent. This Oil, when cold, thickens like other Oil, or like Butter of Wax; the Caput Mortuum weighed two Ounces seven Drams, the Spirit two Ounces, the Oil three Ounces and a half. The Spirit was not very hot, but highly penetrating, neither was it ungrateful to the Smell, as those Spirits generally are which are drawn from Blood or Flesh. The Oil is, in like manner, wonderfully pungent and penetrating, before it is separated from the volatile Salt, of which it contains a large Quantity; it is also highly aromatic and cordial. The Spirit soon becomes acid, a Circumstance which sufficiently proves, that it contains a great deal of an acid Principle. From what has been said, 'tis obvious, that the *Cacao* contains a large Quantity of Oil, and this Oil is found, from Experience, to be highly excellent for some Medicinal Purposes, when it is neither alter'd by Distillation, nor spoil'd by Expression, but obtain'd pure, only by boiling in Water. For this Reason the *Oleum e Nucleis Cacao* is one of the Oils in the *Pharmac. Paris*. For obtaining this Oil, the Nuts, when roasted, and clear'd of their Husks and Buds, are levigated upon a Stone with Fire under it, and then boil'd in Water, till the Oil appears on the Surface, which, when the Water is cold, may be gathered from it concreted and thick like Suet, of a brownish Colour, which is chang'd into that of white, by washing it with warm Water whilst liquid. But it seems to be a preferable Method, by which the Oil is extracted from the Nuts by boiling, after having taken off their Husks and Buds, and bruis'd them without roasting them. Sixteen Ounces of the Nuts, thus treated, yielded three Ounces and an half of a very beautiful Butter, of a white Colour, with a Cast of green and yellow. This Butter, as to its Consistence, had a nearer Resemblance to Suet than to Oil; but it had a most fragrant and delicious Taste. *Comm. Lit. for the Year 1737.* From its Consistence it is call'd *Butyrum Cacao*, or Butter of *Cacao*. In *America* this native Oil, when separated and pure, is said to have no Smell, but a pretty grateful Taste. 'Tis also said, that, in Process of Time, it acquires the Consistence of Cheese, which may be kept for a long time without becoming rancid or corrupted, and which may afterwards be liquified with a very gentle Heat. A certain Quantity of this Oil, distill'd from a Cucurbit, plac'd in the Heat of Ashes, yielded

an unctuous Liquor, which concreted as it drop'd, and seem'd to differ in nothing from the Butter or Oil itself, except in its being somewhat empyreumatic, and depositing in the Bottom of the Receiver a few Drops of a clear Liquor, of a somewhat acid, and highly grateful, Taste. This Butter of Cacao, when not rectify'd, may not only supply the Place of the best Oil of Olives in Food, but 'tis also extol'd as a highly anodyne Medicine, and proper for correcting the acrimonious Humours which prove uneasy to the *Aspera Arteria*. The Method of using it is, to make it up into Troches with Sugar-candy, to be held in the Mouth to melt gradually. Painful Hæmorrhoids are also much reliev'd by being anointed with it, when reduc'd to the Form of a Liniment, with pounded Scorizæ of Lead, or mix'd with Powder of Millepedes, Saccharum Saturni, Pompholyx, and a small Quantity of Laudanum. Some, with Success, apply a Linen Cloth, dipp'd in the Oil, warm, to the Parts affected with arthritic Pains, applying a warm Cloth over it. It is also recommended as a proper Basis for the apoplectic Balsams; and may be substituted, if not prefer'd, to the Oil of Nutmegs. It is also highly proper for anointing Instruments of Steel or Iron, in order to preserve them from Rust. In *America* the Women use it for rendering the Skin smooth and even, without leaving any shining unctuous Gloss behind it. But since, in *Europe*, it is of too firm and hard a Consistence for this Purpose, it may be mix'd with Oil of Ben, or with Oil of sweet Almonds, express'd without Fire. Where the Butter of Cacao, prepar'd of unroasted Nuts, is to be us'd internally, 'tis to be dreaded lest it prove of too hard Digestion, and bring on those Symptoms mention'd in *Comm. Lit.* where we have an Account of a Woman, who, after a *Hæmoptoe*, became phthisical. This Patient, in the Space of seven Days and an half, us'd fourteen Drams of the Butter of Cacao, taking scarce a Dram for each Dose, Morning and Evening; but, next Day after the Use of it, she was afflicted with Head-achs, and Loss of Appetite; to which, on the ninth and tenth Days, were added Weaknesses, and Faintings; and, upon injecting a Clyster, the Patient discharg'd indurated Globules, of a greenish Colour, form'd by the Coagulation of this Butter of Cacao.

But the Circumstance which, of all others, renders the Cacao-nut most celebrated, is, its being the Basis of Chocolate, a factitious Substance, first brought from *America*, into *Europe*, by the *Spaniards*, about the Beginning of the last Century. It is a solid Mass, form'd either into round or square Plates, or made up into Cylinders of a dark-brown Colour. This Substance is friable, and, for the most part, of a grateful aromatic Smell. It is sometimes dissolv'd in Water, sometimes in Wine, and sometimes in Milk; at other times 'tis eaten dry, or mix'd with other Food. It is drank either with a View to nourish, or regale the Stomach, to provoke to Venery, or to answer some Medicinal Intention. The Effects of Chocolate on our Bodies, whether produc'd by its nutritive or stimulating Quality, ought to be determin'd from a joint Consideration of the aromatic Ingredients which enter its Composition, and of the Nature of the Liquor in which it is dissolv'd for Use. Its nutritive Quality is diminish'd by the Addition of a large Quantity of Aromatics, since by that means it becomes too hot. It is also too hot when dissolv'd in Wine, except in those remote Northerly Regions, where the Inhabitants are accusom'd to a hot Regimen. When prepar'd with Milk, it nourishes more than in any other Form; but it seems, at the same time, to load the Stomach too much. By the Addition of an Egg or two, which is the Custom with some People, its nutritive Quality is augmented. Water, therefore, seems, of all others, to be the best Vehicle for Chocolate, since, by its Dilution, it must, of course, promote the Distribution of its nutritive Principles. In the hotter Countries of *Europe*, it is generally prepar'd with Water; and, because it is drank hot, and must, of course, relax the Tone of the Stomach, it is customary to take a Draught of cold Water either before or after it, with a View to assist the Contraction of the Stomach. The *Americans* drink Chocolate, as a Cooler, at their Feasts and Entertainments. Many also of the *Italians* and *Spaniards* drink it, cool'd with Ice or Snow. Chocolate is particularly proper for cold Constitutions, for old People, for such as have their Strength impair'd by continual Watchings, and for those who travel in cold Mornings. It is also, by some, commended in Cases where the Digestion is weak; but the Cacao-nut is of too oily and tenacious a Nature, to be digested by a weak Stomach. For which Reason *Cheyne* thinks, that the Weak and Infirm should not use it, either as Food, or as a Medicine; but rather recommends to them, for common Food, farinaceous Substances, such as Pease, Beans, Millet, Oats, Barley, Rice, Wheat, and other Substances of a like Nature, boil'd in Water or Milk; but he owns, that Chocolate may produce all the salutary Effects of a wholesome Food, in vigorous and robust Constitutions; in which it may also be us'd, as an anodyne Medicine, in Colics, and Nephritic Pains; since, by its Viscidity, it sheaths up and blunts the salt, acrid, and irritating Humours, that

thus, by the lively Impetus of the Viscera, they may be discharg'd thro' proper Passages. *Cheyne's Essay on Health.*

It is confirm'd, by the Experience of many practical Physicians, that, in hectic, scorbutic, and catarrhus Disorders, Atrophies, malignant Itches, and Chin-coughs, Chocolate has prov'd a divine and miraculous Remedy; and that, in these Disorders, when other Remedies have prov'd ineffectual, the Physician has been oblig'd to have recourse to Chocolate, as the last and most effectual Medicine.

According to *Meisner*, in all Disorders arising from an acrid Salt, whether bilious or acid, austere or muriatic, Chocolate may afford the miserable Patients a singular Relief. From this Class of Disorders we do not exclude the *Lues Venerea*, the Gutta Rosacea, the Gout, and wandering arthritic Pains. *H. F. Konig* asserts, that a small Quantity of Chocolate, with a few Aromatics in its Composition, wonderfully relieves the Hypochondriac, and corrects the Acrimony of their Juices, especially if exhibited with the Spices *Diatragacanthi frigidi*; and the celebrated *Hoffman*, in his Consultations, asserts that Chocolate, prepar'd with Water, and drank at proper Times, may conduce very much to the Cure of melancholic Disorders, arising from too weak and lax a State of the Nerves, especially if a few Drops of the Essence of Amber are mix'd with it; for he affirms, that he had, from Experience, found it to contain a kind of Oil, highly friendly to the nervous System. But because Chocolate is frequently recommended in Weakness of the Stomach, we must observe, that, according to *Meisner*, "Chocolate is only proper in such Weaknesses of the Stomach as arise from Inanition or Defect, either in Consequence of using such Aliments as afford little Nourishment, like those in *America*, in Consequence of the Constitution and Stomach being too much exhausted by some previous Evacuation, or in Consequence of the Aliments being too speedily dissipated by the excessive Subtlety of the Atmosphere, as generally happens in cold and mountainous Countries, where the Appetite is always keen. But, in such Weaknesses of the Stomach as arise from other Causes, Chocolate is far from being proper." Thus we find Chocolate possess'd of two Qualities which it derives from the Cacao-nut; that is, a nutritive Quality, and that by which it corrects the Acrimony of the Juices. Hence 'tis obvious, that the learned *Stubbs* was in the right, when he affirm'd, that well-prepar'd Chocolate was an excellent Diet, not only for such as are scorbutic, afflicted with arthritic Pains, or the Stone; for Women in Labour; and for preventing Convulsions, and expelling the Meconium of Children; but also for hypochondriac and chronic Disorders. *Philosoph. Transact.* Its alexipharmic or poison-resisting Quality, or rather its oleous Nature, adapted to obtund and sheath up the Spiculæ of Poison, is sufficiently conspicuous from a Case in *Eph. M. C. D. 1. a. 3. o. 40. D. 3. a. 5. app. p. 102.* where, thro' a Mistake, Arsenic was us'd instead of Sugar, foredulcorating roasted Cherries, and, at the same time, for sweetening Chocolate; and it was observ'd, that those who drank the Chocolate were afflicted less terribly, and struggled longer with the Poison, than those who eat the Cherries. That Chocolate contains a large Quantity of Oil, is also plain from this Circumstance, that it does not keep long before it acquires a kind of Rancidity. *Caldera* is of Opinion, that Chocolate justly deserves a Place among the aperient Medicines; and, indeed, 'tis certain, that every nutritive Substance, whether eatable or drinkable, adds those Degrees of Strength to the Body which are necessary to carry on Perspiration. Besides, Chocolate must be useful for opening Obstructions, on account of those Ingredients, which, being of an aromatic and stimulating Nature, increase the oscillatory Motions of the Vessels, and promote the Circulation of the Juices; so that it must, of course, contribute to carry on the proper Secretions, and excite the various Excretions, in proportion to the Regimen us'd, provided the Patient is not too much accusom'd to drink it; for such Substances as we are not habituated to, only operate as Medicines on our Constitutions.

It would be too tedious to give an Account of the different Methods used by different Nations in preparing the Chocolate. *Benzo*, in his *Nov. Orb.* gives us the Recipe commonly followed by the *Americans*. *Le Fevre* gives us an Account of the Method used by the *Mexicans*; and, in short, different Authors inform us of the various Methods used by different Nations. According to *Herman*, the richer and more opulent Inhabitants of *Spain* prepare it in the following manner:

Take of excorticated clean and roasted Cacao, six Pounds; of Cinnamon, half a Pound; seven Vanelloes, dissolved in Syrup; six or seven Cloves; Meal of *Indian Corn*, half an Ounce; of *Spanish Pepper*, one Dram; of *Arnotto*, in order to give it a reddish Colour, two Drams, dissolved in Rose-water, or Syrup of Roses; of Sugar, a sufficient Quantity, or about three or four Pounds: Beat and mix all together in a Vessel placed over a gentle Fire; stir them constantly, till they are intimately mix'd; reduce to a Mass;

a Mals; and if you have a Mind, add a proper Quantity of Musk, or of the Essence of Amber.

In *Meisner* we have the Receipt of *Barthol. Marradon*, that celebrated *Spanish* Physician, which is as follows:

Take seven hundred Cacao Nuts; of the finest white Sugar, half a Pound; of Cinnamon, two Ounces; of *Mexican* Pepper, fourteen Grains; of Cloves, half an Ounce; of Vanilloes, half a Scruple; or, in their stead, two Ounces of Anise-seeds; and of Arnotto, the Bulk of a Nut: To these some add a little Orange-flower Water, and one Grain of Musk or Ambergrise.

In the Memoirs of the Royal Academy of Sciences at *Paris* we are told, that Chocolate is prepared of

A Pound of Cacao, roasted after the Husks are taken off, with an equal Quantity of Sugar, two Drams of Cinnamon, and half a Dram of Vanilloes.

This Composition, when subjected to Distillation, yielded eight Ounces and four Drams of Oil; and what remained after Distillation yielded two Drams and eight Grains of a lixivial Salt. *Hamel. Hist. Reg. Scienc. Academiæ.*

Le Fevre prefers the following Recipe, taken from *Lemery*, to all the other Methods of preparing Chocolate, used in *France*.

Take two Pounds of Cacao Nuts decorticated, roasted, and reduced to a Paste; with these mix one Pound and an half of Powder-sugar; to these are added a Scruple and an half of Vanilloes, four Cloves, half a Dram of Cinnamon, one Grain of Amber, and half a Grain of Musk, reduced to Powder. *Lemer. Alim.*

At present the Pepper and *Indian* Corn are for the most part rejected by the *Europeans* in making Chocolate; and in *Spain* and *Italy*, that Species, which is prepared without the Vanilloes, is called *Chocolata Sanitatis*, because it is thought less hot than the other Kinds. In the *American* Islands belonging to the *French*, the Vanilloes, though there produced in great Plenty, are not used in preparing Chocolate. But because many love Chocolate of a pungent Taste, some in the room of the Vanilloes substitute other acrid Aromatics, such as Pepper, Ginger, and others of a like Nature. The most simple of all the Methods of preparing Chocolate used in *Europe*, is directed in the *Pharmacop. Augustan.* thus:

Take Cacao Nuts, gently roasted, decorticated, and reduced to a fine Powder; let two Parts of this Powder be reduced to a Paste, with one Part of white Sugar, and dry'd in a gentle Heat.

Whoever has a mind to inform himself more fully of the various Ingredients used in preparing Chocolate, let him consult *Meisner*, *Caldera*, *Du-Four*, and *Piso*. As for the Goodness of the Chocolate commonly sold, that is generally thought best which is intirely dissolved in the Liquor with which it is made, without leaving any Sediment. In *Spain* the Chocolate is thought best which is pierc'd by Worms, who are said to be fond of none but what is good. *Reaumur.*

It now remains, that we say something concerning the Method of reducing Chocolate to a proper Liquor for drinking. The most ordinary manner of doing this is to put boiling Water, or, in its stead, Milk or Wine, in a proper Vessel; then the Chocolate, being cut down, is added to the Liquor; and, during the boiling, the Mixture is well agitated with a denticulated or notched Piece of Wood, commonly called a *Mill*, till it froths; then the frothy Liquor is poured into a Cup or Bowl, and drank warm or tepid. It is also a Custom with many to eat toasted Bread or Biscuit soak'd in it. What remains of the Liquor is, before it is poured into the second or third Cups, to be again agitated as before, till at last the Whole is converted into Froth. Some allow the Chocolate to boil for some time with the Liquor, before they attempt to raise it into a Froth. But 'tis to be fear'd, that, by this Method, it may lose too much of the subtle Aromatic it contains. They who do not think the Chocolate before sufficiently impregnated with Sugar, add of that Ingredient whatever they have a mind. The Proportion of the Chocolate to the Liquor, with regard to Weight, ought, according to *Mundius*, and some other Authors, to be as one to eight. But the Proportion is always varied, according as the Chocolate is wanted strong or weak.

As for the Dose or Quantity of Chocolate to be drank at a time, it is commonly determined by the Person who drinks it. *Colmenero de Ledesma*, a celebrated *Spaniard*, affirms, that between five and six Ounces of it may be drank, without doing any Injury to the Constitution. And that larger Quantities are not prejudicial to such as are not accustomed to it, is plain, from daily

Experience, especially in Cases where the Stomach becoming empty requires fresh Supplies. They who drink the gross Substance which subsides to the Bottom, imagining it to be the most nutritive Part of the Chocolate, are grossly mistaken, and by that Practice considerably injure their Health; since, according to the last quoted Author, it is only the terrestrial Part of the Cacao, which, by creating Obstructions, disposes to melancholic Disorders. The Dose or Quantity must also be considerably varied, according to the Strength or Weakness of the Chocolate, and according as it is made with Milk or Wine. A Man in perfect Health may drink as much as he has an Appetite for, provided he finds himself refresh'd, and his Stomach not overloaded by it. But he ought to remain in a State of Rest for half an Hour, or an Hour, after he has drank it, lest Concoction and Digestion should be interrupted, or irregularly carried on. He ought also to abstain from Food for some time after he has drank Chocolate, lest by a contrary Practice he should injure his Stomach; for Chocolate is itself very good Matter of Nourishment. For this Reason the most proper Time for using it is when the Concoction is finish'd, whether in the Morning, or in the Afternoon. And since in a hot Air the Powers of Digestion are fainter and more languid than in a cold State of the Atmosphere, 'tis hence obvious, that Chocolate ought to be used in smaller Quantities, and less frequently, in Summer than in Winter, as *Colmenero* has justly advis'd; though he adds, "That in *America*, and even in *Spain*, Chocolate may be drank at all times; and that this is owing, first, to Custom; and, secondly, to the excessive Heat of these Countries, by which, in Conjunction with an abundant Humidity, the Pores of the Inhabitants are open'd, and a great Dissipation of the Substance of the Body is caused; so that Chocolate may there be safely drank, not only in the Morning, but at any Hour of the Day. Now, since by the intense Heat the natural Heat of the Body is dissipated; and since the Heat of the Stomach, and other Viscera, retires to the Circumference of the Body, the Stomach must of course be rendered considerably weakened; so that the *Americans* and *Spaniards* find themselves refresh'd, and the Tone of their Stomachs restor'd, not only by Chocolate, but also by pure and unadulterated Wine." The aromatic Ingredients of the Chocolate recruit the languid Stomach; as also generous Wine, by restoring a due Degree of Contraction to the nervous System, and raising the Spirits to a proper Motion. But lest, in Consequence of a Dissipation of the aqueous Liquids, the parched Vessels of the Body should receive a Heat which would farther inflame the Humours, to the no small Detriment of Health, *Caldera* advises, "That if, during an excessive Heat, the Person who intends to drink Chocolate is thirsty, he should a little before take a small Draught of cold Water, lest the Chocolate produce a fresh Degree of Thirst, and render it more intense than it was before. But any Liquor drank after Chocolate generally produces the most terrible Symptoms, whether it be Wine or Water. I myself saw a Vertigo produc'd by this imprudent Practice in a Citizen of *Seville*; the Colic in another; and a Privation of Voice in many others." Physicians are not fully agreed, whether without any Prejudice to Health cold Chocolate may be used as a Cooler. *Gage* affirms, "That it is so excessively cold, that few can use it safely; since it excites Pains of the Stomach, and other Disorders, especially in Women." According to *Caldera*, when this Liquor is cooled with Ice or Snow, it is equally virulent and dangerous with cold Poisons: For, says he, when a sudden Cold seizes the Organs of Respiration, it affects them with such a Numbness and Torpor, that they can no longer perform their proper Motions; and this Motion ceasing, a sudden Death ensues. Now 'tis evident, not only from Reason, but from daily Experience, that the same fatal Consequences must be produced, when an intense and preternatural Cold has seiz'd the Stomach, the Liver, the Uterus, and the extreme Orifices of the Veins; because such a Cold, by obstructing these Orifices, puts a Stop to the Circulation of the Blood, which in this Case is so coagulated in the Extremities of the Veins, that the Functions of Life cease, Syncope ensue, and the Patient dies suddenly, without any apparent Cause. To such an object, that all who daily drink Chocolate thus cool'd do not die suddenly, *Caldera* makes this Reply, That neither do all who are seiz'd with a Plague die of it; because, though the *Fomes* of this Disease is an Agent of wonderful Force and Efficacy, yet it only operates on Subjects properly disposed for yielding to its Virulence; so that every one ought to take care of himself, and become cautious, by an Observation of the Fates of others. *Colmenero*, according to *Meisner*, is of Opinion, that Chocolate drank in the Dog-days by People of hot Constitutions, and such as are afflicted with a Weakness and Debility of the Stomach, is most conducive to Health, when made with Endive-water. But since in Distillation what rises in the Alembic from the Endive does not partake of its saponaceous Qualities, and since that Plant is found to contain no aromatic and volatile Parts, I see no Reason why Endive-water should be more proper for this Purpose than pure com-

mon Water, or distill'd Water. Corroborating and stomachic Virtues are in vain sought for in Endive-water; but these may much more probably be found in a little Wine added to the Chocolate, if no Circumstances concur to contraindicate such a Practice. When Chocolate is prescribed as a Medicine, the Physician must determine the Quantity, and fix the proper Seasons of Exhibition. Such as are become weak; in Consequence of Inanition, may judge of the Quantity from the Sense of Refreshment they feel; but at the same time they ought to use it more sparingly than those who are vigorous and robust.

Having thus considered Chocolate as a Drink, we now come to view it in another Light; that is, when used in preparing Viands. Many, then, add powder'd Chocolate to certain Foods, as an Aromatic; for the sake of a more grateful Smell, and delicious Taste. They also mix it with Broths, and other Dishes. But 'tis obvious, that the more of it is used for these Purposes, the Food becomes not only more fragrant to the Smell, and grateful to the Taste, but also more nutritive. Others, especially on a Journey, in the Morning, eat Chocolate dry, without any foreign Mixture; this supplies the Place of an aromatic Confection; and defends them from the Injuries of the cold and damp Air; since, by stimulating the Juices into a somewhat brisker Motion, it in some measure prevents those unlucky Consequences which are generally produced by an obstructed Perspiration. Besides, as Travellers are sometimes reduced to Straights for want of Food, this Defect may, in some measure, be supply'd by Chocolate; of which are also made Sweetmeats, and other Delicacies, very grateful to the Taste, whose Virtues may be judg'd of from what has already been said of Chocolate, and a Consideration of the other Substances which enter their Compositions. The *Royal Chocolate*, for Instance, prepar'd for *Uladislaus the Fourth, King of Poland*, and preserv'd among the *Arcana Gnofseliana*, is made thus:

Take four Ounces of *Indian Chocolate*, reduc'd to a Powder, and pass'd through a Sieve; of powder'd *Canary Sugar*, one Pound; twelve sweet Almonds decorticated, and well beat in a Marble Mortar: Let these be sufficiently mix'd, incorporated with Whites of Eggs, and by a long Agitation converted into Foam; then add between half a Dram and a Dram of *Ambergrise*, triturated with *Canary Sugar*; and of Musk dissolved in Sugar of Roses, half a Scruple. Reduce the Whole into a Mass, of which form small Cakes an Inch square, to be laid upon Paper, and dry'd over a small Iron Furnace.

The Rob of Chocolate, prepared with Saffron and Oil of Almonds, is by *Bruckman* recommended as a Specific in Coughs. The *Confectio Pacifica de Succolata Inda*, in *Mynsicht*, is an Electuary, which, besides Chocolate, consists of a great Number of Aromatics, and other stimulating and nutritive Ingredients. It is recommended as a Secret of wonderful Efficacy in the Cure of Venereal Impotence, if, after proper Evacuations, a Piece of the Bulk of a Chestnut is daily used.

I must here also observe, that 'tis customary for some to mix purgative, antifebrile, and other Medicines, with Chocolate, in order to render them more grateful and agreeable to the Patient; but whether, and in what Cases, it is a proper Vehicle for other Medicines, must be judg'd from what has already been said concerning it.

From what has been advanc'd, we must be guided in our Judgment, whether Chocolate is proper for all those to whose Palates it is agreeable. When moderately used, it seems to contribute to the Health of those who are in no Danger of having their Juices stimulated into too brisk a Motion, or their Constitutions overheated by the Use of Aromatics; as also of those whose Stomachs are able to concoct and subdue the pinguious and tenacious Substance of the Cacao Nut. Hence 'tis obvious, that those People must abstain from the frequent and immoderate Use of it, who are in the full Vigour of Youth; whose Juices are easily put into preternatural Commotions; who have spare dry Constitutions; and whose *Primæ Viæ*, in consequence of having lost their Tone, are unfit for a due Concoction of the Aliments. The Expressions then of *Piperus*, *Corall*, ad *Myns*. where he calls Chocolate a *Panacea*, and an universal Medicine; and those of *Caldera*, when he asserts, that, like the Apples of the Tree of Life, it preserves from Death, and the Infirmities of Age, are evidently hyperbolic and extravagant; since by one Medicine many Diseases may be remov'd, but no one is found capable of eradicating all the Disorders to which Mankind is subject, as has been demonstrated by the incomparable *Boerhaave*. Lest this should appear a random Assertion concerning Chocolate, I shall, from *Caldera*, who bestows the highest Encomiums upon it, enumerate the several Cases in which the Use, and much more the Abuse, of it is to be avoided. "*Chocolate*," says he, "is prejudicial to all those who labour under Fevers, or any other acute Disorders; since in these it is converted into Bile. It is also hurtful to the Stomach, when disordered with Crudities, in Consequence of Indigestion. It is highly improper in all Diarrheas, especially those of the bilious Kind; though it sometimes proves serviceable in Lienteries, by promoting the Digestion of the Aliments. It is hurtful after Dinner and Supper, especially after Feasting in a luxurious manner. Besides, Chocolate is attended with this Inconvenience, that it carries the crude and unconcocted Chyle along with it to the Blood-vessels, which, if it there becomes putrid, lays a Foundation for the most terrible Disorders; and either creates new, or augments old Obstructions, before too obstinate to be consistent with a State of Health." Then subjoining some things relative to the bad Consequences arising from the Abuse of Chocolate, he adds these Words: "If it is used in larger Quantities, or more frequently than is consistent with preserving the native Heat of the Stomach; it in this Case creates a great deal of Trouble to the strongest and most vigorous Digestion. The habitual Drinking of it proves a Burden to the Stomach, when already full, especially when it is drank with a View rather to provoke, than to remove Hunger: For by such a Practice, Paleness of Colour is produc'd, and Crudities are generated, which bring on a Tremor of the Nerves, and an extreme Leanness. By this Custom the Belly is distended, the Countenance discoloured; and sometimes Vertigoes, Head-achs, creeping Pains of the Brain, and perhaps long-continued Fevers, and insuperable varicose Obstructions, are form'd. From this Cause, and the various Crudities inseparable from it, arise hypochondriac Melancholy, and an incredible Complication of Disorders."

"If," says *Baglivi*, any one, especially of a sanguine and hot Constitution, drinks Chocolate immoderately, since it inspissates the Blood, and renders it unfit for Circulation, probably in Consequence of the viscid and tenacious Nature of the Cacao; it produces Inflammations of the Viscera, long Mesenteric Fevers; and Apoplexies; the Frequency of which is perhaps owing to the too liberal Use of Chocolate, which too much inspissates the Blood; for which Reason the Drinkers of it become excessively fat; as I have observed in a great many Instances."

According to *Meisner*, "Chocolate not only generates Obstructions in those who drink it to Excess, but also when used moderately in every Constitution previously disposed to them by the lacteal Vessels being too small, depressed, or stuffed with a viscid Humour; since, in these, the terrestrial Parts of the Chocolate stop, and either form or augment Obstructions. For this Reason young Girls labouring under a *Chlorosis*, and all others subject to Obstructions, ought to abstain from it." For this Reason also Mr. *Jussieu* disapproves of its being used by Students, since its oleous and pinguious Substance being of difficult Digestion, disposes to Obstructions of the Viscera. He also observes, that Colics, Suffocations, and intense hæmorrhoidal Pains, are produced by it.

Hoffman affirms, that the more of it is drank by hypochondriac Patients, the greater Injury they sustain; since Eructations, Loss of Appetite, Pains and Uneasiness of the *Præcordia*, are produced by the Inflation and Distention of the Stomach occasioned by it; for the strong Acid with which the *Primæ Viæ* of the Hypochondriac always abound, meeting with the earthy and oleous Parts of the Chocolate, produces a tough, viscid Mass, which, adhering strongly to the Foldings of the Stomach and Duodenum, lays a Foundation for the above-mentioned Disorders. In this Case I have observ'd, that a gentle Emetic has afforded present Relief, restor'd the Strength, and eas'd the Patient, by bringing up a large Quantity of a blackish sordid Matter, which had been generating for some time. This happens most readily in Cases where the Tone of the Stomach is lost, and the Patient is costive. Such as indulge themselves to Excess in drinking Chocolate, should according to *König*, take care, lest, like *King William the Third*, as appears from the History of his Disease, by an Accumulation of Viscidities, they destroy the Tone of the *Primæ Viæ*, and rashly bring on a Flux. That drinking Chocolate to Excess also contributes very much to the Formation of Stones, especially in the Gall-bladder, has been attested by the Observations of some of the best practical Physicians. Thus at *Paris*, according to *Carolus Sponius*, the Body of a certain Man who indulg'd too liberally the Use of Chocolate, being laid open, in the Gall-bladder were found above twenty small Stones, which, according to *Meisner*, were justly ascrib'd to his immoderate Use of Chocolate. On account of the large Quantity of Sugar which enters the Composition of Chocolate, its Use, and much more its Abuse, ought to be shun'd by Women labouring under uterine Disorders, and by those who are subject to hypochondriac Flatulencies; not so much because the viscid and tenacious Humours, lodg'd in the *Primæ Viæ*, and which are the immediate Matter of hypochondriac Obstructions, are increas'd by the Sugar, as because the Sugar, meeting with a peccant Acid, increases the troublesome Flatulencies. The Disadvantages arising from the Abuse of Chocolate, consider'd as made up of warm Water, are abundantly plain to every one who will allow himself to reflect, that

the too frequent Use of warm Water relaxes the Organs of Digestion, and all the Solids in general, and must, consequently, be pernicious.

'Tis much disputed, whether a Composition resembling Chocolate may not be made in *Europe*, without the Assistance of *Cacao*. Some maintain the Affirmative, since, in the *European* Climates, Vegetables are produc'd of highly nutritive Qualities, which is the principal Property of the *Cacao*, and which, being reduc'd to Powder, and mix'd with other Substances, may be form'd into a Mass, and made up like Chocolate. Besides, the *European* Vegetables, among many others, have this remarkable Advantage above the *Cacao*, that they are less heavy and burdensome to the Stomach. *Grew* expressly affirms, that Almonds, well triturated, and sufficiently mix'd with a due Proportion of Sugar and Aromatics, make a Mass as pleasant to the Palate as the finest Chocolate; concerning which Composition, *Valentini* affirms, "That, in *Batavia*, he knew a Landlord who sold no other kind of Chocolate than what was prepar'd after this manner." *Rosinus Lentilius*, when speaking on this Subject, has these Words: "*Blancard* orders a Substance, resembling Chocolate, to be made of our own Almonds, sufficiently triturated, with an Addition of Cinnamon, Cloves, Anise, Sugar, and a small Quantity of the Balsam of *Peru*. This Composition he extols very much, and affirms that its Taste is not greatly different from that of Chocolate; nor do I in the least doubt, but a most elegant Composition, possess'd of the same Virtue with Chocolate, may be prepar'd in the following manner.

"Take one Pound of excocticated sweet Almonds, Pine-nuts well clean'd, and fresh Pistache-nuts, each half a Pound; the best Cinnamon, half an Ounce; Cloves, two Drams; choice Manna, four Ounces; of Sugar, a sufficient Quantity. Make into a Confection like Chocolate, to which you may, if you please, add a little Musk and Amber. This Confection drank in Milk, with the Yolk of an Egg, is a celebrated Analeptic; the Confectio Alkermes may also be added to it for answering particular Intentions." *Eph. N. C. D.* 3. a. 5. app.

"In like manner, according to *Bruckmann*, the Chocolate of *Brunswick* is prepar'd of that sort of Ale called *Mum*, with some Yolks of Eggs, and Aromatics; and this is certainly no despicable Liquor. Besides, a Drink resembling Chocolate is prepar'd of the fine Wheat-flour of *Halle*, roasted and mix'd with Yolks of Eggs, Sugar, Cinnamon, and Milk."

The learned *David Friedel*, in a Treatise which he calls, *Medicinishe Bedencken*, prefers to Chocolate a Liquor prepar'd of equal Quantities of bitter and sweet Almonds decocted, and bruised with Sugar and Aromatics. To these must be added a proper Quantity of warm Milk: Or thus:

Take of sweet and bitter Almonds, each an Ounce; after having roasted them in an Iron Pan till they have assum'd a brownish Colour, and wip'd them with a Linen Cloth, bruise them in a Mortar, and with a Spatula mix them with four Measures of boiling Milk, and to this Mixture add the Yolk of one or two Eggs, broken in a little cold Milk; and, last of all, add a little Cloves, Cinnamon and Sugar.

CACAOTETL. An *Indian* Stone, otherwise called *Lapis corvinus*, which when heated, is said to give a Crack like Thunder.

CACATORIA FEBRIS, a Name given by *F. Sylvius* to a kind of intermittent Fever, attended with copious Stools. *Castellus*.

CACAVI, *Monard. frus. Cazabi*, Clus. in *French, Cassave*, or *Pain de Madagascar*, is a kind of Bread which the *Indians* make of the Root of a Plant called *Yuca*. *Caspar Baubine* calls it the *Manihot* of the *Indians*, or the *Yuca* with hempen Leaves; and *John Baubine*, the *Manihot Theveti*, *Yuca*, & *Cassavi*; in *French* they call it *Manioc*, or *Manioque*. It is a Shrub which grows to the Height of five or six Feet; the Stalk is woody, wreathed, abounding with Joints and Bunches, brittle, and full of Pith. The Leaves are of the Breadth of a Man's Hand, divided each into seven or eight Parts, always green, and resembling the Leaves of Hemp; the Flowers are monopetalous and Bell-shap'd, near an Inch in Diameter, and indented with five deep Jags. The Pointal in the Middle becomes a Fruit almost round, and nearly as big as a Hasel-nut; it is composed of three Capsules, or oblong Cells join'd together, which inclose each a Stone or oblong Seed, a little bigger than the Kernel of a Pine-apple. The Root is of the Size and Figure of a large Turnep, of a dark Colour without, and white within. This Plant is cultivated in several Countries of *America*, where they set it in Furrows; it is very fruitful, but its Virtues are very different

according to the Climates where it is produc'd. Thus what grows on the Continent is wholesome, and good to eat raw or dressed; but that of *St. Dominica*, *Cuba*, *Hayti*, and other Isles, is very pernicious, and a violent and speedy Poison, if it be eaten raw; and yet it is of this last that they make the Bread called *Cacavi*, or *Cassave*, in Manner following.

They peel the Roots of the *Yuca*, rasp them, and, putting them into Bags made of the Leaves of the Palm-tree, press out the Juice. After this, they take the Dregs, or pressed Matter, and fry it in a Pan over a small Fire, tossing and turning it from one Side to another, that it may thicken. When it is sufficiently dressed, they make it into thin Cakes, which they dry in the Sun, or over a Fire; and this is the Bread called *Cassave*, which is very nourishing, and, when it is dry, will keep as well as Biscuit, without corrupting. The *Savages* of the *Antilles*, and all the Inhabitants of the *West-Indies*, feed on it.

The Use of this Bread contracts the Gullet by its Asperity, and causes a Strangulation, if care be not taken to steep it in Broth or Water, or mix it with other Aliments: They who have not taken that Precaution, and are willing to eat it dry, ought always to have a Bottle of Water at Hand, to moisten every Mouthful they take.

The expressed Juice of this Root would kill any Animal which should swallow it crude; but if it be boiled to the Consumption of half, and suffer'd to cool, it will be converted into a sour Liquor, of the Taste, Use, and Qualities of Vinegar; being inspissated to a *Sapa* over the Fire, it becomes sweet, and serves the *Indians* instead of Honey.

The *Yuca* Root of the Islands, in order to produce the different Effects before-mention'd, must contain an acrimonious and corrosive volatile Salt, which is dissipated by Boiling, so that nothing remaining but a fixed Salt confounded and entangled with the Oil, it has only Strength enough to make an Acid like Vinegar; and even that Acidity is for the most part destroy'd by Evaporation, and inspissating the Liquor to a *Sapa*, because the Oil, being then much more collected together, straightly binds and encompasses the Salts, and hinders them from making any other Impression upon the Nerves of the Tongue, than a sort of Titillation called Sweetness.

The Juice of the *Roucou* is said to be a Counter-poison to the *Manioque*. *Lemery des Drogues*.

CACCIONDE. The Name of a Pill, which has for its Basis the *Terra Japonica*, or *Catechu*; and is commended by *Baglivi* against a Dysentery. *Castellus*.

CACEDONIUS Tartarum, is peccant Matter in the human Body, generated from Separations by the secretive Faculty, which are not immediately succeeded by the Operation of the expulsive Faculty. *Rulandus*.

CACHECTICUS. One who labours under a *Cachexia*. **CACHEXIA**, καχεξία, from κακός, ill or bad, and ἔξις, a Habit. A Cachexy, that is, an universal bad Habit of Body, proceeding from a Defect in Nutrition, which must arise, either from a Depravation of the nutritious Juices; a Defect in the Vessels which ought to receive these Juices; or a Deficiency in that Action of the Animal Oeconomy, by which a Part of the circulating Juices is apply'd to the Solids for their Nutrition.

The nutritious Juices are deprav'd by Aliments which are superior to the Powers of Digestion, that is, which cannot be digested, and assimilated by the proper Organs. Of this Sort are all crude, farinaceous, and leguminous Vegetables, which on a weak Stomach are subject to form a kind of tenacious Paste. Add to these, all Sorts of Food, which are hard, fibrous, fat, acrid, aqueous, and viscid. Among these may justly be reckon'd some indigestible Substances, which deprav'd Appetites sometimes covet, as Cinders, Chalk, Sand, or Lime.

It must, however, be remark'd, that the Aliments above-mention'd will not be subject to induce a Cachexy, provided the Organs of Digestion are sufficiently strong, and proportional Exercise is used by the Person who takes them. Hence other Causes of the Depravation of the nutritious Juices must be join'd to the preceding; as a Deficiency with respect to Animal Motion or Exercise, and a Debility of the digestive Organs; tho' a too great Tension thereof may have the same Effects, if sufficient to interfere with the Solution and Assimilation of the Aliment. If the general Mass of Blood also happens to be vitiated extremely in any manner whatever, the nutritious Juices must in Proportion be deprav'd. These Defects in the Organs of Digestion are brought about in various manners; as by all profuse Secretions of what kind soever, as violent Vomitings, Diarrhoeas, Dysenteries, or Hæmorrhages; by a scirrhus Disorder of any of the Viscera; or by a Retention of something in the Body which ought to have been excreted.

It is evident, that these Causes united act either by diminishing the Solids, or by distending them with Fluids not adapted to circulate thro' them. Hence arise two Sorts of Diseases; that is, a Consumption, and what is usually called a *Leucophlegmatia*, or an *Anasarca*.

According

According to the different Colour, Bulk, Tenacity, Acrimony, and Fluidity of the stagnating Liquids, various Appearances arise, which may be esteem'd Symptoms of a Cachexy. Thus the Skin appears white, pale, yellow, livid, red, green, black, or tawny; the Patient perceives a Sensation of Gravity; Tumors arise under the Eyes, and affect the more thin Parts of the Body. Add to these, Flatulencies, oedematous Tumors of the Parts remote from the Heart; Palpitations of the Heart and Arteries, which are augmented by the least Motion; crude and thin Urine; spontaneous, and evidently watery Sweats; all which are succeeded by Emaciation, or a *Leucophlegmatia*, and Dropsy.

No universal Defect of the Vessels which ought to receive good nutritious Juices can be assign'd; but their too great Contraction or Laxity, and the Consequences thereof, may be admitted as Causes of these Defects.

There is a Deficiency in that Action of the Animal Oeconomy, by which a Part of the Juices is applied to the Solids, whenever the Force of the Circulation is either too languid, or too violent.

From what has been said, a Cachexy may be easily distinguish'd. And as to the Consequences thereof, they may be foreseen by carefully considering the Cause, Standing, Effects, and Degrees of the Disorder.

To these also the Method of Cure must be carefully adapted; for it is evident, that a Mitigation, and moderate Inspissation, of the too acrid and too fluid Juices are sometimes requir'd; and, in other Cases, the tenacious and adhering Juices must be dissolv'd, and render'd fluid. And as a Dissolution, and an Inspissation, of the Juices may be induc'd by various Causes, it will be necessary to vary the Medicines, and the Manner of applying them, as the different Causes shall determine.

But the principal Rules to be observ'd in the Cure are,

First, To administer such Aliment as approaches nearly to the Nature of the healthful Fluids of the Body, which are easily digestible; which are in their Nature opposite to the Cause of the Disorder; and which are agreeable to the Patient.

Secondly, To promote the Digestion of such Aliments, by seasoning them with proper Aromatics; by drinking proper Quantities of generous Wine; and by Exercise and Air.

Thirdly, To dispose the Organs of Digestion to perform their Duties, by proper gentle Digestives, Vomits, Purges, and Corroborants.

Fourthly, As soon as the Passages are relax'd, and the morbid Matter is attenuated, to promote its Expulsion, by attenuating Diuretics and Sudorifics.

Lastly, To complete the Cure by Chalybeates, alkaline and saponaceous Substances, together with Walking, Riding, or other proper Exercises, Frictions, and Baths.

The Cause however of the Distemper only can determine the Choice of all these, and the Manner of applying them.

When a Cachectic Consumption arises from too great an Acrimony of the Juices, the particular Species of Acrimony must, if possible, be discover'd.

First, By investigating the Cause of the Cachexy.

Secondly, By examining into the Nature of the Disease, and the Constitution of the Patient.

Thirdly, By the Symptoms.

Fourthly, By the Excretions.

And, when the Nature of the prevailing Acrimony is known, it must be corrected by Substances of a contrary Nature. *Boerb. Aph.* See *ALCALI* and *ACIDUM*.

This Account, which *Boerhaave* gives of a Cachexy, is very distinct, and has the Appearance of being just. But for the farther Illustration of the Subject, I shall explain how I apprehend that a Cachexy may be, and generally is, produc'd.

Suppose then, a Person of any Constitution, whatever has his Stomach and Organs of Digestion impair'd by any Accident; and that this Person takes one or more hearty Meals of any Aliment which is superior to the Force of the digestive Organs; and that moreover, he uses little or no Exercise. Upon this Occasion it is not likely, that the Aliment should be digested and assimilated, so as to produce good Blood; but in proportion, as the Aliment is more or less dissolv'd, the partially dissolv'd Portions will stagnate in the first, or more remote Series of Vessels, that is, in the larger or smaller Vessels; and will cause various Disorders, according to the Uses and Importance of the Parts which they obstruct.

Suppose the Aliment so little dissolv'd, that the largest Particles which the Lacteals can possibly admit, are by these convey'd to the Receptacle of the Chyle, and from thence to the Mass of Blood, with which circulating till they arrive at the Lungs, they either pass not at all, or with Difficulty, thro' the minute Vessels of that Organ, on account of their Bulk: Hence Difficulty of Breathing, and Palpitations, arise. And as the Blood should be farther elaborated, and receive its red Colour in the Lungs, this Impediment will in some Degree prevent both: Hence the Blood will be pale, and the Particles of which it consists, will not be so perfectly mix'd and united

together, as to form a Fluid adapted to the Exigencies of the Animal Oeconomy. For this Reason the watery Particles readily separate from the rest, and loiter, or stagnate in different Parts, where they cause soft Tumors, as under the Eyes, and in the Parts remote from the Heart. As these large Particles must, moreover, stagnate in the Glands, and obstruct them, the Secretions of their respective Fluids must be impair'd. For this Reason many of the aqueous Particles, which should either be separated for Expulsion, or apply'd to particular Uses, are retain'd in the Mass of Blood; the Bile also, a Fluid of the utmost Importance in Digestion, as well as the Pancreatic Juice, becomes defective, inert, and languid; and all the Solids are farther relax'd, and, amongst them, the Organs of Digestion; whence every subsequent Meal lays a new Foundation for an Increase of the Disorder, and all its Symptoms. The Consequences of all this are, all the Symptoms related above from *Boerhaave*.

I must add, That when Women have acquir'd such a Habit, the watery Particles of the Blood loiter, or stagnate; and the other Particles are too large to pass thro' the minute Uterine Vessels, and form the *Catamenia*.

From what has been said, the Reasons are evident, why the eating Chalk, Cinders, Dirt, unfermented farinaceous Vegetables, as Oatmeal, and other indigestible Substances, induce a Chlorosis.

I cannot conceive it possible to adapt any Method of Cure to such a Disorder as has been describ'd, more likely to succeed, than that which consists in supplying the Organs of Digestion with Aliments the most easy of Digestion, and which approach the nearest to the Nature of the sound and healthful Juices; in due and prudent Evacuations of the first Organs of Digestion; in corroborating these Organs, and supplying the Deficiencies of Bile, by Aromatics, Bitters, and at last by Steel; in directing proper Exercise; and in expelling the Matter stagnating in the Glands, and other Parts, by the proper Emunctories, when once sufficiently resolv'd, in the manner specify'd above.

CACHIMIA. See *CACHYMIA*.

CACHLEX, καχληξ. A little Stone or Pebble, particularly such as is found in Waters, or by the Sea-shore, according to *Suidas*, who also makes it the Name of an Animal. *Galen*, *Lib. 10. de S. P.* says, that *Cachleces*, καχληκες, heated in the Fire, and quench'd in Whey, endue it with an astrigent Virtue against a Dysentery. *Castellus*.

CACHOS, J. B. *Solanum pomiferum folio rotundo tenui*, C. B. It grows only on the Mountains of Peru, being a Shrub of an extraordinary Greenness, and bearing a round thin Leaf. The Fruit is like a Mad-apple, sessile on one Part, and turbinate on the other, of an Ash-colour, of a grateful Taste, and void of Acrimony, containing a very small Seed.

It is in great Esteem among the *Indians*, for its extraordinary Virtues. For it provokes Urine, expels the Stone in the Kidneys, and, what is better, they say that the Use of it diminishes the Stone in the Bladder, while it is yet soft, and capable of yielding to any Medicine. *Raii Hist. Plant.*

CACHOU. See *TERRA JAPONICA*.

CACHRY.

Cachry is of a heating and vehemently drying Quality, for which Reason it is a proper Ingredient in Smegmas, [external deterfive Medicines] and makes a good Plaster for the Head in Defluxions upon the Eyes, provided it be taken off at the End of three Days. *Dioscorides*, *Lib. 3. Cap. 88*.

CACHRY is the Seed of the *Libanotis*, which Mr. Ray calls *Libanotis Cachryophora*. It is not used in the present Pharmacy; but is by some of the Antients recommended for its heating and drying Qualities; and if taken with Pepper and Wine, is said to be good for the Epilepsy. *Pliny* says, it is the Seed of one Sort of Rosemary; I suppose by Mistake, because Rosemary is sometimes called *Libanotis*. See *LIBANOTIS*.

CACHRYS signifies sometimes roasted or parch'd Barley, as *Galen* explains it.

CACHUNDE.

This is the Name of a Medicine highly celebrated among the *Chinese* and *Indians*; but as the Describers of Aromatics, and the later Authors, had made no mention of it, *Zacutus Lusitanus* gives us the following Method of preparing it, which he says was with great Difficulty obtain'd of celebrated Physicians, who had the Health of the *East-Indian* Viceroy, and other Princes, for many Years committed to their Care.

Take, says he, of the Terra Cimolia, or of any other proper Earth, two Pounds; of Amber, one Pound; of Musk and Ambergrise, each three Ounces; of the best Aloes-wood, by the Portuguese called Calambac, ten Ounces; of prepar'd Pearls, three Ounces; of prepar'd Rubies, Emeralds, Granats, and lacinths, each four Ounces; of red Sanders, four Pounds; of yellow Sanders, three Ounces; of Mastich, sweet Flag, Galangals, Cinnamon,

Cinnamon, Aloes wash'd with the Juice of Roses, the best Rhubarb, *Indian* Mirobalans, Belleric Mirobalans, Wormwood, red Coral, and *Armenian* Bole, each two Ounces; and of calcin'd Ivory, three Pounds and a half. The Ingredients to be pounded must be reduc'd to a very fine Powder, and after having sprinkled them with odoriferous Wines and Balsams, and Water distilled from the Flowers of the Cinamon-tree, they must be dry'd in a Shade, and mix'd up with a sufficient Quantity of the finest white Sugar; then with a Mucilage of Gum Tragacanth, and Gum Arabic, the Whole is to be reduc'd to a very tenacious, viscid Mass, which is of a pretty red Colour.

Of this Mass various Figures are form'd, which the Merchants convey to several Parts of the World, but principally to *Lisbon*, the most celebrated Emporium of the whole Earth. The *Indian* Princes, and the *Grandeos* of *China*, use this Antidote in the following manner: In the Day-time they keep a small Portion of it, about the Bulk of a Lentil, in their Mouths; from this Portion a sweet and fragrant Liquor gradually and insensibly drops from the Fauces to the Stomach, and gives the Breath so agreeable a Flavour, that all who come near them are sensible of it. This Medicine is truly worthy to be used by Kings and *Grandeos*, for the Preservation of the natural Heat; for it preserves and defends the Body from Corruption, prevents the bad Consequences of a peffilential Air, removes Melancholy and Flatulencies, and wonderfully relieves those who labour under melancholic Disorders. It removes Palpitations of the Heart, cures the Cardialgia, the Apoplexy, and the Epilepsy. It refreshes the animal and vital Spirits, invigorates all the Faculties, strengthens the Stomach, and resists Poisons of every Kind. It corroborates the Brain, and is the most sovereign Remedy in the World against a stinking Breath. It proves an Incentive to Vener, for which Intention it is much used by both Sexes in the *Indies*. In short, it is a truly royal Medicine; for it protracts Life, puts Death at a Distance, and is consequently sold at a high Price. Whoever uses it, cannot help admiring the happy Effects produced by it. *Zacutus Lusitanus de Medicor. Princip. Hist. Lib. 1. Observat. 37.*

CACHYMIA, *Cachimia*, *Kakimia*. A Term in *Paracelsus*, by which he intends an imperfect metallic Body, or an immature metalline Ore, which is neither a saline Substance, nor Metal; but almost metalline, since it has the first metallic Matter, and derives its Original from the three first Metalls.

CACHYMIE may be divided, first, into *sulphureous*, as *Marcafites*, *Bismuths*, and *Cobalts*; secondly, into *mercurial*, or *arsenical*, *orpimental*, and *suck-like*; and, thirdly, into *saline*, such are all *Tales*. *Castellus*.

CACIA ferrea. An Iron Spoon. *Rulandus. Johnson.*

CACOA. See **CACAO**. *Blancard.*

CACOALEXITERIUM, *κακοαλεξιηριον*, from *κακός*, evil, and *αλεξιηριον*, a Remedy or Medicine. The same as **ALEXITERIUM**, which see.

CACOCOLIA, *κακοχολία*, from *κακός*, ill, and *χολή*, Bile. An Indisposition of the Bile. *Blancard.*

CACOCROI, *κακοχρόι*, from *κακός*, ill, and *χρῶμα*, Colour. Such as are ill-colour'd in the Face, in which respect they differ from the *Achroi*, *ἀχροί*, colourless. *Galen, Comm. de R. V. I. A. Castellus.*

CACOCHYLIA, *κακοχυλία*, from *κακός*, ill, and *χυλός*, Chyle. A depraved Chylification. *Blancard.*

CACOCHYMIA, *κακοχυμία*, from *κακός*, ill, and *χυμός*, Humour. A depraved State of the Humours. See **CACHEXIA**.

CACODÆMONUM Magia, from *κακός*, evil, and *δαίμων*, a Spirit. Diabolical Magic, which uses the Assistance of evil Spirits; and is opposed to natural Magic, which is promoted only by natural Means. *Castellus.*

CACODES, *κακώδης*, from *κακός*, ill, and *ὀσμή*, to smell. Ill-smelling, fetid. Thus *κακώδης ἐμῆς*, in *Coac.* is ill-scented Matter discharged by Vomiting, which, in *Prognost.* is express'd *ἐν ὀσμῇ δυσώδης*, "if it has an offensive Smell."

CACOETHES, *κακοῖθης*, from *κακός*, ill, and *ἦθος*, a Quality, which, when used with respect to Diseases, signifies Quality or Habit, and is expounded in *Galen* by *τέρας*, Manner, Disposition. An Epithet applied by *Hippocrates* to malignant and difficult Distempers. *Galen, Comment. 1. in Prorrhet.* says, *κακοῖθης νοσήματα καλεῖται ὅσα κινδυνον ἀπελθεῖν τοῖς κάμνοντι, καὶ ἀντιπίπτει τὴν τῆς σωτηρίας ἐλπίδα*. "We give the Name of *Cacoethes* to Diseases, which, tho' they threaten Danger to the Patients, do not cut off all Hope of Recovery." *Κακοῖθης*, when applied to Signs or Symptoms, imports what is very bad, and threatening. Thus *Galen, Comment. 3. in Prorrhet.* expounds *κακοῖθης* by *μοχθηρὴν*, "laborious," under which the Patient labours hard for Life. And in the following Passage, *1. Prorrhet.* τοῖσιν ἡσυχάζουσιν μελαγχολικῶς

Vol. I.

εἰς τρέμουσι ἐπιγίνωσται, κακῶθης. "If a Trembling seizes those who rave thro' Melancholy, it is *Cacoethes*." *Galen, Comment. 1. in Prorrhet.* explains the Word by *ἐξ ὧντος ἐλέβειν*, "fatal to the last Degree." In *Coac.* in the same Case, *κακός* is used instead of *κακῶθης*. The Word, applied to a Tumor, Ulcer, or Erysipelas, or any other like Affection, denotes Malignity, as in *Galen, Paulus*, and thus in *Epidem. 3.* *κακοῖθης* (*ἐρυσιπέλας*) *πολλὰς ἐξέσωεν*, "a malignant (*Erysipelas*) proved fatal to Multitudes." Opposite to *κακοῖθης* is *εὐῖθης* (*Euthes*).

CACONIE, *κακονία*. A corrupt Word for **CANONIE**, which see. *Castellus.*

CACOPATHIA, *κακοπάθια*, from *κακός*, ill, and *πάθος*, an Affection. An ill Affection, an Affliction. The Word occurs in *Hippocrates*, *περὶ ἀρχ. ἰησ.*

CACOPHONIA, *κακοφωνία*, from *κακός*, bad, and *φωνή*, Voice. A Depravation of the Voice, of which there are two Kinds, *ἀφασία*, and *δυσφωνία*, that is, Dumbness, and Difficulty of Speech. *Gal. de diff. Sympt. Cap. 3.*

CACOPHRASTUS. A Name of *Theophrastus Paracelsus*, bestowed upon him, as he complains, by malevolent Persons, tho' he calls himself by the same, *Præfat. ad Paragramm.* *Castellus.*

CACOPRAGIA, *κακοπραγία*, from *κακός*, ill, and *πράξις*, to do or act. A Depravation of the Viscera; by which Nutrition is perform'd. *Blancard.*

CACORRHEMOSYNE, *κακορρημοσύνη*. The same as **CACANGELIA**, which see.

CACORRYTHMUS, *κακορρυθμός*, from *κακός*, ill, and *ρυθμός*, Order. An Epithet of a disorderly Pulse. The same as **ARYTHMUS**, which see.

CACOS, *κακός*. Evil, bad. The Word is very frequently used by *Hippocrates* in prognosticating; and, *2. Aph. 33.* is opposed to *ἀγαθός*. But whether it always signifies the same as *lethalis*, "deadly, mortal," is, with good Reason, doubted by *Galen. Castellus.*

CACOSINON, *κακίσινον*, signifies the same as *κακός*, evil, hurtful. Thus *κακοσινώτατα*, in *Galen's Exegesis*, is expounded by *ἐπιβλαπέςτατα*, "most pernicious." In the same Sense is *κακοσινώτερον* used in *Hippocr. Lib. de Fracturis*.

CACOSIS, *κάκωσις*, from *κακός*, to be indisposed, or disorder'd. An Indisposition. Thus we read, in *Hippocr. de internis Affect.* *κάκωσις τῆς σάρκός*, "a Disorder or Indisposition of Body."

CACOSITIA, *κακοσίτια*, from *κακός*, ill, and *σιτία*, Food. A Loathing of Food. *Castellus.*

CACOSPXYXIA, *κακοσπύξια*, from *κακός*, ill, and *σπύξιν*, to leap, or beat, like an Artery. A Disorder of the Pulse in general. *Galen. de diff. Sympt. C. 4.*

CACOSTOMACHUS, *κακοσμάχος*, from *κακός*, ill, and *σμάχος*, the Stomach, is spoken of such Food as is disagreeable or hurtful to the Stomach, and is opposed to *εὐσμάχος*, (*Eustomachus*) "grateful to, or good for, the Stomach." *Gorræus.*

CACOTHYMIA, *κακοθυμία*, from *κακός*, ill, and *θυμός*, the Mind. Any vicious Disposition of the Mind in general.

CACOTROPHIA, *κακοτροφή*, from *κακός*, ill, and *τροφή*, Nutriment. Any sort of vicious Nutrition in general. *Galen. de diff. Sympt. Cap. 4.*

CACTOS, Offic. *Carduus esculentus*, Park. Parad. 519. *Carduus spinosissimus elatior Chardone dictus*, Hist. Oxon. 3. 158. *Cinara spinosa, cujus pediculi esistantur*, C. B. 383. Raii Hist. 1. 300. Tourn. Inst. 442. Boerh. Ind. A. 139. **THE CHARDON**. Dale.

This is a Species of the Artichoke. It is a culinary Plant, which is blanched like Celery, and, like that, eaten raw with Pepper and Salt in Italy. In the Medicinal Virtues it agrees with the Artichoke, **CINARA**, which see.

CACUBALUM *quibusdam vel Alfine baccifera*, J. B. *Alfine baccifera*, Ger. *Scandens baccifera*, C. B. *Repens baccifera*, Park. **BERRY-BEARING CHICKWEED**.

It is distinguish'd from the other Species of *Alfine* by its Berries, which are of the Size of a Grain of Pepper, or an ordinary Juniper-berry, are green when young, and black when ripe, and full of small, black, shining, round Grains. It grows in Italy, and the Southern Parts of France; but I find no particular Virtues ascribed to this Plant. *Raii Hist. Plant.*

CACUMEN, *ἀκρον*. The Top of any Thing. See **ACRON**.

CADAVER, *νεκρόν*. A Carcase.

CADEL AVANACU. A Species of *Ricinus*, growing in *Brasil*, and flowering and bearing Fruit twice in the Year, that is, in January and July.

The Leaves, bruised, and drank in Water, are purgative: They help the Bite of the Serpent call'd *Cobra Capella*, if reduced to Powder, and put into the Wound. The same, mix'd with the Leaves of the *Pandi Avanacu*, the Flowers of *Schem Pariti*, (a sort of *Indian Alcea*) and Honey, make a proper Unction for Pustules of the Head. One Seed of the Fruit, bruised,

bruised; and taken in Water, is the usual Dose for a Purge. In general this Shrub, in its tricoecous Fruit, agrees with the Ricinus, but differs from it in other respects. *Raii Hist. Plant.*

CADMIA.

The best sort of Cadmia is the *Cyprian*, which is call'd *Botrytis*, (cluster'd) and is of a dense Substance, moderately ponderous, or rather inclining to Lightness, cluster'd on the Surface; of an Ash Colour, and, when broken, appears cineritious and æruginous on the Inside. The next in Goodness to the fore-mention'd, is pretty much of an azure Colour on the Outside, but whiter within, and distinguish'd by Veins, like those Onyx-stones which are digg'd out of old Mines [Hence it is call'd *Onychitis*]. There is also a sort of Cadmia call'd *Placitis*, (crusty) which is surrounded with Veins in the manner of Zones or Girdles, whence it is also call'd *Zonitis*. There is yet another Sort, which is call'd *Ostracitis*, (testaceous) which is of a thin Substance, and, for the most part, black and earthy, or testaceous, on the Outside; but the white is good for nothing.

The *Botrytis* and the *Onychitis* are useful Ingredients in Medicines for the Eyes; and the other Sorts are put in Plaisters, or among Powders, [Ætæ] for cicatrizing of Ulcers. The best for these Purposes is the *Cyprian*; for what is brought from *Macedonia*, *Thracia*, and *Spain*, is of little Value.

Cadmia has an astringent Virtue, fills up hollow Places, and deterges Filth, is an Obstruent, Dryer, and Escharotic, restrains carnos Excrecences, and cicatrizes old and malignant Ulcers [*τὰ κακὰ ἔλκυστα ἐκκαίει*].

There is also a sort of *Cadmia* which is made of the Soot that sticks to the Walls and Roof of the Furnace, in boiling of Copper. These Furnaces, which consist of Iron, and are very large, and call'd by the Workmen *Aceftides*, are closed at Top, in order to intercept and detain the Corpuscles which fly off from the Copper; and, after adhering in great Quantities, they at last thicken, and unite into one Body, constituting sometimes one, sometimes two, and sometimes all the sorts of *Cadmia*.

Cadmia is also made by burning the Stone *Pyrites*, which is digg'd out of a Mountain which overlooks the City of *Soli*. In the same Mountain are found, as it were, Veins of *Chalcitis*, *Misy*, *Sory*, *Melantery*, *Cæruleum*, *Chrysocola*, *Vitriol*, and *Diphryges*. Some say, that *Cadmia* may be found in Quarries of Stone, mistaking for it a Stone which is much like it; such a Stone may be found at *Cumæ*, but void of all Virtue, and may be distinguish'd from the *Cadmia* by its being lighter, ungrateful to the Taste, and offensive to the Teeth; whereas the *Cadmia*, readily yielding to the Impression of the Teeth, may be chew'd without Offence. They may be distinguish'd also by the following Experiment: The *Cadmia*, when levigated in Vinegar, and dried in the Sun, concretes; which the Stone, after the like Management, does not. Besides, the Stone bruised, and thrown into the Fire, hops, and sends up a Smoak nothing different from that of the Fire itself; but the *Cadmia* remains quiet, and emits a yellowish Fume, resplendent like Brass, and curl'd and variegated like a Girdle. Moreover, the Stone heated in the Fire, and afterwards cool'd, changes its Colour, and becomes lighter; but the *Cadmia* suffers no Alteration, except it be kept in the Fire for many Days together.

Cadmia is also produced from the Silver Smelting-furnaces, but it is whiter, and less ponderous, and not so efficacious. They burn the fore-mention'd *Cadmia* by covering it with Coals, till it becomes transparent, and bubbles like the Scoria of Iron; and then quench it in *Aminæan* Wine, but, for the Psora, in Vinegar. Some, after it is thus burnt, levigate it with Wine, and torrefy it afresh in a crude earthen Pot, till it appears like Pumice-stone; then levigate it again with Wine, and burn it the third time, till it be quite reduced to Ashes, retaining not the least Roughness, and so use it instead of Spodium. It is wash'd by pounding it in a Mortar, and throwing away the Water till no Drops swims at Top; and is then made into Troches, and reposited for Use. *Dioscorides, Lib. 5. Cap. 84.*

The Name *Cadmia* has been applied to several Things. *Dioscorides* understood by *καδμεία*, the Recrements which arise from Brass, while melting in the Furnace. *Galen* applied it to two Substances, one which comes from Brass, which is the same with the *Cadmia* of *Dioscorides*; the other a native Substance in the Island of *Cyprus*, which he terms *λίβαδνς*, or stony. *Pliny*, besides the factitious *Cadmia* of *Dioscorides* and *Galen*, mentions another by the Name of *Lapis Ærosus*, which, he says, was an Ore out of which Copper was made; and this is, perhaps, the same with the *Cadmia Lapidosa* of *Galen*. The Dealers in Metals call by the Name of *Cadmia* the *Lapis Calaminaris*, used in making Copper into Brass; and the *Germanis* have given the same Name to *Cobalt*; and therefore *Agricola*, and the more modern Writers, distinguish three Kinds of *Cadmia*, one metallic, one fossil, and the third that of the Furnaces, which Division we shall here retain.

The metallic *Cadmia* is a fossil Substance, containing some

Portion of Copper, Silver, or of both, and is of two Kinds: First, the native *Cyprian Cadmia*, which is a fossil Substance, or Copper-ore. It is likewise found in several Places of *Asia* and *Italy*; and is probably the same which *Galen* found in the Island of *Cyprus*, tho' he does not mention, that Copper was obtain'd from it by Fusion. It is now altogether unknown, or at least confounded with other Copper-ores. The other kind of metallic *Cadmia*, or the Cobalt of the *Germanis*, is a metallic Substance, from which *Arsenic*, (see ARSENICUM) *Zaffera*, and the *Encaustum Cæruleum*, are prepared.

This is distinguish'd, by Authors, by the Names *Cobaltum*, Offic. *Cadmia Metallica*, Worm. Mus. 128. Charlt. Foss. 51. Aldrov. Mus. Metal. 256. Matth. 1338. Kentm. 74. Woodw. Att. 2. P. 1. p. 50. *Cadmia Metallaris alius*, *Cobaltum metallicis*, Schw. 370. *Cadmia fossilis*, ex qua præp. *Zaffera*, Woodw. Att. COBALT.

The fossil *Cadmia* of *Agricola*, stony *Cadmia* of *Schroder*, *Lapis Calaminaris*, or Calamine of the Shops, is a fossil Substance, of a middle Consistence between Stone and Earth, of different Colours, such as a pale Colour inclining to White, Yellowish, and a blackish Red. This last is full of small ferruginous Globules, like Grains of Pepper, and mark'd with white Veins; and is found in great Quantities about *Bourges*, near *Saumur* in *Anjou* in *Frauce*, and in many Parts of *England*. The others are dug in *Germany*, near *Aix la Chapelle*; and all Kinds of it seem to partake of an Iron-ore, because the greatest Part is attracted by the Load-stone. This Species of *Cadmia* was probably unknown to the ancient *Greeks*, or at least was not used by them in Physic, since it is not mention'd either by *Dioscorides* or *Galen*. It is now prescribed, by some Physicians, to dry running Ulcers, to heal the excoriated Parts of Children, either in a fine Powder by itself, or mix'd with Ointments. It is an Ingredient in the Ophthalmic Ointment of *Renodæus*, and in the red drying Ointment, the Plaister call'd *Manus Dei*, and in the styptic Plaister of *Charas*.

The *Lapis Calaminaris* is much used in cooling and drying Cerates; and is, in Powder, frequently sprinkled upon Sores and Ulcers, with a View of drying them, and disposing them to cicatrize. I have been told, that the Surgeons have lately observed, that *Lapis Calaminaris*, reduced to a very fine Powder, operates as an Escharotic; whereas in a more gross Powder it acts as a Dryer.

Preparation of LAPIS CALAMINARIS.

Take any Quantity of *Lapis Calaminaris*, and levigate it upon a hard Marble, with Rose-water; dry it, when reduced into an impalpable Powder, in little Drops, as it will fall from a Spatula upon a Chalk-stone.

In the same manner are prepared Tutty, and all hard friable Substances of the like Kind.

MAGISTERIUM LAPIDIS CALAMINARIS: *Magistery of Calamine.*

Take Calamine, four Ounces; beat it into fine Powder, or levigate it as above: Put it into a Matrafs, and pour upon it, of Spirit of Salt, one Pound. Let them digest upon warm Sand forty-eight Hours; filtre the Dissolution, and precipitate the Magistery with Spirit of Urine; free it from its Salt by several Ablutions, and dry it gently for Use.

It is emetic and cathartic, and given in the like Cases as Antimonial Emetics. Its Dose is from three to seven Grains.

CALAMINARIS DIAPHORETICUS: *Diaphoretic Calamine.*

Beat four Ounces of Calamine into fine Powder; put it into a Matrafs, which place in a Chimney; and put to it, by three or four Ounces at a time, of Spirit of Nitre, one Pound: Let it there stand, cover'd from Dirt, for twenty-four Hours; then decant the Liqueur, which put into a Retort set in a Sand-furnace, and give it a gradual Heat to the third Degree, and so keep it till no Drops fall from it. When all is cold, take it out of the Retort, and keep it for Use.

Some say it is a good Sudorific, but it is little used. Its Dose is from ten Grains to half a Dram. One Ounce of it, infused in half a Pound of Spirit of Wine, makes an admirable Collyrium, and does great Service, by dropping it into the disorder'd Eye three or four times a Day. Some likewise make a good Collyrium by quenching a Lump of Calamine, of about four Ounces, ten or twelve times in one Pound of White-wine. Quincey.

CERATUM DE LAPIDE CALAMINARI: *Cerate of Lapis Calaminaris*, commonly call'd *Turner's Cerate*.

Take of fresh-made unsalted May Butter, and of the best yellow Wax, sufficiently defecated, each three Rounds and

and an half; of pure and newly-prepared Oil of Olives; four Pounds; and of the best Calamine-stone, sufficiently triturated, and pass'd thro' a Sierce, two Pounds and ten Ounces: Let the Wax and Butter be put into a proper Vessel, with the Oil, and melted over a gentle Fire; then strain them thro' a Linen Cloth into another Vessel, and immediately sprinkle the Powder of the Calamine-stone into it by Degrees, continually agitating the Mixture, and stirring it from the Bottom of the Vessel, till it begins to cool, and becomes so thick, that the Powder, in consequence of its Weight, can no longer subside to the Bottom of the Vessel.

Turner gives the following Encomium of this Cerate:

As I have had ample Experience of this Cerate, I may be allow'd, I hope, to judge of its singular Properties, and good Effects, in all cutaneous Ulcerations and Excoriations, either from Scalding, Burning, or Fretting of the said Parts by means of salt, acrid, or sharp Humours; upon which Accounts, not straining a tittle beyond its deserved Eulogy, I am bold to affirm, it will do more in all these superficial Hurts of the Body, than either *Unguentum Tutia*, *Diapompholyx*, *Nutritum*, *Desiccativum Rubrum*, *Album de Calce*, *Rosatum*, or all the Epulotic Medicines now in Use; and for which Cause I can, for the public Benefit, sincerely recommend it to all the Professors of the Art; and do wish, that the Apothecaries would keep it made up in their Shops, to deliver, at a suitable Price, to indigent or poor People, instead of their ridiculous *Lucatellus's Balsam*, and other improper Medicines, which they call for ignorantly to heal their Skin-deep Maladies.

I know the Medicine has been imitated by several, and I have seen somewhat like it in some Gentlemens Salvatories; but I know not more than two Persons I ever communicated it to, as I was wont to prepare it for my own Use.

The Medicine, thus prepared, is of a good Consistence, and a true Cerate, serving both for Pledget and Plaister, neither sticking troublesomely, nor running off, or about, by the Heat of the Parts; but keeping its Body, and performing Things incredible. Whoever thinks fit to take it into Practice, will never repent it, nor perhaps (when he has experienced it as I have done) think I have said too much in its Commendation. This is the Medicine I have so often taken Notice of, under the Name of *Ceratum de Lapide Calaminari*, which, that I might contribute my Mite to the Surgeon's Treasury of Medicine, I here have publish'd, and leave it to take its Fate: I am sure no ingenious Person will despise it for its being less compounded, and consequently less pompous, than some others, or for that it is only a *Tetrapharmacum*. Turner.

Tho' the above quoted Author claims the Invention of this Cerate, I have, as I remember, met with it in a very old *English* Chirurgical Author.

The greatest Quantity of Calamine is consumed in making Brass; and *Agricola* describes two Ways of doing this, in the following manner:

They take some Pieces of the best Copper and Calamine, first calcin'd, and finely powder'd; lay them in Strata in large Pots, each of which holds about fifty Pounds, Some add Glas likewise; and some use the *Cadmia* of the Furnaces, instead of the fossil Kind. These Pots are set in an arched Furnace, on Iron-Stands, placed in the Middle of it, and the Fire is kindled below them. In the upper Part of each Furnace is a round Hole, cover'd with a Stone, by which they regulate the Fire. When the Mixture in the Pots has been thus exposed to a very great Degree of Fire, and continued in Fusion, for eight or nine Hours, it is changed to Brass, and increased very much in specific Gravity, tho' it has not yet the Gold-colour. The Pots, being cool'd, are taken out of the Furnace; and the Brass, which is now of the Colour of white Embers, and cavernous like a Pumice-stone, is melted a second time, and thrown into a Mould, the Sides of which are Stone, and the Wideness or Distance between these Sides equal to the Thickness that the Brass-plates, now become of a yellow or gold Colour, are desired to be of. These Plates are afterwards beat upon the Anvil, to make them perfectly uniform.

The other Way of making Brass is to

Take a Vessel in which Silver is usually melted, to coat it on the Outside with Clay, mix'd with Filings of Iron; and to line the Inside with the purest Honey. Small Copper-plates, of about a Finger's Breadth, are likewise rubb'd over with the same Honey, and then cover'd with fine Powder of Calamine, crude Tartar, and Charcoal made of the Lime-tree, mix'd in equal Quantities. The Plates, thus prepared, are thrown into the Vessel, and the Vessel cover'd with a Brick, over which the Coat of Clay is likewise carried, a Hole being made in the Middle large

enough to admit an Iron Rod; to stir the melted Metal. The Vessel is then set in such a Furnace as the Refiners use; and, as soon as the Calamine begins to mix with the Copper, a red Smoke ascends, which afterwards becomes partly red, and partly blue, and last of all yellow; and this shews, that the Mixture is now perfected. The Vessel being then taken out of the Furnace, the Brass is found of a perfect Gold-colour. In this Operation the Copper takes up a third Part, or at least a fourth Part, of its Weight of Calamine, and yet remains as ductile as before; for it may be drawn out into very fine Wire; or beat into very thin Leaves.

A much better Way of making Brass is now practised at Bristol, which, I am inform'd, consists principally in granulating the Copper, before it is fused, with the *Lapis Calaminaris*; but I am not acquainted with the precise Method of doing it.

Dale mentions two Kinds of *Lapis Calaminaris*, which do not seem to differ in any thing, except that the first is got from the Mendip Hills, and other Places in England; the second, in France.

The first is thus distinguish'd.

LAPIS CALAMINARIS, Offic. Mer. Fin. 211. Dougl. Ind. 50. Schrod. 348. *Cadmia fossilis*, alias, *Lapis Calaminaris*, Worm. 128. Charlt. Foss. 51. *Cadmia fossilis*, Aldrov. Mus. Metall. 256. Worm. 128. Matth. 1338. *Cadmia Lapis*, Calc. Mus. 460. CALAMINAR-STONE.

The second is call'd

Calaminaris Lapis Bituricum, seu *Cadmia fossilis*, Ind. Med. 24. CALAMINE OF BERRY.

Cadmia Fornacia, or of the Furnaces, is of two Kinds; the factitious *Cadmia* of the Antients, and *Cadmia* of the Moderns, or the Tutty of the Shops. But the first Kind of factitious *Cadmia*, *Dioscorides*, *Galen*, and *Pliny*, understood to be only the Recrements of Copper-ore, which is blown off by the Bellows in melting Copper, and sticks to the Sides of the Furnace; of which there are different Species according to the different Figures into which it is concreted, and the Fineness and Variety of its Colours. The finest Kind, says *Pliny*, sticks in the very Edge or Border of the Furnace; and is as light as Wood-ashes or Embers. The best is that which hangs down from the Arch of the Furnace, and is call'd *βερρυδνς*, from the faint Resemblance it bears to Grapes hanging on the Vine. This is of a middle Weight between the foregoing Kind and the following, being of two Colours, one whitish like Wood-ashes, which is least esteem'd, the other purple, which is more valued. It is very brittle, and much used in Medicines for the Eyes. The other Kind sticks to the Sides of the Furnace, as being too heavy to rise to the Top. It is properly a Crust, and is used to destroy Cicatrices, or the remaining Marks of Wounds. From this, two other Kinds are obtain'd; one of a bluish Colour and spotted, the other red. The best *Cadmia*, according to *Pliny*, was found in the Furnaces of Cyprus; and he informs us further, that a *Cadmia* was likewise found in the Silver Furnaces lighter and whiter; but, however, much inferior to the *Cadmia* from Copper. *Galen* says, that a Sort of *Cadmia* was made from one Kind of Pyrites. But all these Kinds are now unknown in the Shops, neither do they seem to have been known to the *Arabians*, who were so little solicitous about the Substances called by the Name of *Cadmia* by the Antients, and which were only to be found in the melting Furnaces of the Island of Cyprus; that they gave the same Names without Hesitation to other Substances; whence a great deal of Confusion has arisen, and especially, because some of the latter *Arabians*, as well as those who have come after them, have endeavour'd to apply to these other Substances, what the Antients said of their true *Cadmia*; and thus *Avicenna* says of the Litharge of Silver all that *Dioscorides* has said of *Cadmia*.

The modern *Cadmia*, *Cadmia Fornacum* of *Agricola*, Tutia of the Shops, is a Recrement of Calamine melted with Copper, and not of Copper alone, as was that of the Antients. The official Tutty therefore may be defin'd a Sublimation of Calamine from melting Copper to the upper Part or Roof of the Furnace, where it concretes round Iron Rods placed there, into a solid Crust, which is afterwards beat off into Pieces, like the Bark of Trees, of a yellowish Colour, smooth on the inside, and sonorous; of a bluish Ash-colour on the Outside, and powder'd, as it were, with very small Grains of the same Substance.

This is perhaps the same with the Tutty of the *Arabians*; for *Serapion* describes a kind of Tutty, which is produced and collected in the Furnaces in which Copper is turn'd to a yellow Colour. But it is not certain, whether they might not likewise mean the Calamine itself by that Word.

The *Cadmia Fornacia* is usually thus distinguish'd.

Tutia, Offic. Dougl. Ind. 92. *Lapis Tutia*, Woodw. Att. T. 2. P. 1. p. 50. *Cadmia Fornacia*, Geoff. Prælect. 182. Schw. 370. Worm. Mus. 134. Charlt. Foss. 55. *Agricola*. *Cadmia*

C A D

Cadmia Boiryitis, Aldrov. Mus. Metal. 16. *Cadmia Capnitis*, Kentm. 43. *Cadmia Facititia*, Schrod. 3. 458. TUTTY. Dale.

Tutty is reckon'd among the principal ophthalmic Medicines. It deterges and dries without Acrimony, and is therefore prescribed with Success in Ulcers of the *Cornea*, *Adnata*, and Eye-lids; and likewise in Itchings of the Eyes, inveterate Ophthalmias, and to stop an involuntary Flux of Tears, and fistulous Humours.

It is seldom used without Preparation, which consists in heating it red-hot, and then quenching it three or four times in Rose-water, and afterwards levigating it according to Art on a Marble or Porphyry.

Take prepar'd Tutty, half a Dram; Mouse-ear, Eye-bright, and Rose-water, of each an Ounce; mix them, and make a Collyrium. Or,

Take Succotrine Aloes, and prepar'd Tutty, of each six Drams; white Sugar, a Dram; Rose-water, and any mild White-wine, of each six Ounces. Digest them in the Sun for forty Days, in a close glass Vessel, and keep the Liquor without straining it. It is apply'd, by dropping a small Quantity of it into the Eyes from time to time. Or,

Take of prepar'd Tutty, a Dram; fresh Butter, half an Ounce; make an Ointment, of which a little is to be apply'd to the Corners of the Eyes, and Edges of the Eye-lids. It is an Ingredient in the ophthalmic Ointment of Charas.

Unguentum Tutiae, Ointment of Tutty.

Take of prepar'd Tutty, two Ounces; of Calamine burnt and quenched two or three times in Plantain-water, one Ounce; let them be reduc'd to a very fine Powder, and mix'd with a Pound and a half of the *Unguentum Rosaceum*, so as to make them into an Ointment.

Nicolaus was the first who gave a Prescription under this Title, which is in the *Augustan* Dispensatory; but that is loaded with a great many unnecessary Ingredients, and differs but little from the *Diapompholygos*: But the College at first receiv'd it in this more compendious manner, with the Liberty of making it either with Hog's-lard, or the *Unguentum Rosaceum*. The Tutty is prepar'd by Levigation, but if the Stone upon which it is ground, be not extremely hard, it will carry a good deal along with it into the Medicine: This is not very often referr'd to in Prescription, but is in great Esteem amongst the common People. *Quincy*.

The *Pompholyx* and *Spodus*, or *Spodium* of *Dioscorides* and *Galen*, are now unknown in the Shops. They tell us, that it was made two ways; the first by burning melted Copper to a white, smooth Powder; and the other by blowing off with Bellows what can be thus separated from *Cadmia*. *Dioscorides* mentions two Kinds of *Pompholyx*; one nearly the Colour of Copper, and moist and fatty; the other very white and smooth. This last, he says, was made by the Copper-smiths, in endeavouring to meliorate that Metal, which they did, by throwing into it a greater Quantity than usual of powder'd *Cadmia*; but it is uncertain, whether he here means New-ore, or the factitious *Cadmia* already mention'd. However this be, the fine Dust, or Flour, that arose from this Mixture, concreted into *Pompholyx*. It was likewise made by burning *Cadmia* alone in Furnaces; for having thrown it in small Pieces into the Fire, near the Nozel of the Bellows, they blow the most fine and subtle Parts against the Roof of the Furnace; and what was reflected from thence was called *Spodium*, which is of a blacker Colour, and heavier, than the *Pompholyx*, and full of Earth, and other Filth; and indeed was no better than the Sweepings of the Shops and Furnaces, and therefore was much less esteem'd than *Pompholyx*. These Substances might probably still be had, where great Quantities of Cyprian or red Copper are melted; but they are now unknown in the Shops.

The *Pompholyx* of our Shops, *Nil*, or *Nil album* of some Authors, is a fine white Flour, or Soot, which sticks to the Arch of the Furnaces and Covers of the Crucibles, in which Calamine and Copper are melted together. It is to be chosen very clean without any Mixture, and has the same Virtues with Tutty. It dries, and is gently Astringent without Acrimony; it absorbs the corroding Acrimony of the Fluids, and from thence is reputed a Cooler.

It is used with Success to dry old cancerous Ulcers, and to cure Defluxions of the Eyes. From this Substance is made the *Unguentum Diapompholygos*, which is thus prepar'd.

Take of Oil of Roses, twelve Ounces; of the Juice of Garden Nightshade-berries, six Ounces; of White-wax,

C Æ C

and wash'd Cerufs, of each four Ounces; of Lead that has been macerated three Days in the sharpest Vinegar, and then dried and powder'd, and prepar'd *Pompholyx*, of each two Ounces; and of fine Frankincense, one Ounce. Let the Oil and Juice be boiled together to the Consumption of the latter; then let the Wax be melted in the same Oil, and the rest immediately added in Powder, and continually stir'd about with a wooden Spatula, till the Whole is cold, and form'd into an Ointment.

This is ascrib'd to *Nicolaus*, and receiv'd into the *Augustan* Dispensatory, and the first of our College, with the Addition of *Nihil* to its Title. The latter hath indeed taken it with some Alterations, which are conform'd to in this; but they are of no great Moment. It was design'd for salt, hot, inflammatory Ulcers; but it is very rarely used for those, or any other Purposes in the present Practice. *Quincy*.

We have already said, That the *Spodus* or *Spodium*, of the *Greeks*, was the Ashes, or rather the metallic Flour, collected in the Furnaces and Shops of Copper-smiths; and that it differ'd from the *Pompholyx* in being more heavy, and not so pure. *Pliny* has, however, distinguish'd several Kinds of it; the *Spodium* of Copper, which is the best of all, that of Silver, called also *Laurosis*, from Mount *Laurus*, where there were Silver Mines; that of Gold, collected in refining that Metal; and that of Lead, which was next in Goodness to the Copper *Spodium*, according to *Dioscorides*.

The *Spodium* of the *Greeks* was never given inwardly, but was applied externally. Besides these Metallic Kinds of *Spodium*, the *Arabians*, abusing that Name, which in the *Greek* Language is very like the Word which signifies Ashes, added other Kinds, such as the Ashes of Plants and Animals. These Succedanea to the true *Spodium* were by the *Greeks* term'd *ANTISPODA* (See *ANTISPODA*); some of which are mention'd by *Dioscorides*; such as the Leaves, Flowers, and unripe Fruit of the Myrtle, calcined and wash'd; the Leaves of the wild Olive; Balls Glue; new-thorn, rough, greasy Wool; Pears, or Apples, moisten'd with Water, and then burn'd, and such-like. The Ashes of some burnt Roots were by *Avicenna* term'd *Tabasfir*, which Word the Interpreters have render'd *Spodium*; and that *Spodium*, which was brought from the Eastern Countries, was undoubtedly a kind of coarse Sugar, as is prov'd by very strong Arguments, by the learned *Salmasius*; and therefore it is no Wonder, that by the *Arabians*, and those who follow'd them, the inward Use of *Spodium* has been so much recommended.

The *Arabians* were deceiv'd by the Ash-colour of coarse Sugar, and the Merchants by what was related to them, that it was the Powder of some burnt Reeds. Burnt Ivory is now commonly called *Spodium* in the Shops. *Geoffroy*.

The metallic *Spodium* is thus distinguish'd.

Spodium Græcorum, nihil gryseum, Offic. *Spodium*, Matth. Ed. 1339. Aldrov. Mus. Metall. 16. *Spodium facitium*, quidam cinerulum vocant, Worm. Mus. 135. *Spodos*, Kentm. 72. *Spodios facititia*, quibusdam cinerula, Charl. Foss. 55. PUTTY. Dale.

CADUCUS, the Word alone put substantively, or, as an Adjective, with the Substantive *Morbus*, signifies the Falling-sickness, or Epilepsy. See *EPILEPSIA*. *Castellus*.

CADUS, *κάδος*, perhaps from *χάδω*, which signifies to contain, or from the *Hebrew* *Cad*, a Measure mention'd in the Bible, and translated *ἑσπια* by the *Septuagint*. It is a Measure equal to the *Metretes* (about ten Gallons two Pints, *English* Wine-measure); for what *Dioscorides*, Lib. 5. calls *μέτρητον γλεύκος*, *Pliny*, Lib. 14. Cap. 16. renders *Cadum Musti*. It is sometimes writ with a double *δ* as in *Pollux*, Lib. 9. where he tells, that *ἀμφορεύς* was called *κάδδος* by the *Antients*. And the same Author relates from *Philochorus*, that *ἡμικαμφορεύς* esse *ἡμικάδδιον*.

Cadus was called *καράμειον*. *Hesychius* says, *κάδος ἐστὶ καράμειον*. He tells us also, *καράμειον τὸ οὖρον ἢ ὕδωρ σαμνίου*, "a Ceramium of Wine or Water is a Stannium." So *Cadus* and *Stannium* are the same. *Arbuthnot*.

CÆCILIA, Offic. *Jonf. de Serp.* 19. Aldrov. Hist. Serp. 243. *Cæcilia Typhlops*, Charl. Exer. 36. *Cæcilia Typhlops Græcis*, Gefn. de Serp. 60. *Cæcilia Typhlinus Græcis*, Raii Synop. A. 289. *Typhlops Cæcilia*, Mer. Pin. 208. THE BLIND-WORM, or SLOE-WORM. Dale.

This is a sort of Serpent, whose Bite has much the same Effects as that of the Viper; and is to be cur'd by much the same Methods.

Dale, from *Gesner*, gives an Account of a Theriaca being prepar'd of this Serpent, and Treacle-water, for a Sudorific in the Plague.

CÆCUBUM. Old *Aminæan* Wine. *Oribas. Med. Collect. L. 9. C. 6.* See *AMINÆUM*.

CÆCUM *Intestinum*. What we now call the *Appendicula Cæci*, is by *Rufus Ephesus* called the *Cæcum*. But modern Anatomists divide the large Intestines, which form one continu'd Canal, into three Portions. This Canal begins by a kind

kind of Sacculus or Bag, which is reckon'd the first of the three Portions, and called *Cæcum*.

The *Intestinum Cæcum* is then only a round short Bag, the Bottom of which is turn'd downward, and the Mouth and Opening upward. It lies under the Right Kidney, and is hid by the last Convolution of the *Ileum*. It is about three Fingers-breadth in Length, and its Diameter is more than double that of the small Intestines.

Through the membranous or common Coat of the *Cæcum*, we see three white Ligamentary Bands, which adhere very close both to the outer and muscular Coat. One of them is hid by the Adhesion of the *Mesocolon*; and all the three divide the *Cæcum* longitudinally into three Parts, more or less equal.

They all unite on the *Appendicula Vermiformis*, and cover its whole outer Side, immediately under the common Coat. Tho' they appear exteriorly on the *Cæcum* to be Ligamentary, they are made interiorly of fleshy Fibres, which accompany and strengthen the longitudinal Fibres of the muscular Coat.

The villous Substance of the inner Coat of the *Cæcum* is very short, and furnish'd in several Places with glandular Lacunæ, or solitary Glands, broader than those of the small Intestines.

These glandular Lacunæ, or Folliculi, are flatten'd and depressed in the Middle like the Pustules of the Small-pox. When we blow through a Pipe into these Lacunæ without touching them, the Folliculi are inflated, and represent little Caps with a Hole in the Middle of their convex Side: *Winslow*. See *INTESTINA*.

CÆMENTUM.

Cement. This is a Name given by Architects to that Substance put betwixt the Stones of Buildings for fixing and securing them. That tenacious Matter or Paste commonly used by Mechanics for making one Body adhere to another, is also called *Cement*. In a Word, Artists of different kinds have their different *Cements*, prepar'd in such a manner as best to answer their respective Intentions; but these are foreign to our Design. The Matter used by Chymists for the Joinings of their Vessels, is by some also called *Cement*; but as that Substance is more generally known by the Name of *Lute*, see the Article *LUTUM*.

It now remains, that I consider the *Cement* used by the Metallurgists, and Assayers of Metals, since by its Assistance the *Cementatory Calcination* of Metals, as it is called, is perform'd. This *Cement* then is prepar'd of the Dust of the reddest Bricks, Crocus of Mars, Crocus of Venus, plumious Alum, Vitriol, Salt, Blood-stone, Nitre, Sulphur, Sal Ammoniac, Sal Gemmæ, and some other Ingredients. This Powder, either dry, or moisten'd with Vinegar, Urine, or some other Liquor of a like Nature, is alternately sprinkled upon Plates of Metal, either with an Intention of corroding, depurating, or exalting. These Metal Plates, together with the *Cement*, are committed to a Box or Pot, which from its Use has the Epithet *Cementatory* affix'd to it. A Crucible may also be used for this Purpose. The Vessel carefully cover'd, is put upon the Fire, which is not to be rais'd to that Degree of Heat as to melt the Metal, but only increased so far as to put the corrosive Salts in Action, for corroding the prepar'd Metal from which the *Lamina* are intended to be purg'd.

Hence 'tis obvious, that several Salts are proper for forming *Cements*; that is, those Salts which are of such a Nature, as to act like a Menstruum upon the particular Metal to be corroded and separated from the rest of the Metallic Mass, on which they ought to have no Influence. *Cements* are used in the Depuration of the nobler Metal, and the *Cement* used in the Depuration of Gold is called *Cæmentum Regale*; because it spares Gold alone, and destroys all other Metals. What, in *Schroder's Pharmacopœa*, is called *Cæmentum vulgare*, is prepar'd thus.

Take of Brick-dust, eight Ounces; of common Salt prepar'd, four Ounces; of Nitre and Verdegrise, each half an Ounce: Mix together.

For depurating Silver from Copper, *Baguinus*, in his *Tyrociniū Chymicum*, gives a Receipt under the same Name, and consisting precisely of the same Ingredients, except that there is an Addition of two Ounces of white Vitriol. *Stahl*, in his *Opuscula*, excellently accounts for the Manner in which *Cements* act upon Gold. "When, says he, Gold is adulterated by an Inter-mixture of other Metals, especially Silver, tho' in a very small Quantity, by the Addition of corrosive Salts, reduc'd to a kind of Vapour by the Influence of the Fire, it is so thoroughly acted upon, that the Particles of the heterogeneous Metal are corroded, whilst those of the Gold are not in the least affected, by which means its Compages becomes very porous; and if a little more of a foreign Metal was added, it by that means becomes sufficiently friable. For this Purpose Nitre is chosen, together with such Substances as free its acid Spirit from its alkaline Parts, that the Spirit

"may have Access to corrode the Silver or Copper mix'd with the Gold. Substances of this kind are Brick-dust, Bole, and Vitriol; sometimes a little Verdegrise is added, and sometimes Blood-stone, or Crocus of Mars. But this is done principally with a View of heightening the Colour of the Gold, rather than promoting the Efficacy of the Corrosion. But, that this Business may succeed the better, the Gold must be prepar'd, that it may be fitly dispos'd for the Reception of these corrosive Steams. This is done by beating the Gold into pretty thin Plates, that the Vapours, which are not able to penetrate very far, may pervade them so much the sooner."

But 'tis to be observ'd, that many now disapprove of the Use of *Cement* in the Depuration of Gold, because it generally happens, that they carry off some of the precious Metal with them. The Reason of this seems to be, that some Quantity of common Salt, which is the Menstruum of Gold, is often lodg'd in the Nitre. 'Tis now obvious, that to *cement* is the same as to *stratify*; that is, for some time to expose a metallic Body to the Fire, along with *Cement*, Layer above Layer. Hence the Reason is plain, why *Cementation* is call'd corrosive Calcination. From what has been said, we likewise understand, why that Operation is call'd *Cementation*, in which Antimony; mix'd with Nitre, and, pounded, is calcin'd, in order to obtain the Liver of Antimony; and upon what Account *Kircher*, in his *Mundus Subterraneus*, affirms that the *Crocus of Mars* is prepar'd by *Cementation*; since, in that Preparation, Plates of Steel are laid, *Stratum super Stratum*, with a Paste made up of Quick-lime and Urine, and calcin'd in a cementatory Vessel: *Rieger*.

CÆRULEUM. A Name for the *CYANUS*, which see.

CÆSALPINA. This Plant was so nam'd by Father *Plumier*, who discover'd it in *America*, in Honour to *Andreas Cæsalpinus*, who was an eminent Botanist, and one of the first Writers on a Method of classing Plants.

We have no English Name for this Plant.

The Characters are;

It hath a Flower of an anomalous Figure, consisting of one Leaf, which is divided into four unequal Parts; the upper Part is large, and hollow'd like a Spoon. From the Bottom of the Flower arises the Pointal, amongst many incurv'd Stamina, which afterwards becomes a Pod, including oblong Seeds.

We have but one Sort of this Plant, which is, *Cæsalpina polyphylla, aculeis horrida*, Plum. Nov. Gen. Many-leav'd *Cæsalpina*, with large Thorns.

I find no Medicinal Virtues attributed to this Plant: *Mil-ler's Dictionary*.

CAESAREA SECTIO.

By the *Cæsarean Section* the Moderns mean no more than that surgical Operation, whereby the *Fœtus*, which can neither make its Way into the World by the ordinary and natural Passage, nor be extract'd by the Attempts of Art, whether the Mother and *Fœtus* are as yet alive, or whether either of them is dead, is, by a cautious and well-tim'd Section, taken from the Belly of the Mother, with a View to save the Lives of both, or either of them. This Operation is, by some, call'd *usægyptia*, or *usægyptioria*, tho' these Words are not to be found in the Writings of the Greek Physicians. In order to draw an *Odium* upon this Practice, we are told, that some of the most expert and knowing Physicians and Surgeons have not only censur'd the Operation as unsafe and cruel, but absolutely condemn'd it, as necessarily and unavoidably productive of Death. The Authors commonly allieg'd as favouring this Opinion, are *Paré*, *Guil-limeau*, *Rolsincius*, *Hoorn*, *Mauriceau*, *Solingen*, and some others, who are asserted to be sworn Enemies to the *Cæsarean Section*. But, upon a careful Perusal of the Works of these Authors, I find none of them promiscuously condemning the Operation in all Circumstances, but only in certain dangerous Cases; when, for Instance, the *Fœtus* is to be cut from the Uterus of the Mother, as yet alive; in which Case, and others of a like dangerous Nature, the above-mention'd Authors have observ'd the most fatal Consequences resulting from the Operation. But, for the sake of Accuracy, I must here observe, that there are three Cases in which the *Cæsarean Section* is necessary.

The first is, when a pregnant Woman dies, either before the stated Time of Delivery, especially in the last Months, when the *Fœtus* is perfect, and suppos'd alive; or when she dies in Labour; or is cut off by a violent Death, and the *Fœtus* is perceiv'd alive in the Uterus, or at least is, upon good Grounds, presum'd to be so.

The second Case is, when the Mother is still alive, and the *Fœtus* dead, but, at the same time, so unnaturally situated, as that it cannot come into the World in the natural Way, either by the Efforts of the Mother, or the Art and Skill of the Midwife or Physician, in which Case the Life of the Mother is in the highest and most evident Danger.

The third Case is, when both the Mother and *Fœtus* are still alive; but the *Fœtus*, as in the former Case, can neither be expel'd in the natural Way, by the Efforts of the Mother, nor extract'd by the Art of the Midwife, so that both the Mo-

ther and the Fœtus must be in the most imminent and unavoidable Danger of Death, unless they are sav'd by the *Cæsarean Section*.

In the first Case, that is, when the Mother is dead, and the Fœtus reasonably presum'd to be alive, I find few or none of the more noted Physicians and Surgeons, who disapprove of the Operation, since, without it, the Fœtus must necessarily die, as well as the Mother. And, as Delays in this Case are highly dangerous, they universally agree, not only that the deceas'd Mother should be laid open, but also that the Operation should be perform'd as soon as is possible; because, generally speaking, the Fœtus does not long survive the Death of the Mother; tho' *Doleus*, in *Encyclopæd. Lib. 4. Cap. 5.* informs us, that he perceiv'd the Fœtus to move in the Belly the Day after the Death of the Mother. In consequence of the Operation being perform'd in this Case, we have several Instances, not only in the remoter, but also in the latter Ages, of the Fœtus being taken alive from the Belly of the Mother. Accordingly, among the Antients, this memorable Circumstance is recorded of *Lycas*, mention'd by *Virgil*, of *Æsculapius*, of *Scipio Africanus*, thence denominated *Cæsar*, of *Manlius*, and, according to some, of the Emperor *Julius Cæsar*; and, in latter Ages, of *Edward the Sixth*, King of *England*, of *Sanctius*, King of *Navarre*, and several others mention'd by different Authors, and from that Circumstance call'd *Cæsares* or *Cæsones*. When, therefore, the Mother is already dead, or when the Surgeon perceives her to be struggling with the Agonies of Death, he should take care to have every thing prepar'd for the Operation, that, when she is actually dead, he may be ready to save the Fœtus, either by making a crucial Incision in the Abdomen, as in ordinary Dissections; or, which is a safer and more cautious Method, by a large longitudinal Incision, and not a crucial one, as most advise, made on either Side, with a Razor or Incision-knife, without any Regard to the Direction of the muscular Fibres, or the Course of the Blood-vessels. The Operation may be perform'd either in the Bed, or upon a convenient Table. If the Fœtus has fallen into the Cavity of the Abdomen, either in consequence of a Rupture in the Uterus, or by some other Cause, it must, in this Case, be taken out as soon as possible; and since, on the like Occasions, the Fœtus is generally very weak, a little *Hungary Water*, or some other Liquor of a like Nature, may be held to its Nose, for the sake of the Steam. The Breath also, either simply, or after having drank a little Wine or Brandy, is to be blown into its Mouth and Nostrils, in order to cheer it. The Navel-string must be ty'd in the ordinary Manner, and, for Decency's sake, Baptism administer'd. But if the Fœtus remains conceal'd in the Uterus, that Body must be cautiously laid open, the Child extracted, the Navel-string cut, and, if it is still alive, proper Methods must be us'd to cherish and support it; and thus the Operation is at an End. If the Fœtus is lodg'd in the Fallopian Tube, or the Ovary, which sometimes happens, the Abdomen is first to be laid open, and the Child carefully extracted; proceeding in other respects as before directed. But, in an Affair of such vast Importance as the *Cæsarean Section*, the Surgeon should carefully observe whether the Mother be really dead, or only in a Deliquium, lest he rashly perform the Operation on a live Woman, as we are told *Vesalius* did. He should rather be thoroughly satisfy'd of the Mother's Death, by observing whether there be any Motion of the Parts left, especially of the Heart, Arteries, and Lungs; and have the joint Concurrence, if possible, of the By-standers, as to the Propriety of the Operation, before he attempts the least Incision; tho', at the same time, we have no Instances of the Mother reviving under the Operation, after she has been taken for dead; and tho' such an Accident should really happen, the Surgeon has no Reason to think, that he commits Murder, since, in consequence of his believing the Mother to be dead, his Attempts to save the Fœtus not only flow from a Principle of Humanity, but are also authoriz'd by the Laws of the Land. In such a deplorable Case, as there are still some faint Remains of Hope, especially if the Operation has been perform'd by a simple longitudinal Incision on one Side, the Surgeon must stitch up the Wounds, and treat them in the most skilful Manner he possibly can, since live Persons, who have voluntarily submitted to have the Fœtus extracted in this Manner, have sometimes happily recover'd; for, if the Surgeon should delay too long, from a mistaken Terror of murdering the Mother, the Fœtus may be lost, and the Operation perform'd in vain. Some condemn the Operation altogether, because, say they, after the Death of the Mother, we are not certain whether the Child is still alive; for which Reason they are not, in the Phrase of the Vulgar, for disturbing the poor Mother, after she is dead. Tho' I do not deny, that it is often a hard Task to determine certainly whether the Fœtus be dead or alive, and that, in consequence of this, the Operation must often be perform'd in vain; yet, in my Opinion, it is still more adviseable to open ten, or even an hundred dead Mothers in vain, than to lose one live Fœtus for want of the Operation.

My Advice, in general, is, that the Operation should be

perform'd as soon as possible on all Women, who die either a little before, or in the very Pangs of Delivery; partly that the Fœtus may be extracted alive, baptiz'd, and rescu'd from the Jaws of Death; and partly for the better Information of Physicians, Surgeons, and Midwives, to acquaint them with the Figure, Bulk, and Structure of the Uterus in pregnant Women, with the Posture of the Fœtus in it, the State of the Membranes, the Disposition of the Secundines, and their Connexion with the Uterus, that they may, at other times, be the better qualify'd for affording Relief in Circumstances of a like Nature; and partly, according to *Deventer*, that it may be discover'd whether the Death of the Mother was owing to the Unskilfulness of the Midwife or Surgeon, or to some other Cause; that they may be punish'd or acquitted accordingly, and arrive at a greater Knowledge in their Profession. We must not then delay performing the Operation upon a Woman who dies in these Circumstances, much less must we bury her with the Fœtus in her Belly, which is too often the Case; since, on some Occasions, the Child may remain alive in the Uterus a long time after the Death of the Mother; for I think it barbarous and inhuman, repugnant to Christianity, and inconsistent with Mercy, to bury the Child, as yet alive in the Uterus, with its dead Mother. I therefore think, that not only among Christians, but also where-ever Humanity and Compassion have the least Regard paid them, Princes and Rulers should enact the severest Laws, injoining that all Women, who have died during Pregnancy, should not only be laid open before they are bury'd, but also that this should be done immediately after the Death of the Mother, by skilful Physicians and Surgeons, lest, by a Delay, the Fœtus should be allow'd to die in the Uterus, or, by omitting the Operation altogether, it should be bury'd alive with its dead Mother; since, in this Case, they might justly be said to be murder'd, according to that eternal, immutable, and unalterable Law of Nature, *Whom thou didst not save from Death, when it was in thy Power so to do, him thou hast kill'd*. The most antient of the Roman Kings, tho' destitute of the Light of Reveald Religion, were mov'd with the highest Compassion for Infants in this Condition, since they made a Law in their Favour call'd the *Lex regia*, which may be justly dignify'd with the Epithets *Christian* and *Divine*, injoining, *That no Woman who died pregnant, should be bury'd before the Fœtus was extracted from her, and making it a capital Crime to do otherwise*; adding this as a Reason, *That he seems, by so doing, to have destroy'd the Life of the Fœtus*. Their Intention in this Law, doubtless, was, that the Operation should be perform'd in due Season, that is, soon after the Death of the Mother; because the Fœtus, as we know by Experience, does not long survive. But, tho' most of our Lawyers acknowledge the Equity and Sanctity of this Law, yet, by some unhappy Fate, it is seldom or never minded any-where among Christians in our Times, but as much neglected, as if there were nothing relating to it inserted in the Body of the Law. *Hildanus*, indeed, tells us, that this Royal Law was, for the most part, observ'd in his Country, that is, in *Switzerland*; but in other Countries, as far as I could learn, they make no Scruple to bury their dead pregnant Women without Section. Princes and Magistrates, indeed, convict and punish Whores, when their Infants perish for want of a Ligature of the Navel-string, or for some other Neglect; and, in my Opinion, justly; for which Reason I cannot but the more wonder, that they inflict no Punishment on those by whose Fault, or Negligence, the Children of those who die pregnant, perish in the Womb, when they might often have been preserv'd; since the Life of a Child is as much concern'd in one Case as the other, and the Guilt in both Cases is alike. Pertinent to this Purpose is what *Mauriceau, Observ. 345.* relates of a Man who would not suffer his Daughter's Womb, who dy'd without Delivery, to be rip'd open, and so wilfully occasion'd the Death of the Child; a Crime which deserves to be severely punish'd: So here, at *Helmstadt*, a Man would not suffer me to make an Incision in his dead Sister, but threaten'd to shoot me, if I came into his Doors upon such an Account; and so the Child also perish'd. I cannot but think, that Legislators would do nothing improper, or unbecoming their Office, by taking all due Care, and issuing strict Orders, that no pregnant Woman, who dies before or in the Time of Travel, should be interred before Incision of her Belly and Uterus.

When the Mother is still living, but her Child dead in the Womb, without any Hopes of its coming away, or being extracted by the natural Passages, as usually is the Case; when there are Indications, that the Child sticks in the Tuba Fallopiana, or the Ovarium, or in the Cavity of the Abdomen, or, perhaps, in a kind of Hernia without the Belly, of which *Sennertus* and *Hildanus* have given us each an Example; or if the Passage be obstructed by a Callus, a Scirrhus, a Tumor, or an Exostosis about the Os Uteri, or in the Vagina; or if there be too great a Straightness of the natural Parts, occasion'd either by an incurable Coalition of the Vagina, or a Callus, or an ill Conformation of the Bones of the Pubes, which is incident especially to Women of a dwarfish Stature; and thereby the Fœtus is render'd incapable of Expulsion; and the Mother,

thro'

thro' the Vehemence of the Pains, or Convulsions, or a violent Hæmorrhage, or some other considerable Cause, should have her Strength exhausted, and, by that means, her Life endanger'd, I judge the *Cæsarean Section*, tho' never prescrib'd by the Antients for living Persons, and condemn'd by many of the Moderns, to be absolutely necessary for preventing the Death of both the Mother and the Child; for, in these Cases, an Extraction by the natural Ways, which *Mauriceau* advises before a *Cæsarean Section*, in every preternatural Birth, can have no Place. Therefore, in all such Circumstances as render it impossible to extract the Fœtus by the ordinary Ways, (for about these are we principally concern'd) Incision of the Belly is, indeed, a severe and dangerous, but the only Remedy to deliver the Mother from the Fœtus, and from imminent Death; and we are not without Examples, in various Authors, of this Section being happily perform'd; so that *Mauriceau* speaks against Reason and Experience, when he asserts, that this Section is always mortal to the Mother; for which Reason he is also reprehended by *La Motte*, who was himself no Friend to this Operation, but rejected it on some very proper Occasions.

However, tho' there be many Examples of this Operation being perform'd successfully, and tho' there are very few but will admit of a Section of the Belly and Uterus, when the Mother is dead, and even while she is alive, if Nature points out the Way, by some Tumor, Pain, or Abscess, in some Part of the Belly, as on one Side, or about the Navel, in which Case this Operation is usually perform'd with Success, as several Authors have observ'd, because it is follow'd by little or no Hæmorrhage, and the Fœtus, on these Occasions, generally sticks in the Fallopian Tube, the Ovary, or the Cavity of the Abdomen; yet there are some very eminent Physicians and Surgeons, who will by no means admit of it, and not only dissuade from the Practice of it, but utterly condemn it, as cruel and barbarous, and always destructive and fatal to the Mother, when the Fœtus is detain'd in the Uterus, and no Abscess manifests itself. Some of the principal Gentlemen of this Opinion are *Guillemeau*, *Mauriceau*, *Rolfincius*, and *Solingen*; and for this Reason, because they always observ'd it to be succeeded by the Death of the Mother; tho' that might often happen from some other Cause. And some of them do not stick at branding those Physicians, who advise or undertake this Operation while the Fœtus is in the Uterus, and no Abscess is discover'd, with the Titles of *cruel* and *rash*; because, say they, the Fœtus should rather be extracted, by the natural Passage, with the Hand, or by the Help of Instruments, and not by ripping up the Belly and Uterus, with the utmost Danger of the Mother's Life, by the *Cæsarean Section*. But these Gentlemen are sufficiently confuted, both by Reason, and the Experience of some of the most sagacious and approv'd Physicians and Surgeons, such as *Rosset*, *Baubine*, *Sennertus*, *Hildanus*, *Fienus*, *Scultetus*, *Scipio Mercurius*, *Roonbuisen*, *Ruleau*, *Lancisi*, *Saviard*, *Jobert*, *La Motte*, *Teichmeierus*, and others, who all assure us, that the Mother has sometimes happily surviv'd the Operation.

I confess, with respect to the Mother, the Operation is very dubious and hazardous, especially when the Fœtus is to be cut out of the Uterus, and no Abscess appears; and, therefore, I am of Opinion, that it ought not to be undertaken without absolute Necessity; tho', from what has been said, and what will further be remark'd, I cannot but think it, on some Occasions, useful and necessary. *Gouey*, indeed, one of the latest Writers of Surgery among the French, *Rosset*, *Scipio Mercurius*, and *Welschius*, endeavour to prove, that the *Cæsarean Section* has no more of Difficulty or Danger in it, than cutting for the Stone; and, if dexterously manag'd, ought to be frequently undertaken, as appears from Examples which they bring. But, for my part, I cannot consent to so great a Length, and that for weighty Reasons, added to the Observations of *Paré*, *Guillemeau*, *Rolfincius*, *Mauriceau*, and *Solingen*, shewing the frequent unhappy Events which attend such an Operation; and, particularly, because of the Danger of an immoderate Hæmorrhage, or a Gangrene, and the Hazard which accompanies Wounds of the Uterus, especially in pregnant Women, as was long ago well observ'd by *Celsus*, *Lib. 5. Cap. 56*. *Mauriceau*, with some others, as I observ'd, is for extracting the dead Fœtus always by the natural Passages, with the Hands, or by the Help of Instruments, rather than have recourse to so dangerous an Operation as the *Cæsarean Section*. I heartily agree with this their Opinion, as often as the thing is practicable; and utterly disapprove the Rashness of those Surgeons, who have ventur'd upon a Section of the Belly, when the Fœtus might have been extracted by the Vagina, tho' the Operation was sometimes attended with Success. However, since Cases often occur, such as I mention'd above, where it is impossible to extract the Fœtus by the usual Passage, and the Mother is in utmost Danger of perishing, on account of its Detention in the Uterus; I look upon it as a barbarous and impious thing to leave the unhappy Woman, who earnestly implores our Assistance, or at least extremely wants it, without Help; and am of Opinion, that, in Cases of Extremity, the last or most desperate Remedies are to

be us'd; and certainly, according to the Judgments of *Hippocrates* and *Celsus*, the venerable Fathers of Medicine, a dubious Remedy is better than none, and preferable, in such Cases, to leaving the poor Woman helpless in that most deplorable State; under the greatest Torments, and giving her up to inevitable Death, while there is still Hope of saving her, as appears from happy Examples. Therefore I think those Physicians much in the wrong, who had the Care of the Woman mention'd by *Saviard*, *Observ. 114*. who, when they found the Birth was impossible, because of the Narrowness of the Passages, would not undertake a Section, but left both Child and Mother to perish together. And in his *Observ. 60*. we have an Instance of a Woman who beg'd for Section, but could not obtain it. Some there are, as *Mauriceau*, *La Motte*, and others, who acknowledge, that there are Cases in which it is impossible for the Fœtus to be brought away by the ordinary Passage; and yet advise, in such a Circumstance, to leave the Conduct of the Matter wholly to Nature, rather than expose the Patients to so dangerous a Section; because Nature often finds out Ways, by means of an Abscess in the Belly, Navel, Groin, or *Intestinum Rectum*, to expel the putresc'd Fœtus with less Danger than it could be extracted by Section of the Belly. In this I agree with them, as often and as long as the Mother is in no Danger of her Life from this Forbearance, which is sometimes the Case: But when the Danger is urgent, when by too long waiting we hurt, and in a manner kill the Mother, I think we ought to have recourse to the last Remedies, especially such as have been known to succeed, rather than give up the Patient, who might be under a Possibility of being helped, tho' by a dubious Remedy, to an unavoidable and most miserable Death. For, certainly, a Physician seems to me then only to have discharg'd his Duty to the full, and satisfy'd his Conscience, when he has done all things, and omitted nothing that he knows to be serviceable, and which he is sensible has done Good in other Cases of the like kind, without regarding what some, perhaps, may object against his Proceedings, especially when the Patient herself, whose Life is dear to her, and who had rather try a dubious Remedy than none at all, desires it of him. Others there are, who confess that the Reason why they will not undertake this Operation, is the Disgrace they are like to undergo, if it should not succeed: But this seems to me a very vain and trifling Excuse in so serious an Affair, and hardly becoming a good Man, much less a Christian Physician, who, in the way of his Duty, ought to stand in Awe of no Man, much less to be deterred by the Censures of the Vulgar, or the Calumnies of the Malicious. In short, all things are to be done by a Physician for the Preservation of his Patients in general, and especially those of the weaker and tender Sex, in this their most miserable and helpless Condition. And *La Motte* himself has several times perform'd Operations on Women, and particularly the Extractions of the Fœtus, even against the Mother's Consent; to accomplish which, he order'd Women in such a Circumstance to be held by strong Men, that he might by Force extract the Child, when in an ill Situation, in what manner he thought fit. Now, if he thinks such a Proceeding to be fair and lawful, why may we not, with a safe Conscience, use the same violent Means for extracting the Child by a Section of the Belly, that, if the Mother will not voluntarily submit to what skilful Physicians shall judge necessary for her Preservation, she may be compel'd by Force to undergo it? For my part, I see no Reason to the contrary. How much more then are we to lend our Assistance in the former Case, when it is not only voluntarily desir'd, but earnestly intreated!

If, then, the unhappy Woman consent to submit to Section, or voluntarily desire it, the first thing to be consider'd is, whether she has sufficient Strength to undergo the Operation. For if she be very weak and low, be cold in the extreme Parts, and in a cold Sweat, it is to be fear'd, that she will die soon after the Section, and so the Cause of her Death, by ignorant and malicious Persons, may be imputed to the Operation, and the Surgeon. It is best, therefore, in this Circumstance, to forbear such an Undertaking, lest, as *Celsus* says, *Lib. 5. Cap. 16*. we might be thought to kill the Woman, who, in reality, dies of the Violence of her Distemper. But if she be in good Strength and Heart, and there is Hope of saving the Mother, or Child, or both, the Operation is to be readily undertaken; for the right Performance of which, we are to consider, first, what is to be done before the Operation; secondly, what is to be done under the Performance; and, thirdly, what after it. Before the Operation the proper Instruments are to be laid ready, which are, a straight Knife, firmly set in the Handle, and such as is represented (*Tab. 52. Fig. 8.*); or such a one as is commonly used in anatomical Dissections, or else a Razor, or some such Instrument; or one of the blunt Instruments, represented (*Tab. 26.*); also a blunt-pointed Pair of Scissors, with crooked Needles, threaded with strong Threads, or Cords, as for Gastrography; a clean Sponge or two; hot Wine, or some hot vulnerary Decoction in a Vessel; with the proper Apparatus of Bandage, consisting of Lint, Plaisters, Bolsters, and Fillets; not forgetting internal corroborative Medicines, and external

ones, to be apply'd, if needful, to the Mouth and Nostils. All these Things being fitly disposed out of the Woman's Sight, she is first to make Water, lest the Bladder, being distended with Urine, might be exposed to the Knife; she is then to be placed in a proper Situation, either on a Table, or Bed, in the midst of the Chamber, on her Back, in such a manner as that the Attendants may have convenient Access; and her Spirits are to be kept up by pleasing and pious Words; her Face being cover'd, that she may not be terrify'd at the Sight of the Instruments; and her Arms and Legs are to be held by at least four robust Persons, that she may lie immoveable; or, if you think fit, they may be ty'd.

The Surgeon then, standing at that Side of the Woman which seems most convenient, enters a strait Knife by the external Side of the Musculus Rectus, or in the Space between the Navel and the upper and fore Eminence of the Os Ileum, where Persons are now usually tap'd for the Dropsy, (which seems to me, as yet, the fittest Place) making a strait Incision, first thro' the Skin and Fat, about eight or ten Fingers-breadth in Length, after that, thro' the *Musculi Obliqui* and *Musculus Transversus*, and, lastly, with the utmost Caution, thro' the *Peritonæum*; where the principal thing to be observ'd by the Surgeon is, to make but a very small Wound, or Aperture, with this first Knife, for fear of hurting something withinside. Then with another Knife, probe-pointed, (*Tab. 26.*) or with the Scissars, he is to dilate the Wound; or, if he has not the last Instruments in Readiness, or thinks fit to use but a few, he may introduce his Finger thro' the Wound into the Belly, and by the Assistance and Direction hereof, with the first Knife, or with the Scissars, enlarge the Wound, till it seems wide enough for the Extraction of the Fœtus, taking all possible Care, that he hurts nothing else withinside, which may be readily avoided, by dexterously following these Directions: A sufficient Aperture being made in the Belly, the Situation of the Child, and where it sticks, is to be thoroughly inspected. If it be found to lie without the Uterus in the Cavity of the Abdomen, as it sometimes happens, you are immediately to extract it, together with the Secundines. If it be situated in the Fallopian Tube, or in the Ovary, an Incision is to be cautiously made in these Parts, and the Fœtus, with the Placenta, to be extracted thence. If the Fœtus be detain'd in the Womb, the Case is more hazardous, for fear of an immoderate Hæmorrhage, or dangerously hurting the Uterus, the Wounds of which Part have, from all Antiquity, been observ'd to be very pernicious, especially in pregnant Women. However, since the Child cannot be otherwise extracted, an Incision is here also to be made, and afterwards in the Membranes of the Fœtus, wide enough for accomplishing the Extraction. This done, and the Fœtus and Secundines being brought away, the extravasated Blood in the Belly is to be deterg'd with Sponges express'd out of warm Wine, or some warm vulnerary Decoction; and if the Effusion of Blood be immoderate, it should be restrain'd by Lint moisten'd with highly rectify'd Spirit of Wine, and introduc'd into the Wound of the Uterus; and the divided Orifices of the larger uterine Vessels are to be compressed with the Fingers upon Lint, till the Hæmorrhage ceases, or, at least, is very much abated. We have here Occasion to take Notice, that Women, in Child-birth, and after it, often lose a vast Quantity of Blood without Danger of Death; and, therefore, the Surgeon ought not, on a sudden, to be terrify'd at a pretty copious Hæmorrhage on this Occasion, especially if his Patient continues to preserve her Strength and Spirits. After some reasonable Space of Time allow'd for the Woman to recollect her Spirits, and to be refresh'd with some corroborative Medicine, the Lint is to be gently remov'd from the Wound, and the Belly again deterg'd with warm Sponges. The Wounds of the internal Parts are not to be sew'd, as some heretofore directed; but, after an Application of Balsam of Capiivi, or something like it, are to be left to Nature; for, as the Uterus gradually contracts itself, the Lips of the Wound come together, and, at last, if nothing intervene to prevent the Cure, are conglutinated.

But the Wound in the Belly is to be sew'd up with two or three Sutures, in the same manner as has been directed for Wounds of the Abdomen (See ABDOMEN); and a Tent, Pipe, or Canula, of considerable Bigness, is to be adapted to the lower Part of the Wound, in order to keep it open; for thro' this Aperture not only the noxious Humours, discharg'd from the Wound in the Uterus, and remaining within, and those which continue to discharge themselves, may find a Vent, but by the Help of Injections, as is practis'd in other Wounds of the Breast and Abdomen, they may also be brought away. And this Method must be continu'd till the Lips of the Wound are conglutinated, and all Efflux of Pus, or any other Humour from the external Wound, ceases; an Indication that the internal Wound is heal'd. After the Threads us'd in the Suture are cut and extracted, omitting the Tent or the Pipe, the exterior Wound is also gradually conglutinated by vulnerary Balsams, and agglutinating Plaisters. Most, indeed, advise sewing the Wound of the Belly; but, after considering the Matter with myself, and observing that other strait, or, as they are commonly call'd, longitudinal

Wounds of the Abdomen, for the most part, need no Suture, and, by the more modern Surgeons, are excepted from those which are to be sew'd, since their Lips may, for the most part, be commodiously join'd, and retain'd in Contact, by proper Plaisters, and a large uniting Bandage, I am of Opinion, that, in these Cases, we do not often stand in need of Suture, if proper Bandage is carefully apply'd. *Roussel*, taught by Experience, declares that, in this Case, he did not think Suture very necessary: But, if Bandage should be thought absolutely insufficient for the Purpose, then Suture is to be us'd. Some, before the Section is made, mark with Ink not only the Part where it should be made, but also where, and in what Places, Suture should be perform'd; but, as these Marks are quickly obliterated, and effac'd by the Effusion of Blood, I think this Advice altogether trifling and useless. As for the Situation of the Patient in Bed after the Operation, most Authors advise, that she should lie continually on her Back; but, to me, it appears more proper, especially if the Wound has been made on the Side, that the Patient should, as much as possible, lie with the Wound undermost, that some Part of the noxious Humours collect'd within may not only flow continually, and, as it were, insensibly ouse from the external Wound, but also that the Lips of the Wound may be the more easily agglutinated; which Advantage is more easily procur'd when the Section is made in the Side, than when the Operation is perform'd in the middle or anterior Part of the Belly. *Roussel* also advises, that a hollow Pessary should be introduc'd into the Uterus, that the Blood may be the more easily convey'd from it. Besides, the Physician must prescribe a proper Regimen, and suitable internal Medicines, such as are, on other Occasions, order'd for those who have receiv'd large Wounds; and these are to be persisted in, till the Patient is thoroughly recover'd, which, in *Lancisi's* Patient, happen'd in six Weeks.

From what has been said, 'tis obvious to every one, that this Operation, especially when a very large Aperture is made in the Uterus, must be attended with the greatest Danger. But since there are many Instances of Mothers being preserv'd by this Operation, who must have otherwise died very soon according to all Appearance, and since there is often no better, and indeed no other, Method of relieving the miserable Woman, I think it adviseable, rather to attempt this hazardous Operation in Cases where all other Hopes of Relief are cut off, than to abandon the miserable Patient, and leave those to the gloomy Prospect of unavoidable Death, who are often so fond of Life, as to submit to the most cruel Measures for preserving it.

Enough I think has already been said concerning the common and ordinary Method of extracting the Fœtus from the Uterus. But as certain Cases now-and-then occur, in which the Operation is to be otherwise perform'd, these also deserve our Consideration. When, for Instance, the Fœtus can neither be born in the natural manner, nor extracted from the Uterus, there appears any Tumor or Abscess in some Part of the Belly, especially about the Navel, accompanied with Pains more or less acute, as happen'd in the Cases mention'd by *Roussel*, *Baubine*, *Hildanus* from *Albucaſi*, *Alexander Benedictus*, and others; as also in the Instance recorded by *Cyprianus*, that celebrated Dutch Physician, in *Epist. de Hernia uterina*; and in the Case describ'd in the Annals of the *Julian Academy*, for the Year 1727; in which a Tumor and Abscess appear'd in the Musculus Rectus, hard by the Navel, as happen'd in most of the foremention'd Cases; and, upon opening the Tumor, all the Bones of a perfect, but putrified Fœtus were extracted. These Bones are in my Custody, and the Mother is still alive.

In Cases of this Nature, I think the most proper Place for performing the Operation, is that which is indicated and pointed out by Nature itself; since under it, for the most part, are lodg'd both the Fœtus, and the corrupted Humours, which create such intolerable Pains to the miserable Mother. If, then, such an Abscess should be already broken, as sometimes happens, and if the Aperture in it should be too small, it is, as in other Abscesses, to be sufficiently enlarg'd, either with a groov'd Probe, and proper Knife; or, instead of the Probe, with the Finger and Knife, or with Scissars, or with that Knife delineated in *Tab. 26. Fig. 3.*

Then the Bones of the Fœtus left after the Putrefaction of the soft Parts, or whatever of a corrupted Nature is found in it, are to be extracted, either with the Fingers, or with a Pair of Forceps; the vitiated Humors are to be evacuated, the Ulcer is to be deterg'd by proper Medicines, and then conglutinated by such Balsamics as are in like Cases directed by skilful Surgeons. If there is as yet no Aperture in such a Tumor of the Belly, but if Pains, and other bad Symptoms in and about it afflict and weaken the Patient; and especially if to the Touch there appears to be Pus in the Tumor as in Abscesses, lest the Patient should suffer thereby, we must, after consulting with other skilful Practitioners, make a sufficiently large Incision in the Abscess or Tumor, extract the Fœtus, or its Bones; if the Flesh be putrified, dislodge every thing of a corrupted Nature, deterge the Ulcer, and agglutinate it in the manner

manner already directed. In the above-mention'd Cases, there was no Occasion for Suture; but the Wounds gradually united and healed in the same manner other Abscesses do.

If the Fœtus should be lodg'd in a certain uterine Hernia; which rarely happens, tho' it occur'd in the Case related by *Sennertus* and *Hildanus*; a sufficiently large Incision is to be made in the Hernia or Tumor itself, first thro' the Integuments, then thro' the Uterus, and, last of all, thro' the Membranes of the Fœtus. Then the Fœtus is to be extracted, and the Secundines are to be taken from the Uterus, which is to be replac'd in the Belly, either immediately, if it can be done, or a few Days after, when it becomes less by its Contraction. The other Steps to be taken are the same with those already directed. In the Case related by *Sennertus* and *Hildanus*, the Surgeon did not replace the Uterus, but immediately flitch'd up the Skin: Hence I believe it happen'd, that the Uterus could not afterwards be replac'd, but the Mother died a Month after, tho' the Fœtus was alive and sound. It had therefore been better to have omitted the Suture, and replac'd the Uterus in the Belly some Days after, when it had become less by Contraction; for by this means the Mother might have possibly been sav'd.

If Pieces of Bones belonging to a corrupted Fœtus seek a Passage by the *Intestinum Rectum*, and *Anus*, which they sometimes do, as is evident, not only from the Cases already mention'd, but also from one which happen'd a few Years ago in a neighbouring Village; upon such an Emergency, the Splinters which come not away spontaneously are to be extracted cautiously, either with a proper Hook or Forceps; and the Wound of the *Intestinum Rectum* is afterwards to be agglutinated with Balsamics. But these are Circumstances which do not properly belong to the *Cæsarean* Section. But if Cases of this Nature should occur, I advise the Surgeon to read and compare what has been advanc'd upon this Subject, by the above-quoted Authors, that he may at once be apprisd of the Variety of Cases of this kind, and qualified for treating them with the greater Skill and Judgment.

In the third Place, the *Cæsarean* Section is to be perform'd when the Mother and Fœtus are still alive, but at the same time the Fœtus, on account of some Impediments, can neither be born in the ordinary Manner, nor extracted, especially when a bad Conformation of Parts in the Mother prevents the Introduction of the Surgeon's Hand for her Relief. In this deplorable State of Things, both Mother and Fœtus must unavoidably perish, unless reliev'd by the Operation. Tho' in Cases of this Kind, many Physicians and Surgeons are too timorous, tho' many Women from a false Principle of Compassion, or mistaken Notions of Religion, condemn the Operation in these Circumstances as impious, tho' by it the Fœtus, or the Mother, and often both, might be preserv'd; yet I think it more prudent, and more agreeable to the Precepts of Christianity, to undertake the Operation, where no other Means of Relief can be found, than to destroy both Mother and Fœtus, for want of it; especially on Queens and Princesses, where the Peace and Safety of Kingdoms and Nations depend on the Production of a Successor, without which there would be an unavoidable Foundation laid for the most cruel Wars, Devastations of Cities, Robberies, Murder, and the Subversion of States; for, by this Operation seasonably undertaken, either the Mother, or the Fœtus, or both, but most frequently the Fœtus, is preserv'd. The Lives of a great Number of Soldiers are often expos'd in the Field of Battle for the Good of the State, without any Hesitation or Reserve; and, if Circumstances require it, why should not the Life of one Woman be risk'd for the same End? If therefore we think justly on the Point, we shall have Reason to condemn as cruel, barbarous, and inhuman, those very Physicians and Surgeons, who thro' mistaken Views either delay the Operation, or dissuade from it; especially when the Women themselves desire it should be perform'd.

Mauriceau, tho' a skilful Man-midwife, and an inveterate Enemy to the *Cæsarean* Section, yet gives an Instance of the Fœtus being preserv'd alive by it, tho' the Mother died; whereas, without it, both Mother and Child had unavoidably perish'd; for, upon the Principles of common Sense, it is far more eligible to save one, than to destroy both. The Operation is to be perform'd in the same manner, as when the Mother is alive, and the Fœtus dead; only greater Caution is to be used, lest, in opening the Uterus and Membranes, the Fœtus should be hurt or injur'd.

But, tho' I have only perform'd this Operation on dead Women, yet I am so fully apprisd of the Danger that attends it, that I am far from advising it in Cases where there is the least Probability of bringing the Fœtus away by the natural Passages. *Mauriceau*, and others, seem to think, that some Physicians advise the *Cæsarean* Section, where the Fœtus can be extracted thro' the common Passage; and, so far as I can understand, they seem to believe, that some Physicians prefer this Operation to the other gentle and natural Method. But 'tis scarce credible, that a prudent Physician or Surgeon

should either advise, or actually perform, the *Cæsarean* Section; which is so dangerous on a live Woman, when there is a Possibility of extracting the Fœtus thro' the Vagina, tho' it should only be brought away in Pieces, except in some particular Cases upon Queens or Princesses, where Interests of State, and the manifest Good of the Community, require it. Whenever it happens then, that the Fœtus, either on account of its unnatural Situation in the Womb, its excessive Bulk, especially that of the Head, the monstrous Conformation of its Body, or some other Cause, cannot be born, tho' at the same time it is contain'd in the Uterus; and when there is an evident Danger of the Mother's Death, as well as that of the Fœtus, in consequence of her Strength being exhausted; if on such Occasions there should arise a Dispute, whether, in order to preserve the Fœtus, the Operation should be perform'd on the Mother, or whether the Fœtus ought not rather to be extracted with Instruments, if it cannot otherwise be done; I think the Mother is to be preserv'd, and the Fœtus, even tho' alive, to be extracted by any Means. In this Sentiment I am supported by the Judgments of many Physicians, Surgeons, and Divines, who, in Cases of difficult Births, where 'tis impossible to save both Mother and Fœtus, lay it down as a Maxim, that the Life of the Mother is to be prefer'd to that of the Child; or, as they express it, the Tree before the Branch. I am also of Opinion with *Solingen* and *la Motte*; that if a Callus of the Vagina, or Mouth of the Womb, be the Cause why the Fœtus cannot be brought away, and if these Parts can be sufficiently dilated, either by Section or Dilaceration, that this latter Method should be prefer'd to the *Cæsarean* Section; because by this Method the Belly and the Uterus itself are left entire, and the Blood discharg'd flows all thro' the Vagina, but in the other Case is thrown into the Abdomen, and considerably endangers Life. Besides other Advantages attending this Method, the Wound is also more easily agglutinated in it than in the other. I also think, that when the Vagina is shut up by the Hymen, or any other Membrane, these are to be cut rather than the Belly and Uterus: But when the Vagina is cover'd with too large and hard a Callus to admit of a sufficient Dilatation, and especially where there is an originally bad Conformation of the Bones of the Pelvis, then the *Cæsarean* Section is to be had recourse to as the only Method of Relief.

In like manner, if, by the Pains and Efforts made during Labour, the Uterus should be broken, and the Fœtus slip into the Cavity of the Belly, as sometimes happens, the Belly is in this Case to be laid open, since without such an Operation the Fœtus could not be extracted, and consequently neither it nor the Mother preserv'd. It may be known by the following Signs, when this happens to be the Case: If violent Pains, by which the Child is not forc'd into the World, are remitted, or cease all of a sudden, the Mouth of the Uterus in the mean time not being open, or at least not sufficiently open for the Purpose; a Circumstance which denotes the preternatural Situation of the Child; if a certain Rupture or Fragar is perceiv'd in the Belly; if a Shivering succeeds; if a large Tumor afterwards appears, and the Fœtus is perceiv'd to be situated higher in the Belly than before; if the Parts or Members of the Fœtus are more distinctly felt than when it was in the Uterus, especially if it is felt in either of the Hypochondria, with Pains in another Part of the Belly than before; as also, if the Patient is seiz'd with fainting Fits, convulsive Motions, or perhaps Alienation of Mind. When these Symptoms attend a difficult Birth, when no Part of the Fœtus appears externally, and when, upon passing the Finger thro' the Vagina, it is not found to press so strongly on the Mouth of the Uterus, we may conclude, that the Uterus is burst, and the Fœtus slip into the Cavity of the Abdomen. If this should happen to be the Case, the Belly of the Mother is to be open'd in the most prominent Part, where the Child is found to be lodg'd, with a View to save the Lives, if not of both, yet at least of the Fœtus. When the Arm hangs out of the Rupture of the Uterus, 'tis a bad Symptom, and a Cure is in this Case very difficult, if not impossible; however, we must prognosticate from the concomitant Symptoms. I am surpris'd, that the Physicians and Surgeons belonging to the *Strasbourg* Hospital, in which a Patient had been in Labour for five Days, and whose Case is recorded by *Pistor*, should have delay'd laying her open, since even during her Life they had the most manifest and incontestable Proofs, that the Uterus was burst; or, if they were afraid to perform the Operation on a live Woman, why did they not lay open her Belly after her Death, in order, if possible, to save the Life of the Fœtus? The Case of *Saviard* is also worthy of our Attention, when in the *Hôtel Dieu* the Fœtus, in consequence of a Rupture of the Uterus, had fallen into the Abdomen, the Secundines in the mean time hanging out of the Vagina. This he knew to be the Case, as he himself informs us, by introducing his Hand into the Uterus by the Navel-string. Notwithstanding these Circumstances, he did not open the Woman alive, in order to save the

the Child, and perhaps the Mother too, but suffer'd them to die together.

If the Fœtus should happen to be generated in the Cavity of the Belly, and not in the Uterus, (a rare Case) which may be known from the preceding general Signs of Pregnancy, from the Fœtus being situated higher in the Belly than is usual, and from the Mouth of the Uterus being closed at the expected Time of Delivery, even when there are Pains, and some other Symptoms already mentioned; in this Case the Cæsarean Section ought to be performed, because the Fœtus cannot otherwise be preserved; and, besides, the Mother is in less imminent Danger, because there is no Necessity for making an Incision in the Uterus. Sometimes, in difficult Labours, the Uterus is burst in such a manner, that not the whole Fœtus, but only some Part of it, falls into the Abdomen, the rest remaining in the Uterus. The Arm, for Instance, may hang out of the Vagina, whilst the Head or Feet are fallen through the Rupture of the Uterus into the Cavity of the Abdomen; in this Case the Cæsarean Section is not necessary. Thus I myself found the Arms of a Fœtus out of the Uterus, whilst the Head was in the Abdomen, and the rest of the Body in the Uterus. *Albinus* and *La Motte* saw a Case, in which the Head of the Fœtus was duly lodg'd in the Vagina, whilst its Feet had perforated the Uterus, and stuck in the Belly near the Diaphragm. Another Case they make mention of, where the Arm was hanging out of the Vagina, whilst the Feet were in the Abdomen. In both Cases the Patients were excessively weak. *La Motte* brought away the Fœtuses in the natural manner; but both Mothers died a few Days after. But an Instance directly opposite to these was told me by *Rungius*, a Surgeon of *Bremen*, in which, after having brought away the Fœtus, though, through the Rupture of the Uterus, he plainly felt the Intestines of the Patient, and with his Hand kept them for some time from rushing into the Uterus till it contracted itself, yet the Patient happily recover'd.

But I must not forget to make mention of the Difference between *Hysterotomy*, and what is commonly called *Embryulcia*; or between extracting the Fœtus, especially if unnaturally situated, from the Uterus, through the natural Passage, and cutting it out, by making an Incision in the Belly and Uterus; because often by the Vulgar, and even, which is more surprising, by some of the Learned, as also by Physicians themselves, these two Operations are confounded, and taken for each other, tho' nothing can be more different; for when the Fœtus is extracted from any Woman, nothing is more ordinary than to say, that her Child has been cut from her, though there was no manner of Section made, either on the Belly or the Uterus; but only the Child, on account of its unnatural Position, or its excessive Bulk, has been brought away by the Vagina, either by the Hands of the Surgeon, or some proper Instruments. This Operation, therefore, by which the Fœtus is extracted through the natural Passage, is called *Embryulcia*; but that whereby it is cut from the Belly *Hysterotomy*, or the *Cæsarean Section*. And if in this Sense *Embryulcia*, or the Extraction of the Fœtus through the natural Passage, is falsely taken for *Hysterotomy*, it is, perhaps, in some measure, true, which is advanced by *Scipio Mercurius*, "That Exsection of the Fœtus was, in his Time, as customary in *France*, as Venesection in *Italy* for "Head-achs." Thus, when I was lately perusing the Observations of *Franciscus Valleriola*, I found one, concerning Mothers, who were happily cured, and lived after the Fœtus had been cut from them by the Hand of the Surgeon. I expected to find many remarkable Instances of the Cæsarean Section being happily and successfully performed, and perhaps a particular Method of performing it, not mentioned by others. But after I had run over the whole Observation, I found, indeed, several Cases where the Fœtus had been extracted by Hooks, or the Hand of the Surgeon; but not a single Instance of the true Cæsarean Section being once performed. So that 'tis plain, that not only the Vulgar, but also learned Men and Physicians, have often mistaken one of these Operations for the other, as did also *C. Baubine*, though they differ very widely from each other. But by this unjust and unaccurate Way of speaking, a false Horror is often excited in Patients, as if the Belly was to be laid open, so soon as the Surgeon applies his Hand, in order to assist in a difficult Birth, though he sometimes performs his Business, without creating much Pain to the Patient.

As the monstrous Fœtuses, with two Heads, or two Bodies, cannot, for the most part, be born entire, without performing the Cæsarean Section on their Mothers, 'tis disputed whether, for their sakes, the Cæsarean Operation ought to be performed, and the Life of the Mother thereby exposed to imminent Danger; or whether the Fœtus, if it cannot be had entire, ought not rather to be cut in Pieces, and brought away piece-meal, through the natural Passages. In this Case, because these Monsters are either not alive, or, for the most part, horrid and useless Loads and Incumbrances to the Earth, I think the Mother is to be spared, and the monstrous Fœtus to be extracted by Instruments of whatever Kind. *Melli*, a late Italian Writer, condemns the Cæsarean Section on a living Mother;

and not sufficiently viewing the several Reasons that may induce to this Operation, he inconsiderately asks, whether, for the sake of a Monster, the Life of the Mother ought to be exposed to the greatest Danger; but for this very Reason he justly advises, that the Monster should be brought away by any means, thro' the natural Passage. But since there are other Cases which require this Operation, where the Fœtus cannot be brought away through the natural Passages, I think it cannot, with a safe Conscience, be neglected, as I have already shewn.

If the Head of the Fœtus, either by its own Largeness, or the Narrowness of the natural Passage, sticks in the internal Mouth of the Uterus, or in the Vagina; if from its long Continuance there the Fœtus dies, which generally happens in three Days, though it sometimes lives longer; and, in consequence of this Accident, the Lives both of the Mother and Fœtus are exposed to imminent Danger, because the Hand of the Surgeon can neither be introduced to alter the Position, nor the Fœtus expell'd; this is justly look'd upon as the most difficult and important Case in Midwifery. As the Head of the Fœtus cannot be held, in consequence of its Slipperiness, and the Narrowness of the Passage, as the Hand cannot be introduced to alter its Position in the Uterus, and as no Instrument can lay hold of it without killing the Fœtus, it is by some made a Question, whether the Cæsarean Section ought to be performed, in order to preserve the Fœtus; for unless the Child is quickly relieved from this Imprisonment, it must not only die very soon, but the Life of the Mother must be exposed to certain Danger; so that with *La Motte*, and *Sigismunda*, I must own this to be at once the most deplorable and intricate Case that can possibly occur to a Surgeon. 'Tis the Opinion of most of the above-mentioned Authors, that neither the Cæsarean Section ought to be performed, nor the Child dismember'd, whilst either Mother or Fœtus are alive; but, with the superstitious Casuists of the Roman Church, they are for allowing both to perish, rather than for preserving one at the Expence of the other. In this Case they absolutely condemn the Cæsarean Section, notwithstanding the many Instances recorded of both Mother and Fœtus surviving the Operation, which, we are told, by *Roonhuys*, was performed seven times by *Sennius*, a Physician at *Bruges*, upon his own Wife, and both Mother and Fœtus were preserved each time. The celebrated *Olaus Rudbeck* is also said to have performed the Operation with Success on his own Wife, the Fœtus also surviving. *Heister's Surgery*.

In the Case last-mentioned, there is no Possibility of a Necessity for the Cæsarean Section. The Methods of extracting the Fœtus under these Circumstances are specify'd in the proper Place.

Heister proceeds to inform us, that, in his Opinion, it is both prudent and lawful to bring the Fœtus away, in order to save the Mother's Life, though it should not be really dead. It, however, requires great Judgment to determine when this is to be attempted, and when not; though, to speak Truth, there seldom can be any Necessity of destroying the Child in this Situation.

There is something extremely ridiculous, in the Advice given by several Medicinal Authors, of the Catholic Religion, as well as Divines, which is, to baptize the Child in the Womb, by the Help of a Syringe, when any Danger is apprehended of its dying in the Birth; as if it was worth while to keep the Mother in Torture a single Instant, for fear the Supreme Being should punish the Child for the Omision or Crime committed by the Midwife, whether Physician, or old Woman. With whatever good Intent such Fooleries were originally introduced, I am afraid, that the Interests both of Religion and Physic are not much promoted by them.

CÆSIUS. A Colour frequently apply'd by Medicinal Authors to the Eyes, and to the Excrements, as the Urine. It is the same as **GLAUCUS**, which see.

CAFA, CAF, CAFAR. Camphire. *Rulandus. Johnson.*

CAFFE. See **COFFEE**. *Caffe* seems to be the right Word; but as *Coffee* is more in Use amongst us, I chuse to refer this Article thither.

CAGASTRUM. A Term used by *Paracelsus* to signify the morbid Seed, which is not innate or hereditary, but adventitious from Corruption; and, upon that Account, distinguished from the *Iliastrum*. Diseases from the *Cagastrum* are the Pleurisy, Pestilence, Fever, and the like. *Paracelsus Labyrinth. Med.*

CAHOS. A Term in *Paracelsus*, by which he intends not only the universal Mass, or *Chaos*, but the Air, and the *Iliastrum*. *Johnson. See ILIADUS.*

CAJACIA. The same as **CAACICA**, which see.

CAJAHABA. An Indian Plant, which adheres to Trees like Ivy. The Natives bruise it, and bind it upon Fractures. *Raii Hist. Plant.*

CAJAN *Arbor Indica, foliis trifolii bituminosi, siliquis orobi*, Breyne. Prod. *Phaseolus Arbor Indica incana, siliquis torosis, Kayan dista Thora Paerou, H. M. Pisum arborescens quibusdam.*

It is a shrubby Plant, bearing Pods which contain four reddish Peas, which are good to eat. An Apozem of the Leaves restrains the immoderate Flux of the Hæmorrhoids. The Leaves bruised with Pepper cleanse the Gums, and ease the Tooth-ach. The Seeds boiled in the Washings of Rice, and made into a Liniment with Butter, are a Relief to painful Lassitudes of the Joints; and they prepare of the same a wholesome Liquor against the Small-pox. *Raii Hist. Plant.*

CAJEPUTI-OLEUM. An aromatic Oil, imported from the *East-Indies* into some Parts of *Europe*. It is mentioned by *Hoffman* in his *Observationes Physico-chymicæ*, L. 1. Obs. 4. But he does not tell us from what Plant it is procur'd.

CAINITO, [this is the *American* Name by which the *Indians* called this Tree, according to *Oviedo*] Star-Apple, *vulgo*. It hath an open Bell-shap'd Flower, consisting of one Leaf, and cut into several Segments towards the Top, from whose Cup arises a Pointal, which afterwards becomes a globular or Olive-shaped, soft, fleshy Fruit, inclosing a Stone of the same Shape. *Miller* reckons but two Species of this Tree, which are the Star-apple *vulgo*, and the *Cainito* with Olive-shaped Fruit. I find no medicinal Virtues ascribed to it.

CAJOUS. See *ACAJAIBA*.

CAIRION, *καίριον*, in *Hippocrates*, signifies mortal, or very dangerous. Thus *Lib. de Art.* *καίριον πνεύματι ἀνθρώπου*, "Wounds in the Temples are very dangerous, or deadly." The Word is used in the same Sense by *Homer*; as *Iliad* 6, (Verse 84. and 326.) *μάλιστα δὲ καίριον ἐστὶ*, "is most mortal." He speaks of the Top of a Horse's Head, where a Wound is most dangerous or deadly.

CAIROS, *καίρος*, in the same Author, signifies the Season and Opportunity for doing a thing; as *Apb. 1. Lib. 1. καίρος δέξου*, "Opportunity is fleeting;" and the same Sense it bears in many other Places.

Καίροι also signifies the proper Seasons and Opportunities for taking of Remedies; as *καίρος μὲν τοῦδε ἔχει*, "the proper Seasons for using it are as follow;" where *Galen*, on the Place, says, *τὰς καίρους ἵπται, &c.* "He (*Hippocrates*) speaks of the proper Seasons of Use, according to Custom, or the proper Seasons for receiving Benefit; for in this latter Sense he sometimes uses the Word *καίρος*, as I have shewn." Sometimes *καίρος* means the same as *τὸ προσήκον*, "convenient." Thus, *Lib. de Rat. Viæ. in Morb. acut. ἐστὶ δὲ τὸ καίριον ἐξέρχον μᾶλλον ὥς καίριον ἢ ἀπρόσδεκτον*, "sometimes they (the Excrements) are deeper ting'd, and more frothy, than is convenient, or than might be suspected." So also in another Place of the same, where *Galen* observes, that *μᾶλλον ὥς καίριον* is put *ἀντὶ τοῦ μᾶλλον προσήκοντος*, "instead of more than convenient."

Καίροι also signify the Times or Stages of Diseases, universal and particular, the different Ages of human Life, and the Seasons of the Year.

CAKILE. A Name for the *ERUCA MARINA*, which see.

CAL. Yellow Arsenic; also Vinegar. *Rulandus. Johnson.*

CALABA, *Indian* Mastich-tree.

It has a rosaceous Flower, consisting of several Petals, which are placed in a circular Order, from whose Flower-cup arises the Pointal, which afterwards becomes a spherical, fleshy Fruit, including a Nut of the same Form.

This Tree grows to a great Magnitude in the warm Parts of *America*, where it is a Native. From the Trunk and Branches issues out a clear Gum, somewhat like Mastich, from whence it received its Name, the Gum being used in those Countries as Mastich.

CALAE, *Calaem*, *Calaëum*. A kind of *Indian Tin*, which being subjected to the Fire, is transmuted into a kind of Cerufs, such as is made of Lead and *European Tin*.

CALAF. See *CALLAF*.

CALAMAGROSTIS, **CALAMOGROSTIS**, from *καλαμῶς*, a Reed, and *ἀγροστis*, *Agrostis*. A reedy kind of Grass. *Blancard.* See *ARUNDO*.

CALAMBAC. A Name for the *Lignum AGALLOCHUM*, which see.

CALAMBOUR. See *AGALLOCHUM*.

CALAMEDON, *καλαμῆδον*, from *καλαμῶς*, a Reed. A Species of Fracture, which runs along the Bone in a Right Line, but is lunated at the Extremity. It is otherwise called *sis ὀνυχᾶ*.

CALAMINA. *Lapis Calaminaris.* *Johnson.*

CALAMINARIS (*Lapis*). See *CADMIA*.

CALAMINTHA.

Calamintha montana, *Offic. Calamintha*, *Chab. 417. Calamintha vulgaris*; *Park. Theat. 36. Raii Hist. 1. 569. Synop. 3. 243. Calamintha vulgaris officinarum*, *Ger. Emac. 687. Mer. Pin. 18. Calamintha vulgaris vel officinarum Germaniæ*, *C. B. Pin. 228. Tourn. Inst. 194. Elem. Bot. 169. Boerh. Ind. A. 175. Rupp. Flor. Jen. 187. Volck. Flor. Nor. 75. Calamintha montana vulgaris*, *Hist. Oxon. 3. 413. Merc. Bot. 1. 25. Phyt. Brit. 19. Calamintha flore magno, vulgaris*, *J. B. 3. 228. CALAMINT.* *Dale.*

The Stalks of this *Calamint* grow to be a Foot high, hairy,

and four-square, having at each Joint two broad, somewhat roundish, Leaves, hairy, and a little indented about the Edges, scarce an Inch long, and about the same Breadth. The Flowers grow upon the upper Part of the Branches, on each Side the Stalks, but few in Number, several growing on one common Foot-stalk; besides which, they have each a shorter of their own; they grow in long hairy Calyces, and are of a pale-purple Colour, labiated and galeated; and are succeeded each by four small Seeds, lying at the Bottom of the Calyx. The Root is small and fibrous. The Leaves and Flowers have a pleasant aromatic Smell, somewhat like wild Mint. We have two Species of this *Calamint*, whereof one has Flowers almost as big as the other. They are both found together by Hedges, and Highway Sides, especially in *Kent*; and flower in *June* and *July*.

This Plant is full of an aromatic, oily, volatile Salt. It is stomachic, diuretic, aperitive, and provokes the Menfes. It must be used after the manner of Tea. The Decoction of it, given in a Clyster, asswages the Colic, resolves cedematous Tumors, and strengthens the Parts. *Martyn's Tournefort.*

This Herb probably has its Name from the two *Greek* Words *καλὰ μίνθη*, which signify good Mint; for the *Calamintha vulgaris*, or common *Calamint*, not only agrees with Mint in its Virtues, but also resembles it pretty much in Smell. *Calamint* is an aromatic Herb, which, by the grateful Fragrance of its Effluvia, rouses the Spirits, and gently warms the Nerves of him who smells it. What grows in the Mountains has not only a more agreeable Smell, but is also thought more proper for medicinal Purposes, than what is produced elsewhere. The Antients extol'd it for its heating, alexipharmac, resolvent, and discutient Qualities; and prescrib'd not only the external, but also the internal, Use of it, asserting, that it kill'd Worms. It is an Ingredient in the *Theriaca*, and such other Preparations, as go under the general Name of Antidotes. Internally, it is most properly used in Infusions, in Cases where a Stimulus is required. It is proper for phlegmatic Constitutions, and such as are afflicted with Flatulencies; but it is principally conducive to the Relief of Women labouring under Obstructions of the Uterus, a violent *Fluor albus*, or a catarrhus Disorder of the Womb. According to *Etmuller*, it is so powerful a Provoker of the Menfes, that it even excites them in Women big with Child, and kills the Fœtus. It is also said to expel the Lochia, Secundines, and Fœtus. It is an excellent and a mild Diuretic, cleanses Ulcers of the Kidneys, and cures Discharges of bloody Urine. In Asthma and Orthopnoea, whether arising from a Defect of the Stomach, or Ulcers of the Lungs, it is of excellent Service, if boiled with Oxymel. But it ought not to be exhibited to such as have no Occasion for an additional Stimulus; for it acts by producing a Heat, which, though small, is nevertheless often found prejudicial to the Asthmatic, to such as discharge a bloody Urine; nor will it always agree in Ulcerations of the Lungs. But where the languid and relaxed Fibres are to be stimulated, or the sluggish Humours roused into a brisker Motion, *Calamint* will be found of singular Use and Importance; and, upon these Considerations, it is justly rank'd among the several Classes of cordial, alexipharmac, stomachic, carminative, uterine, and emmenagogue Medicines; for this Reason 'tis also used in Clysters, Cataplasms, Fomentations, and such Baths as are intended for the Purposes of Resolution, Discussion, and provoking the Menfes. An Ounce, or an Ounce and an half, of the distil'd Water of *Calamint*, may be given for the same Intentions with the Herb itself; but 'tis rarely used, on account of its ungrateful Taste. The *Syrupus de Calamintha* of *Mesue*, in the *Pharmac. August.* together with *Calamint*, consists of other Aromatics, and Raisins, with which, after they are boiled in Water, Honey is mixed. This Syrup, being of an aperient Quality, is recommended in Obstructions of the Viscera; and its Dose may be an Ounce and an half. Besides this Syrup, there are other two Preparations of *Calamint*, in *Mesue*. The Species *Diacalaminthæ*, of the *Brandenburg Disp.* and of the *London Pharmacop.* are in the *Pharmac. August.* ascribed to *Galen*; and in the *Pharmac. Antwerp.* call'd *Diacalaminthum Galeni*. They are, indeed, Compositions, differing in the Proportions of their Ingredients, but agree in this, that they consist almost of the same Aromatics, or at least Aromatics of the same Virtues, pounded with *Calamint*, as are required for preparing the *Eleæuarium de Calamintha*; in which Case they receive an Addition of a sufficient Quantity of Honey, or dissolved Sugar. This Medicine is, by *Galen*, highly extol'd in many Passages of his Works, not only as serviceable to the Stomach and Intestines, but also as useful in provoking Urine and the Menfes; and curing chronic Diseases; by correcting the Chyle, and consequently purifying the Blood. But our Descriptions of this Medicine differ from that of *Galen*, the Copies of whose Works seem to be corrupted in this Particular, since they require an excessive Quantity of Pepper. I do not doubt, but the continued Use of this Medicine may be of some Service to old Men, and to phlegmatic and pituitous Constitutions. These Species to me appear pretty much to resemble the *Pulvis Ari compositis*. One Scruple may be given for a Dose. *Schulz. Praelect.* What in *Lemery's*

Lemery's Pharmacop. is call'd *Pulvis Diacalaminthes Nicolai Alexandrini* has a smaller Quantity of Pepper; for which Reason two Scruples of it may be given for a Dose. The Species *Diacalaminthes Mesuae*, in the *Pharmac. August.* by Mesue call'd *Diacalaminthum Descriptione Galeni*, differs very little from those above-mention'd.

There is another Species of Calamint call'd

CALAMINTHA MAGNO FLORE, Cod. Med. 24. Hist. Oxon. 3. 412. C. B. Pin. 229. Tourn. Inf. 194. Elem. Bot. 165. Boerh. Ind. A. 175. *Calamintha montana præstantior*, THE MORE EXCELLENT CALAMINT, Ger. 556. Emac. 687. THE GREATEST CALAMINT, OR MOUNTAIN-MINT, Park. Theat. 37. MOUNTAIN-CALAMINT, WITH A LARGE FLOWER, Raii Hist. 1. 569. *Calamintha montana, flore magno ex calyce longo*, J. B. 3. 229. *Calamintha montana, flore magno ex calyce magno*, Chab. 416. MOUNTAIN CALAMINT.

This Plant is of a sweet and grateful Smell, and is cultivated in the Gardens of some, not only on this Account, but also because this Sort is recommended for the *Theriaca*. In its other Virtues it agrees with the *Calamintha vulgaris*.

Another Species of Calamint is the

CALAMINTHA, Offic. *Calamintha odore Pulegii*, Ger. Emac. 687. Raii Hist. 1. 569. Synop. 3. 243. Mer. Pin. 18. *Calamintha flore minore, odore Pulegii*, J. B. 3. 229. Chab. 416. Hist. Oxon. 3. 413. *Calamintha altera, odore Pulegii, foliis maculosis*, SPOTTED CALAMINT, Park. Theat. 36. *Calamintha Pulegii odore seu Nepeta*, C. B. Pin. 228. Tourn. Inf. 194. Elem. Bot. 169. Boerh. Ind. A. 175. Rupp. Flor. Jen. 188. *Calamintha Pulegii odore, Nepeta vera Antiquorum*, Merc. Bot. 1. 25. Phyt. Brit. 19. FIELD CALAMINT.

This Calamint somewhat resembles the *Calamintha montana*; but the Difference between them is, that the Branches of this Sort incline more to the Ground; the Leaves are smaller, and not so broad, but more triangular. The Flowers are much alike; and the Smell comes pretty near that of Penroyal. It grows in the like Places with the *Calamintha montana*; but flowers rather later.

This agrees with the *Calamintha montana* in its Virtues, especially as to the opening, deobstruent Qualities, and they are used promiscuously: But this Species being to be had in greater Plenty than the mountain Sort, the Apothecaries Shops are mostly supplied with it. *Miller's Bot. Off.*

This Plant is of a more acrimonious Nature than the *Calamintha vulgaris*, or common Calamint. When bruised, and applied to any Part of the Body, it acts like a Veficatory; for which Reason it is by some used for removing rheumatic Pains. Others boil the Plant in Water, and apply it, by way of Cataplasm, for the same Purpose, in which Case it acts more mildly. This same Cataplasm is of Use for resolving Tumors, and preventing Anchyloses.

CALAMINTHA PALUSTRIS, Offic. *Calamintha aquatica*, Ger. Emac. 684. Merc. Bot. 1. 25. Phyt. Brit. 18. Mer. Pin. 18. WATER CALAMINT, WITH WHORLED CORONETS, Raii Hist. 1. 530. *Calamintha arvensis verticillata*, C. P. Pin. 229. *Calamintha arvensis verticillata seu aquatica Belgarum, Lobelio*, FIELD CALAMINT, WITH WHORLED CORONETS, Park. Theat. 36. *Mentha seu Calamintha aquatica*, Raii Synop. 3. 232. *Mentha arvensis verticillata hirsuta*, J. B. 3. 217. Chab. 413. Hist. Oxon. 3. 369. Tourn. Inf. 189. Boerh. Ind. A. 185. Dill. Cat. Giff. 145. Rupp. Flor. Jen. 185. Buxb. 213. *Mentha alba Officinarum*, Volck. Flo. Nor. 287. WATER CALAMINT.

Dale imagines this to be the *Polycnemum* (πολυκνήμων) of *Dioscorides*.

This Calamint, or rather Water-mint, grows to be about a Foot high, or more; with square and somewhat hairy Stalks, on which, at every Joint, are set two Leaves, opposite, on short Foot-stalks, roundish, sharp-pointed, larger and longer than the common Calamint, indented about the Edges. The Flowers grow in very thick Whorles, with the Leaves on the upper Part of the Stalks; they are labiated and leaved, being small and purple. The Roots are small, slender, and creeping. The whole Plant has a strong Smell, like Water-mint. It grows in moist Places, and where Water has stagnated in Winter; and flowers in June.

As the Scent of this Plant comes near Penroyal, or the second Calamint, so it is concluded to partake of their Qualities. This is very rarely used. *Miller's Bot. Off.*

CALAMINTHA INCANA, *ocymi foliis*, B. *Calamintha folio & flore parvo, incana*. Hoary Calamint, with Leaves like Basil.

This Species is possess'd of the same Virtues with the *Calamintha magno flore*, or Mountain Calamint, with a large Flower.

Tournefort calls the *Hedera terrestris* by the Name of *Calamintha humilior, folio rotundiore*.

Some few other Calamints are taken Notice of by *Boerhaave*, as the

Calamintha Hispanica frutescens, mari folio, T. 194. *Satureia Hispanica frutescens, mari folio*, Elem. de Botan. H. R. D.

Calamintha montana præalta, Pulegii odore, dentatis foliis, floribus dilute cæruleis, ex longo ramo brachiato pedunculo prædeuntibus, Bocc. Mus. 2. 45.

Calamintha præalta, pulegii odore, Ejusd. T. 40.

Calamintha præalta, pulegii odore, Icon. Altera ex Sabaudia.

CALAMITA. An Appellation for the dry sort of *Styrax*, to distinguish it from the liquid. See *STYRAX*.

CALAMITAS, ἀπισυχία, from ἀπισυχία, to be disappointed or unprosperous, signifies any calamitous or unfortunate Event. Thus the Word ἀπισυχία is used by *Galen*, Comm. 2. in R. V. I. A. and applied to the Effects of Cathartics; and *Calamitas* by *Scribonius Largus*, N°. 231.

CALAMITIS, καλαμίτις. An Appellation of that sort of fictitious *Cadmia*, which, by adhering to Iron Rods, acquires the Figure of a Reed; but the Word is used to express either *Pompholyx*, or *Lapis Calaminaris*. *Agricola* also gives this Name to a marine stony Plant, from its Form.

CALAMOCHNUS. A Name for the *ADARCES*, which see.

CALAMUS. The Reed, of which the following Species are omitted under the Article *ARUNDO*.

ARUNDO FARCTA ATRO-RUBENS, Offic. *Arundo farcta maxima atro-rubens*, C. B. Pin. 17. Theat. 274. Raii Hist. 2. 1286. Hist. Oxon. 3. 220. *Arundo nastos five farcta, crassa & major*, J. B. 2. 487. *Arundo nastos five farcta, crassa & major, Calamus Toxicus Theophrasti*, Chab. 193. *Arundo farcta decima*, Park. Theat. 1210. *Nastos Clusii*, Ger. 34. Emac. 37. THE WALKING-CANE.

It is brought from India and Syria. Dale.

ARUNDO FARCTA FLAVA, Offic. C. B. Pin. 17. Theat. 277. Raii Hist. 2. 1277. Hist. Oxon. 3. 221. *Arundo farcta*, Ger. 33. Emac. 37. *Arundo farcta nana*, Park. Theat. 1210. *Arundo nastos five farcta, seu toxica, & gracilis plicatilis*, J. B. 2. 487. *Arundo nastos, seu farcta, five toxica gracilis & plicatilis Indica*, Chab. 193. THE DART-WEED.

It is brought from Syria. Dale.

ARUNDO FARCTA INDICA, Offic. *Arundo farcta Indica Orientalis sanguinem Draconis manans*, Hist. Oxon. 3. 220. Raii Hist. 3. 615. THE DRAGON'S-BLOOD CANE.

It grows in the East-Indies. The Juice of the Fruit is call'd *DRAGON'S-BLOOD IN DROPS*.

The Method of making this sort of Dragon's-blood is to macerate the Fruit in warm Water, till the red Matter subsides to the Bottom of the Vessel; then the Water is either evaporated, or pour'd off, and the red Substance remains concentered in the Vessel. Of this the Chinese are said to make an excellent Varnish. Dale. See *SANGUIS DRACONIS*.

CALAMUS AROMATICUS. See *ACORUS VERUS*.

CALAMUS ASIATICUS. See *ACORUS ASIATICUS*.

CALAMUS ODORATUS, Offic. *Κάλαμος*, Diosc. *Calamus Aromaticus*, Chab. 199. *Calamus Aromaticus verus quibusdam*, J. B. 2. 528. *Calamus Aromaticus Syriacus*, C. B. Pin. 17. Theat. 255. *Calamus Aromaticus Matthioli*, MATTHIOLUS'S AROMATICAL REED, Park. Theat. 138. *Arundo Syriaca aromatica, foliis ex adverso sitis*, Hist. Oxon. 3. 221. *Calamus odoratus*, Camel. Syllab. 22. AROMATIC REED. Dale.

Some imagine this to be the true *Calamus Aromaticus* of *Dioscorides*, of which he gives the following Account.

It grows in India; and the best is of a tawny Colour, full of Joints, and, when broken, flies abroad into many thin Splinters, has its Cavity full of Cobwebs, is of a whitish Colour, and, being chew'd, is of a viscous, astringent, and somewhat acrimonious Taste.

Calamus Aromaticus, taken in a Potion, provokes Urine; for which Reason, being boiled with Couch-grass, or the Seeds of Smallage, and the Decoction drank, it is good for the Dropsy, Disorders of the Kidneys, the Strangury, and Ruptures: Drank, or used as a Pessary, it provokes the Menfes. The Smoak thereof, either alone, or mix'd with Refin of Turpentine, received into the Mouth through a Reed, cures a Cough. The Decoction is used for Infections, and in Clysters. The *Calamus* is also an Ingredient in Salagmas; and serves to give a Fragrancy to Suffumigations. *Dioscorides*, Lib. 1. Cap. 17.

The true *Calamus*, or rather the bitter *Calamus*, is a Reed the Thickness of a Quill, of two or three Foot high, composed of Joints; from whence grow green Leaves, and little Clusters of yellow Flowers. This little Reed grows in several Parts of the Levant, from whence it is brought, sometimes whole, but generally in small Bags of about half a Foot long. Choose the largest which is fresh, cleansed from the small Root and the Branches, and made up in Bags. It is of a brownish Red without, and whitish within, furnish'd with a white Pith, which when it is stale, the said Pith will turn yellow; and after the Reed is broke, and you put it into your Mouth, it has an intolerable Bitterness. It is chiefly used for Venice Treacle. *Pomet*.

CALANDRA, *Chalandra*, *καλάνδρα*. A large sort of Lark, reckon'd among the most wholesome Foods. *Aldrovand. Ornith.*

CALATLÆ, from *Caleo*. Wanton and shameless Persons. *Johnson.*

CALAZIA. A precious Stone, with Spots like Hail. *Johnson.*

CALBIANUM. The Name of a Plaster in *Myrsus*, *Sect. 10. Cap. 29.*

CALCADINUM, *Calcatar*, *Colcotar*. Red Ink, Vitriol. *Rulandus.*

CALCADIS. White Vitriol, or, according to others, Sal Alkali. *Ruland. Johnson.*

CALCANEUM.

The Calcaneum, or Os Calcis, is the largest Bone of the Foot, of which it makes the posterior Part, and, in some measure, the Basis. It is oblong, and very irregular, and may be divided into a Body, and two Apophyses, one great and anterior, the other small, lateral, and internal.

The Body of the Os Calcis has six Sides, one posterior, one anterior, one superior, one inferior, and two lateral.

The posterior Side is broad, unequally convex, and, as it were, divided into two Portions; one superior, small, and polish'd; the other inferior, much larger, unequal, and rough, which, in Children, is an Epiphysis, and may be named the Tuberosity of the Os Calcis. The lower Part of it is bent downward, and terminates in two Tubercles, or obtuse Points, which belong rather to the inferior than to the posterior Side of the Bone.

The upper Side may be divided into two Parts, one posterior and unequal, having a small Depression; the other anterior, convex, and cartilaginous, proportion'd to the great inferior Cavity of the *Astragalus*. This Side is turn'd obliquely forward, and by this Obliquity becomes Part of the fore Side, the remaining Part of which is lost in the anterior Apophysis.

The lower Side is narrow, and behind it lie the two Tubercles, of which the internal is the biggest. They both serve for the Insertion of the Aponeurosis in the Sole of the Foot, but principally the biggest.

The two lateral Sides are continued over the anterior Apophysis. The external is gently convex and unequal, cover'd only by the common Integuments and Ligaments. The internal is hollow'd and depress'd.

The great or anterior Apophysis lies in the same Direction with the Body, being a Continuation thereof. It has five Sides, or remarkable Parts; and, were it not for the Body, it would have a sixth.

The upper Side has an irregular and unequal Depression, which, together with that in the Apophysis of the *Astragalus*, forms a considerable Fossula. At its anterior Extremity there is a small cartilaginous Surface, answering to one of those in the Apophysis of the *Astragalus*.

The anterior Side of the Apophysis is broad, oblique, cartilaginous, partly convex, and partly concave, and articulated with a little Surface of the Os *Cuboides*. This is the fore Side of the whole Os Calcis, when considered without any Division.

The Outside of the Apophysis is very rough, being a Continuation of the outer Side of the Body, with a Tubercle or Eminence at the Place where these two Sides meet, which, however, is not found in all Subjects. On the lower Part of this Tubercle is a cartilaginous Surface, for the Passage of the Tendon of the *Peronæus Longus*: Sometimes we see only some small Vestiges of this Eminence, and often none at all. We sometimes meet with another small cartilaginous Surface lower down, and more forward, near the anterior Extremity of the Apophysis, for the Passage of the same Tendon. The lower Side is a Tuberosity, continued from the Side of the Body, and designed for the Insertion of Muscles.

The lateral Apophysis is almost common to the Body, and to the great anterior Apophysis, and increases the Cavity on the Inside of the Os Calcis. On its upper Part it has a very smooth cartilaginous Surface, articulated with one of the inferior Surfaces of the *Astragalus*. This Apophysis is very low down, and its inferior Part is smooth for the Passage of Tendons.

The Os Calcis has four Cartilages, of which three are superior, one large, and two small, for its triple Articulation with the *Astragalus*; the fourth is anterior, for the Os *Cuboides*. To these must be added a small thin Cartilage, of a kind of ligamentary Substance, under the Tubercle on the Outside of this Bone. *Winslow.*

The large Tendon, call'd the *Tendo Achillis*, is inserted into this Bone.

CALCANTHOS, *Calcanthum*, in *Rulandus*, are put for *Chalcanthum*, the same as *VITRIOLUM*, which see.

CALCANTUM. A kind of Ink. *Rulandus.*

CALCAR. The same as *CALCANEUM*, which see.

CALCARIA. A sort of calcining Furnace in Glass-houses, which is useful in making of Glass-work. *Castellus.*

The Calcar, or Fornax Calcaria, is made in the manner of

an Oven, ten Foot long, and seven broad, where widest, and two Foot deep. On one Side thereof they have a Trench about six Inches square, the upper Part whereof is level with the Surface of the Calcar, separated only from it at the Mouth by Bricks some nine Inches wide. Into this Trench they put their Sea-coal, the Flame whereof passeth into all the Parts of this Furnace, and reverberates from the Roof upon the Frit, over whose Surface all the Smoak flieth very black, and goeth out of the Mouth of the Calcar; and the Conciator, or Pounder, never stirs his Frit till the Smoak is past. The Coals burn (as in other Furnaces) on Iron Grates, and the Ashes fall thence into the Ash-hole, which is level with the Floor. *Meret's Notes upon Antonius Neri.*

CALCARIS FLOS, is the same as *Flos Regius*, or Larkspur; and so call'd because its Flower, in some measure, resembles *Calcaria*, or Spurs. *Blancard.*

CALCARIUS LAPIS, *Offic. Schw. 376. Geoff. Prælect. 65. Aldrov. Mus. Metall. 745. Schrod. 348. Mer. Pin. 213. Saxum Calcarium; Worm. 45. Charlt. Foss. 20. Boet. 522. Calcaria, Kentm. 55. LIME-STONE. See CALX.*

Castellus seems to think this Stone is sometimes call'd *Asbestos*, *ἀσβεστος*; but I have never met with the Word in any other Author.

CALCATA. Yellow Ink. *Johnson.*

CALCATAR. See *CALCADINUM*.

CALCATON. Troches of Arsenic. *Johnson.*

CALCATREPOLA, *Matth.* The same as *CALCITRAPA*, which see.

CALCATRIPPA. The same as *DELPHINIUM*, which see. *Dale.*

CALCEDONIUS, for *CHALCEDONIUS*, which see.

CALCENA, *Calcenon*, *Calcenonia*, *Calcinonia*, are Terms in *Paracelsus* to express a morboous tartareous Matter, or tartareous Calx. *Paracelsi de Tart. Lib. 2. Cap. 1.*

CALCEOLUS D. Mariæ, Sacerdotis, our Lady's, or Priest's Slipper, is a Species of *Alisma*, having, in the Middle of its Flower, a Concavity resembling that of a *Calceolus*, or Slipper. *Blancard.*

CALCETUS, *Calcenonius*, *Calcenos*. *Paracelsus, Lib. 2. de Tartar. Tr.* says, the Blood is *Calcetus*, by which he means impregnated with tartareous Particles.

CALCHITHIOS, *Verdegrise*. Also a *Marcasite*. *Johnson.*

CALCHOIDES Ossicula. The same as *CUNEIFORMIS OSSICULA*, which see. *Blancard.*

CALCIDICUM. A Medicine prepared of Arsenic. *Rulandus.*

CALCIFRAGA, Breakstone. An Epithet given to the Herb *Scolopendrium*, or *Spleenwort*, in *Scribonius Largus*, No. 150.

CALCIGRADUS, *καλκίγραδνος*, from *καλκίς*, the Heel, and *βαίω*, to go, in *Hippocrates*, *περὶ ἀρθρῶν*, is one who, in Walking, lays much Stress upon the Heels. *Foesius.*

CALCINATIO. See *CALX*.

CALCINATUM majus, is whatsoever is dulcified by the Chymical Art, which was not so by Nature; such are dulcified Mercury, Lead, Anima Plumbi, Salts, and the like Substances, which are very speedily consolidated. *Johnson.*

CALCINATUM MAJUS POTERII, is nothing but Mercury dissolved in Aqua-fortis, and precipitated with salt Water. This Preparation *Poterius* used with great Success in the Cure of obstinate Ulcers. *Etmuller, Lib. 1. c. 516.*

CALCINATUM minus, is any thing which is sweet by Nature, without Edulcoration, and speedily cures; as Sugar, Manna, Terenabin, Nostoch, (sorts of wild Honey) and the like. *Johnson.*

CALCINON. *Rulandus* and *Johnson* seem to make it the same with *Calcinatio*, when all they say of it is, that *Calcinon*, by the Reverberatory, is two-fold; *Calcinatio* specially so call'd, and *Cinefaction*.

CALCITARI, Sal Alkali, Alkael. *Rulandus. Johnson.*

CALCITEA, *Dragantum* (Vitriol). *Johnson.*

CALCITEOSA, Litharge. *Rulandus.*

CALCITHOS, *Verdegrise*. *Rulandus.*

CALCITRAPA. *Dale* takes Notice of two Plants which are call'd by this Name. The first is the

1. *Carduus stellatus*, *Offic. Ger. 1003. Emac. 1166. Schw. 250. Raii Hist. 1. 317. Synop. 87. Carduus stellatus, foliis Papaveris erratici, C. B. 387. Dill. App. 15. Carduus stellatus five Calcitrapa, J. B. 3. 89. Chab. 355. Tourn. Inft. 440. Carduus stellatus five Calcitrapa vulgaris, Park. 989. Jacea ramosissima, capite longis aculeis stellatim nascentibus armato, Hist. Oxon. 3. 144. Jacea stellata, folio Papaveris erratici, Boerh. Ind. A. 140. Herm. Flo. 2. 40. Crupina capite stellato, foliis Papaveris erratici, Dill. Nov. Plant. Gen. 140. STAR-THISTLE.*

The Root of the Star-thistle is single, about a Finger thick, long, and running deep into the Ground, of a whitish Colour, having a pretty thick cortical Part. The lower Leaves grow flat on the Ground, encompassing the Root in a Circle, much

cut in, or jagged to, the middle Rib. The Stalk is divided into numerous Branches, spreading about, and seldom arising above two Foot high, with a few Leaves here-and-there at the Division of the Stalks. The Flowers grow thick upon the Branches, consisting of reddish or purple fistular Flowers, coming out of Heads, which are composed of several Scales, each ending in a long, strait, hard, and sharp Thorn. The Flowers pass away in Down, containing white flattish oblong Seed. The *Star-thistle* grows near Highways, and upon Commons; and flowers in June.

The Root is commended by some as a singular Remedy against the Stone, Gravel, or Colic, by giving it either in Decoction with Wine or Water, or in Powder, with a convenient Vehicle. *Miller's Bot. Off.*

Its Leaves are very bitter, and give a faint Tincture of Red to the blue Paper; the Root gives it a deeper, and has the Taste of an Artichoke. The *Star-thistle* contains a Salt very like that which is natural in the Earth; for its Solution is very bitter, and loaded with Sal Ammoniac and Nitre. It is likely, that the Sal Ammoniac predominates in this Plant; for the Nitre makes no Impression upon the blue Paper, whereas the Sal Ammoniac reddens it considerably. That which is found in this Plant is join'd with a considerable Quantity of Sulphur and Earth; thus the *Star-thistle* is febrifugous, vulnerary, and aperitive. For an Intermittent Fever they give to drink, at the Beginning of the Fit, four or six Ounces of its Juice. It removes the Webs of the Eyes, and cures Wounds.

M. De Lamoignon, Intendant of *Languedoc*, has been willing the Public should enjoy the Benefit of a Remedy, by which he was cured of a troublesome Nephritic Colic, with which he was often afflicted. The Remedy, as it was printed at *Montpelier*, by his Order, is as follows:

The 28th Day of the Moon, every Month, drink, early in the Morning, a Glass of good White-wine, in which has been infused a Dram of the first Bark of the Root of *Star-thistle*, gather'd about the End of September. This Bark is a small Skin, very fine, brown without, and white within. It is dried in the Shade, and reduced to a very fine Powder. The Evening before you take this Medicine, put in a Gallon of Water a Handful of Pellitory, a Dram of Saffraas-wood, as much of Anise, and a Pennyworth of fine Cinnamon; seeth it over a clear Fire for half a Quarter of an Hour; then remove it from the Fire, cover it well with its Lid, and with Paper, and set it upon hot Ashes. The next Day set the Pot again before a clear Fire, and make it seeth for half a Quarter of an Hour; after which put two Ounces of powder'd Sugar-candy in a Silver Porringer, and pour upon it the Infusion, strain'd thro' a Linen Cloth, with the Expression of the Fœces; when the Sugar is dissolved, let the Patient drink it as hot as he can, and take nothing else for three Hours; which must be observed also after taking the first Medicine. The Use of these Medicines requires no particular Regimen.

Camerarius affirms, that at *Frankfort* they make use of the Root of *Star-thistle*, instead of that of *Eryngo*: It is employ'd in aperitive Ptisans and Broths. One Dram of the Seed of *Star-thistle*, infused in a Glass of White-wine, takes away the viscid Matter which obstructs the Urinary Passages. *Martyn's Tournefort*.

A Water distill'd from the Flower, or the Seeds in Powder, are said to expel the Stone. The Root is said to be good in slow Fevers, and to purge the Body of ill Humours. *Dale*.

2. *Calcitrapa*, Offic. *Carduus stellatus luteus, foliis Cyani*, C. B. Pin. 387. Raii Synop. 3. 196. Tourn. Inst. 440. Elem. Bot. 349. *Carduus Solstitialis*, Ger. 1003. Emac. 1166. Mer. Pin. 21. *Carduus Solstitialis Dedonæi*, Park. Theat. 989. *Spina Solstitialis*, J. B. 3. 90. Raii Hist. 1. 317. *Facea stellata*, *Spina Solstitialis dicta, foliis Cyani*, Herm. Flor. 2. 40. Boerh. Ind. A. 141. *Facea lutea, capite spinoso minori*, Hort. Lugd. Bat. 332. *Leucacantha veterum, Carduus vel Spina Solstitialis*, Chab. SAINT BARNABY'S THISTLE. *Dale*.

Gesner affirms, that it is good for the Jaundice: *Camerarius* says the same thing; and commends it in all sorts of Obstructions, for the Cachexy, Dropsy, Pleurisy, and Sciatica. *Martyn's Tournefort*.

It is esteem'd aperient, deobstruent, lithontriptic; and is said to assuage the Fervor of the Blood. *Dale*.

CALCOCOS, Brass. *Rulandus*.

CALCOIDEA Officula. Three little Bones belonging to the Ankle, so call'd by *Fallopian*, and are the same with the Officula Cuneiformia.

CALCOKEUMENOS, Burnt Copper. *Rulandus*.

CALCULIFRAGUS, *lithontripticus*. Stone-breaking, Lithontriptic.

CALCULOSUS. Afflicted with the Calculus, or Stone.

CALCULUS.

The Lithiasis in Greek, Calculus in Latin, the Stone in Eng-

lish, is usually understood of the Stone in the Kidneys, Ureters, or Bladder. Yet these are not the only Parts in which Stones are generated; for we find Stones, and stony Concretions, in many of the Cavities of the Body, and sometimes in other Parts. Thus *Hippocrates* takes Notice of a Stone in the Uterus, which render'd the Woman barren, and was brought away with great Pain when she was Sixty: See the Article AMPHIPOLOS. Thus also it is notorious, that Stones are frequently generated in the Gall-bladder. *Lister* takes Notice of Stones generated in the *Vesiculæ Seminales*; and I have taken small ones out of the *Prostate*, to the Number of twenty or thirty.

Alexander Trallianus relates a Case of a Person who cough'd up a Stone; and I knew a Lady, now alive, who was thought many Years ago to be in a deep Consumption; but, upon coughing up a Stone, near as large as a small Nutmeg, she recover'd her Health perfectly. Dr. *Freind* says, That of such Stones, cough'd up, he had seen several, and some as big as a Filbert, where no Signs of a Consumption appear'd, only there continued an inveterate Cough. One he knew, who had brought up four or five such, at long Distances of Time.

We may therefore conceive, that if any small indissoluble Substance is fix'd in any Part of the Body whatever, a stony Crust soon forms itself upon it, either more or less. If such a Concretion of the earthy Parts of the Blood happens at the Extremities of the Urinary Ducts, where they open into the Kidneys, and forms a small Grain of Sand, hence arises the Stone in the Kidneys, which, increasing daily, in time grows considerable enough to incommode and obstruct the Kidneys, and bring away a Part of its Substance in the Form of grumous Concretions, Pus, Caruncles, or Skins, till at last it corrupts the Whole, exciting bloody, purulent, and fetid Urine; and sometimes an Inflammation, and consequent Exulceration, of the adjacent Parts.

When this is by any Cause whatever remov'd from its native Place into the Pelvis of the Kidney, and from thence into any Part of the Course of the Ureter, or its Entrance into the Bladder, it frequently intercepts the Urine, and causes an acute inflammatory Pain.

When the Stone is convey'd into the Bladder thro' the Ureters, it is often expel'd from thence, and discharg'd by the Urethra. But, if it remains in the Bladder, the earthy Parts of the Urine adhere to it, and increase its Bulk, forming upon it various Strata, which are sometimes red, sometimes white, ash-colour'd, or azure, the Nucleus which fell from the Kidneys always remaining red. And it appears, by Chymical Experiments made upon Stones, that those of an Azure-colour are the most indissoluble, the Ash-colour'd next, the White next, and that the Red are most easily dissolv'd.

The Symptoms of a Stone in the Kidneys are, an obtuse Pain at the Region of the Kidneys; a Discharge of bloody Urine after any considerable Motion of the Body, especially in a Coach upon stony Roads; gravelly small Stones, Caruncles, or Filaments, discharg'd with the Urine. *Boerh. Aph.*

As the Account *Aretæus* gives of Nephritic Complaints is, perhaps, inferior to none, I shall give it in this Place, in order to make up the Deficiencies of *Boerhaave's*.

The Kidneys are of a glandulous Consistence, and of a red Colour, in which respect they are more like the Liver than the Breasts or Testicles; for these, tho' glandular Substances, are more white. The Shape of the Kidneys is like that of the Testicles, only flatter, and more incurvated. Within them are small narrow Sinuses, which serve for the Percolation of Urine; and from them proceed two nervous Ducts, one from each Kidney, like Pipes, which are inserted into the Bladder, one on each Side, and convey the Urine, by equal Passages, on each Side, from the Kidneys to the Bladder.

The Kidneys, and their Canals, or Ducts, before-mention'd, are subject to many and various Disorders, some of which are acute, and destroy the Patient in a short time; such are Hæmorrhages, Fevers, and Inflammations; others are chronic, but mortal and incurable, and, after long wasting the Body, come to one common Period with the Life of the Patient. Of this kind are Abscesses, Ulcers, Stone, and, from hence, bloody Urine. Ulcers proceed from Abscesses, but are always extremely tedious, and difficult of Cure.

The Generation of Stones is very slow, but the Fit very painful, from the Obstruction of the Passages; and, which is the most dismal Circumstance, the Urine is suppressed. If many small Stones, compressed together, or but one great Stone, stop up the Passage, and this be the Case with respect to both Kidneys, Death must necessarily follow in a few Days, from the Suppression of the Urine, and the Distention of the Parts. Nature, indeed, has taken care to form the Sinuses of the Kidneys of an oblong Figure, and of equal Capacity with the Ureters, and larger than small Stones, with an Intent that if such Concretions should be generated in the upper Parts, they might find an easy Descent into the Bladder. For the same Reason the Stones are of an oblong Figure, since they are generally found sticking in the Ureters; and such as are of an uneven

uneven Bigness, are slender in the fore Part, because of the Narrowness of the Ureters, but thicker in the hinder Part, because the Kidneys discharge themselves downwards. The Stones are generated only in the Kidneys, and that when very much distemper'd with Heat, and have no Seat in the Ureters; into which, however, the Gravel falling, is both a Sign, and the Matter, of the Disease. If the Sinus of the Kidney be obstructed with a Stone of considerable Bigness, there arises a Pain in the Loins about the Muscles call'd *Psoæ*, which extends itself to the middle Rib, so as to cause the Disease to be oftentimes mistaken for a Pleurisy; there is a Sense of Weight upon the Hip; the Patient bends forwards with Difficulty, and can scarcely move his Back; he labours under severe Gripings, which are attended with a Sensation of Heaviness, and remove from one Place to another, because of the Convulsions of the Intestine. If there be a Redundancy of Urine, the Parts are distended, and the Patient is tormented with a Desire to make Water, like a Woman in Travail. He becomes fill'd with Flatulencies, which are not readily discharg'd; a biting and dry Fever seizes him; his Tongue is parch'd, his Belly constipated, and his Body wasted; he loaths all Food, or, if he takes any Sustenance, it is with great Difficulty that he digests it, or receives any Refreshment from it. If a Stone falls into an Ureter, it raises a Shivering, as from Cold, and the Progress of the Stone is felt, attended with a violent Pain. If a Stone falls into the Bladder, there is a plentiful Discharge of aqueous Urine, the Belly is evacuated, Flatulencies are expel'd, the Stomach is easy, there are Eructations, and the Patient is freed from those Evils which before molested him. If the Ureter be lacerated by the Stone, Blood sometimes passes off with the Urine. Another Pain commences, when the Stone passes thro' the Urethra; for, if it is larger than that Canal, it is there detained for a long time;—mean while the Bladder is fill'd, and there is a total Suppression of the Urine, attended with a most tormenting Pain; for even the Ureters are full. The crooked Stones are most painful in their Passage; for I have seen some which have bended like a Hook, and have observ'd Callosities in the Urethra; but these Stones are, for the most part, form'd into an oblong Figure, according to the Shape of the Passage. As to the Colour of these Stones, some are white, like Chalk, and these are commonly found in Children; others are yellow, like Saffron, and generally afflict old Persons, who are also most subject to the Stone in the Kidneys, as Children are to the Stone in the Bladder. There are two Causes of the Concretion of these Stones: In aged Persons, the Coldness of their Bodies, and the Thickness of their Blood; for Cold soonest causes a Concretion of thick Matter. A Proof of this is, that the Waters of naturally hot Springs are by Cold congeal'd into a callous sort of Stone. In Children, the Generation of the Stone is owing to much slimy Matter, which the Blood, like Fire, torrefies, and reduces to a stony Consistence. Such are the Disorders which are consequent to the Generation of a Stone.

Some, at certain Seasons, make bloody Urine, in which respect this Disease is like the Hæmorrhoids, and induces a like Habit of Body. Persons thus affected are of a pale Colour, lazy, unfit for Business, and have neither Appetite nor Digestion. After their periodical Hæmorrhage, they become languid and paralytic in their Limbs, but lighter and freer in their Heads: But, if they miss their usual Evacuation, they are troubled with a Pain in the Head, a Dimness of Sight, a Scotomia, and Vertigo; whence many become epileptic, others bloated, blind, and hydropical; others grow melancholy, or paralytic: And these are the Effects which proceed from a Retention of the Blood which used to be evacuated. If the Blood flows from the Kidneys, it is usually discharg'd pure, and unmix'd with the Urine, out of the Bladder. Sometimes it rushes on a sudden, in a full Stream, from a Rupture of the Kidneys, and congeals into Clots; sometimes it congeals in the Bladder, as if it were out of the Body, and thereby causes a terrible Suppression of Urine. A Rupture is succeeded by inveterate and stubborn Ulcers. The Signs of an Ulcer are, the voiding of a Coat, or thin reddish Membrane, like a Spider's Web, or white Pus with the Urine, sometimes pure and unmix'd, and, at other times, mix'd with the Urine. The Signs of the Formation of an Abscess are, a Fever and Shiverings in the Evening, with Pains and Itchings about the Loins. An Abscess is known to be broken by the coming off of purulent fleshy Clots, and white Pus. The Ulcers are of the biting Kind, and sometimes pure, sometimes foul, which is known by the Pus, and from the Urine having sometimes an ill Smell, at other times none at all.

The Spring generates Hæmorrhages and Abscesses; the Winter and Autumn, the Stone and Gravel. If an Ulcer succeeds the Stone, the Disease becomes incurable, and the Patient falls into a Consumption, which soon terminates in Death. *Aræteus πρὸς ἀσθ. καὶ σπυ. καὶ σπ. παθ. Lib. 2. Cap. 3.*

From ALEXANDER TRALLIANUS.

Stones in the Kidneys are generated of a thick and viscid Matter, too much bak'd or torrefy'd by the igneous Heat of

those Parts; so that the material Cause of the Stone is a gross Matter, but the efficient Cause an igneous Fervency; for of such Matter, with the Help of Fire, do Potters make their Vessels, in such a manner as to be indissoluble by Water. This being the Case, we must endeavour to prevent the Generation of this gross Matter in the Kidneys, and to preserve those Parts free from that igneous and intemperate Heat; for, without either of these, no such thing as a Stone can be generated.

You ought to be very careful in your Examination, whether a Pain proceeds from the Stone, or not; for the same Symptoms happen to those who are afflicted with the Colic, as to those who labour under the Stone; and it is no easy Matter, especially in the Beginning, to distinguish one from the other by the Signs. In both Affections the Patients are molested with Vomiting and Costiveness, with Flatulencies and Distentions; which extend so far as to affect even the Stomach and Liver. But tho' they have the same Symptoms in common, a Man who is Master of his Business will know how to distinguish them; for, in the Colic, the Vomiting is more, and the Matter ejected crude and pituitous; the Belly also is more bound, and the Flatulencies more retain'd: But, in the Stone of the Kidneys, it is otherwise; for oftentimes they have the Benefit of a Stool by the Use of proper Remedies, and sometimes break Wind, and evacuate downwards, without the Help of Medicine, which never happens in the Colic. The Urine ought also to be nicely inspected, in which you will perceive a very considerable Difference; for, in the Colic, it has a more pituitous, as well as more copious, Sediment; but, in the Stone of the Kidneys, it has less Sediment, and, upon a careful Examination, you may discover sandy Particles therein, which are not found in the Urine of those affected with the Colic. The Pain also under a Fit of the Stone is not only more severe, but fix'd principally in one Place, which does not happen in the Colic. *Alexander Trallianus, L. 9. Cap. 4.*

From LOMMIUS.

The Pain proceeding from the Stone in the Kidneys may be known by the following Signs: There is a most severe and pungent Sensation in the Kidney, as if a Thorn were fix'd in it, which settles in that Part, without shifting, except that sometimes it communicates itself thro' the Groin towards the Hip, or the neighbouring Testicle: There is no external Tumor: The Patient cannot bend his Back without Difficulty: The Leg on the same Side with the affected Kidney is sometimes contracted, sometimes, as it were, benumb'd: There are frequent Eructations, with a great Loathing of Food. When the Pains are very intense, the Patient is seiz'd with Vomiting; first of Phlegm, soon after of yellow Bile, and, at last, of æruginous Bile; after which the Pain is mitigated. The Belly, in this Disorder, is constipated, and, by pressing upon the Kidney with the contain'd Fæces or Flatulences, augments the Pain: But, if it happens to be evacuated, a sort of bilious Matter, together with Wind, is discharg'd. When the Patient lies on the affected Part, or while he is fasting, the Pain is mitigated; but, when he lies on the contrary Side, or after a full Meal, when the Food begins to descend towards the Intestines, the Pains and Disorder are exasperated.

At the Approach of the Fit, the Urine is little in Quantity, thin, and aqueous; and soon after, as the Pain increases, is frequently utterly suppress'd, till the Stone being discharg'd from the urinary Passage, which the Greeks call *σπινθηα*, (Ureter) a great Quantity of thick Urine comes off, which deposits a good deal of Sand, and sometimes large rough Stones, or Fragments of Stones; sometimes the Urine appears with Bubbles, and has an ill Smell; sometimes comes away frequently, and in small Quantities, attended with a scalding Heat; oftentimes it brings away what is like Blood with it, especially after Labour, or hard Riding. They who are obnoxious to this Disease, have, for a long time, discharg'd a thick reddish Urine, with a dense and tenacious Spume, which sometimes deposits a red, sandy, and somewhat viscous Sediment; sometimes it continues foul, and, if strain'd thro' a Woollen Cloth, leaves a Substance like the Sediment before-mention'd. This kind of Urine often passes off, for many Years together, without any Inconvenience, without any Pain in the Kidneys, or any other Symptom of the Stone; when, unexpectedly, and all on a sudden, the Kidney is seiz'd with a most acute Pain, and, at the same time, the Belly is constipated, and the Leg on the same Side with the affected Kidney taken with a Numbness. The Pain often remits, and returns at pretty long Intervals, and sometimes without discharging any Stone, but a thick and turbid Urine, and, perhaps, after hard Riding, a bloody one. And, indeed, the voiding bloody Urine often shews the Stone in the Kidneys, when there is no Pain, nor any other Mark by which it can be known, or so much as suspected.

When the Pain is succeeded by an Excretion of the Stone from the Kidney, the same, falling into the Head of the Ureter, causes a Discharge of thin waterish Urine, in a small Quantity; or, which often happens, totally suppresses the same. But if the Stone should happen to be repressed into the Cavity of the Kidney,

Kidney, or, at least, if it penetrates into the Bladder, there follows an Evacuation of such Urine as was before describ'd; so that I am of Opinion, that *Hippocrates* was in the right, when he said, that a sudden Pain of the Kidneys, with a Suppression of Urine, prognosticated a Discharge of Stones or thick Urine. The Stone is often so big as not to be expel'd from the Substance of the Kidneys, in which it was generated, into their Cavity; and, during that time, the Patient feels little or no Pain, but makes a thick, foul, reddish Water, as above describ'd. But after violent Exercise, or hard Riding, not only such kind of Urine is discharg'd, but a bloody Urine, which deposits a grumous Concretion of a Substance like Blood. When the Stone is remov'd into the void Space, or Cavity, of the Kidney, if it be large, and tend downwards, it stops the Ureter, and intercepts the Passage of the Urine, in such a manner that but very little, and such as is of a thin and aqueous Substance, can be discharg'd; such a Stone, at the same time, excites a very sharp Pain. But when the Stone, tho' descended into the Ureter, is too small to cause a considerable Stoppage of the Urine, or when large, and newly remov'd from the Substance into the Cavity of the Kidney, and it has not yet applied itself to the Beginning of the Ureter, there passes off a thick, foul, red, or a dark, and somewhat livid Urine.

Smooth and round Stones are not so difficult to be discharg'd, as oblong and rough ones; but all are not of the same Bigness, Figure, or Roughness. Persons who have been long troubled with Pains in the Kidneys, and have their urinary Passages pretty open, are, for that Reason, tormented with large Stones, but not with those of a moderate Size; whereas those who are but newly affected with this Disorder, or, at least, have seldom been pain'd, suffer severely from the least Stone.

The Stones of the Kidneys are, almost all of them, of a reddish Colour; tho' purulent Kidneys discharge also white ones; black and pale Stones have also been observ'd. In this Affection, the more aqueous the Urine is, and the longer it so continues, and the less Sediment it has, the harder, you may assure yourself, are the Stones in the Kidneys, the more confirm'd, and the more obstinate in resisting Remedies; tho' Urine seldom comes off clear from those who are subject to great Pains of the Kidneys. Fat and aged Persons are most frequently afflicted with this Distemper; it seldom or never happens to Children, and rarely to adult Youth. It seldom also molests those who frequently vomit, and are not subject to be costive. As all Disorders in old Persons are very difficult to be cur'd, so this, of which we have been speaking, admits of no Cure at all. The same is hereditary to a greater Degree than all other Distempers; so that a Man seldom or never escapes the Torment of the Stone, who was, on account of his Parents, by Nature subjected to this Disease from his Birth. *Lommius, Med. Obs.*

From HOFFMAN.

The Word *Calculus*, among the antient Romans, had a great many different Ideas affix'd to it: Thus it signify'd a small Pebble or Gravel-stone, a Chess-man, a Counter, and, by a Metonymy, an Account or Computation, a Doubt or Difficulty, a Sentence of Absolution or Condemnation, as also a Vote or Suffrage; but, by Physicians, this Word is appropriated to Stones form'd and generated in the human Body. These are produc'd in various Parts; in the Stomach, for Instance, in the Gall-bladder, in the Liver, in the Lungs, and in the Interstices of the Muscles in almost every Part of the Body; but no-where do they produce such terrible Consequences, or excite such intolerable Pains, as when lodg'd in the Kidneys, the Ureters, and urinary Bladder.

As the Pain, rising from a Stone slipping from the Kidneys into the Ureters, is the most intense and racking that can possibly afflict Mankind; so, upon its first seizing the Patient, it often happens, that it is with Difficulty distinguish'd from other acute Pains of the lumbar Region.

'Tis a Notion as false and absurd, as 'tis common and popular, that when any one is seiz'd with Pains about his Loins, he must therefore be afflicted with the Stone in the Kidneys; since, in that Region, there are several Parts highly sensible of Pain, and susceptible of Injury; such as the external and internal Muscles of the Loins, the nervous Ligaments of the lumbar Vertebrae, the superior mesenteric Plexus of Nerves, a Branch of the superior meseraic Artery, and, in their Neighbourhood, the winding Extremity of the Intestinum Duodenum, and the Sigmoid Flexure of the Colon; in all which Parts, when either too much distended, or compressed, by the Stagnation of an impure bloody, or serous Humour, very terrible Pains are excited. Sometimes also a Rheumatism, seizing these Parts, produces Pains so racking and intolerable, that the miserable Patient, as if his Loins were cut in the Middle, bends forward, and cannot raise himself up. The same Symptom may also be produc'd, if by a Fall, or lifting any great Burden, the Vertebrae and Nerves are remov'd ever so little from their natural and proper Situation. Too large a Quantity of Blood stagnating about the mesenteric Plexus, and emulgent Arteries, in plethoric Habits, and in those who are subject to the Hemorrhoids, or, in other

People, in consequence of neglecting Venesection, when they have been habituated to it, frequently excites a violent Pain in the Region of the Loins, which is commonly, tho' falsely, ascrib'd to the Stone; since it is often suddenly remov'd, either by Venesection in the Foot alone, or by discutient nitrous Powders.

But it very often happens, that the Colic is mistaken for a Pain produc'd by the Stone; for, when the Flexure of the Colon, which lies near the Loins, is either too much distended with Flatulencies, or spasmodically constricted, a violent Pain is not only produc'd in the Region of the Loins, but also passes to the Præcordia, excites a Nausea and Reaching, prevents the Discharge of Urine, renders the Patient costive, and racks the whole Abdomen with Pains as severe as those generally arising from the Stone. But since this spasmodic Pain is not constant and fix'd, but rather wandering, and of such a Nature as to be greatly reliev'd by the Injection of emollient Clysters, the skilful Physician may, from these Circumstances, easily distinguish it from the Pain arising from the Stone, which bears down more powerfully, does not waste the Strength so much, and remits at Intervals, so that the Patient can frequently rise, and walk about, which does not happen in the Colic. Besides, if the Pain arises from the Stone, the Vomiting and Nausea are greater when the Stomach is empty than at other times; a Tithilation, and pricking kind of Pain, are also felt in the Urethra and Glans; the Urine is loaded with Sand, the Testicle is retracted, the Thigh seiz'd with a Stupor, and the Side itself contracted; none of which Symptoms are observ'd to attend the Colic.

'Tis to be observ'd, that Stones of a very large Size, with considerable Branches rising from them, may be lodg'd in the Substance of the Kidneys for some Years, without creating any great Pain or Uneasiness to the Patient; but, as soon as they are remov'd from their former Seat, and falling into those narrow, nervous, and muscular Ducts, call'd the Ureters, seek a Passage thro' them into the Bladder, the most terrible Symptoms forthwith appear: So that the Ureters themselves may be the fix'd and genuine Seat of Pains arising from the Stone; but these Pains are more or less intense, according as the nervous Coats of these Canals are more or less distended by the Bulk, or irritated by the Roughness, of the Stones which shall happen to be lodg'd in them. These Pains are sometimes so severe and intense, that, besides a Shivering and Refrigeration of the Extremities, they also excite a Nausea, a Vomiting, a spasmodic Constriction of the Præcordia, a difficult Discharge of the Urine, a Stricture of the Belly, an Uneasiness in Breathing, a Stupor of the Leg, a Retraction of the Testicle to the Os Pubis, Restlessness, incredible Loss of Strength, a Syncope, and even epileptic Fits; at other times they bring on a Suppression of Urine, which proves fatal to the Patient. I have sometimes observ'd Patients complain, that they felt such a Pain as if one was continually inflicting a deep Wound all along the Spine, near the Bladder; and, in these Cases, when the Patients were laid open after their Death, the Ureters appear'd distended and turgid like a Pudding, by the large Quantity of Urine which had been deny'd a Passage into the Bladder, on account of a Stone lodged in the Ureter, near its Insertion into that Organ.

'Tis confirm'd by Observation and Experience, that a Stone has sometimes been lodg'd for a long time in the Ureter without creating any great Pain, or intercepting the Passage of the Urine; after which the Pain has seiz'd the Patient unexpectedly, and brought along with it Loathing of Food, Nausea, Vomiting, and Interception of Urine. This Phenomenon has, in all Probability, been owing to the Situation of the Stone being chang'd by some Accident, so as, by its Roughness and Inequality, to prove more offensive to the nervous Coat of the Ureter. Nor is this Disorder universally accompanied with the same Train of Symptoms; for, as *Erasmus* says of the Stone with which he himself was afflicted, in his Epistle to *Perckmeyerus*, "It transforms itself into Shapes so unlike those it formerly bore, that one would really believe it to be another Disorder; one Set of Symptoms attends its Beginning; another appears in its Progress; it sometimes remains fix'd, and sometimes changes its Seat."

'Tis a Circumstance worthy our Attention, that Stones are more frequently lodg'd in the Left, than in the Right Kidney; hence it happens, that Pains arising from the Stone in the Kidneys are observ'd to happen more commonly in the Left than in the Right Side. This is confirm'd by *Carolus Piso*, in *Tract. de Morbis ex serosa colluv. oriund.* where he affirms, "that among an hundred labouring under the Stone of the Kidneys, eighty and more have the fatal Cause of their Disorder lodg'd in their Left Kidney." Nor is the Reason of this Phenomenon so much a Mystery as at first it may appear; for in the Vessels of the Right Kidney, which is cover'd with that large Organ the Liver, and cherish'd with a more considerable Warmth than the Left, the Circulation of the Blood is quicker, and the Separation of the urinous Serum more speedily perform'd. Hence a Stagnation of the Blood and Urine cannot so readily happen in this as in the Left Kidney, which

which, being encompassed by the Flexure of the Colon; is more compressed in consequence of a frequent Stagnation of Flatulencies. Hence it happens, that the intercepted Course of the Blood thro' the compressed Vessels renders the Percolation of the Urine thro' the small Tubes more difficult; brings on a speedy Stagnation in them, and consequently lays a Foundation for the Separation and Concretion of a tartareous or calcareous Matter.

'Tis equally remarkable, and equally confirm'd by Experience, that a Stone which has long remain'd in the Parenchyma of the Kidneys, or in the Pelvis, may be remov'd from its former Seat, and thrust into the Origin of the Ureters, by various Causes; the principal of which are, violent Perturbations of Mind in consequence of indulging the Sallies of Passion; vehement and sudden Commotions of the Body, by Gestation or Riding; and particularly the penetrating Cold of Northerly Winds admitted to the Loins; as also a too liberal Use of Diuretics, such as Preparations of Turpentine and Juniper, generally, tho' absurdly, prescrib'd by some Physicians, as Preservatives against the Stone. I have also often observ'd, that flatulent Colics, and the Spasms with which the Hypochondriac, the Hysterical, and such as are subject to the Hæmorrhoids, are commonly afflicted, do by protruding the calculous Concretions lodg'd in the small Papillæ of the Kidneys, frequently lay a Foundation for intense and violent Gravel Pains.

As for the remote, or, as they are called, the natural Causes, which contribute to the Generation of Stones in the Kidneys, and the Production of the subsequent Pains arising from them, the principal and most considerable is what we call a sanguine Constitution; for Bodies of a soft and spongy Texture, especially those of the Female Sex, whose Veins are filled with Blood, who live delicately, and drink Wine, who indulge themselves in Idleness, and lead a sedentary Life, and who wantonly use Cheese, Milk, and Sweet-cakes, are, especially after the fiftieth Year of their Age, when the Monthly Evacuations cease, subject to Pains arising from the Stone, with which for the most part they are not afflicted so long as the Monthly Discharges are duly and regularly carried on. Among Men, they who in their Youth have been subject to Hæmorrhages of the Nose, and frequent Head-achs, as also they who, having been accusom'd to hæmorrhoidal Discharges, have them either entirely stopt or diminish'd, are in a more advanc'd Age most subject to be afflicted with arthritic and nephritic Pains. Experience convinces us, that old Age is of all others most subject to the Stone, both in the Kidneys, and in the Bladder; because then the Humours are more inspissated, the Aliments become acescent in the Stomach, the Belly is less open, and Ease, which at that Period of Life is generally more indulg'd than in Youth, contributes not a little to the Generation of Stones. This Circumstance *Erasmus* in all Probability had in View, when he passes the following Jest upon his own Misfortune. "It may, says he, appear wonderful that "Women should become barren by Age, which has render'd "me more fruitful; for from Day to Day I bring forth more "frequently."

It also happens, that scarce any Disorder whatever is so frequently observ'd to be convey'd from Parents to their Children, as the Stone, and the Gout, another Disorder of a near Affinity to it in consequence of a peculiar Disposition of the Fluids and Solids; for both these Calamities not only afflict those Men who are full of Blood, and are said to be of sanguine Habits, but they also both draw their Origin from a natural Weakness, and want of Tone, in the Solids; with this Difference, that in the nephritic Patient the Kidneys are the Seat of the Weakness; and in the arthritic, the Ligaments of the Joints. We also frequently observe, that rheumatic and arthritic Disorders are easily transform'd, and converted into those of the nephritic Kind; which in their turn are, by a Translation, as readily chang'd into the former; so that when a Person naturally subject to the Gout has been long free from that Disorder, he very readily becomes afflicted with the Stone in the Kidneys, and *vice versa*. It also frequently happens, that both these Calamities in Conjunction rack the miserable Patient at one and the same time.

As for the Generation of Stones in the Kidneys, we may account for it in this manner: When, in consequence of too large an Impulse of Blood, which with Difficulty returns by the Veins, the Blood-vessels of the Kidneys are too much distended and stuff'd; hence it happens, that the minute Arteries, where they become small Papillæ, and slender urinary Ducts, are burst and forc'd open; thus, by a Stagnation of the extravasated bloody Serum, small Abscesses and Ulcers are at first form'd, and afterwards gradually enlarg'd. When the urinous Serum, which is impregnated with many tartareous and slimy Parts, stops in these Abscesses and Ulcers, the more weighty and acuminated Particles are separated from the rest, and form themselves into Concretions, which at first have the Appearance of a thick and coarse fabulous Matter; afterwards Grains of a closer and more compact Texture are generated,

VOL. I.

which by the Assistance of a plentiful Secretion of Urine are easily wash'd away; and often not totally discharg'd without Pain. Where-ever, then, such a gross and heavy Sand subsides in the Urine, it is an infallible Sign of Stones being lodg'd in the Kidneys. But when these calculous Concretions form'd in the ulcerated Substance of the Kidneys become gradually larger and harder, and are either by the Urine, which is impregnated with tartareous Parts, or by some other Cause, convey'd into the Pelvis, or the Beginnings of the Ureters, more terrible Pains are excited, and a formidable Train of Symptoms appear; because the calculous Concretions must make their Way thro' these narrow Ducts, of exquisite Sensation, to the urinary Bladder, into which when they have fallen, the Symptoms are entirely remov'd, and Strength is restor'd, to the no small Joy of the Patient.

That Stones may also be generated in the Parenchyma of the Kidneys, by the Stagnation of an ichorous, bloody, or purulent Humour, is, among other Circumstances, plain from these, that in nephritic Patients, as was long ago observ'd by *Celsus*, something of a bloody or purulent Appearance is discharg'd with the Urine; that Patients afflicted with the Stone frequently discharge a bloody Urine; and that their Kidneys have, after their Death, been found to be large, flaccid, and exulcerated. This is also obvious from a Consideration of the Cure, which is most happily brought about by abstergent, vulnerary, consolidating, and gently astringent Remedies. Nor do I deny, that without the Substance of the Kidneys being previously injur'd, a tartareous Matter, or Concretions of Sand of a very surprising Bulk, may be gradually form'd in the Pelvis, and larger Ducts of the Kidneys, in consequence of a Stagnation of the Urine. But in proportion, as this Matter, whether ichorous, or tartareous, differs with regard to Colour, Crasis, and Consistence, and according as the Accretion is greater or less, so various Kinds of Stones are generated and form'd; for some consist of a Substance so hard, that they appear almost to be of the Nature of a Stone; others are friable, and less firmly compacted; some are of a pale, and others of a cineritious Colour, whilst others are red, or of the Colour of Sandarach; some are larger, and others smaller; some are more angular and rough, whilst others are much less so.

That all nephritic Disorders, such as Infarctions of the Kidneys, Inflammations, Exulcerations, and Pains arising from the Stone, are more difficultly cur'd in old, than in young People, is a Truth not only confirm'd by Experience, but establish'd by the Authority of *Hippocrates*, in the sixth Aphorism of his sixth Section; for as Wounds and Exulcerations of the internal Parts are in an advanc'd Age difficultly cur'd, by reason of an increased Intemperies of the Humours, and an abundance of the Excrements; so the Wounds and Exulcerations of the Bladder are in that Period of Life cur'd with the greatest Difficulty, by reason of the excessive Acrimony of the Urine.

When violent nephritic Pains do not remit for several Days and Nights, but incessantly rack the Patient, and resist the most approv'd Remedies; and when at the same time a total Suppression of Urine comes on, accompanied with Coldness of the Extremities, and a kind of Convulsion of the Tendons; these Symptoms pronounce the Death of the Patient to be near. But Pains arising from the Stone presage the most particular and imminent Danger to those, who, thro' a long continued Course of Grief and Sorrow, have had their Strength previously impair'd; since, immediately upon their being seiz'd, a greater Loss of Strength, and a Gangrene of the internal Parts, ensue. Nor is it a good Symptom, when a Stone lodges long in one of the Ureters; for by this means the Appetite is lost, and the Digestion destroy'd, whilst the Nausea, the strong Efforts to vomit, and the Uneasiness remaining for a considerable time, a slow hectic Fever comes on, wastes the Strength, consumes the Flesh, and puts a speedy End to the Patient's Life.

After the Death of some Patients, Stones of a surprising Bulk, considerably compact, and furnish'd with large Branches, have been found in their Kidneys, which appear'd to be totally exulcerated, and cover'd with a hard Membrane, tho' they were never known to complain of any Pain during their Lives; and these Patients are cut off by a Disorder which we call *Tubes Renalis*. Some are, soon after their being seiz'd with nephritic Pains, cut off by an acute Distemper, whilst an Inflammation of the Stomach or Intestines at last succeeds the racking Pains they have endur'd. Others, by reason of a total Suppression of Urine, fall into a Dropsy of the Breast, a Lethargy, or Convulsions. *F. Hoffman*.

The CURE, as propos'd by *ARETÆUS*.

To prevent the Generation of Stones in a Constitution naturally disposed to breed them, is a Thing impossible; for it is more easy to prevent the Conception of Children in the Womb, than breeding of Stones in the Kidneys; our only Way therefore is to endeavour to expel them. For this Reason I shall

give Directions in Cases of Difficulty, where the Stone pertinaciously adheres to the afflicted Part, which is a Circumstance attended with a violent Pain, and sometimes the Patient sinks under a Complication of Gripes, Colic, and a Suppression of Urine; for the Kidneys and Colon are contiguous. In a Fit of the Stone, therefore, attended with Gripes, and a Suppression of Urine, open the Vein of the Ankle, on the same Side with the affected Kidney; for an Effusion of Blood from the Kidneys relaxes that Constriction, which is the Effect of the Stone; and an Inflammation having seiz'd all the Parts, it is most readily resolv'd by an Exinanition of the Vessels. Embrocations also of the Loins near the Seat of the Kidneys are to be used with old or new Oil, in which Rue has been infused, or Diuretics, such as the Tops of Dill, Rosemary, or Sampsuchus; with these let the affected Parts be embrocated, as with Water; for simple Unctions are of little Service. Besides these, foment the Parts with Oil of Chamomile in Ox-bladders, and let Cataplasms be made of the same Materials, mix'd with Meal. Sometimes Cupping without Scarification relieves in a Fit of the Stone; but the best Way under an Inflammation is to scarify. If none of these move the Stones, let the Patient bathe in Oil, which is instead of all Remedies; for the Warmth thereof relaxes, and in some measure lubricates the Parts, and its Acrimony stimulates to Excretion. These then are the topical Medicines which promote the Expulsion of the Stones. Simple Medicines are Potions of the Roots of Valerian, Spiguel, and Afarabacca; or of the Herbs Prionites, Parsley, or Sium; compound Medicines are, Ointments composed of Spikenard, Cassia, Myrrh, Cinnamon. *Arctaus nesi besan.* *xpcv. nab. Lib. 2. Cap. 3.*

From ALEXANDER TRALLIANUS.

The Cure of the Stone in the Kidneys, at the time of the Fit, must be attempted by such Medicines as are of relaxing and lenitive Qualities, and are, besides, endu'd with the Virtue of dissolving and expelling the Stone. The best Remedy for these Purposes is Bathing; because it not only mitigates, but has Virtue sufficient to cure the Distemper. It frequently indeed mitigates the Pain of the Colic, without curing it; but, under a Fit of the Stone, it not only mitigates the Pain, but wholly relieves the Patient. For the more effectually answering this End, let the Parts be anointed with Oil of Chamomile while in the Bath, and let the Patient sit for a good while together in the Solum, or Bathing-chair, in plenty of hot Water; and not only use the Bath once every Day, but two or three times. In the Summer Season let him often use the cold Bath; after which, being well wrapt in Linen, let him drink the Decoction of Carduus, with Smallage, or a little Anise. If the Pain continues, and the Expulsion of the Stone does not succeed, let him drink the Decoction of Cinquefoil, with his Cloaths still wrapt about him. This is a very grateful as well as effectual Medicine, and ought to be taken out of the Bath, either alone, or with Oxymel. If the Root of Cinquefoil be wanting, a Decoction of Eryngo, or Erysimum, and Prionites, being drank, is very effectual for the same Purpose. Outwardly may be apply'd Bags of frumentaceous Meals, with Decoctions of Chamomile, Marshmallows, Melilot, and Oil of Chamomile, often changing them. If frumentaceous Meals be wanting, you may use Woollen Rags, moisten'd with sweet Oil, or Oil of Chamomile, often warming and changing them. Clysters also are to be administered, but such as are not very acrimonious, but have a good Quantity of Oil in them, and are endu'd with a laxative and dissolvent Virtue. Such are Decoctions of Marshmallows, Fenugreek, dry'd Figs, Chamomile, and Oil of Chamomile; and in Constitutions where Heat much abounds, Cremor of Ptisan, mix'd with Oil of Roses, Chamomile, and Yolks of Eggs. These Medicines being of a lenitive Quality, by restoring the Parts to a good Temperature, lessen the Cause of the Disease, and prevent those who have always the Stone in the Kidneys from having a Fit. If the Disease be still obstinate, we must have recourse to more powerful Medicines; such is Goat's Blood, which must be thus prepar'd:

When Grapes begin to be ripe, take a new earthen Pot, and put Water in it, and boil it, in order to take off the earthy Quality of it; then take a He-goat, in the Vigour of his Age, which is about the fourth Year, and fed for some time with Fennel-leaves, Amomum, and such-like sweet-scented Herbs; cut his Throat, and receive the middle Part of the Blood, rejecting what comes out first and last, in the Pot. After it is coagulated, mince it small in the Pot, and expose it to the Air, under the Cover of a fine Sieve, or a thin Linen Cloth, that the Sun and Moon may shine upon it, and that it may be dry'd, taking care that it receives no Moisture. When it is dry, reduce it to Powder, of which give a Spoonful at a time in *Cretan Wine*.

This is a most powerful and efficacious Remedy, as I know by long Experience. I have given it with burnt Troglodytic Myrrh in the severest Pains, and by that means brought away a large Stone piece-meal by Urine. This Medicine, besides dissolving the Stone, mitigates the Pain, and prevents the Generation of Stones for the future; for which Reason it is called; *The Hand of God*.

Anodynes are to be used only in the time of the Fit, and under extreme Pain, but avoided at other times, for fear of creating a Distemperature in the Kidneys. But if there be any Danger of the Patient's sinking under the continual Pain, and want of Sleep, we must have recourse to such Remedies, as have not only the Virtue of mitigating Pain, but of procuring Sleep.

As to Bleeding, if the Patient be full of Blood, or the Fit be attended with an Inflammation, you ought to begin with breathing a Vein; by means of which, the Parts being relaxed, and the Passages open'd, the Remedies to be administer'd will have the more room to exercise their Virtue.

Amidst a Plenty of Medicines for this Disease, some indeed diminish the Stone, but at the same time promote the Generation of other Stones, by increasing their efficient Cause, which is the igneous Heat and Distemperature of the Kidneys. To prevent this Effect, avoid such Medicines as are very hot and acrimonious; or, if you are necessitated to use them once or twice, desist from them after you have obtain'd your Purpose, and do not use them, as is too commonly done, for the sake of Preservation. But all our Intentions must be directed to the procuring of a good Temperature, for which End we must make use of such Medicines as are attenuating without any considerable Degree of Heat. Such are Oxymel, Maiden-hair, a Decoction of Marsh-asparagus, and Couch-grass, the Roots of Smallage and Eryngo, and the Herb Cinquefoil, the Root and Leaves of Plantain, but especially its Seed, the Broth of Chiches, and Seeds of Peony and Almonds. But these are not to be used continually, but only when you are apprehensive of a Collection of gross Matter in the Kidneys. You would do well, always, before you eat, to drink warm Water; for nothing so well cleanses the Reins from Recrements, or brings them to a just Temperature, so as to be indisposed for generating the Stone; for in Length of Time their fiery Heat is extinguish'd by the Tepidness of the Water. They are in the Right therefore, who in the middle of their Meals drink Water, or Wine cool'd, or prepar'd with the Juice of Roses or Violets. All season'd Meats, of what Kind soever, Pickles, and every thing that has Pepper in it, are to be avoided. And not only acrimonious Food, but such as yield a gross Juice, are to be prohibited, such as salted Meats, prepar'd Swines Udders, fine white Bread, hard Eggs, Cakes, and all other things prepar'd with Milk, as well as Milk itself, and Cheese, together with very black and austere Wines. The Patient also must never lie upon a Feather-bed, for these heat the Kidneys to a great Degree; he ought also not to stand much, but to keep himself sitting, or in Motion. He must avoid eating late, and Meats of hard Digestion, such as Sausages, all Fish of the cetaceous Kinds, as the Tunny, Mackrel, Pollard; and all testaceous Fish, except the Scallop and Sea-urchin, which last he would do well frequently to eat; for, besides inducing a good Temperament, it has a Faculty of provoking Urine. Lobsters and Whelks may sometimes, tho' seldom, be eaten; but Oysters are wholly forbidden, as well as all fat Beasts and Birds, and the continued Use of such as live in Marshes: But the Wings of Geese, and small Birds, which are not fat, as green Sparrows, and such as build in Towers, and the like; of Fruits, Cucumbers, especially the inner and medullary Part, Melons, dry'd Figs, thick-rind'd Apples, and Pears in moderate Quantities, but not for Continuance, are allow'd. *Trallian, Lib. 9. Cap. 4.*

From HOFFMAN.

The whole Secret in curing Nephritic Pains seems to consist in bringing away the Stones easily, and with as little Trouble as possible; and in preventing and hindering the fresh Formation of that Sand or Matter which proves the immediate Cause of the Disorder, and all its concomitant Symptoms; for the Method of Cure, under an actual Paroxysm, differs widely from the Measures to be taken when the Patient is in a State of perfect Ease; in which Case, Preservation or Prevention ought to be the Intention of the Physician.

In the Paroxysm itself, where the Symptoms are violent, and the whole Economy of the vital Functions disorder'd by the exquisite and intolerable Pain, the first Step to be taken is, by proper Medicines, to allay the Vehemence of the Pain; and, by well-chosen Remedies, to sooth, and, if possible, remove the spasmodic Strictures, which not only rack the adjacent Parts, but, in consequence of that mutual Consent which prevails between any one Part and all the others, the whole nervous System. This is so much the more necessary, because, under such a violent Attack of Spasms, which constrict and brace up the Urinary Ducts, the Progress of the Stone thro' the Ureter into

into the Bladder is, with the greatest Difficulty, promoted. Among the most celebrated Medicines for answering this Intention, I must, above all others, recommend my own anodyne Mineral Liquor, on account of its Efficacy and Safeness; for, when exhibited in small, but frequent Doses, by allaying the Spasms of the *Primæ Viæ*, it wonderfully removes the uneasy Sensation there felt, the Nausea, and the Vomiting. If a sufficient Quantity of this Medicine cannot be had, the most proper Succedaneum to it is Spirit of Nitre, carefully prepared, in the manner directed by me in *Observat. Physico-chym.* See NITRUM. For this Spirit, being now divested of its acid Quality, by its mild and sulphureous Exhalations dispels Flatulencies, and relaxes spasmodic Strictures. The Spirit is, for this Intention, most properly exhibited with sedative Waters; such as that of black Cherries, and those of the Flowers of *Egyptian Thorn*, *Elder*, red Poppies, *Lime-tree*, *Primrose*, *Lily of the Valley*, *Meadow-sweet*, and especially the Waters of *Chamomile-flowers*, and the *Tops of Yarrow*, with the Addition of a little of the Syrup of red or white Poppies. It may also be exhibited in *Flesh-broth*, with a few Spoonfuls of pure and new Oil of Almonds, obtain'd without Fire. This Intention is also answered by Emulsions of Sweet Almonds, the Four cold Seeds, and those of Poppy, Gromwel, and Carrot-seeds, prepared with the above-mention'd Waters, and edulcorated with a sufficient Quantity of the *Syrupus Albus*. But when these mild and gentle Medicines are not sufficient for mitigating the Pain, we must have recourse to those which are somewhat more powerful, such as Opiates, corrected, and render'd safe, by the Addition of other Substances; of this Kind are the *Pilulæ Wildeganii*, the *Pilulæ Starkii*, *Sydenham's Liquid Laudanum*, the *Theriaca Coelestis*, and the *Trochisci de Alkekengi*; all which, on account of their Efficacy, and the Tendency of their Ingredients to sooth and allay Pain, deserve the highest Encouragements.

Besides these Remedies already mention'd, nitrous Preparations, and among these Nitre alone, purified and crystallized, or an artificial Composition of the Spirit of Nitre, and Salt of Tartar, or antimoniated Nitre, are superior, both in Efficacy and Safeness, to all other Remedies in allaying intense and acute Pains, accompanied with violent and raging Commotions of the Blood and Humours; and must, of consequence, be of all others the most proper in Nephritic Disorders. These Preparations are most commodiously mix'd with Powder of Crabs-eyes, with Cinnabar, or the *Pulvis Marchionis*, and a few Grains of the *Trochisci Alkekengi*, or the *Pilula Wildeganii*, and so drank off in an Emulsion, or in sweet Whey.

But when the Pains and Spasms become so violent as to be intolerable, internal Medicines alone are not sufficient for soothing and allaying them; but external Applications must also be called in to the Relief of the Patient; and, among these, none produce more happy and salutary Effects than Clysters prepared of emollient Flowers, especially those of the Garden Mallows, *Elder*, red Poppies, *Yarrow*, common *Chamomile*, and *Mullen*, boiled with Whey; adding some of the *Syrupus Dialthææ* of *Fernelius*, Nitre, and *Epsom Salt*. When the inferior Part of the *Rectum* and *Colon* is so violently constricted, that the Flatulencies cannot be transmitted, but, rising to the superior Parts, increase the Uneasiness they already labour under, I have, in this Case, often observed very singular Relief afforded by Clysters of Oil, and pinguious Substances. The Belly being thus rendered soluble, and a Passage open'd for the Flatulencies, the Reachings to vomit, and the uneasy Sensation of the *Præcordia*, forthwith disappear.

In mitigating Pains of this Kind, as the Method of *Hippocrates* is the most antient, so I think it the best and most efficacious of any; for, says he, in his fifth Book *de intern. Affection.* "when a Pain has seiz'd the Kidneys, wash in a large Quantity of hot Water; and apply tepid Fomentations, especially to the Part affected." The same Remedy is recommended by *Trallian*: And it must be owned, that no Remedies whatever are equal to Baths, and Semicupiums of pure Water, especially Rain-water moderately warm, in removing the most violent Pains of this Kind; and the Effect may be the more certainly depended upon, the oftener they are repeated. In Cases of this Nature I have also often seen singular Relief afforded, by applying to the Part affected, Liniments of human Fat, or that of a wild Cat, a Dog, or Beaver, made up with *Unguentum Dialthææ*; or a Bladder fill'd with a Decoction of the above-mention'd emollient Flowers, prepared with Milk.

When, in consequence of a due and careful Use of these Medicines, a remarkable Remission and Alleviation of the Spasms ensues; when the Pulse becomes more calm and gentle; when a moist and equable Heat is felt over all the Surface of the Body; and when the Flatulencies are successfully discharged by the Anus; then the Protrusion of the Stone is to be attempted, with proper Remedies, and due Caution. I have seen this Intention speedily answer'd by various Remedies, and, among these, none affords a more remarkable and instantaneous Relief than liberal Draughts of an Infusion prepared of *Paul's-betony* and *Parsley*, or of the Seeds of wild Carrot, Ce-

lery, and Fennel, Winter Cherries, Liquorice-root, and Yarrow-tops; especially if a Glass of Liquor somewhat spirituous, such as *Malmsey Wine*, or *Geneva*, is drank immediately after the Exhibition of the Infusion. I have also observed, that in Conjunction with the Motion of the Body, a large Draught of *Forestus's Antinephritic Infusion* has proved of singular Efficacy in bringing Stones from the narrow Ducts in which they were lodged. But there is, in some Cases, a Necessity for more powerful Propellers, the safest and most efficacious of which are, Mother of Pearl, or the Shells of Eggs calcined, and exhibited with Lemon-juice, in some proper Vehicle.

The PRESERVATIVE METHOD.

As, in the Beginning of this Disease, Preservation is, comparatively speaking, an easy Task; so in its Progress, when, in consequence of any considerable Fault or Exulceration of the Kidneys, a large Quantity of Stones is form'd, and the Paroxysms return frequently, the Disorder is attended with the greatest Difficulty of Cure, and a Set of the most perplexing Circumstances; for since, as I have already observed, many are afflicted with Nephritic Pains, either in consequence of a preternaturally large Quantity of Blood, or from its being render'd crude and thick, by the Use of a Variety of incongruous, viscid, and acid Aliments; hence nothing can be more proper for removing this terrible Calamity, than taking a sufficient Quantity of Blood, using due Motion and Exercise, drinking diluting Liquors, especially the medicinal *Selterian Waters*; as also fresh, but acidulated, Whey.

In Cases where Stones are continually discharged, there is a Necessity for having recourse to Medicines of a vulnerary, gently consolidating, and astringent Quality; for which Reason it has long ago been observed by many, and confirmed by the Practice of the common People, that, by a long Use of Decoctions, or Infusions of vulnerary Herbs, prepared with Water or Ale, and mix'd with sweet Butter or Honey, many have been entirely freed from this Disorder. The principal Herbs proper for this Purpose are Horsetail, Golden-rod, Ground-ivy, Strawberries, white Horehound, *Paul's-betony*, *Pellitory of the Wall*, *Yarrow* with its Tops, Mallows, Bark of *Egyptian Thorn-root*, Club-moss, torrefied Juniper-berries, Strawberries dried, the Stones and Fruit of roasted Hips; of which Powders an Electuary may be prepared, with white *Prussian Honey*, which, by its consolidating and balsamic Quality, is very proper against Disorders of the Kidneys; and half a Spoonful of it, taken in the Morning, drinking Tea after it, has been observed to afford very singular Relief to those who, for many Years, have laboured under these Disorders.

There is also another Method of preserving from the Stone by alkaline Medicines, which subdue and destroy that acid and glutinous Matter, which is the principal Foundation and Ground-work of the calculous Concretions: Hence it is, that Crabs-eyes, Mother of Pearl, Shells of Eggs, Shells of Fishes, and Snails, either simply prepared, or calcined; as also Thunder-bolts, Jews-stone, and the celebrated Powder of *Volkhammer*, which is thought to consist of calcined precious Stones; or simple Oil of Tartar *per Deliquium*, or of Potash, or fixed Nitre, Tinctures of Tartar, and the acrid Tincture of Antimony, frequently used, prevent the Generation of Stones, and consequently free the Patient from the violent Pains produced by them.

There are still more Remedies, whose Efficacy is observed to be equally beneficial to Nephritic Patients; and these are such as, consisting of oleous, pinguious, mild, and somewhat anodyne Particles, prevent that Union of the saline Spiculæ, which is necessary to the Formation of a solid Concretion; for it is known, from Chymical Experiments, how small a Quantity of any pinguious Substance retards Crystallization. To this Class we may also justly refer those Seeds and Fruits which abound with a mild and sweet Oil; such as the Four greater cold Seeds, those of Gromwel, Saxifrage, white Poppy, and Ladies-thistle, sweet and bitter Almonds, Stones of Cherries and Peaches, which, either when reduced to a Powder with Sugar, or made up in the Form of an Emulsion, and frequently used, prove of singular Service to those who are frequently afflicted with this Disorder. We may also reckon, among the best Remedies for Distempers of the Kidneys, Liqueurice-root, the Powder or Infusion of which is of singular Efficacy, in obtunding and correcting the acrid Particles of the Salts, and washing off mucous Substances. Among other valuable Medicines of this Class we may also justly reckon Yarrow, with its Tops; an Infusion or Decoction of which is, in Disorders of this Kind, of the most singular and surprising Efficacy, if used daily for a considerable time. By the Use of this single Herb, I have observed some Patients entirely freed from Nephritic Pains, to which they had been long subject; for it is proper in Cases of this Nature, upon several Accounts, since, besides its consolidating and mitigating Quality, it abounds with a truly anodyne Oil, which, both in Colour and Virtues, resembles that of Chamomile; and is highly efficacious in allaying Pains, and relieving Spasms.

But,

But, as in all Chronical Disorders, so more especially in preventing Nephritic Indispositions, we are to take particular Care, that the Stomach and Digestion, as also the Discharge of the Fœces, be kept in a due and natural State. *Actius*, in his sixteenth Chapter, has a memorable Passage to this Purpose. "A moderate Quantity of Food, of an easy Digestion, prevails against the Stone; for Crudities not only exasperate the Disorder, but even lay a Foundation for it where it was not before: Let such as are subject to the Stone, therefore, abstain from eating to Excess, and from Supper altogether; let them vomit frequently, and daily drink Liquors impregnated with Wormwood. Let them also be purged at certain times; and live upon Food which can neither create Surfeits, nor generate Crudities. Let them also use such Substances as provoke Urine, daily eating well-boil'd Parsnips, Fennel, Pennyroyal, and Calamint; and, among Sea Substances, the Strombus, (*a kind of Shell-fish*) the Lobster, and the Crab. Let them also drink, for many Days, a Decoction of Eryngo-roots, and also of Dittany. The Water they drink should be of the purest Kind, and strained: Their Wine should be small and white, so that it may provoke Urine. They should use moderate Exercise, and Frictions in a Bath, impregnated with calcin'd Nitre, calcin'd Dregs of Wine, and Pumice-stone." *Trallian* is also very full and circumstantial, as to the Regimen of Nephritic Patients: See his Sentiments above.

The celebrated Secret of *Zecchius*, recorded in his Consultations, was undoubtedly borrow'd from *Trallian*, since it consists only of about a Pint of warm Water, drank before Dinner. And *Carolus Piso*, many Years before the Days of *Zecchius*, recommended warm Water, affirming, that after the first Stone was discharged, none would ever after be form'd, if the Use of warm Water was persisted in.

CAUTIONS and PRACTICAL OBSERVATIONS.

But as in the Cure, as well as the Prevention, of this Disorder, the chief Business of the Physician consists in adjusting his Medicines to different Constitutions, Ages, and Temperaments, and accommodating them to the particular Functions injured, and the several concurring Causes of the Disorder, I shall subjoin some Cautions and Observations, which will be found to be not only useful, but necessary in Practice. First of all, then, we are diligently and carefully to consider, that the Medicines used in the Cure of this Disorder are not equally fit and proper for all Constitutions; nor do they always produce the same Effect, or afford the same Relief, on account of the different and mutable State of the Fluids, and the peculiar Texture of the Solids depending upon that Difference, which is, by the *Greeks*, call'd *Idiosyncrasia*. For this Reason Medicines should sometimes be varied; since, in Process of Time, Nature becomes so habituated to one Medicine, that it often ceases to produce the same Effect it formerly did.

It has often happen'd, that Nature herself, without the Concurrence of Medicines, has unexpectedly discharged the Stone: Something analogous to this happens in Child-birth, when, in some Cases, Medicines are of no manner of Efficacy, till Nature herself come in to their Assistance: Hence it sometimes happens, that Quacks, with their insignificant Medicines, have acquired the Reputation of performing a Cure which was wrought by Nature herself. The Physician ought therefore to advert to this, that Nature alone often puts a Period to these violent Spasms, Pains, and Commotions; which is not to be ascribed to the Force of Imagination, since it may be accounted for from real physical Causes; for the great Art of Physic consists in making a due Estimate, with regard to the precise and lucky Moment in which Nature begins to act, and exert her Force for the Relief of the Patient: Hence it is sometimes advisable, especially when Medicines have for some time been exhibited without Success, to desist from their Use, that Nature may be allow'd to take her own Measures, since she often spontaneously, and unexpectedly, produces more happy Effects than the Physician can possibly do, by disturbing her Operations with his forcing and stimulating Preparations.

Tho' the more acrid and vehement Diuretics, and Provokers of Urine, such as the Preparations of Turpentine, Juniper, Amber, Garlick, Onions, and Parsley, are neither useful in preserving from the Stone in plethoric Patients, nor of any Service in a Nephritic Paroxysm, whether simple, or produced by Stones, but render the Disorder worse, and heighten the Symptoms; yet the prudent and cautious Use of them is not altogether to be condemn'd and laid aside; since in coarse, robust, moist, and sluggish Constitutions, especially when exhibited with a preservative Intention, they produce happy Effects, not only by strengthening the Tone of the renal Vessels, but also by discharging thro' the Kidneys a large Quantity of impure tartarous Serum.

As seasonable, moderate, and dry Gestation, or Motion, is highly assistant to Nature in protruding the Stones, and may be properly used after well-chosen Propellents, especially diluting Liquors, such as hot and cold Medicinal Waters, and Whey,

which, by their Weight, act so powerfully as to remove the Stone from its fix'd Seat; so it has been observed, that unseasonable Gestation, or Riding, has proved prejudicial to many, since, by removing the Stone from the Place in which it created no Uneasiness to the Patient, and altering its Position, so that its rough and pointed Surface more strongly irritated the delicate nervous Coats, Spasms so violent and terrible have been excited as sometimes to prove mortal.

There perhaps is not a better or a more efficacious Method of preserving from the Stone than seasonable Venesection, especially in Cases where the Body is naturally disposed to discharge too large a Quantity of Blood. This Remedy is, in some Cases, also highly proper in the Paroxysm itself; when, for Instance, a Plethora and quick Pulse are attended with an intense Heat, and a preternatural Thirst; for such is the Nature of intense Pain, that, in consequence of the violent Spasms it excites, the free Circulation of the Blood thro' the Veins is retarded, and impetuously carried in large Quantities to improper Parts: Hence arise Epilepsies, Convulsions, Deliriums, Apoplexies of the sanguine Kind, Discharges of bloody Urine, inflammatory Fevers, and other Disorders, of which we have too frequent Instances; all which might be prevented by a due and seasonable Venesection.

When Pains, arising from the Stone, happen in scorbutic Constitutions, in such as abound with impure and recrementitious Humours, or in those who are subject to a chronical purple Eruption, and when, under the very Nephritic Paroxysm, a scorbutic Impurity exerts its Force, various and highly dangerous Symptoms appear, which require the highest Skill and Caution in the Physician; nor, in this Case, can any thing be so properly prescribed as diluting and Pain-allwaging Liquors, such as Whey, either acidulated or sweet. The Patient must also abstain from every kind of Malt-liquor, and Wine of all Sorts; but I have observed, that, in such Cases, Whey moderately warm, and gentle Diaphoretics, were of singular Service.

However instantaneous Relief Baths may afford, or however necessary they may appear, yet they are by no means to be used in plethoric, full, and fat Constitutions, where there is at the same time a Difficulty of Breathing. Before Baths can, in this Case, become proper, the Plethora is to be removed, the Belly render'd soluble, and the Violence of the Pain mitigated.

Nephritic Pains are often accompanied with a convulsive Colic, arising from the Hemorrhoids: The prudent Physician must be at the Pains to distinguish all these Circumstances, and proceed cautiously, both in pronouncing the Fate of the Patient, and in the Cure of his Disease. But what demands our particular Care and Attention, is the racking and intolerable Pain of the Intestines, which must be mitigated or removed by Venesection, the Application of Leeches, or by rendering the Body soluble by means of proper Clysters. It often happens, that when the Stone is thrust, by one continued and violent Impetus, thro' the Ureters, an intolerable Pain, accompanied with Loss of Strength, is excited in the whole Region of the Back and Abdomen; but the Pain immediately ceases when the Stone falls into the Bladder.

When the Pain has continued for a long time, and the Patient has lost his Strength; when old People are afflicted with this Disorder; or when it is brought on by Grief, and a Weakness of the Pulse is observed, that Opium is to be shun'd like so much Poison, and none more carefully than the *Pilula de Cynoglossa*, is confirmed both by Reason and Experience. In these Cases it is better, and more advisable, to recruit and reinforce Nature by analeptic and moderately spirituous Waters, such as those of Mint, Baum, Lilies of the Valley, or of Cinnamon, without Wine; adding a Grain or two of Ambergris, and of the Extract of Saffron: Wine may also be used, in Moderation, for the same Purpose. Externally also the weaken'd Tone of the Intestines must be restored, as much as is possible, by spirituous and balsamic Liniments.

Among the hot and mineral Waters, none, by reason of the calcarious Earth with which they abound, more powerfully resolve and dislodge the tartarous Matter which is the Cause of this Disorder, than the *Caroline Springs*; which, at the same time, must be used very cautiously and circumspectly. After the internal Use of these for a Month's time, I have seen above five hundred small smooth Stones, as large as Vetches or Lentils, discharged: But, after an Accident of this Nature, consolidating and gently-balsamic Medicines are absolutely necessary, in order to unite and incarn the Cavities left in the Kidneys, in consequence of the small Stones being dislodged. But I know, from numberless Instances, that the safest, both for Preservation and Cure, is the *Selteran Spring*; which, besides the Purity of its Waters, contains an alkaline Salt, and is superior to all other Medicines in the Cure of Wounds, and Imperfections of the Bladder. In Cases also where the Humours are fraught with a scorbutic Impurity, and the Parts at the same time are exulcerated, the Waters of the same Fountain, mix'd with Milk, and used for a sufficient time, are very proper.

BOERHAAVE.

BOERHAAVE's Method of Cure of a Stone in the KIDNEYS or URETHERS.

In order to the Cure of a Stone in the Kidneys, the Physician's Views must be directed to diminish the Stone; to procure its Expulsion; or, at least, to bring it into a Part, where it may reside, without giving exquisite Pain, as into the Bladder.

This is principally done by a moist, mild, thin, and moderately salt Diet; by drinking Liquors of an aqueous Nature, or Fluids of the like Kind; and by the vital Powers.

The Vegetables which Boerhaave recommends in this Case, and which he advises to be taken plentifully, boil'd in Broth, are these, and others possess'd of the same saponaceous Virtues.

Borage,	The Roots of Turneps,
Chervil,	————— Skerrets,
Gum Succory,	Sow-thistle,
Lettuce,	Vipers-grass,
Parley,	Dandelion,
The Roots of Carrots,	Yellow Goats-beard.

Amongst Liquors, Whey, Milk, and Buttermilk, of Animals fed on fresh Grass only, are principally recommended.

The Use of these is excellent, provided it be persisted in till a Diarrhea is brought on, which must be continued for some time, though it should reduce the Patient to a considerable Degree of Weakness; for this Method has frequently been known to cure inveterate Disorders of this Kind.

Boerhaave somewhere observes, that Oxen, Stall-fed, and kill'd in Winter, have usually stony Concretions found in their Livers, Gall-bladder, and biliary Ducts; and that in Cattle kill'd immediately after a Summer's Grass, these Concretions are seldom or never found. And hence he draws an Argument for the Efficacy of the young saponaceous Vegetables.

Experience, the Touchstone of Medicinal Applications, does not want the Confirmation of Reason. But it is entertaining, at least, to examine into the Reason of Appearances, when attended with any Degree of Abstruseness. It may not, therefore, be amiss to examine, why the saponaceous Spring Vegetables dissolve stony Concretions in the Body. I have in many Places remark'd, that some *Menstruum* is necessary to dissolve a Portion of the Earth, in order to render it small enough to enter the Pores of the Roots of Vegetables. It is not our present Business to consider what this *Menstruum* may be, having already discuss'd this Subject under the Articles *ACETUM*, and *BOTANY*. But whatever it be, we may reasonably suppose a Portion of it to reside in the Juices of the Spring saponaceous Vegetables, not so much alter'd in its Circulation through them, as to divest it of a Power of dissolving earthy Concretions, when taken into the Body, and assisted by the vital Forces. And as the Milk also of Animals, whose Food is Grass only, and Water, is, in a great measure, immediately produced from these vegetable Juices, may not Milk, Whey, and Buttermilk, be in some measure endu'd with a dissolving Power?

Another Method of bringing about the Expulsion of the Stone is, to relax the Parts by Baths, Clysters, and relaxing Liniments; to lubricate the Passages by moist, emollient, mild, and oily Medicines; to remove the spasmodic Stricture of the Fibres by Opiates and Anodynes; to propel the Stone cautiously by Diuretics, and moderate Motion.

In these Views the subsequent Forms are recommended by Boerhaave.

Take of the Leaves of Mallows, Marshmallows, yellow Mallows, Mercury, Pellitory of the Wall, Brank-urline, and Orache, each four Handfuls: Boil in a sufficient Quantity of Water for a Bath, to reach as far as the Loins.

Clysters of the same Decoction are to be injected, and large Quantities of the same are to be perpetually drank; for all these contribute to relax, open, mollify, and expel.

An oily Lubricating Decoction.

Take thirty sweet Almonds; twenty Pistachio Nut-kernels; Poppy-seeds bruised, three Ounces: Let the Almonds and Pistachio Nuts be blanch'd, and then bruised with the Poppy-seeds; after which let them boil in a sufficient Quantity of common Water for half an Hour; then let them be strongly beat together for some time; and afterwards add of Venice-soap, four Ounces; Liquorice, two Ounces. Let all boil together a little, and strain off the Decoction, which must amount to three Pints. Let the Patient drink half a Pint of this four times a Day, upon an empty Stomach; and afterwards let him walk gently a little time.

An aperient Anodyne Opiate.

Take of Syrup of the Five opening Roots, an Ounce and an half; of solid Laudanum, two Grains; of purify'd Nitre,

twenty Grains; of distill'd Parsley-water, six Ounces: Mix together. Let the Patient take half an Ounce every Hour.

A propellent Diuretic Decoction.

Take of red Chiches contus'd, two Ounces; Parsley-seeds, an Ounce; Roots of Quich-grass, and of Parsley, each four Ounces; Leaves of Agrimony, Golden-rod, Male Speedwell, each half an Handful; Liquorice, an Ounce: Boil for half an Hour, with a sufficient Quantity of Water for three Pints of strain'd Liquor; to which add of Nitre, two Drams. Let the Patient drink two Ounces every Hour.

Thirdly, Regard must be had to the Symptoms. Thus, if there is an Inflammation, it must be remov'd, or at least moderated, by Bleeding, relaxing Remedies, and the other Methods specify'd under the Article *INFLAMMATIO*. The Pain must be mitigated by anodyne Emulsions; and the Asperities of the Stone must be guarded by oleous, saponaceous, and glutinous Remedies.

Boerhaave is of Opinion, that no Dependence is to be had on Lithontriptic Medicines.

Whilst the Stone is falling from the Pelvis of the Kidney thro' the Ureter to the Bladder, the above-specify'd Method and Medicines are proper; particularly Bleeding, Clysters, and Fomentations. Boerhaave *App*.

I must farther remark, that few Fits of the Stone occur, without inducing an absolute Necessity for Bleeding immediately, which generally gives great Relief.

Laxative and emollient Clysters, in which Turpentine is an Ingredient, are highly necessary; and these are to be repeated, or not, according to the State and Constitution of the Patient, and the Effects of the first; which the Physician, who inquires into these Circumstances, can only judge of rightly.

Next to these are lenitive Purges, prepared, for Example, of Manna dissolv'd, and quickened with some of the Cathartic Salts, and whatever else the Physician shall think adapted to the Case.

Opiates, also, are highly necessary, in order to take off the spasmodic Contraction of the Parts where the Stone resides, and to alleviate the Pain; but I think they should seldom or never be administer'd, without the above-mentioned previous Evacuations. Amongst Opiates *Matthew's Pill* is generally most esteemed in these Cases, on account of the Soap of Tartar, and other opening Ingredients. The usual Dose is betwixt six and ten Grains. But the Dose, and Times of Exhibition and Repetition, can only be determined by the attending Physician.

As it may be agreeable to gouty People afflicted with the Stone, to know how Dr. Sydenham, perhaps the best practical Physician that any Age has produced since *Hippocrates*, treated himself under this Circumstances a Part of his Method is specify'd under the Article *ARTHRITIS*; the rest is contain'd in the following Dissertation.

Though it may seem to argue Indiscretion to publish an Observation which I have experienced in myself alone, yet it is hop'd no equitable Person will be displeas'd with me, who have suffer'd so long, and so much, from bloody Urine, from a Stone in the Kidneys, for being moved to compassionate those who labour under the same Disease, and to communicate those Remedies which have given me Relief, though they may, perhaps, seem common, and not worthy of Notice.

In the Year 1660, I had the longest and severest Fit of the Gout I ever had in my Life, so that I was constrained for two Months in the Summer Season to lie always in or upon a soft Bed; whence, towards the Close of the Fit, I began to feel a dull heavy Pain, especially in the Left Kidney; and sometimes, though very seldom, in the Right. And after the Gout went off, the Pain in the Kidneys remain'd, and attack'd me at Intervals, which, though it was not very sharp, made me fear the Stone; for I had hitherto escap'd those Fits which are attended with severe Pain along the Ureters, and violent Vomiting. But though these Signs of the Stone in the Kidney appear'd not hitherto, yet I had Reason to believe I had a large Stone in one of them, being too big to pass into the Ureters, occasioned the above-mentioned Symptoms. And several Years afterwards I found I was not mistaken; for having walk'd considerably, and for a long time, in the Winter Season, in 1676, soon after the breaking of a severe Frost, I made a bloody Urine directly, and constantly did so whenever I walk'd much, or was carried in a Coach over the Stones, though the Horses went slowly; but this Symptom did not seize me when I travell'd in a Coach in unpav'd Roads, how long a Journey soever I made.

The Urine I voided on these Occasions, though it look'd very bad at the time of making, so as to resemble Blood, yet soon after it became clear at the Top, like natural Urine, the Blood falling to the Bottom by itself in Clots. To relieve this Disorder, I had a large Quantity of Blood taken from my Arm;

and, after taking some Purges, had recourse to several Sorts of cooling, incrassating Remedies, along with a proper Regimen, and carefully forbore all sharp, pungent, and attenuating Liquors. But having received no Benefit from these, and many other Remedies, which it would take up too much Time to enumerate, and fearing to drive the Stone forwards by Steel-waters, as suspecting it was too large to be expel'd thereby, I at length lost all Hopes of relieving myself by this Way, especially having found, that some of my Acquaintance hastened their Death by fruitlessly endeavouring to cure this Complaint by such Medicines; for which Reason I resolv'd to desist from all farther Trials, unless by way of Prevention, by avoiding all Motion of the Body as much as I could.

But happening afterwards to recollect the great Commendations which some Persons have bestow'd on the Seed of the Ash-tree, for its Stone-dissolving or Stone-breaking Virtue, I imagin'd, that if the Seed had so much Virtue, the Manna thereof might probably have more. For the Manna which comes to us, according to Mr. Ray, and other earlier Writers, is neither an aereal Honey, nor a certain heavenly Dew, but rather a Liquor ousing from the Leaves, Branches, or Trunk of the *Calabrian* Ash-tree; of the Truth of which Mr. Ray was farther satisfied, whilst he was on his Travels to *Italy*, by a Physician, who frequently gathered Manna from the Branches and Leaves of these Trees, first closely covered with Linen. Accordingly, to make the Trial, I dissolved two Ounces and an half of Manna in a Quart of Whey, and drank it; and took a little Lemon-juice between whiles, as well to make it operate more speedily, it being ordinarily a slow Purgative, as to render it more agreeable to the Stomach. It is hard to express the Ease I perceiv'd in the Region of the Kidneys, from this Medicine; for though the Pain was not continual before, yet I felt a troublesome Weight. Encourag'd by this Success, I took this Purgative every Week, on a set Day, for some Months, and found a manifest Amendment after every Purge; till at length I could bear more shaking in a Coach; and indeed continued free from this Symptom till last Spring, at the Beginning of which it return'd, occasioned by my having had the Gout severely all the preceding Winter, and my Inability to Motion, whence I was constrained to abate of my ordinary Exercise. And now I doubted whether I should have recourse to Purging again, as finding that the mildest Purge certainly occasioned a Fit of the Gout, because the whole Substance of my Body, in these latter Years, had, in a manner, degenerated into Nourishment for this Distemper. But at length I recollected, that I might safely resume my former Method of taking Manna once a Week, provided I took an Opiate in the Evening, after the Operation, to quiet the Tumult rais'd by the Purgative. Accordingly, in the Morning, I drank two Ounces and an half of Manna dissolved in a Quart of Whey; and at Night took sixteen Drops of liquid Laudanum in Small-beer; and repeated the Manna and Laudanum in this manner twice a Week, for three Weeks. But afterwards I took the Manna only once a Week, because it discharged such Plenty of foul Humours, as to leave little Fear of the Gout. And Reason intimating, that if Manna was possess'd of any Stone-dissolving or Stone-breaking Virtue, its Efficacy, on which I depended, must needs be lessened, in some measure, by so powerful an Astringent as Laudanum is, I thought it best to omit taking the Opiate, as I only purged once a Week.

I have continued this Method for some Months, always purging on the same Day of the Week, and would not upon any Account be persuaded to break it. But though the Pain of my Back abated as formerly, upon taking the first Purge, yet soon after repeated Purging brought on some Symptoms of the Gout, and sometimes affected the Limbs, and sometimes the Bowels; but Laudanum effectually check'd these Motions of the Distemper. This Method, however, having hitherto been successful, I judg'd it proper to continue it, both to prevent the Return of the bloody Urine, and to carry off a Part of the Matter which forms the Stone. And, in the End, it answer'd my Expectation, having never had this Symptom since my first Publication of this Treatise, and therefore I left off the Manna entirely.

With respect to Purging, therefore, in case of bloody Urine, and provided only Manna be used according to the Method above delivered, I must retract an Assertion I formerly publish'd in my Treatise on the Gout, which is, that it is absolutely improper to purge gouty Persons, either at the Beginning, Declension, or in the Intervals of the Fits. For I did not then recollect, that the Fit, which I fear'd might be occasioned by the Purgative, might be prevented by giving an Opiate at Night. Nevertheless, if the Gout only be attended to, all manner of Evacuations are very pernicious therein, and therefore not to be us'd, unless the above-mentioned Symptom requires them.

To these Observations I will add a few Particulars relating to the Regimen and Diet, which should seem proper in both these Distempers; for I would not omit mentioning any thing that may be serviceable to Persons in my Condition. In the Morn-

ing, after I rise, I drink a Dish or two of Tea; then I go out in my Coach till Noon; and, at my Return home, dine moderately upon any kind of Meat I like, that is easy of Digestion; for Moderation is principally necessary. I drink a little more than a Quarter of a Pint of Canary immediately after Dinner every Day, to promote Digestion, and drive the Gout from my Bowels. In the Afternoon I go out again in my Coach, and, when Business permits, take a Turn into the Country, two or three Miles, for good Air. A Draught of small Beer serves me instead of a Supper; and I drink another Draught after I am in Bed, and about to compose myself to Sleep, in order to dilute and cool the hot and acrid Humours lodg'd in the Kidneys, which breed the Stone. I always prefer small Beer brew'd with Hops, to that which has none; because, tho' unhopp'd small Beer is smoother and softer, and so better suited to bring away the Stone from the Kidneys, yet that which is brew'd with Hops, on account of the Stypticity it receives from the Hops, is less subject to breed Gravel and calculous Matter, than that which has none, as being more viscid and slimy. On my purging Day I dine upon a Chicken, and, notwithstanding, drink my Canary as usual. I go to Bed early, especially in the Winter Season; this being one of the best Helps for promoting Digestion, and preserving the proper Order of Nature; whereas, on the contrary, sitting up late weakens all the digestive Faculties in aged Persons afflicted with any Chronic Disease, and injures their vital Principle to a Degree not to be easily remedy'd. And, to prevent bloody Urine from the Stone, whenever I am oblig'd to go very far in my Coach upon the Stones, (for the longest Journey in unpav'd Roads does me not the least Hurt) I always drink a large Draught of small Beer before I set out, and another in the Way, if I am abroad a considerable time; by which means I secure myself pretty well from bloody Urine.

Lastly, we are to take Notice of the great Danger which some Persons, who have the Gout and Stone, run, by unadvisedly taking Manna dissolv'd in the purging Mineral Waters; for, tho' being taken this way, it works quicker, and sits easier on the Stomach, yet these inconsiderable Advantages are no Equivalent for the Mischief otherwise occasion'd by the Waters. For if the Stone in the Kidneys be too large to be forc'd thro' the Ureters into the Bladder, these Waters generally occasion a Fit, which continues, not without endangering the Life of the Patient, till the Stone gets back again into the Pelvis. Steel Waters likewise are unsafe, unless it be certainly known beforehand, that the Stone is small enough either to slip, or force its Way, thro' the Ureters; which, to the best of my Judgment, can only be learn'd with Certainty from hence; viz. if the Patient hath already had a Fit of the Stone, (which consists in a very sharp Pain in one of the Kidneys, extending thro' the whole Duct of the Ureters, and accompany'd with violent Vomiting) he may be assur'd, that the Pelvis, instead of having a large Stone in it, rather contains a Number of small Stones, one of which will fall occasionally into the Ureters, and cause a Fit, which generally lasts till it is forc'd into the Bladder. In this Case, I say, there is no better Remedy, either to prevent the Increase of small Stones, or to expel them from the Kidneys, than drinking Steel-waters plentifully every Summer.

But, as Persons may often be seiz'd with a Fit of the Stone, when these Waters are either not procurable, or at an improper Season for drinking them, they are to be treated according to the following short Method. The Patient being sanguine, and not aged, take ten Ounces of Blood away from the Arm of the pain'd Side; then let a Gallon of Posset-drink, in which two Ounces of the Roots of Marshmallows have been boil'd, be drank with the utmost Expedition, and the following Clyster injected.

Take of the Roots of Marshmallows, and the white Lily, each an Ounce; the Leaves of Mallows, Pellitory of the Wall, Bear's-breech, and Chamomile-flowers, each an Handful; the Seeds of Flax and Fenugreek, each half an Ounce: Boil them together in a sufficient Quantity of Water to a Pint and a half; in the strain'd Liquor dissolve brown Sugar, and Syrup of Marshmallows, each two Ounces: Mix the Whole for a Clyster.

When the Patient has thrown up the Posset-drink, and the Clyster has done working, give a sufficient large Dose of liquid Laudanum, for Instance, twenty-five Drops, or fifteen or sixteen Grains of *Matthew's* Pill. But Bleeding is not to be us'd in aged Persons, worn out by some inveterate chronic Disease, and ancient Women, subject to the Vapours, especially if they void black gravelly Urine at the Beginning of the Fit. Nevertheless, in other respects, this Method must be closely follow'd.

But, to return to the Stone, supposing it a large one, which is our present Subject: If the Patient hath never had a Fit, on account of the Stone's being too large to quit the Pelvis, Steel-waters will not only do no Service, but cannot be us'd without immediate Danger, for the Reasons above-mention'd. Nor do Mineral Waters succeed better in gouty Persons, if they be advanc'd in Years, as such mostly are, and withal of a weak and phlegmatic

phlegmatic Constitution; the Strength of Nature being sometimes impair'd to that Degree in such Subjects, as to give great Reason to apprehend the total Loss thereof from such a Quantity of Water. But whether the ill Consequences, happening to Persons of this Constitution, proceed from this, or some other Cause, I am thoroughly persuaded, that abundance of Persons, who have been extremely debilitated, and in a manner worn out by this Distemper, have been destroy'd by these Waters. *Sydenham.*

The Stone in the BLADDER.

From ARETÆUS.

No Disease affecting the Bladder is of a gentle Nature; for, as to acute Disorders of that Part, such as Inflammations, Wounds, Convulsions, and acute Fevers, they are all mortal; and an Ulcer, an Abscess, the Palsy, or a large Stone in the same, are incurable. The Stone is not to be dissolv'd by any Potion, or lithontriptic Medicine, nor taken out by cutting, with any Safety; for the fine Membranes of the Bladder must, at the same time, be cut, which Operation kills the Patient on the same Day, or carries him off in a few Days with Convulsions and a Fever. If the Stone be not cut out, an Ischury, Pain, Fever, and Colliquations, destroy the Patient; or, if it be of no considerable Bigness, the Suppression of Urine is the more obstinate, because it the more easily falls into the Neck of the Bladder, and intercepts the Passage of the Urine; and tho' such a Stone may be extracted with less Danger than a larger, it is necessary to cut the Bladder, the Consequence of which, if not Death, is a continual Efflux of the Urine, which, tho' no dangerous Disorder, is yet insupportable to a free Person, who knows not how to live under a perpetual Dribbling, which molests him whether he sleeps or wakes, and is very troublesome in walking; but a Multitude of small Stones may be cut out with Safety.

If a Stone grows to the Bladder, it manifests itself by the Uneasiness, and sometimes Pain, which it excites, and a Weight which is felt, tho' not accompany'd with a Dysury; but if it does not adhere to the Bladder, there is also a Dysury. All Stones may be known by the sandy Sediment in the Urine; the Pudenda also project. The Patients void their Urine with Pain, by reason of the Obstruction from the Stone, and handle and attract the Pudendum, as if they would pull out the Stone and the Bladder together; the Anus suffers by Consent, being affected with an Itching. The Intestinum Rectum is protruded by the violent Efforts of the Patient, who imagines himself on the point of voiding the Stone; for there is so near a Vicinity between the Bladder and the Anus, that they mutually affect each other; wherefore, in an Inflammation of the Anus, the Bladder labours under a Suppression of Urine; and, in Diseases of the Bladder, the Anus will discharge nothing, tho' the Belly be not costive. *Aretæus, περί δι. & σπ. χρο. παθ. Lib. 2. Cap. 4.*

From ALEXANDER TRALLIANUS.

The Stone in the Bladder afflicts the Patient by Fits at certain Times, after the same manner as the Stone in the Kidneys; but the former is more frequent in Children than adult Persons, and does not owe its Rise to so great a Heat, but rather to a grosser Matter, proper for the Generation of Stones, which readily forms Concretions, by means of the natural Heat. Our main Intention, therefore, must be to correct the Grossness of this Matter by Attenuants, and to prevent any considerable Collection of it, which is promoted by nothing so much as an inordinate Voracity, and stirring of the Body after eating.

The Signs of the Stone in the Bladder are, a crude and whitish Urine, with a sandy kind of Sediment, resembling Scurf. Besides, the Patients are very subject to scratch the Pudenda, and violently and frequently to distend them; and that most of all, when they have occasion to make Water. *Alexander Trallianus, L. 9. C. 7.*

From LOMMIUS.

The Pain which proceeds from the Stone in the Bladder is most afflicting, because it lasts a long time, and makes frequent Returns at certain Intervals. While it holds the Patient, there is an extraordinary Sensation of a Weight, if the Stone be large, and especially when the Body is mov'd, or a sort of Titillation about the Pubes and Perinæum. There is a Difficulty of Urine, with a continual Desire of making Water, and a kind of Strangury, so that the Urine seems hardly possible to be restrain'd, and yet, as soon as it begins to flow, is on a sudden quite intercepted; and thus is the Evacuation perform'd with continual Interruptions. During this time a Pain is felt throughout the Duct of the Penis, but oftentimes seizes only the Glans, and is most tormenting when the Patient has just made an End of making Water; at which Time he has also a Desire of going to Stool. From some the Urine comes off more freely when they stand upright, than when they lie upon their Back, if the Stone be large. Others evacuate bending forward, and endea-

vour to ease their Pain by handling and extending the Pudendum. Women often rub the external Parts of the Pudenda with their Hands, and, by applying a Finger to the Neck of the Bladder, now-and-then feel the Stone. Many Patients, in the midst of their Pains, cross their Feet one over another by turns. The Urine which comes off is white, thick, and turbid, with a purulent or mucous Sediment; sometimes Blood, or a bloody concreted Matter, is discharged with it. This Disease is more incident to Children than adult Persons, to Men than Women. The Stone of the Bladder is whiter, larger, and harder, than that of the Kidneys: A lesser Stone more easily slides into the Neck of the Bladder, and more pertinaciously retains the Urine, than a larger; for the latter, by a proper Position of the Body, or by introducing an Instrument, may, with no great Difficulty, be remov'd from the fore-mention'd Part. *Commius, Med. Obs.*

From BOERHAAVE.

We may know, that a Stone is got into the Bladder, by a Cessation of the Signs of a Stone passing from the Kidney to the Bladder thro' the Ureter; and by its Effects, when in that Organ; which are, Inflammation, with all its Symptoms; Pressure upon, and Fretting of the internal Membrane; Ulcerations; purulent Urine; Strangury; entire Obstruction of the Urethra, inasmuch that the Patient cannot discharge his Water, unless in a supine Posture; a hectic Fever, and Consumption; a Pain is felt before, during, and after the Discharge of Urine, which does not come away in a full Stream, but, as it were, dribbling, and with many Interruptions; and which is white, and deposits a mucous, thick, heavy Sediment, in considerable Quantities; an uneasy Itching is felt in the Glans of the Penis; and the Discharge of Urine is attended with a *Tenesmus*. But the most certain Method of discovering a Stone in the Bladder is by searching; for the Method of doing which, see LITHOTOMIA.

The CURE. From ARETÆUS.

If the Suppression of Urine be caus'd by the Stopping of its Passage by Stones, they must be remov'd by the Instrument call'd the *Catheter*, that a Passage may be open'd for the Urine to run off, unless there be an Inflammation, in which Case the Passage will not admit an Instrument, and, besides, is subject to be wounded by the Catheter. But if this Method be impracticable, and the Pain insupportable to the Patient, we must have recourse to cutting the *Trichas*, (*τρίχας*, some read *πληχάδα*, which, according to *Ruffus*, is the Place between the Scrotum, the Neck of the Bladder, and the Thigh) and the Neck of the Bladder, that the Stones may fall out, and so the Urine be evacuated. This done, the Wound must be cicatrized, if it can be done; if not, it is, however, better for the Patient to be troubled with a running Sore all his Life, than to be suffer'd miserably to expire with Extremity of Pain. *Aretæus, περί βεζαν. δι. παθ. Lib. 2. Cap. 9.*

From ALEXANDER TRALLIANUS.

As for Medicines, the Blood of a Goat, rub'd warm upon the Part, is of excellent Service; but a better way is, to apply the Blood of a He-goat upon the Bladder; tho' the Method which is by far the most convenient and effectual, is, to rub the Parts with it in the warm Air of the Bath, and to bind it thereon; and this must be done not only once, but often, and at Intervals. *Trallian. Lib. 9. Cap. 7.*

From BOERHAAVE.

As soon as we have reason to believe, that a Stone is pass'd thro' the Ureters into the Bladder, we must use our utmost Endeavours to procure its Expulsion by the Urethra; otherwise it will increase in Bulk, and become more troublesome. This is done by the same Methods and Medicines that are recommended above for a Stone in the Kidneys and urinary Ducts, except that the Topics are to be apply'd to the Region of the Bladder; to which add Baths, and Clysters of Oil; Injections of Oil into the Urethra; and it will be of Service to rub the external Part of the Urethra with the same Oils.

If a Stone is fix'd in the Urethra, and will not move forwards, the Part is to be relax'd by Injections of Oils frequently repeated, and by the most emollient and relaxing Fomentations which can be contriv'd. The *Egyptians* have a Method of diffusing the Urethra by blowing into it, and then inviting the Stone forwards by Suction. It may also be pressed gently forwards, or brought out with an Instrument shap'd like an Ear-probe; or, if that will not do, the last Remedy is to cut the Urethra or Perinæum.

If the Stone sticks in the Neck of the Bladder, it may be put back by the Catheter. *Boerh. Aphor.*

The Method of extracting a STONE out of the URETHRA.

From HEISTER.

Sometimes, in Persons afflicted with the Stone and Gravel, a small Stone slips into the Urethra, or Passage of the Urine, and

and there sticks, where it excites not only violent Pains, but a great Difficulty of Urine, and sometimes a total Suppression of the same; in which Case the lamentable State of the Patient calls upon the Physician to use his best Endeavours to expel the Stone. There are various Parts of the Urethra in which the Stone may be seated: Sometimes it lies in the Beginning of the Urethra, behind the Scrotum, about the Perinæum, in the Neck or Sphincter of the Bladder; sometimes about the Middle of the urinary Duct, before the Scrotum, and sometimes not far from the End of the Urethra. Sometimes the Stone is lodg'd in a peculiar Expansion, or Bag of the Urethra; such a one is describ'd by *Le Dran, Obs. Chir. 79. Tom. 2.* and *Dionis*, in his Surgery, mentions some of the like Kind; and I myself, this present Year 1737. discover'd Stones in such a Bag before the Scrotum; and, what is seldom known, cut two out of one little Bag under the Urethra, which are represented (*Tab. 48. Fig. 16. and 17.*). In what Part the Stone is detain'd, may be judg'd partly from the Pain, and partly from Searches made with the Fingers or Instruments. The Cure may be attempted various Ways: Sometimes internal Medicines, which provoke Urine, and, at the same time, external ones, as Fomentations, Cataplasms, Bathing, Clysters, and the like, are administer'd, and continu'd for some time. If all these prove ineffectual, the next Attempt is to moisten and lubricate the Inside of the Urethra by Injections of Oil of Olives, or Oil of sweet Almonds, that the Passage being render'd slippery, the Stone may the more easily slide off; or the Patient is put into some emollient Bath, with the same View. Some bind the Penis behind the Stone, and then distend the Forepart of the Urethra by strong Inflation, in order to enlarge the Passage for the more easy Expulsion of the Stone. This Method of Cure is practis'd by the *Egyptians*, as we are assured, among other Authors, by *Prosper Alpinus* in his *Medicina Ægyptiorum, Lib. 3. Cap. 14.*

If the Stone cannot be expel'd by these Remedies, but the Difficulty of Urine is rather exasperated by them, it will be convenient to try some other powerful Remedy. First, then, if the Stone be detain'd in the Neck of the Bladder, it may be cut out by making a Section in the Perinæum, where it is perceiv'd by the Touch; but, because many are very much afraid of an Instrument which carries an Edge, the Stone may be push'd back into the Bladder by introducing the Catheter. However, since it is to be fear'd, that the Stone will increase in the Bladder, and, by that means, expose the Patient to far greater Danger, I should prefer Section. So, also, if the Stone should happen to stick too fast in this Place to be repel'd by the Catheter, and so reduce the Patient to Extremities, or if we do not think it advisable to repress it for the Reason aforesaid, it must be artfully extracted by the Section call'd the *Apparatus minor*, or *lesser Apparatus*, one or two Fingers being introduc'd into the Anus, in order to sustain the Stone; for oftentimes there is no other Way to save the Patient's Life. If the Stone be detain'd near the Glans, the best Method, after using the Remedies above propos'd, is, first to lubricate and relax the narrow Passage, by repeated Injections of Oil into the Urethra, and then, with the Fingers, to press the Stone forwards, or attempt its Extraction, especially in Boys, by Suction with the Mouth of some Woman, Nurse, or Assistant; for, by this means, all Wounds, Cicatrices, and Fistulas of the Urethra, are happily prevented. If the Stone sticks near the End of the Passage, it is to be taken with the Forceps, Hook, or some sort of Ear-probe, (see *Tab. 27. Fig. 14.*) and gently drawn forth. If this be impracticable, it will not be amiss to try the Instrument so much recommended by *Marini*, and describ'd by him (see *Tab. 50. Fig. 7.*). Of this Instrument the Part (A) is cautiously introduc'd into the Urethra, beyond the Stone, of which it takes hold; then the Operator takes the Part (B) in his Hand, and gently pulling, draws along the Stone, and extracts it. But if either an Inflammation, or the Bulk of the Stone, should, contrary to Expectation, render all these Methods ineffectual, we are directed by *Tulpius* and *Garengot* to make use of Section. And *Garengot*, in such a Case, immediately cuts the Extremity of the Glans with the Scissars, and then introducing a Probe, or Hook, into the Wound, extracts with it the Stone; after this he washes the Wound with Wine, and dresses it with Lint and some glutinous Balsam.

If none of the Methods before propos'd prove successful for extracting the Stone, as it often happens, when it is detain'd in the Middle of the Urethra, and there is Danger, lest the Difficulty of Urine, with the most intense Strainings to discharge it, and the tormenting Pains, should, in a short time, destroy the Patient, there is but one Remedy left, and that is, to make an Incision in that Part of the Penis where the Stone lodges, and, by that means, extract it. The Manner of Operation is thus: The Extremity of the Skin, as *Celsus* formerly advis'd, is very much drawn forwards; or, as others advise, retracted; and the Glans being by this means cover'd, or laid bare, the Penis is ty'd behind the Stone, in order to prevent the Stone from being forc'd back by the Hands of the Operator, when apply'd upon the Penis. The Operator then sets the Thumb of his Left Finger

against the Stone, in such a manner as to hinder it from giving way forwards, and, with his Right Hand, makes a strait Incision in the Side of the Penis; and then, with his Fingers, or some Instrument, as the Forceps, Probe, or Hook, pulls out the Stone. This done, the Skin is set loose, and the Wound, after being anointed with some proper vulnerary Balsam, is cover'd with a Plaister. By this Way of Management the sound Part of the Skin comes to cover the Incision in the Penis, the Urine flows the natural Way, and the Conglutination of the Wound is promoted. When a Wound requires to be made a little larger than ordinary, the best way is to introduce a Leaden Pipe into the Urethra beyond the Wound, and to keep it there for some time for the Reception and Emission of the Urine. For if this should be suffer'd to flow by the Wound, it is very much to be fear'd, that its Acrimony would excite sharp Pains, and an Inflammation, by which the Conglutination of the Wound would be considerably retarded, and a Fistula might be generated in the Urethra. But a very good way to preserve the Wound from the pernicious Effects of the Urine, is, to drink very sparingly for some Days before and after the Operation. As for making the Incision in the Side of the Penis, it is done for very good Reasons; for, if it were made in the under Part of the Penis, the Wound would be much more liable to be incommoded by the Urine; and to make an Incision in the upper Part would be very unadvised, because of cutting the cavernous Bodies of the Penis; whence an immoderate Hæmorrhage, besides other pernicious Consequences, might justly be fear'd. *Albucasis*, formerly a very celebrated Physician among the *Arabians*, shews a Way to break a Stone which sticks in the Urethra, by perforating it with a sort of Terebra, which he delineates; but if he happen'd to fail in this Attempt, he ty'd the Penis on both Sides near the Stone, to prevent its giving way on either Side, and then cut it out.

Thus we have explain'd the common Method of cutting the Urethra for extracting the Stone. We shall now give some Account of a new Way invented by *Thibaut*, formerly a very celebrated Surgeon of *Paris*, and describ'd by *Garengot*, which was this: He took the Penis in his Left Hand, and made an Incision on the Side; then, with the Knife, he separated the cavernous Body from the Urethra, in which he afterwards made a strait Incision in the Place where the Stone was lodg'd, which is commonly under the cavernous Body, and, extracting it with the Hook or Forceps, he anointed the Wound with some glutinous Balsam, and then applying Lint and Compresses, carefully bound up the Whole with a Fillet. By this Method, the entire Part of the cavernous Body is brought to cover the Incision in the Urethra; and the Lips of the Wound, as they assert, sooner unite, and come to a Coalescence.

When the Stones are lodg'd in a peculiar Bag, the best way, in my Opinion, is, to make an Incision in the Place where we can most conveniently (and that sideways) have Access to them; for thus, thro' a pretty large Wound, I extracted the Stones above-mention'd, which you see represented (*Tab. 48. Fig. 16, 17.*). The Cavity of the Bag I first treated with a Digestive, then with Corrosives, as red precipitate, Mercury, and sometimes cleansed it with Lapis Infernalis, and at last heal'd it with Balsam of *Copivi*, and little glutinating Plaisters. But Conglutination, in this Case, is sometimes very difficult, as appears from *Le Dran, Obs. 79.* where several ways of Healing were try'd to no Purpose. *Heister Chirurg.*

The Case refer'd to by *Heister*, in *Le Dran*, is very remarkable, and deserves Notice.

Towards the End of the Year 1722. a Lad, sixteen Years of Age, perceived a small Swelling in the *Perinæum*, but gave no Attention to it, as it was not painful.

Some time after, he went a Journey on Horseback, and the Pressure of the Saddle against the *Perinæum* forc'd a Stone out of it, of the Bigness of a Pea, which pass'd thro' the Skin and Urethra, both being worn out by the reciprocal Pressure of the Saddle and the Stone; and the Urine, distilling thro' this Aperture, form'd a Fistula.

Soon after, the Patient perceived a Swelling at the Bottom of the Scrotum, on the Left Side; and, finding it to increase daily, he shew'd it to a Surgeon of his Acquaintance, who look'd upon it as venereal, and propos'd a Salivation: He consented to this Proposal, and went thro' it without receiving the least Benefit. During this time the Fistula closed, and the Urine pass'd no longer that Way, which might perhaps happen from the daily Augmentation of the Volume of the Tumour.

The Occasion of this Augmentation was a fresh Stone, which, being stopp'd in that Place, and perpetually moisten'd by the Urine, was considerably increased. At length, in December 1725. the Patient straining to lift a great Weight, he felt a violent Pain in the *Perinæum*, and, putting his Hand to the Part, felt something hard which had pierced the Skin: He used his Endeavour to extract it with his Nails, but could not succeed; but, as the Stone was soft, he crush'd a Part of it in Pieces (whence we may judge what Situation it had kept during its Stay there). He was much incommoded by it for eight Days, not being able to sit without a violent Pain; and at length, in rising from his Seat,

Seat, perceived the whole Stone to come out. He came to *La Charité* the next Day, and gave me an Account of his Disposition, producing the Stone, which I preserve for the Rarity of the Case: It weighs an Ounce and fifteen Grains, is almost of a triangular Figure, two Inches and a half from one of the Angles to each of the other two; and two Inches from each Angle to the Sides subtending them, and three Quarters of an Inch thick.

It seems surprising, that an extraneous Body should lodge so long, without causing either Pain, or Difficulty in making Water. By examining the Stone you may discover the Reason: There is a Depression in it, on that Side next the *Os Pubis*, and probably the Urine flow'd freely by it.

Tho' the Lips of the Wound, thro' which the Stone pass'd, were approach'd, the Hole was still large enough to admit of my Finger. I felt a large Cavity where the Stone had lodged, which was formed by a Dilatation of the Urethra; and I imagined, at first, that the Stone, when it was small, came from the Urethra thro' the Hole by which the former had pass'd, and then had increased between the Urethra and the Skin; but my Finger undeceived me, and convinced me, that it had been grown in the Urethra itself; for, besides feeling the whole Circumference very smooth, as it grew narrow, it guided my Finger almost behind the Scrotum, where the Dilatation ended. The dilated Urethra was very thin in that Part where the Stone had lodged, and a Callosity was to be felt on both Sides, without any Sinus. This Circumstance proves, that the Urethra was not open'd, but when the Stone came out; for, if it had been open'd before, the Urine would undoubtedly have form'd Sinuses and Fistulas in several Parts of the Perinæum, and here we had none; from whence I infer, that the Callosities at the Side were occasion'd only by the Pressure of the Stone.

I had recourse to generous Remedies and Topics to dissolve them, such as emollient Cataplasms, applied to the *Perinæum*; and that the Urine, by passing that Way, might not wet the Flesh and the Dressings, and that it might not be lodged in the Cavity from whence the Stone proceeded, I introduced an *Algaly* into the Bladder, and there left it. After I had used the Cataplasms two or three Days, I substituted resolvent Plaisters in their stead, and put small Dossils into the Wound, cover'd with melted Diachylon, with the Gums, and the Mucilage-plaister. All the Hardness decreased in less than three Weeks; after which I used only Injections, with Barley-water, and vulnerary Water, every Day. But my Attempts were fruitless, for nothing could close the Urethra, and cicatrize the Fistula. *Le Dran*.

An *Algaly* is a sort of hollow Probe, or Catheter.

Dr. *Hale* has obliged the World with an Account of an Instrument of his own Invention, for extracting a Stone out of the Urethra.

While I was, says he, intent upon these Experiments on the Calculus, it occur'd to my Thoughts, that large Gravel-stones, which often stick for several Days in the Urethra, to the great Torment of the Patients, and which they cannot sometimes be delivered from without cutting them out, might be drawn out by the following Instrument.

I cut off the lower End of a strait Catheter, which made it a proper Canula for a Stillet or Forceps to pass thro'; the lower End of the Forceps was divided into two Springs, like Tweezers, whose Ends were turn'd a little inwards: These Springs were made of such a Degree of Tenderness and Pliancy, as not to bear too hard against the Sides of the Urethra, by their Dilatation.

When this Instrument is used, the Springs are drawn up within the Canula; which being pass'd into the Urethra, as far as to the Stone, the Canula must then be drawn back, so far as to give room for the Forceps to dilate; which dilated Forceps being then thrust down a little farther, so as to embrace the Stone, then the Canula must again be slid down, to make the Forceps take fast Hold of the Stone, so as to draw it out.

I sent this Instrument to Mr. *Ranby* to have his Opinion of it, who tells me, That, upon repeated Trials, he found it extracts these Stones with great Ease and Readiness; and that it is so well approved of by other Surgeons, that many of them make use of it.

This strait Instrument will, therefore, serve to extract such Stones as are lodged, after they have pass'd the Turning at the *Os Pubis*; and I am informed, that they are aptest to lodge in those Parts of the Urethra which are within the Reach of this strait Instrument: But if it should lodge a little beyond the Turn at the *Os Pubis*, it might probably be practicable to extract them thence by bending this Instrument, as the common Catheters are bent: If the Stillet were Silver, it would bend the more easily.

Mr. *Ranby* is of Opinion, that this Instrument may be farther useful, in case of a Stricture or Contraction of any Part of the Urethra, viz. by thrusting the Forceps into that Stricture, where, by continuing some time, the constant Tendency of the Springs to dilate will widen the Stricture. *Hale's Vegetable Statics*, Vol. 2.

If the Stone of the Bladder is too large to pass thro' the Duét of the Urethra, the only Remedy is Lithotomy. *Boerhaave* has the best Opinion of the greater Apparatus, as being most certain; the Event, however, is always uncertain, on account of many Accidents, which can neither be foreseen, prevented, nor remedy'd.

In Women the Stone is generally taken away by dilating the Urethra, and seldom by Cutting. See LITHOTOMIA.

I do not know why *Boerhaave* has omitted mentioning Honey as a Remedy for, or Preservative against, the Stone. As this is extremely saponaceous and detergent, it is, by these Qualities, well adapted to scour off the calculous Concretions adhering to the Tubes of the Kidneys. And it is possible, that, if the Blood, and consequently the Urine, could be for a long time much saturated with Honey, small Stones might be dissolved, and large ones diminish'd. But the smallest Portion of Honey affects some Constitutions in such a manner, as to render the taking of it as a Medicine, impossible; and few can endure large Quantities of it without falling into a violent *Diarrhæa* or *Cholera Morbus*.

As the Bladder is subject to many other Disorders besides the Stone, which appear with Symptoms not unlike it, I shall give the following Treatise from *Hoffman*, in which the Reader will find his Account:

The Bladder, as being a nervous and muscular Part of the Body, is very subject to Spasms; by which Word we understand an intense and preternatural Constriction of the Body of the Bladder, and also of the Sphincter; or a Stricture, Coarctation, and Crispation of the Fibres, to which Disorder many other morbid Affections owe their Original.

Those tormenting Pains which are excited by the long Continuance of a Stone in the Bladder, together with a perpetual Desire of making Water, and the very difficult and painful Evacuation of the Urine, are owing to nothing but Spasms. For a convulsive Stricture, which affects not only the Musculo-nervous Coat of the Bladder, but also its Sphincter, and the Urethra itself, in a violent manner, excites a Strangury, and so great a Straining in the Pubes, as if it were scarce possible to stop the Urine, which yet, as soon as it begins to drop, is quite repressed and retain'd. This Disorder is attended with a Pain throughout the whole Region of the Penis, but oftentimes only with a most acute Pain in the Glans; according to the Observations of *Hildanus* and *Baglivi*. This extraordinary Sensation of Pain, Itching, and continual Irritation, in the Glans and Extremity of the Penis, is to be accounted one of the Pathognomic Signs of the Stone, both in Boys and Men. But, besides this, there is also a frequent Desire of going to Stool, or a Tenesmus, because of the strict Connexion of the *Intestinum Rectum* with the Bladder, and the Communication of the Nerves. The Urine which comes off in this Dysury, is, for the most part, white and foul, with a mucous Sediment; for the Convulsion of the muscular Fibres, by a violent Stricture and Compression, squeezes out, from the interior mucous Coat of the Bladder, a great Quantity of viscid glutinous Lymph, which, mix'd with the Urine, supplies that mucous Sediment. Oftentimes also a thin, aqueous, and almost colourless Urine comes away from the Patient, while under this racking Pain; and these Spasms, which, by mutual Consent and Communication of Parts, penetrate to the very Ureters, and are the Cause of their transmitting nothing but a thin and aqueous Substance, convey'd from the Blood by the emulgent Vessels. Moreover the Patient, in making Water, often suffers very severe Pains, sets his Legs across, compresses his Hips, bends his Body forwards, and, with one Hand, sometimes with both, presses with all his Might upon his Belly near the Region of the Pubes; and this painful Evacuation of the Urine is attended with Trembling, and, as it were, convulsive Motions of the whole Body, as is well observ'd by *Vienissens* in his *Neurologia*; for the fine Nerves of the Bladder, being vellicated and convulsed in a violent manner, by means of the intercostal Nerves, communicate the same to the spinal Nerves; and so to all the other Parts. It is observ'd also, that, under a Strangury, and a vehement Dysury, the Belly is constipated, and the Fæces, together with the Flatulences, retain'd, which, when the Pain ceases, readily resume their usual and natural Course.

It is certain also, from Observation, that all these recited Symptoms, and even worse, may be excited not only by a Stone in the Bladder, but by a Stagnation of the Blood within the Blood-vessels of that Part; the frequent Consequence of which is a violent Inflammation. For it is a vulgar Error to ascribe all these Symptoms to a Stone in the Bladder, or an Acrimony of Urine; since Observations and Dissections of dead Bodies abundantly shew, that the Diseased have not only been afflicted with the same Symptoms which proceed from a Stone in the Bladder, but have undergone worse Torments; tho' there has not been the least Sign of a Stone found in them after their Death. For, as when a Check is given to the Course of the Menes or Hæmorrhoids, the Blood regurgitates upon the Vessels of the Stomach and Intestines; and, stagnating within their nervous and sensible Coats, by stretching and compressing them,

them, excites violent Gripings, Anxieties, Pains, Convulsions, and spasmodic Motions; so also, when thro' the Default or Retention of the Hæmorrhoidal Flux, or from any other Cause, the Blood is repelled in great Quantities upon the Body of the Bladder, and there stagnates, no wonder if, in such a sensible Part, it excites Spasms, and other consequent Symptoms.

Thus a Suppression of the Hæmorrhoidal Flux is sometimes follow'd by bloody Urine, which being stop'd, the Bladder is seized with a Pain, Convulsions, and Inflammation. Sometimes Women of a plethoric Habit of Body, when past their fiftieth Year, after a total Cessation of the Catamenia, have been taken with terrible Convulsions of this kind, which have ended in a fatal Inflammation. For those who die of Diseases of the Bladder, are destroy'd by an Inflammation and Sphacelus, which are owing to a stubborn and fix'd Stagnation of the Blood in its Vessels, whereby their small Ramifications are too much distended; and that in such a manner, that the Inflammation, for the most part, affects not only the Bladder, but the *Rectum*; the Truth of which the Hæmorrhoidal Vessels, being full of black Blood, with the Lividness of the Penis, and the Veins in the Neck of the Bladder being very much distended, and varicose with Blood, sufficiently prove.

There is but one principal Cause of this mortal Inflammation, and that is a strong Spasm of the Bladder, which the more violent it is, so much the more it increases the Stagnation and Detention of the Blood in the Vessels, and hinders its Resolution and Discussion; whence it passes at last into an Abscess and Ulcer, and so becomes a chronic Disease, or degenerates into a Sphacelus, which soon destroys the Patient. And, indeed, this violent Convulsion of the Bladder, which is increased by the present Inflammation, is the Cause of a Multitude of dreadful Symptoms with which an Inflammation is attended; among which, according to *Aetius* and *Oribasius*, are a continual Fever, great Heats, Pain, a burning Heat, and Tumor under the Perinæum, and above the Pubes, an Emission of Urine by Drops, with great Difficulty, hard Strainings, and lamentable Cryings-out, a frequent Stimulation to evacuate by Stool, attended at last with Vomitings of Bile, a Pain of the Head, Thirst, Difficulty of breathing, Redness of the Face and Eyes, a Tongue black with parching Heat, obstinate want of Sleep, Delirium, Restlessness, Refrigeration of the extreme Parts, and at length Death. There is a Passage in *Hippoc. Lib. Prænotionum*, concerning the fatal Event of Diseases of the Bladder, which deserves to be mention'd here: "Hardnesses and Pains of the Bladder are dreadful and pernicious in the utmost Degree, especially such as attend a continual Fever; for the Pains themselves (these are the Effects of Convulsions) are sufficient to kill the Patient; and the Belly, at this time, makes no Excretions, but of a hard sort of Substance; and that forc'd. A Solution is attended with a Discharge of purulent Urine, depositing a white and thin Sediment. But if, after such an Evacuation, the Pain be not mitigated, nor the Bladder mollify'd, it is to be fear'd, that the Patient will die in the first Periods (*πρῶτον*) of the Distemper."

These Symptoms which attend an Inflammation of the Bladder, and discover themselves in various Parts of the Body, are, indeed, very much to be dreaded; and yet all of them, if well consider'd, can hardly be ascrib'd to any other Cause than a violent Spasm, which begins in the Bladder, as being the Part affected, and is thence communicated to the whole System of the Nerves; for when a most violent Stricture and Crispation affect the Fibres of the neighbouring Parts, which are the *Intestinum Rectum*, and the *Sphincter* of the *Anus*, there is either a continual Stimulation to Excretion, or so great a Constriction of the *Anus*, that neither Fæces nor Flatus can be transmitted, nor so much as a Clyster can gain Admission. And since a strong Spasm is well known to debilitate the Part it long affects, and leaves it at last in a State of Relaxation, the Consequence is a Falling-out of the *Anus*, especially in aged Persons and Infants. Whenever a severe Spasm of the Bladder extends itself to the superior Parts, and particularly the Intestines, it excites Rumbings and Gripes, and, when it is communicated to the Stomach, Loss of Appetite, ill Digestion, and Vomitings. *Celsus, Lib. 7. C. 27.* has a very remarkable Passage of the Consent between the Bladder and the Stomach. "We know very well, says he, that an Ulcer in the Bladder often affects the Stomach, between which two Parts there is a kind of Sympathy. Hence it is, that the Food is not retain'd, or, if retain'd, is not concocted, nor the Body nourish'd." This Convulsion also of the Bladder, which attends an Inflammation, by affecting the Muscle of the Diaphragm, with the Nerves and nervous Coats of the Lungs and Bronchia, causes a difficult and troublesome Respiration, with an Anxiety of the *Præcordia*; and being communicated to the Muscles of the Heart, and the musculo-nervous Coats of the Arteries, makes a hard, contracted, and quick Pulse, with a continual Fever, and an unquenchable Thirst, which is, in like manner, owing to a convulsive Stricture of the soft and glandulous Parts of the Tongue and Fauces. But the Danger is still greater, if it extends itself to the Membranes of the Brain, and the Origin of

the Nerves; for then a constant want of Sleep, Delirium, Convulsions, Refrigeration, and Horror of the extreme Parts, with an unequal and intermittent Pulse, are Signs of approaching Death.

Tho' the Symptoms which proceed from a Stagnation and Inflammation of the Blood, whether pure or impure, in the Bladder, are very much to be dreaded, and often mortal; yet those Disorders which arise from a salt, impure, and corrupted Serum, obstinately adhering to, and vellicating the Coats of the Bladder, are milder, and less dangerous. Of this Nature are those Pains which attend a Difficulty of Urine, and a Strangury. We often meet with Cases of this kind among the Observations of Physicians, particularly *Drawitz*, who deserves to be remember'd, and who, about an Age ago, wrote an entire Treatise, in the *German* Tongue, concerning the Scurvy, which is one of the best on the Subject. In this Book he makes several Observations, and describes Cases of Patients who complain'd of racking Pains in the passing off of their Urine, the Cause of which was no Defect, or Stone, in the Bladder, but only an impure scorbutic Humour. Among others, he relates a memorable Case of a Butcher, who had never labour'd under the Stone, and was on a sudden taken with an intolerable Pain in his Feet; the Disease, being remov'd from those Parts, was translated upon the Urethra, with an intense Heat, and Difficulty of Urine, which scarce came away by Drops. This Disorder yielded to Discutients, but return'd into the Feet, the Consequence of which was a Tumor in those Parts.

We have often observ'd, in aged Persons, Disorders of the Bladder, and especially a Difficulty of Urine, which have been contracted by a sedentary Life, or a scorbutic Dyscrasy of the Humours, which, in old Age, is almost perpetual; and nothing is more frequent, than, upon a Cessation of the rheumatic or gouty Pains, for the Patient to be afflicted with a Dysury, which, on the Return of those Pains, goes off spontaneously. It is also a usual Observation, that scorbutic Persons, affected with a chronic *Purpura*, or purple Eruptions, a Disorder very common in our Days, when, by a Cold, or some other Cause, as, for Instance, often repeated Bleeding, the Humour has been retracted inwards, or remains within, are seiz'd with a great Difficulty of Urine, an Anxiety about the *Præcordia*, a Restlessness, want of Sleep, and an inward burning Heat; all which Symptoms, upon the Expulsion of the *Purpura* to the Superficies of the Body, vanish and disappear.

There is yet another Cause of the Spasms and Pain of the Bladder, which is some Disorder in the Kidneys, whence, sometimes, a purulent and viscous Matter, at other times Stones and Gravel, are transmitted by the Ureters to the Bladder. In both Cases, unless the foreign Matter be timely expell'd, it is capable of exciting very dangerous Disorders, and particularly most violent Spasms. If the Matter be more tenacious and acrimonious than ordinary, it adheres to the Inside of the Bladder, and especially about its Neck, and excites a Strangury, Dysury, Tenesmus, and Inflammation; or secretly and slowly corrodes the Membranes of the Bladder, and so renders it exulcerated. If this Matter, by the Accession of other Causes, become transform'd, and pass into the Nature of a Stone; or a Stone, already made, descends from the Kidneys into the Bladder; it is continually irritating the same by its Roughness or Weight, and produces the same Disorders as before-mention'd; and, in the latter Case, the Bottom also, and the Sides of the Bladder, especially where the Stone is large, are exulcerated.

Sometimes the Neck of the Bladder is irritated, stretched, and convulsed, by other Causes besides those already mention'd; as, for Example, when a Gonorrhea, whether of the mild or malignant Sort, continues, for a long time together, in its proper Seat, which is in the two Glandulæ Prostatæ, which are contiguous to the Neck of the Bladder; for the Humour, in this Space of Time, being corrupted with the Venereal Impurity, becomes every Day more deprav'd, and generates Ulcers, sometimes but slight, sometimes of a more dangerous Nature, or excites Inflammations in the affected Part. And if the Cure of these Disorders happens to be ill perform'd, it is often observ'd, that the next adjacent Parts are infected with the Contagion. The Urine then comes off of a purplish Colour, and a Scabies of the Bladder, and even an Exulceration of that Part, especially about the Neck, frequently succeed. Hence it is that those who labour under a virulent Gonorrhea, often discharge a turbid Urine, which deposits a good deal of a viscid and sanious Sediment.

Among the Causes of this dangerous Spasm of the Bladder, may also be reckon'd, an Inflammation or Ulcer of the *Intestinum Rectum*, or of the Penis; an Abscess in any of the inner Parts of the Abdomen, which breaking, the Pus being discharg'd into the Cavity of the Abdomen, makes its Progress at last towards the Bladder; a Corruption of the Omentum; an Effusion of Blood, however caused, into the Abdomen; the Falling of the Water, in Dropsies, upon the Bladder; an Inflammation and Ulcer of the Uterus, especially its Neck; and other Disorders of the like kind, of all which you may meet with Instances enough in *Bonetus* and others.

As to the external Causes of this convulsive Distemper of the Bladder, we may suppose them to be Contusions, and violent Blows about the *Pubes*, or *Perinaeum*; an unskilful Section for the Stone, in which, thro' want of Dexterity in directing the Knife, or extracting the Stone, especially if it be larger and rougher than ordinary, the Cure of the Wound becomes difficult, and is attempted by improper Means; a too careless introducing of the Catheter, in order to search for the Stone; or in a Suppression of Urine, or for any other Reason, when the Sphincter of the Bladder happens to be under a close Constriction, or the Passage stop'd by a Tumor, Caruncle, Scirrhus, or any other Cause; the Section of a Fistula in Ano, where, for want of Caution, the Sphincter of the Anus, which is pretty closely connected with the Neck of the Bladder, happen'd to be incautiously too much wounded, or due Care was not taken of the Wound. In Women, a Cause may be hard Labour in Childbirth, in which the Bladder, and especially its Neck, are often compressed and affected in such a manner, as to give Rise to an Ulcer and Fistula in those Parts, according to *Mauriceau, Aph. 285*. And here the remarkable Malignity of Cantharides, with respect to the Bladder, deserves our Notice; for whether taken inwardly, or outwardly apply'd, they have been certainly known, from Observations, to excite Spasms, Inflammations, and Ulcers in that Part, of which there are many Examples. It appears also, from practical Observations, that drinking of cold Water, after Section for the Stone, excites violent Spasms, or gives Rise to a mortal Gangrene, or a fistulous Ulcer.

Having assign'd the Causes of this spasmodic Affection of the Bladder, we think ourselves oblig'd to account for a peculiar Phenomenon, which is, why those Symptoms, such as a Difficulty of Urine, attended with a Pain, and other concomitant Evils, should so miserably afflict the Patient only at Intervals, tho' the material Cause, which is the Stone, or a scorbutic Dyscrasy, be always present. The Reason seems to be this: All vehement Pains in a nervous sensible Part, if they continue long, induce and leave a Weakness and Relaxation, in which State the Pains are no longer felt; but then this very Weakness is the Cause of a new Collection and Stagnation of impure Humours supply'd from other Parts of the Body; whence there is always a Generation and Coacervation of fresh Matter, for rekindling and reviving the Paroxysm. For Debility, as *Celsus* says, is subject to all Diseases; and therefore it may be establish'd as an universal pathological Canon, That those Parts which are debilitated by the preceding Violence of a Distemper, are very easily susceptible of the morbid Humour, which, after a gradual Collection, either spontaneous, or excited by some slight Cause, makes a fresh Attack upon the Patient; and hence may be deduc'd the true Original of periodical Affections.

We have several times observ'd, that a Stone in the Bladder is only at certain Intervals the Cause of many Disorders, such as frequent and difficult Attempts to make Water, attended with a scalding Heat and Pain, Gripes of the Belly, Coldness of the extreme Parts, and a Decay of Strength, and that principally when the North Wind blows, or after flatulent Food, or Beer not well defecated, or from some unusual Commotion of the Mind, or too great a Refrigeration of the extreme Parts, or customary Bleeding too long omitted. The general Reason to be given for the Return of those Disorders on such Occasions, is, that all those things before-mention'd as Causes, are of such a Nature, and so qualified, as, partly by suppressing the salutary Excretions, partly by augmenting the Quantity of impure Humours, and propelling them towards the weaker Part, to give Occasion for the Return of the Disease, with its usual Train of Symptoms, upon the Patient. It is often observed also, that Distempers of the Bladder are attended with a flatulent Colic, especially when there is a hot and painful Discharge of the Urine; and that all Aliments which generate Inflammations, exasperate the Disorders of the Bladder, as, on the contrary, all Carminatives are beneficial.

Among Diseases of the Bladder, which are attended with Spasms, may well be reckon'd discharging of bloody Urine, which, however, does not all proceed from the Kidneys or emulgent Vessels, as Physicians usually imagine, but often flows proximately and immediately from the Blood-vessels of the Bladder, and especially the ruptur'd Branches of the external hæmorrhoidal Vein. This Hæmorrhage, attending the Urine, may be known to proceed from the Vessels of the Bladder, by a Difficulty of Urine, a burning Heat, and Tenesmus affecting the *Anus*, convulsive Motions about the *Glans*, a pungent Pain from the *Glans* to the *Perinaeum*, a rigid Tension of the *Penis*, with Rumblings and Flatulencies in the Abdomen, Loss of Appetite, and frequent Eructations; as also, if the bloody Urine, and concomitant Symptoms, after bleeding in the Foot, and Application of Leeches to the Anus, are remitted and cease. And, indeed, tho' such bloody Urine does not so very frequently proceed immediately from the Bladder, yet it has been sometimes observed, and particularly by *Hoechstetter, Decur. 1. Schol. in Cas. 2*. Sometimes pure Blood comes off

with the Urine, or, instead thereof, Urine of a brown Colour, like Coffee; as we observed in a Man eighty Years of Age, whenever he rode on Horseback: The Urine, when cold, deposited a dense and red Sediment.

Dreadful Symptoms also usually happen from concremented Blood within the Bladder, as *Lommius* observes, such as frequent Faintings, a Difficulty of Breathing, a low, small, and quick Pulse, a great Nausea, Anxiety of Spirit, and a cold Sweat, with an universal Inbecillity, Paleness of Countenance, and Refrigeration of the extreme Parts; all which Symptoms are to be ascribed to a violent convulsive Stricture, communicated to the whole nervous System. A Condensation of Blood in the Bladder is also the Cause of racking Pains, with a vehement Heat at the Bottom of the *Pubes*, and about the *Penis*, which have been observed to cease after the Patient had voided large, oblong, grumous Concretions of Blood in his Urine. As to the Cure of bloody Urine, which proceeds from an affected Bladder, *Lommius* rightly judges, that it is more difficult than when it descends from the superior Parts.

We must not omit to observe, that a Spasm of the Bladder, which excites a Strangury and Dysfury, especially in old, scorbutic, and cacochemical Constitutions, may proceed also from a very salt Urine, impregnated with acrid, tartarous, salinofulphureous, and muddy excrementitious Parts: For the Urine is sometimes found so salt as to corrode the Tongue, and, as it distils from the Urethra, to excoriate the neighbouring Parts; and therefore, if it should happen to stagnate for a considerable Time in the Bladder, will, by vellicating the Fibres of the Nerves, close up the Sphincter, and streighten the Urethra; and, by tearing and corroding the Membrane, excite most intolerable Pains. If, after a painful Discharge of the Urine, there appear in it branny little Masses, with Plenty of slender Filaments, which subside, the Antients call this Affection a *Scabies* of the Bladder; because it indicates a Corrosion of the mucous and villous Membrane thereof.

We said before, that a Stone, contain'd in the Bladder, is often the Occasion of strong and painful Convulsions, attended with a Difficulty of Urine, which molest the Patient at Intervals; but we are also to take Notice, that Spasms of the Bladder, when proceeding from other Causes, frequently lay the first Foundation for the Generation and Concretion of the Stone in the Bladder. This principally happens in old Men, who are of a plethoric Constitution, addicted to a sedentary Life, and, on account of a weak Perspiration, commonly void a high-colour'd Urine, saturated with tartarous muddy Scorix: For the Spasm excites a Dysfury; and the urinous Liquor, being retain'd a little longer than ordinary, deposits a tenacious glutinous Matter, which, being involved in tartarous Salts, may be supposed the first Principles of a calculous Concretion hereafter to be form'd; unless the Matter be evacuated by some convenient Medicine, and a free Passage made for the Urine by removing the Spasm.

Of all Diseases of the Bladder, a violent Stricture is most dangerous, and often mortal, especially when it is attended with a vehement Pain, an acute Fever, with an Hardness of the Bladder appearing near the *Pubes*, Costiveness, and a Suppression of Urine, according to *Hippocrates* in his *Prognostics*, and his *Coacæ Prænotiones*, where he says, "That a Hardness and Pain in the Bladder are very bad Symptoms upon all Accounts, but worst when attended with a continual Fever; for the Pain alone is sufficient to kill the Patient: There is but little Evacuation, by Stool, under this Distemper."

If the Pain and Hardness are but moderate, and without an acute Fever, the Inflammation is of a mild Nature. The Event, in such Cases, is various; sometimes the Disease is critically resolved, by the cutaneous Eruption of an Erysipelas; sometimes it tends to a Suppuration, in which Case there comes away purulent Urine, which deposits a thin white Sediment. If there be a plentiful Discharge of the Urine with Pus, the Tumor subsides, the Bladder is mollify'd, the Fever mitigated, and a free Passage made for the Excrements. The worst Event is, when the Distemper degenerates into a mortal Sphacelus. *Hoffman, Medic. Rat. System.*

The CURE.

Having consider'd the many severe and dangerous Disorders proceeding from painful Spasms of the Bladder, Urethra, and adjacent nervous Parts, with respect to the different Nature of their Causes, we now come briefly to propose and explain the most convenient Methods and Remedies for the Relief of the Patient. If we find the Disease approaching, or at least are apprehensive of its coming, and that it proceeds from a Redundance of Blood, especially in old Persons of a vigorous Constitution, who have for a long time pass'd their Lives without sufficient Motion of Body; the greatest Relief, in such a Case, is to be expected from speedy and plentiful Bleeding, which becomes the more necessary, if the Cause is suspected to be a Retention of the Menfes, or a Stoppage of the Hæmorrhoidal Flux,

Flux, or an Omission of long accusom'd Phlebotomy, or Scarification. This is agreeable to the Advice of *Hippocrates*, *Aph.* 36. *Lib.* 6. where, under a Difficulty of Urine, he orders the inner Veins to be open'd.

In a Redundance of impure Serum, impregnated with scorbutic, acrimonious, and saline Particles, which, by its Defluxion, and Settlement about the Bladder, and the Parts included within the Pelvis, furnishes Matter for this Disorder; or if it be owing to the scorbutic Purples, a Distemper grown common in our Times; we must use our best Endeavours, that the Mass of Blood and Humours, which is vitiated by the Mixture of those heterogeneous and impure Particles, may be depurated, and the Redundance of Serum evacuated by the proper Emunctories. For this Purpose temperate Diluents, in sufficient Quantities, and for a convenient Length of Time, are to be used: Of this Nature are the temperate kinds of Mineral Waters, which consist of the purest and lightest Liquid, impregnated with a slightly alkaline Salt; such, above all others, are the *Selteran* and *Spaw* Waters; for they are very agreeable, and extremely beneficial, in all the Disorders and Defects of the Breast, Kidneys, and Bladder, which Parts, in particular, they relieve by a sort of specific Virtue. In the scorbutic Purples they exert their Virtues much more to Advantage, when mix'd with Milk, especially Asses Milk.

As a Regimen of Diet is of the greatest Importance, both in preventing and curing a Disease, so that they who live freely, without regarding the Laws of Medicine, or the Rules of Sobriety, can never be relieved from such afflicting Distempers; but, at most, only procure to themselves some Intervals of Ease; for this Reason, in so chronical a Disorder, where the Nerves, and most sensible Parts, are affected, the least Error in Diet must, of necessity, have a bad Influence upon the nervous Parts. The Patients, therefore, are to be strictly forbidden all salt, acrimonious, and four Meats, all Vegetables which breed Inflations, or are astringent; and they must also abstain from all Malt-liquors, and acid and austere Wines: But sweet Wines, and particularly the *Hungarian*, are not only harmless, but very beneficial. Here a Passage of *Aetius*, *Tetrab.* 3. *Serm.* 3. *Cap.* 22. concerning a Scabies of the Bladder, deserves to be quoted: "The Patient, says he, must abstain from all Things of a biting Quality, and such as render the Humours salt and acrimonious; but give him sweet Wines, and Milk, with Broths made of Hens, or the Flesh of Kids or Lambs." And tho' Motion and Exercise of the Body have a very good Effect in preventing Distempers of this Kind, by giving a Check to the Redundance of Blood, and maintaining a due Circulation of the Humours through the Vessels; yet, if the nervous Parts at the Bottom of the Belly are affected with Pains and Convulsions, Rest is better for the Patient than Motion, which, in such a Circumstance, would be very prejudicial; especially such kinds of Motion as drive the Blood more upon the inferior Parts, as a great Elevation of the Voice, long and earnest Speaking, Agitations of the upper Parts, Gestation, and Lifting of Burdens.

While the Patient is under the convulsive Fit, attended with racking Pains, and a Difficulty of Urine, I have learnt by frequent Experience, that there are no better Remedies than oily emollient Clysters, a Bath, or a Semicupium, which is confirm'd by the Observations of Physicians, every-where to be met with; and we have an elegant Observation of *Drawitz*, in his Book of the *Scurvy*, to the same Purpose. A Vapour-bath of emollient and anodyne Flowers is also beneficial in the Time of the Paroxysm; such are the Flowers of common Chamomile, Melilot, the Elder-tree, Mallows, Mullein, and Millefoil, boiled in Milk; for, by their lenient and demulcent Virtues, they are of excellent Service in composing and mitigating the Pains and Convulsions. Internally may be given our *mineral anodyne Liquor*, either alone, or mix'd with Carminatives; also antispasmodic Powders, as the Marquis's Powder, or purified Nitre, with an Addition of a little Saffron and Castor, taken in an Emulsion of the Four greater cold Seeds. These Remedies are preferable to all others, and may be used even under a Fever, and when an Inflammation is threaten'd, if the Proportion of Nitre be augmented.

When the Disease of the Bladder proceeds from a Translocation of a rheumatic Defluxion from the external Parts upon the Viscera, Fontanels, cut in the Arms, have been of no small Service. Also a demulcent and gently diuretic Decoction of the Roots of Scorzonera, Sarsaparilla, China, the Shavings of Hartshorn, the Roots of Liquorice, Couch-grass, Succory, and Fennel seeds; or our *mineral anodyne Liquor*, mix'd with the Bezoardic Spirit of Buffius, are Remedies which never fail of having a good Effect.

If bloody Urine, having its Origin in the Bladder, be attended with a convulsive Affection of the same Part, or an Exulceration supervene, I have frequently found the good Effects of an Application of the vulnerary Water call'd *L'eau d'Arquebuse*, (see *AQUA*) in answering the Intention of discharging and corroborating. I also use repeated Applications of Bags

of Mint, Baum, Myrtle-leaves, Bay-leaves, Roses; with the Flowers of common and *Roman* Chamomile, all boiled in Red-wine, to the Region of the Bladder: And to prevent a Cohesion of any grumous Blood, that may happen to be retain'd in the Bladder, with a tartarous Mucus adhering to the Part, which may produce a Stone, internal, absterfive, and gentle vulnerary Medicines may very properly be used. Some of the best of these are Golden-rod, Ladies-mantle, the Tops of St. John's-wort, and Millefoil, the Roots of Avena, Marshmallows, and Liquorice, Figs, and Spleenwort, in the Form of an Infusion or Decoction, well sweeten'd with *Prussian* Honey, or *Fernelius's* Syrup of Marshmallows. The Decoction of *Forestus*; and *Sperma Ceti*, are also very good Medicines for dissolving grumous Blood retain'd in the Bladder.

When the Inflammation is succeeded by an Abscess, which is known by the Exacerbation of the Symptoms, and a Sense of Weight in the Region of the *Perinaem* and *Pubes*, it is necessary, that it should be timely open'd, and the Pus discharged from the Bladder; for the longer it continues, the more acrimonious it grows, and corrodes the adjacent Parts, corrupting them in like manner, and introducing *Fistulas*, and other very bad Symptoms. To prevent such mischievous Effects, Injections of warm Milk, boil'd with emollient Species, are to be used: If these are of little or no Efficacy, our last Recourse must be to the Surgeon, who is to make an Incision with the Knife in the same Place of the *Perinaem*, as, in cutting for the Stone, with what they call the *greater Apparatus*. Two Examples of this Method in *Bonetus*, *Sepulchr.* *Lib.* 3. taken out of *Riolanus*, are worth our Notice. In Women the Case is otherwise; for they stand in no need of this kind of Remedy, because in them the Orifice of the Bladder is larger, and the Access to it more open. The Ulcer being open'd, and well cleansed, is to be treated with the same Remedies as were directed in the preceding Paragraph.

PRACTICAL CAUTIONS.

I.

When a Redundance of Blood requires Evacuation, the best Method is to open a Vein in the upper Parts, by way of Revulsion; and the next Day, or the Day after, to cut the Veins in the Anus, if they are swell'd and prominent, for the sake of Derivation; or, if this cannot conveniently be done, a Vein may be open'd in the Ankle or Ham. If the Habit of Body be lax, and full of Blood and Juices, and especially for the Female Sex, Cupping-glasses, applied to the upper and lower Parts, may be very beneficial, by attracting the Blood and Humours towards the Superficies.

II.

You are to take Notice, by way of Caution, that tho' repeated Bleeding, as before advised, be very serviceable in preventing or removing an Inflammation, or hindering its Increase; yet where the Blood and Spirits are deficient, and in case of an Exulceration, Phlebotomy is rather hurtful than beneficial, by exhausting the Strength and Spirits of the Patient, which are absolutely necessary for expelling and subduing the Disease.

III.

In all Pains, and convulsive Disorders, of the Bladder, from whatever Cause they proceed, strong Cathartics are by no means convenient, neither in the Beginning nor Progress of the Distemper; for it is to be fear'd, lest the Humours, being by their means put in Agitation, should be impel'd, and bend their Course towards the affected Parts. But under a Remission of the Pain and Spasms, and in the Decline of the Disorder, it is very useful, and even necessary, now-and-then, to give a Purge, in order to cleanse and free the Intestines from those stercoraceous Recrements and Sordes, of which there is generally a Collection and Coacervation in those Parts, during the Time in which the Pain and Convulsions molest the Patient: But this Intention is to be answered by the milder Sort of Purges, such as those prepared of Manna, and Rhubarb, and solutive Syrup of Roses, drank in Whey, or Asses Milk.

IV.

In order to mitigate the convulsive Paroxysm, besides external Remedies, as Liniments and Fomentations, Clysters composed of Lenients and Emollients are to be injected, which, by their mild and comfortable Warmth and Influence in relaxing the rigid and convulsed Fibres of the adjacent Parts, may probably cause a Remission of the Pain, and afford considerable Relief to the Patient; but these are to be administer'd in small Quantities, for fear of compressing the Sides of the Bladder.

V.

If the Bladder, and Parts connected with it, be affected with a considerable Exulceration, which is indicated by a copious Sediment

Sediment of viscid Matter, and a slow Fever consuming the Strength and Flesh, the Patient must abstain from too free an internal Use of the *Caroline Waters*; for the plentiful Drinking of them, as I have learn'd by Experience, is very prejudicial, because both the Corruption and Fever are increased by the Stagnation of these Waters.

VI.

A seasonable Use may be made of anodyne Injections, as well for correcting the Acrimony of the Humours, as for blunting the Sense of the intolerable Pains. These may be prepared of four Whites of Eggs, beaten to a Water, with an Addition of two Ounces of Woman's Milk, and a Dram of the freshest Butter; or an artificial Emulsion may be made of the Seeds of Gourds, and of white Poppy, the Water of Elder-flowers, Rose-water, and black Cherry-water, for the same Purpose.

VII.

All acrid Diuretics must be carefully avoided in this convulsive Affection; for, in an Exulceration of the urinary Passages, the Pain and spasmodic Symptoms must, of Necessity, be very much exasperated by the Acrimony of such Medicines.

VIII.

When the Patient is under extreme Pains, which may be of dangerous Consequence; Anodynes of the greatest Efficacy may be useful, for preventing too great a Diminution of the Strength, with an Increase of the Fever and Dysury, or Madness; and I have known half a Dram of Troches of Alkekengi given as a Dose, with very good Success: But we must utterly avoid such Medicines when there is a Decay of Strength, either thro' Age, or some Passion of the Mind, particularly Sorrow. *Hoffman Med. Rational. Syst.*

Mr. Sharp gives us the following Remarks relative to the Stone, which, for the farther Illustration of this important Subject, I shall insert.

Hitherto there has never been given any satisfactory Account of the Causes of this concreting Disposition in the Fluids; and tho' there may be some Propriety in considering the Sand of Urine in the same Light as the Tartar of Wine, from their Similitude in several Experiments, yet we cannot infer from thence, what does immediately produce it; at least it is not, with any Certainty, to be imputed to a particular Diet or Climate, which, however, are the Causes commonly assigned; since we see, that in all Countries, and amongst all Ranks of People, as much amongst the Sober as the Luxurious, the Stone is a frequent Distemper; and tho' the great Numbers cut at the Hospitals of *Paris*, where the Water of the *Seine* is so remarkable for its Quantity of Stone, seems to favour the Opinion of its being generated by particular Fluids received into the Blood, yet, I believe, upon Inquiry, this famous Instance will not appear conclusive, since most of those Patients come from the Provinces, or distant Villages, where that River does not pass; and as to the Inhabitants of *Paris* itself, by what I was able to learn of the Surgeons there, the Number of those afflicted with the Stone amongst them is pretty nearly in the same Proportion as in *London*: From which Considerations, and the Circumstance of so many more Children having the Stone than Men, one would be inclined to think the Disposition is much oftener born with us, than acquired by any external Means.

It is certain, the Urine generally abounds with Matter proper to compose a Stone; and, perhaps, if it could grow cold in the Bladder, it would always deposit the Matter there; as it does on the Sides of the Chamber-pot; tho' the Coats of the Bladder, being cover'd with a Mucilage, make them more unfit than the Sides of the Pot to attract the stony Particles; but we see, when once a hard Body is insinuated into the Bladder, it seldom fails to become the Nucleus of a Stone, whether it be a large Piece of Gravel, a Needle, a Bullet, or any other firm extraneous Substance.

From the monstrous Increase of some Stones in a small time, and the Cessation of Growth for many Years of others, we may be persuaded, that the Constitution varies exceedingly at different times, with regard to these stony Separations; and, from the Appearances of most Stones when artfully saw'd through, we may gather, that this Variation of Constitution does not shew itself only in the Quantity of Gravel added to the Stone, but the Quality of it also; so that a red uniform Stone, of an Inch Diameter, may perhaps, at half that Size, have been a smooth white one, at a Quarter, a brown Mulberry one, and so on at different times, altering in its Species: Hence (from the Apposition of different-colour'd Gravel) arises for the most part the laminated Appearance of a Stone, tho' sometimes the Laminæ are very nearly of the same Colour and Composition; and, in this Case, their Formation seems to be owing to the want of Accretion in the Stone for a certain time; during which, its Surface, by rubbing against the Coats of the Bladder, and its Attrition, from the Stream of

Urine, becomes smooth and compact; so that when more fresh loose Gravel adheres to it, its different Density in that Part will necessarily make the Streaks we see in a Section of the Stone, which are only the outside Surfaces of each Lamina.

That the ceasing to grow gives them this laminated Form; and not any particular Disposition in Sand to shoot into such a Shape, is probable from the Examination of some other Stones, in which a great Quantity of Gravel is first collected without any Nucleus, into a spongy uniform Mass; and after that is cover'd with several Laminæ.

'Tis no Wonder that Stones are so generally form'd in the Kidneys, since the Disposition of the Urine will naturally shew itself as soon as it is separated into the Pelvis; that is, the stony Particles, having as strong an Endeavour to unite with one another in the Kidneys as the Bladder, will consequently, from meeting first there, generally produce Gravel and Stone in that Part.

Small Stones and Gravel are frequently voided without Pain, but sometimes they collect, and become very large in the Kidneys; in which Case, a Fit of the Stone in that Part is the Cure, from the Inflammation and Pain occasioning convulsive Twitches, which at last expel them. But in this Disease the Patient is very much reliev'd by several kinds of Remedies, such as the Mucilaginous, the Saponaceous, &c. some of which lubricate, and others both lubricate and stimulate: The Sand, in passing through the Ureters, is very much forwarded by the Force of the Urine, which is so considerable; that I have seen a Stone which was obstructed in the Ureter in its first Formation, perforated quite through its whole Length, and form a large Chancel for the Stream of Urine. The Ureters being very narrow, as they run over the Psoas Muscle; and also at their Entrance into the Bladder, make the Movement of the Stone very painful and difficult in those Parts: but there is seldom so much Trouble after the first Fit; for, when once they have been dilated, they generally continue so: I have often seen them as big as a Man's Finger, but they have been found much larger.

The Symptoms of Stones in the Bladder are by no means infallible, since a Stone in the Ureter or Kidneys, or an Inflammation of the Bladder from any other Cause, will sometimes produce the same Effects; but if the Patient cannot urinate, except in a certain Posture, 'tis almost a sure Sign the Orifice is obstructed by a Stone; if he finds Ease by pressing against the Perinæum with his Fingers, or sitting with that Part upon a hard Body, there is little Doubt to be made, that the Ease is procur'd by taking off the Weight of the Stone; or lastly, if with most of these Complaints he thinks he can feel it roll in his Bladder, it is hardly possible to be mistaken: However, the only sure Judgment to be form'd is from Searching.

That we should not readily distinguish the Complaints of the Stone from many other Affections of the Bladder, is not very surprising, when we reflect, that a Fit of the Stone is nothing but an Inflammation of its Coats, which, tho' it be excited by the Stone, requires a Disposition in the Blood to produce it; for, if the Complaints in a Fit were owing to the immediate Irritation of the Bladder, it should follow, that the Stone being always the same, the Fit would be continual; but, besides that all Patients have considerable Intervals of Ease, (often of many Months) except in those Cases where the Stone is either very large, or pointed, there are Instances of some few happy Constitutions which have no Pain at all, even after having for a certain time suffer'd very much.

To prevent the Violence and frequent Returns of the Fits of the Stone, Bleeding, and gentle Purgings with Manna, are beneficial; abstaining also from Malt Liquors, and Excess of Eating and Drinking, is very serviceable; but a Milk-diet and Honey are the greatest Preventatives, not only of Inflammation, but perhaps sometimes, too, of the farther Accretion of the Stone.

From considering the Disorders of the Stone in this Light, and the frequent Intervals of Ease which happen without the Assistance of Medicine, we cannot wonder, that so many Patients have believ'd the Stone dissolv'd, when they have been under any particular Regimen; and that in all Ages there have been many People deceiv'd for a Length of Time, by a suppos'd Dissolvent, tho' hitherto no safe one has been discover'd. *Sharp.*

Many Authors have pleased themselves with comparing the Animal Calculus with Tartar, and in finding out some Resemblance betwixt them. But I know no two Substances in Nature which can differ more widely than these two, both with respect to their Generation and Analysis. The only Circumstances wherein they agree, are their generating alike large Quantities of elastic Air, and their containing some Earth, tho' Tartar contains but a very little: As to their Generation, Tartar is the Offspring of Fermentation; whereas no such thing can happen in the Animal Fluids: And, who-

ever

ever compares the Analysis of Tartar (see TARTARUS) with the following Analysis of a Calculus, will readily perceive how different they are in their Composition. Tartar is an Acid; but no Portion of an Acid can by any means be discover'd in a Calculus.

Dr. Stare says, We distilled one Ounce of human Calculus that was recently cut out of a Body, which afforded about two Drams of a brownish Spirit, nearer to that of Hartshorn, than Urine. We put the Caput Mortuum upon the Capel, and reduc'd it to near a Dram; the rest burning and smoking away. Another time, we distilled in a naked Fire a Stone that weigh'd two Ounces; the Vapour came over upon a good Streis of Fire, and settled in the Form of Salt without any Liquor, of which we preserv'd only a Dram; it appear'd very brown, and tasted bitter, as the fetid Oil of Hartshorn, and other empyreumatical Oils, do. We examin'd by boiling and evaporating Water from the Caput Mortuum, whether it held any fix'd Salt, but found none. The Caput Mortuum weigh'd one Ounce, and six Drams; so that it lost only two Drams in the Distillation, that is, only two Drams came over the Helm. We proceeded farther, and placed the Caput Mortuum upon a Test in an open Fire, where it burnt away to two Drams forty-four Grains. This we also boiled in Water to see what Salt it held; but it scarce afforded a Taste of Salt, hardly surmounting that we usually find in the like Quantity of common Water. In this fiery Trial, an Ounce and three Drams of the two Ounces evaporated in the open Fire, (a material Circumstance, which Chymists rarely inquire after) of which we have no Account. *Phil. Trans. Abr. Vol. 3.* Dr. Hale says, That the greatest Part of this is raised into permanently elastic Air.

As to the Production of Stones in the Body, if we reflect upon what is said under the Article ARTHRITIS, with respect to the Generation of the Gouty Matter, and consider, at the same time, the great Affinity there is betwixt the Gout and Stone, and that either of these frequently is transmuted into the other, we may perhaps have Reason to believe, that the Causes of both are a Defect in the Solution of the earthy Particles of our Aliment by the Powers of Digestion; and if it happens, that the Sedentary, Luxurious, and Idle, are more subject to the Stone, than the Active, Temperate, and Laborious, it will be a farther Confirmation of its being generated in this manner. That Children also, who use but little Exercise, and whose Stomachs are lax and weak, are often afflicted with the Stone, seems to favour this Opinion.

Upon this Occasion I cannot omit a beautiful Observation of *Boerhaave*, who, speaking of Menstruums, says thus: Tho' earthy Bodies, when corroded by Acids, may be dissolv'd in Water, Alcalies, when intimately united with Earth, cannot be afterwards dissolv'd with Water, as plainly appears in Glafs, which consists of an Alkali, and an Earth, intimately united, and is less soluble in Water, the closer the Union: So great is the Difference between the Solution of Earth by one kind of Salt and another. Alcalies, we see, subtilly dissolve Earth into a fix'd, transparent, hard Body, which resists the dissolving Power of Water, more than any other Body; but it appears stranger still, that the subtil, volatile, alkaline Salts of Animals, intimately united with Earth, should form a Mass undissolvable in boiling Water; for the Stones generated in Animals I take to consist of these two Principles and Oil; and in whatever Part of the Body such Stones are generated, they commonly produce terrible Effects; as having a Power of attracting and joining to themselves a similar Matter, from such Animal Juices as approach nearest to Putrefaction, as the Bile and Urine; which containing Salts nearly alkaline, these Salts unite to themselves the fine Earth, wore off from the Parts of the Body; and thus lay the Foundation of new Stones, or enlarge the old ones: and hence the daily Increase of this monstrous Production, which brings on terrible Disorders.

Hence we may perhaps deduce the Reason, why the Author of Nature has made nearly all the Aliments of Animals incline to Acidity; for the acid Salts, on this Account, predominate in the Stomach, dispose such Aliments to dissolve more easily, whose firmer Parts cohere principally by means of Earth; whence they would otherwise with much more Difficulty be dissolv'd into fluid Chyle. But when afterwards a Matter is to be form'd of this Chyle, fit to bind the Solids together, the Tendency to Acidity, which was necessary in the Chyle, is changed, and an alkaline Tendency of the Salts introduced; which, by binding the earthy Particles, forms a Structure indissoluble in Water, and fit to resist the Action of the Fluid. At least we know, that Bones remain solid and firm, if steep'd in Alcalies; but grow soft and flexible, if detain'd in Acids; as the ingenious Mr. *Ruych* has often assur'd me, he found in his Anatomical Experiments. And doubtless, when the Power of changing Acescents into Alcalies is wanting in the Body, the Bones, Cartilages, Teeth, and Ligaments, become soft, weak, loose, and flexible, as we daily see in the Rickets. *Boerhaave's Chymistry.*

It would be inexcusable, if I was to omit taking Notice of Mrs. Stevens's Medicine for the Stone, as it was thought of Importance enough to merit the Consideration of the Legislature. I shall therefore give it in her own Words, as published in the *Gazette*.

Mrs. STEPHENS's Medicine for the Stone.

It consists of a Powder, a Decoction, and Pills.

The POWDER is thus prepar'd.

Take Hens Egg-shells well drain'd from the Whites, dry and clean; crush them small with the Hand, and fill a Crucible of the twelfth Size (which contains nearly three Pints) with them lightly; place it in the Fire, and cover it with a Tile; then heap Coals over it, that it may be in the midst of a very strong clear Fire, till the Egg-shells be calcin'd to a greyish White, and acquire an acrid, salt Taste: this will take up eight Hours at least. After they are thus calcin'd, put them into a dry clean earthen Pan, which must not be above three Parts full, that there may be room for the Swelling of the Egg-shells in flaking. Let the Pan stand uncovered in a dry Room for two Months, and no longer. In this time the Egg-shells will become of a milder Taste, and that Part which is sufficiently calcin'd will fall into a Powder of such a Fineness, as to pass thro' a common Hair-sieve; which is to be done accordingly.

In like manner:

Take Garden-snails with their Shells, clean'd from the Dirt; fill a Crucible of the same Size with them whole; cover it, and place it in a Fire as before, till the Snails have done smoking, which will be in about an Hour, taking care that they do not continue in the Fire after that. They are then to be taken out of the Crucible, and immediately rubb'd in a Mortar to a fine Powder, which ought to be of a very dark-grey Colour.

Note. If Pit-coal be made use of, it will be proper, in order that the Fire may the sooner burn clear on the Top, that large Cinders, and not fresh Coals, be plac'd on the Tiles which cover the Crucibles.

These Powders being thus prepar'd, take the Egg-shell Powder of six Crucibles, and the Snail Powder of one; mix them together, rub them in a Mortar, and pass them thro' a Cypress-sieve. This Mixture is immediately to be put up into Bottles, which must be close stop'd, and kept in a dry Place for Use. I have generally added a small Quantity of Swines-creffes burnt to a Blackness, and rubbed fine, but this was only with a View to disguise it.

The Egg-shells may be prepar'd at any time of the Year; but it is best to do them in Summer. The Snails ought only to be prepar'd in *May, June, July, and August*; and I esteem those best that are done in the first of these Months.

The DECOCTION is thus prepar'd.

Take four Ounces and a half of the best Alicant Soap, beat it in a Mortar, with a large Spoonful of Swines Cressles burnt to a Blackness, and as much Honey as will make the Whole of the Consistence of Paste; let this be form'd into a Ball. Take this Ball, and green Chamomile, or Chamomile-flowers, sweet Fennel, Parsley and Burdock-leaves, of each one Ounce; when there are not Greens, take the same Quantities of Roots; cut the Herbs or Roots, slice the Ball, and boil them in two Quarts of soft Water half an Hour; then strain it off, and sweeten it with Honey.

The PILLS are thus prepar'd.

Take equal Quantities, by Measure; of Snails calcin'd as before; of wild Carrot-seeds, Burdock-seeds, Ashen-keys, Hips and Haws, all burnt to a Blackness, or, which is the same thing, till they have done smoking; mix them together, rub them in a Mortar, and pass them thro' a Cypress-sieve; then take a large Spoonful of this Mixture, and four Ounces of the best Alicant Soap, and beat them in a Mortar, with as much Honey as will make the Whole of a proper Consistence for Pills, sixty of which are to be made of every Ounce of the Composition. When there is a Stone in the Bladder or Kidneys, the Powder is to be taken three times a Day, viz. in a Morning after Breakfast, in the Afternoon about five or six, and at going to Bed. The Dose is a Dram Avoirdupois, or 56 Grains, which is to be mix'd in a large Tea-cup full of White-wine, Cyder, or small Punch; and half a Pint of the

the Decoction is to be drank, either cold or Milk-warm, after every Dose.

These Medicines do frequently cause much Pain at first, in which Case it is proper to give an Opiate, and repeat it as often as there is Occasion.

If the Person be costive during the Use of them, let him take as much lenitive Eleatuary, or other laxative Medicine, as may be sufficient to remove that Complaint, but not more; for it must be a principal Care at all times to prevent a Looseness, which would carry off the Medicines; and if this does happen, it will be proper to increase the Quantity of the Powder, which is astringent, or lessen that of the Decoction, which is laxative, or take some other suitable Means by the Advice of Physicians.

During the Use of these Medicines, the Person ought to abstain from salt Meats, Red-wines, and Milk, drink few Liquids, and use little Exercise, that so the Urine may be the more strongly impregnated with the Medicines; and the longer retain'd in the Bladder.

If the Stomach will not bear the Decoction, a sixth Part of the Ball made into Pills must be taken after every Dose of the Powder.

Where the Person is aged, of a weak Constitution, or much reduc'd by Loss of Appetite, or Pain, the Powder must have a greater Proportion of the calcin'd Snails than according to the foregoing Direction; and this Proportion may be increased suitably to the Nature of the Case, till there be equal Parts of the two Ingredients. The Quantity also of both Powder and Decoction may be lessen'd for the same Reasons. But as soon as the Person can bear it, he should take them in the above-mention'd Proportions and Quantities.

Instead of the Herbs and Roots above-mention'd, I have sometimes used others, as Mallows, Marshmallows, Yarrow both red and white, Dandelion, Water-creffes, and Horse-radish Root; but do not know of any material Difference.

This is my Manner of giving the Powder and Decoction. As to the Pills, their chief Use is in Fits of the Gravel, attended with Pain in the Back, and Vomiting, and in Suppression of Urine, from a Stoppage in the Ureters. In these Cases, the Person is to take five Pills every Hour, Day and Night, when awake, till the Complaints be remov'd. They will also prevent the Formation of Gravel, and Gravel-stones, in Constitutions subject to breed them, if ten or fifteen be taken every Day. Thus far Mrs. Stephens.

In order to form a just Judgment of these Medicines, it is necessary to know, that Shells by Calcination are converted into a Lime; and that a Lixivium of Lime is a principal Ingredient in Alicant Soap.

I find these Medicines are at present in much Disrepute. But as I am to give my Sentiments upon them undisguised, and without being biassed by any Authority whatever, I shall give my Reasons for believing them of some Efficacy, tho' I have never seen any remarkably good Effects from them.

My first Reason is, That the principal Ingredients in these Medicines are recommended for the Stone, by Authors of the first Reputation. Thus Hoffman speaks of Egg-shells and Mother of Pearl; and Boerhaave prescribes Soap, as we have seen above.

My second Reason is, That they have indisputably been of great Relief to many Persons afflicted, before taking them, with the most exquisite Tortures from the Stone. I say, indisputably; because, to doubt it, would be paying a very bad Compliment to the Understanding and Honour of many Gentlemen of known Integrity, who were appointed by Parliament to inspect into, and who afterwards gave their Opinion in Favour of, these Medicines.

My third Reason is, That I have known in several Instances, great Effects produc'd by a Medicine, which seems to be nearly of the same Nature with those of Mrs. Stephens, as it consists of Lime made of Oyster-shells. The History of it, so far as I am acquainted with it, is thus. Mr. Schuemberg, a German Gentleman, extremely well versed in the most abstruse Operations of Chymistry, has a Method of melting, by the Help of a Flux, calcin'd Oyster-shells, so as to make them run like Wax, and to admit of being cast into Cakes, which dissolve per Deliquium into a Fluid; this, when filtered, is limpid as Rock-water, and extremely alkaline, tho' not corrosive; and, which is pretty surprising, will, upon the Affusion of an Acid, be entirely converted into a Snow-white Powder. Twenty-five or thirty Drops of this Liquid, taken twice a Day in Water, I have frequently known to afford great Relief in nephritic Disorders.

My fourth Reason is, That a Lixivium of Lime will dissolve human Stones, when out of the Body.

My fifth Reason is, That Lime seems to be, in general, a powerful Dissolver of Earth, and earthy Concretions. Thus Lime produces a great Fertility, when laid upon the most barren kinds of Land, as Gravel; that is, it helps to dissolve the

large Particles of Earth, and prepares it for furnishing Matter for a subsequent Vegetation. Hence it happens, that what Boerhaave remarks in the Passage quoted above, in regard to Alkalies uniting with Earth, and rendering it indissoluble, does not hold good with respect to the Salt of Lime, which is an Alkali sui generis, and in many Instances different, as to its Properties, from all others. See CALX.

I shall conclude this Article with remarking, that, as, in all Cases whatever, the principal Duty of a Physician consists in distinguishing accurately one Distemper from another; so, particularly with respect to the Stone, he must take care not to be deceived; for there are three Distempers, which mimic so exactly the Stone of the Kidneys, Ureters, and sometimes even of the Bladder, that it is not easy for a Person, not well versed in these things, to distinguish some Symptoms of these from the genuine Stone; I mean the Gout, latent Intermitting Fevers, and Hysterics. And, indeed, it is of great Importance, in the Practice of Physic, to distinguish the Symptoms caused by these three Distempers, when they seize upon any of the Viscera, from the genuine Disorders to which the Part is otherwise subject; for the Kidneys, Ureters, and Bladder, are not the only Parts subject to their irregular Attacks.

As to the Gout, when it fixes upon the Region of the Kidneys and Loins, and imitates the Stone, or when it affects the Neck of the Bladder, it must be distinguish'd from the Stone, by carefully comparing the Patient's Complaints with the Symptoms of the genuine Stone above enumerated; in which I have been designedly very full, and given them from different, and those the best, Authors, that they may be view'd in every Light. The Constitution of the Patient is also to be taken into Consideration, which, if gouty, gives an useful Hint to the Physician; and the Unsuccessfulness of Remedies, which usually relieve in the Stone, lay a strong Suspicion, that the Disorder may have another Cause. See the Quotation above from Hoffman.

As to Hysterics imitating the Stone, Sydenham has observ'd; and since him, I believe, every Physician concern'd in much Practice, that sometimes this Disease seizes one of the Kidneys; where, by the violent Pain it occasions, it entirely resembles a Fit of the Stone, not only with respect to the kind of Pain, and the Part affected, but likewise by the violent Vomiting wherewith it is accompanied, and the Pains extending thro' the whole Duct of the Ureter: So that 'tis hard to distinguish, whether the Symptoms are from the Stone, or an Hysteric Disorder; unless, perhaps, some Misfortune having depressed the Woman's Spirits, a little before the Disorder came on, or the Discharge of green Matter by Vomit, should shew that the Symptoms are rather to be ascrib'd to an hysteric Disorder than the Stone. The Bladder also is occasionally affected with this delusory Symptom, causing Pain, and a Suppression of Urine, as in the Case of an Obstruction of the urinary Passages from a Stone. This last Species rarely happens, but the former more frequently. Both usually attack such Women as are greatly debilitated by frequent hysteric Fits. Sydenham.

The Constitution of the Patient, and the Symptoms, are to be accurately consider'd in this Case, as well as in nephritic Symptoms proceeding from the Gout. This Disorder I have frequently known instantly remov'd by Bleeding, without any ill Consequences, notwithstanding the Cautions given by some practical Writers against bleeding in Hysterics. See HYSTERICA.

As to intermitting Fevers imitating the Stone, and other Disorders, it is remarkable, that the general Use of the Peruvian Bark has introduc'd many anomalous Symptoms of these Fevers utterly unknown to the Antients. These Irregularities were, so far as I know, first taken Notice of by Morton, in his most excellent Dissertation, de Proteiformi Febris intermit-tentis Genio; where there are many important Observations, so strictly genuine and true, that a Physician must have practis'd to very little Purpose, if he has not almost daily observ'd Cases which strongly confirm them. It seems as if the Bark, by stifling, and not carrying off the Disorder, leaves in the Blood a Portion of the morbid Matter, which causes the Fever; or which, to use the Language of Sydenham, Nature raises a Fever, in order to expel. Now this is, in the Course of the Circulation, convey'd to, and deposited upon, one or other of the Viscera, there causing the Symptoms which are raised by any other Obstructions, or spasmodic Constrictions, in the same Part. Hence Fevers, which have been treated with the Bark, frequently afflict the miserable Patient for many Years, from time to time, under the Mask of other Disorders. But, to do Justice to a Remedy now in so great Reputation not altogether undeservedly, I must confess, that these irregular Symptoms sometimes precede its Exhibition, and even constitute the very first Scene of the Tragedy, before the Fever has shewn itself to be what it really is.

In order to distinguish these Cases, regard is to be had to the genuine Symptoms attending Disorders of the Part affected, to the Constitution, and the Inefficacy of Remedies which usually

usually relieve. If a Fever has preceded, which was treated with the Bark, tho' many Years before, it lays a Foundation for suspecting that to be the latent Cause, especially if it has frequently returned, and as often been treated with the Bark. But if a Sediment of a Pink-colour subsides to the Bottom of the Urine, or the Pain is periodical, it puts the Case out of Dispute. It often, however, happens, that tho' a latent Fever is the Cause of the Complaints, yet at first there is no Separation in the Urine, nor do the Symptoms recur at any regular Periods; but, after prudent Evacuations, the Periods generally become more regular, and the Disease betrays its Family by the Sediment above described. The Method, therefore, is to take away some Blood; after this, to give one lenient Purge, or more, if necessary. The Alteratives should consist princi-

pally of neutral Salts, either natural, as Nitre, or artificial, as Juice of Lemons with Salt of Wormwood, distill'd Vinegar with volatile Sal Ammoniac, and some simple Water as a Vehicle, and an Addition of a proper Syrup to make it agreeable; the *Terra Foliated Tartari*, otherwise call'd *Tartarus Regeneratus*; *Tartarus Tartarizatus*; but, above all, the *Tartarus Vitriolatus*, perfectly neutraliz'd, according to *Boerhaave's* Method. Such a Treatment will very seldom fail to make the Disorder, if caused by an Intermitting Fever, appear in its proper Form; and then the *Peruvian Bark*, if it should be judged proper, will generally cure it; or a Continuation of the same neutral Salts, with lenient Purges, intercalated at proper Intervals, will generally perform a Cure, especially if assisted with Blisters, if necessary, and nothing forbids their Use.

Table XXXV.

EXPLICATIONS

OF THE

TABLES in Volume the First.

TABLE I.

THE Figures mark'd A, B, C, D, E, F, G, H, I, M, N, O, P, Q, R, S, T, U, W, X, Y, Z, are explain'd under the Article ACETUM.

All the rest are explain'd under the Article VINUM.

TABLE II.

All the Figures in this Table are explain'd under the Article ACUS.

TABLE III.

The Figures mark'd 1. 1. 1. are explain'd under the Article ADEPS.

2. 3. 4. are explain'd under ALLANTOIS.

TABLE IV. TABLE V.

These Figures are explain'd under the Article ARTERIA.

TABLE VI.

From the Philosophical Transactions.

FIGURE I.

The Trunks of the Vena Cava, with their Branches, dissected, from an adult human Body.

A. A. The Orifice of the Vena Cava, as it appears when cut from the Right Auricle of the Heart.

a. The Orifice of the Coronary Vein of the Heart.

B. A. The superior or descending Trunk of the Vena Cava.

C. C. A. The inferior or ascending Trunk; so distinguish'd from the Motion of the Blood in these Trunks; which is contrary to their Position.

D. D. The Subclavian Veins.

†. That Part of the Left Subclavian Vein, where the Thoracic Duct enters it, and discharges itself of its Chyle and Lymph.

b. The Vena Azygos, with its Branches going to the Ribs;

e. e.

c. The superior Intercostal Veins.

d. d. The internal Mammary Veins.

E. E. The Right and Left Iliac Branches.

F. F. The internal Jugular Veins.

G. G. The external Jugulars.

H. H. The Veins which bring Blood from the lower Jaw, and its Muscles.

I. I. The Trunks of the internal Jugulars, cut off at the Basis of the Skull.

f. The Veins of the Thymus and Mediastinum.

g. g. The Veins of the Thyroid Glands.

h. The Vena Sacra.

i. The internal Iliac Branch.

k. The external.

K. K. The Occipital Veins.

L. The Right Axillary Vein.

M. The Cephalic.

N. The Basilic.

O. The Median Vein.

P. The Trunk of the Veins of the Liver.

Q. The Phrenic Vein of the Left Side.

R. The Right Phrenic Vein.

r. A large Vein from the Left Glandula Renalis, and Parts adjacent.

S. The Left Emulgent Vein.

T. The Right Emulgent, in this Subject very much lower than the Left, which is not usual.

U. U. The two Spermatie Veins.

VOL. I.

X. X. Two communicant Branches between the ascending Trunk of the Vena Cava and Vena Azygos, by which the Wind passes into the descending Trunk of the Cava, when we blow into the ascending at A. P. C. tho' the Trunk at A. P. and C. is firmly tied on the Blow-pipe.

*. An uncommon Branch between the lower Trunk of the Vena Cava and the Left Emulgent Vein.

Y. A Vein which brings Blood from the Muscles of the Abdomen into the external Iliac Branch.

Z. The Epigastric Vein on the Right Side.

1. 1. The Vena Saphena.

FIGURE 2.

The Trunks of the Vena Portæ dissected, and display'd.

A. A. A. The Branches of the Vena Portæ freed from the Liver.

a. The Umbilical Vein.

B. The Splenic Branch.

C. C. The Mesenteric Branches; which are continued from the Intestines.

b. The Trunk of the Vena Pancreatica, which receives Branches from the Duodenum.

c. c. The Vena Gastrica dextra Coronaria superior.

D. The superior Coronary Vein of the Stomach, on the Left Side.

E. The inferior Coronary Branch of the Stomach, on the Right Side. And,

F. The same Coronary Vein of the Left Side, removed from their proper Situations. From these two last are continued;

1. The Vena Epiploica superior dextra: And;

2. The Sinistra: With;

3. The Media.

G. The Vein call'd Vas Breve.

d. The Vena Duodeni.

H. The Vena Hæmorrhoidalis, arising from the Rectum and Anus; in this Subject emptying itself into the Left Mesenteric Branch; but in other Bodies (and particularly in a Preparation of these Veins) I find this Trunk of the Hæmorrhoid Veins ending in the Ramus Splenicus.

TABLE VII.

LANCISI'S Explanation.

a. a. The Olfactory Nerves.

b. b. The Optic Nerves cut.

c. c. The common Movers of the Eyes.

d. d. The Pathetic Nerves.

e. Processus Annularis.

f. f. The three Branches of the fifth Pair.

g. g. The sixth Pair.

h. h. The two Portions of the Auditory Nerve.

i. i. i. The Origin of the eighth Pair.

k. k. k. Several Ramifications of the Par Vagus, and Intercostal Nerves.

l. l. A remarkable Communication betwixt the Phrenic Nerves and one of the Intercostals, which helps to form the Brachial Nerves.

m. The Recurrent Nerve on the Left Side.

n. The Left Nerve of the ninth Pair.

o. The Right Nerve of the ninth Pair.

p. p. The Corpora Pyramidalia.

q. q. The tenth Pair cut.

r. r. The superior Extremity of the Nerves, commonly called Intercostales; which, according to Lancisi, may be reckon'd an eleventh Pair.

II. L.

S. S. S.

EXPLICATIONS of the TABLES in Volume the First.

TABLE IX.

LANCISI'S EXPLICATION.

3. s. s. The great Trunks of these Nerves.
1. u. u. u. The Nervus Accessorius of the eighth Pair, and its Communication with the third Pair of the Vertebrales.
- x. x. x. The Phrenic Nerves, call'd also the Diaphragmatic Nerves, of which the Left is naturally longer than the Right.
- y. The inferior Opening of the Infundibulum.
- z. z. The Nerves which go to the Testes, Uterus, &c.

Additional Explication.

1. 1. The Brachial Nerves.
2. 2. &c. The Communications of the Vertebral Nerves, with those commonly call'd Intercostals.
3. 3. The Crural and Sciatic Nerves.

TABLE VIII.

1. The Os Sincipitis on the Right Side.
2. The Os Sincipitis on the Left Side.
3. The Os Occipitis.
4. The Os Squamosum.
5. The Sutura Sagittalis.
6. 6. The Sutura Lambdoidalis.
7. The Processus Mammillaris.
8. Part of the lower Jaw.
9. The first Vertebra of the Neck, call'd Axis.
10. The second Vertebra of the Neck, call'd Epistropheus.
11. 11. The Claviculae.
12. 12. The Scapulae.
13. 13. The Basis of the Scapulae.
13. 14. The Costa inferior of the Right Scapulae.
14. The Processus Brevis.
15. 15. The Acromion.
16. 16. The Spina Scapulae.
17. 17. The Os Humeri.
18. 18. The Head of the Os Humeri.
19. The Asperities of the Left Os Humeri.
20. The external Protuberance of the Left Os Humeri.
21. The internal Protuberance of the Left Os Humeri.
22. 22. The Radius.
23. 23. The Ulna.
24. The Olecranon, or the Elbow, on the Right Side.
25. 25. The eight Bones of the Carpus.
26. 26. The four Bones of the Metacarpus.
27. The three Bones of the Thumb on the Left Side.
28. The Bones of the Fingers on the Left Side.
29. 29. The back Part of the Os Ilium, or Dorsum Ilii.
30. 30. The Spine of the Ilium on each Side.
31. 31. The Protuberances of the Os Ilium on each Side.
32. The internal Part of the Os Pubis.
33. The Os Sacrum.
34. The Os Coccygis.
35. 35. The large Sinus of the Ilium.
36. 36. The Foramen of the Ilium on each Side.
37. 37. The Femur on each Side.
38. 38. The Head of the Femur.
39. The Neck of the Femur.
40. 40. The Trochanter major, on each Side.
41. 41. The Trochanter minor on each Side.
42. 42. 42. 42. The two inferior Protuberances of the lower Appendix of the Os Femoris.
43. 43. The Tibia on each Side.
44. 44. The Head of the Tibia on each Side.
45. 45. The superior Appendix of the Fibula on each Side.
46. 46. The inferior Appendix of the Fibula on each Side.
47. 47. The Fibula on each Side.
48. 48. The Os Calcis on each Side.
49. 49. The Astragalus on each Side.
50. The Bones of the Tarsus.
51. The Bones of the Metatarsus.
52. The Bones of the Toes.
- a. b. c. d. e. f. The Spinal Processes of the Vertebrae of the Neck.
- n. n. n. n. n. The transverse Processes of the Vertebrae of the Neck.
- o. o. o. o. o. o. o. o. o. o. The transverse Processes of the Vertebrae of the Back on the Right Side.
- P. P. P. P. P. P. Some of the Spinal Processes of the Vertebrae of the Back.
- R. R. R. R. R. The Spinal Processes of the Vertebrae of the Loins.
- S. S. S. S. S. S. S. S. S. The transverse Processes of the Vertebrae of the Loins.
- b. i. k. l. m. n. o. p. q. r. s. t. The Ribs on the Left Side, at the Articulation of their small Tubercle with the transverse Processes of the Vertebrae.
- u. The last Vertebra of the Back.
- w. x. y. z. The Bodies of four of the Vertebrae of the Loins.

The Figures of this Plate are of the utmost Importance, since their principal Design is to exhibit various Figures of the human Skull, with which, according to Hippocrates in his Book *de Vulneribus Capitis*, every Physician and Surgeon ought to be well acquainted; for, since the natural and most common Figure of the Head resembles that of an oblong Sphere, its anterior and posterior Parts are of course somewhat prominent: But it frequently happens, that Skulls vary from each other, not only in the Number of Sutures, but also in the Diversity of Shapes and Forms.

FIG. 1. represents a human Skull, of the natural Form with the Sagittal Suture, continued to the Root of the Nose, to which it also reaches in Fig. 10. but in this latter the Coronal Suture is wanting; and tho' this Suture is observed in Fig. 17. yet the anterior Eminence, which is generally seen on the Sinciput, and upper Part of the Forehead, is wanting; but the posterior Eminence, belonging to the Occiput, remains. Tho' in Fig. 8. the posterior Part of this Eminence is only to be observed, yet, on the Occiput, it is a little more depress'd than in other Skulls.

FIG. 2. exhibits the Os Petrosum cut through, in order to give a Prospect of the Concha, the Cochlea, and the Foramina which open into it.

1. The Concha.
2. The Beginning of the Styliform Process.
3. The Mastoid Process.

FIG. 3. is, by Eustachius, principally intended for the Confutation of those, who, being more sway'd by Assertions than Fact, assert, with Galen, that the Sagittal Suture is never wanting, but always found in human Skulls; for, says Eustachius, "Tho' no Anatomist has hitherto adverted to it, I myself have frequently found the Sagittal Suture wanting; and some time ago I exhibited to public View and Examination fifteen human Skulls, in which there was not the smallest Appearance of a Sagittal Suture; tho', at the same time, all the other Sutures were to be distinctly and easily observed."

FIG. 5. and 6. represent both the Offa Petrosa, with the Foramina thro' which the Auditory Nerve enters.

FIG. 12. and 14. exhibit the Sella Turcica, with the Offa Cribiformia, and the Processus Cristati. In the Offa Cribiformia are observed the Foramina, thro' which the Processus Papillares, or Olfactory Nerves, pass. In Fig. 14. are observed the Foramina thro' which the Optic Nerves pass to the Eyes, the Foramina thro' which the Blood-vessels are admitted; as also the Sella Turcica. And in Fig. 12. all these Foramina are distinctly seen.

FIG. 13. represents that Side of the Os Cuneiforme which lies next to the Fauces, with its small Foramina, thro' which, according to some Anatomists, the Air enters, and reaches the Brain itself.

FIG. 16. represents the inferior Part of the Cranium, below the Os Sphenoides, with the Septum Medium of the Nose, which, when freed from the other Bones and Cartilages, is of a styliform Shape.

FIG. 17. represents a Cranium almost entirely round, which Figure is by some call'd *κεφαλή*, or *σφαίρα*; with two preternatural Sutures, one running transversely thro' the Middle of the Head, from the Right to the Left Ear; and the other reaching all along the Head, from that Foramen which gives a Passage to the Spinal Marrow, to the Root of the Nose.

Lancisi takes no Notice of the other Figures.

FIG. 4. seems to be the Os Frontis, separated from the other Bones of the Cranium.

FIG. 7. seems to be an irregular Portion of the Cranium, also separated.

In FIG. 8. there appears an irregular Suture.

FIG. 9. is the Os Occipitis separate.

FIG. 11. seems to be another View of the Bone represented in Fig. 16.

FIG. 15. represents a Skull, in which I observe nothing greatly anomalous.

TABLE X.

From EUSTACHIUS.

Represents the Muscles which are conspicuous on the fore Part.

1. 1. The Musculi Frontales.
2. 2. The Orbiculares Palpebrarum.
3. The Attollens Auriculam.
4. The Temporalis.
5. The Masseter.
6. Represents the Muscle call'd, by Lancisi, Constrictor, or Depressor Pinnæ Narium.
7. The Dilatator Alæ Nasi.
8. The Zygomaticus.
9. The Place of the Elevator Labiorum, or Elevator Labiorum.

EXPLICATIONS of the TABLES in Volume the First.

orum communis, called by *Lancisi* Gracilis; but it is not expressed in this Figure.

10. The Elevator Labii superioris proprius.
11. 11. The Constrictor or Sphincter Labiorum, or Orbicularis Labiorum; by some called Osculatorius.
12. The Buccinator. The Reference points too low for this Muscle, which lies exactly betwixt the Constrictor Labiorum, Fig. 11. 11. and the Masseter, Fig. 5.
13. 13. The Musculi Mastoidei. 15. 15. those Parts of these Muscles which arise from the Clavicle.
14. 14. The Sternohyoidei.
16. 16. The Coracohyoidei.
17. The Sceleni.
18. Represents Part of the Cucullaris on the Right Side.
18. On the Left Side is the Levator or Elevator Scapulae, otherwise called Musculus Patientiae.
19. 19. The Place where the Fibres of the Pectoralis unite in some measure with those of the Deltoides.
20. 20. The Deltoides.
21. The Place in the Carpus, where the Palmaris Longus passes thro' a Ring in the Annular Ligament.
22. A remarkable Union of the Tendons of the Extensors of the three last Fingers.
23. 23. The Productions of the Peritonaeum, which, perforating the Muscles of the Abdomen at the Rings, descend to the Scrotum.
24. 24. The Place where the three Tendons of the Sartorius, Gracilis, and Seminervosus, are inserted into the anterior, and internal Part of the Tibia, just under the Knee.
25. 25. The Tendons of the Extensors of the Toes, which are secur'd by a Ligament at the Ankle, as appears on both Sides. But on the Right Side internally another Ligament is represented, which fixes the Tendons of the Extensor longus Digitorum, the Tibialis Posticus, and the Flexor Pollicis.
26. 26. The Musculus Pectoralis.
27. The Triceps Extensor Cubiti on the Right Side.
28. and 30. The Biceps on the Left Side according to *Lancisi's* Explication.
29. Part of the Triceps Extensor on the Left Side.
30. The Biceps on the Right Side. *N. B.* The prick'd Line is not carried far enough by three Lines.
31. The Brachizus Internus.
32. The Anconaeus.
33. The Pronator Rotundus.
34. 34. The Supinator Longus.
35. 55. The Radizus externus, according to *Lancisi*.
36. The Extensor Carpi Ulnaris.
37. 37. The Cubitaeus internus, according to *Lancisi*.
38. The Radizus internus, according to *Lancisi*.
39. 39. The Palmaris with its tendinous Expansion.
40. 40. Tendons of the Muscles of the Thumb.
41. The Tendon of the Adductor Pollicis.
42. The Extensor magnus Digitorum.
43. The Ligamentum Carpi.
44. 44. The Tendons of the Iliaci Interni.
45. 45. The Pectinæus.
46. One of the Heads of the Triceps.
47. 47. The Rectus Femoris on each Side.
48. 48. The Vastus externus on each Side.
49. 49. The Vastus internus on each Side.
50. The Gracilis.
51. The Seminervosus not well distinguish'd in the Figure.
52. The Sartorius on each Side.
53. A Part of the Origin of the Vastus externus.
54. 54. The Membranofus.
55. 55. The Tibialis Anticus.
56. The Gemelli.
57. 57. The Solæi.
58. The Tendo Achillis.
59. According to *Lancisi*, is the Extensor digitorum longus.
60. 60. The Tendons of the Extensors of the Toes. The other 60. is inserted in the Figure by Mistake.
61. The Tendons of the Extensor Longus, Tibialis Posticus, and Flexor Pollicis.
- A. A. Portions of the Latissimus Dorsi on each Side.
- B. B. The Indentations of the Serratus major anticus.
- C. C. The Sternum.

This Explication is principally according to *Lancisi*, as the Figure is taken from his Edition of *Eustachius*; but I think it is not very accurate.

TABLE XI. From EUSTACHIUS.

1. Two Muscles upon the Occiput, called by *Eustachius* Quadrati.
2. The Musculus Cucullaris on the Left Side; that on the Right Side being remov'd.
3. The Splenius.
4. The Musculus Mastoideus.

5. The Musculus Patientiae, or, Levator Scapulae proprius.
6. The Rhomboides.
7. The Articulation of the Clavicle with the Scapula on the Right Side.
8. The Deltoides.
9. The Teres Minor.
10. The Teres Major.
11. 11. The Latissimus Dorsi on each Side.
12. The Gluteus major.
13. The Gluteus medius.
14. The Musculus Pyriformis.
15. The Quadratus femoris.
16. The Biceps femoris.
17. The Semimembranosus.
18. The Membranofus, according to *Lancisi*.
19. 19. The Vasti Externi.
20. The Gastrocnemii.
21. The Soleus.
22. The Plantaris.

TABLE XII. From RIDLEY.

FIGURE I.

Exhibits the Basis of the Brain, with Part of the Medulla Oblongata, the Blood-vessels being injected with Wax.

- A. A. The fore Lobes of the Brain.
- B. B. The hinder Lobes.
- C. C. The Cerebellum.
- D. D. The lateral Sinuses.
- E. E. The Vertebral Arteries, as they pass between the first Vertebra, and the Bone of the Occiput.
- F. The Vertebral Sinus.
- G. G. G. G. G. The Dura Mater on the Right Side taken off from the Spinal Marrow, and remaining on the Left.
- 1, 2, 3, 4, &c. The ten Pair of Nerves belonging to the Brain, with seven of the Spinal Marrow.
- a. The Foramen that opens into the Pituitary Gland from the Infundibulum.
- b. b. The two white Protuberances behind the Infundibulum.
- c. c. The two Trunks of the carotid Artery cut off where they begin to run betwixt the fore and hinder Lobes of the Brain.
- d. d. The two Arteries joining the Carotids, with the cervical Artery called the communicant Branches.
- e. e. Two large Branches of the cervical Artery, sometimes seeming as tho' they came from the communicant Branch on each Side; from the first of which the Plexus Choroideus hath its Original in chief, and from the last the Plexus Choroideus of the fourth Ventricle.
- f. Several little Branches arising from the carotid Artery.
- g. The cervical Artery composed of the two Trunks of the Vertebral Artery within the Cranium.
- h. h. The two Trunks of the Vertebral Artery.
- i. i. i. The Spinal Artery.
- k. A small Branch of an Artery running thro' the ninth Pair, broken off from its other Part thro' Inadvertency of the Graver.
- l. l. The Crura of the Medulla Oblongata.
- m. m. The annular Protuberance, or Pons Varolii.
- n. That Part of the Caudex Medullaris on the Right Side, called by *Willis* and *Vieussenius*, Corpora Pyramidalia.
- o. That Part on the same Side called Corpus Olivare.
- P. The foremost Branch of the carotid Artery, dividing the fore Lobes of the Brain, consisting of two Branches, one of them only appearing here.
- q. q. Little Branches of Arteries, helping to make the Plexus Choroideus in the fourth Ventricle.
- r. r. r. r. Branches of Arteries dispersed from the cervical Artery upon and thro' the annular Protuberance.
- s. s. Part of the second Process, or Pedunculi of the Cerebellum.
- *. *. The Spinal accessory Nerve, not expressed very plain.

FIGURE 2.

Exhibits the Cerebellum cut thro' on its hinder Part, and reclined laterally.

- A. A. A. The Cerebellum.
- B. B. The arboreous Ramification of the Meditullium of the Cerebellum appearing, being cut right downwards.
- C. C. The pathetic Nerves.
- c. c. The Nates; the Engraver has by Mistake made the Letters c. c.
- d. d. The Testes.
- e. The transverse Process, whence the pathetic Pair of Nerves have their Original.
- f. Glandula Pinealis.

EXPLICATIONS of the TABLES in Volume the First.

- g. g. The first Process of the Cerebellum running from it to the Nates, here extended laterally.
 h. h. The third or chordal Processes.
 i. i. The transverse medullary Process in the fourth Ventricle, from whence the soft Branch of the seventh Nerve has its Original.
 k. k. The medullary Process descending from the transverse Process behind the Testes, down to the aforementioned other medullary transverse Process.
 l. l. The Originals of that Process a little too low.
 m. m. The eighth Pair of Nerves.
 n. The Calamus Scriptorius, or Extremity of the fourth Ventricle.
 o. The Spinal Marrow.
 p. p. The accessory Nerves.
 q. q. The tenth Pair of Nerves.

TABLE XIII. From CHESELDEN.

The Engraver by Mistake has omitted numbering the Figures in this Plate.

1. in FIG. 1. The Right Ventricle of a Foetus distended with Wax.
 2. The Right Auricle.
 3. The Left Auricle.
 4. 4. Branches of the Pulmonary Veins of the Right Lobe of the Lungs, those of the Left being cut off short.
 5. 5. The Arteries of the Left Lobe of the Lungs.
 6. The Vena Cava descendens.
 7. Aorta Ascendens.
 8. Arteria Pulmonalis.
 9. Ductus arteriosus.
 10. in FIG. 2. The Under-side of a Heart of a younger Foetus.
 11. The Right Auricle cut open.
 12. The Cava Descendens cut open.
 13. Tuberculum Loweri.
 14. The Foramen ovale closed with its Valve.
 15. The Mouth of the Coronary Veins.
 16. in FIG. 3. The Umbilical Vein.
 17. 17. 17. Branches of the Vena Portæ in the Liver.
 18. Ductus venosus. Here the Engraver by Mistake has omitted a prick'd Line from the 18 to the Vessel refer'd to.
 19. Branches of the Cava in the Liver.
 20. 20. Vena Cava:
 1. in FIG. 4. Larynx.
 2. 2. The internal Jugular Vein.
 3. 3. The Subclavian Vein.
 4. Cava descendens.
 5. The Right Auricle of the Heart.
 6. The Right Ventricle.
 7. Part of the Left Ventricle.
 8. Aorta Ascendens.
 9. Arteria Pulmonalis.
 10. The Right Lobe of the Lungs, part of which is cut off, to shew the great Blood-vessels.
 11. The Left Lobe.
 12. 12. The Diaphragm.
 13. The Liver.
 14. The Ligamentum Rotundum.
 15. The Gall-bladder.
 16. The Stomach, press'd by the Liver towards the Left Side.
 17. 17. The small Guts.
 18. The Spleen.

TABLE XIV. From EUSTACHIUS.

FIG. 1.

- The Liver, Stomach, and intestinal Tube.
 a. a. The Liver turn'd upwards, in order to shew,
 b. The Gall-bladder.
 c. The Cystic Duct, which uniting with,
 d. The Hepatic Duct, forms,
 e. The Ductus communis Choledochus.
 f. The Vena Portæ.
 g. Some small Branches of the Hepatic Artery.
 h. The Vena Umbilicalis cut off.
 i. i. i. The Stomach, with its coronary Vessels.
 k. The Spleen.
 l. l. l. A Portion of the Omentum, with some of the Adipose Glands.
 m. m. m. Windings of the small Intestines.
 n. n. n. Part of the Colon.
 o. o. o. The Fascia Muscularis of the Colon, which, being not so long as the Colon, contracts that Intestine, in such a manner as to form various Cells.
 p. The Extremity of the Colon, where it makes a Flexure, in order to form the Rectum.
 q. The Rectum.
 r. The Anus.

- s. The Sphincter Ani.
 t. t. The Elevatores Ani.

FIG. 2.

- Represents the Oesophagus at A. B. &c.
 C. C. The Stomach.
 D. The Cardia.
 E. The Pylorus.
 F. The external Membrane of the Stomach, which it borrows from the Peritonæum raised.
 G. The Muscular Coat of the Stomach raised.

FIG. 3. Represents

- A. B. The Oesophagus.
 C. C. The Pancreas.
 D. The Pancreatic Duct, in its Progress to,
 E. The Duodenum.

FIG. 4.

- A. The Larynx.
 B. The Aspera Arteria.
 C. C. The Lungs.
 D. The Thymus.
 E. E. Two Branches of Nerves passing to,
 F. F. F. The Diaphragm.

FIG. 5.

- A. The Larynx.
 B. The Aspera Arteria.
 C. C. C. C. Four Lobes of the Lungs.
 D. The Heart inclosed in the Pericardium.
 E. The Vena Cava superior.
 F. The Subclavian and Carotid Arteries.

TABLE XV. From GLISSON.

That the Structure of the Liver may be the better understood, *Glisson* has given us two Delineations of it, one of which represents the Distribution of Vessels in its Cavity, and the other those of its convex Part. But that Author lays down the following general Cautions with regard to both his Representations.

1st. That, in a duly prepar'd Liver, there is a far greater number of Ramifications, and capillary Vessels, than are really express'd in his Figures. This, he says, was designedly done, because by expressing the Traces of the small Ramifications distributed thro' the Meditullium of the Liver, the Delineation of the larger and more important Vessels had been too much clouded.

2dly, He tells us, that we are not to expect the same Distribution of Vessels in all Livers; that his own Representations are not to be made invariable Standards; that when his Figures were engrav'd, he had four newly prepar'd Livers by him, each of which differ'd in some respect or other from the rest; and that Nature, in the Formation of this Organ, delights in that Variety observable in all her other Productions.

3dly, He tells us, that the smaller Vessels, the Arteries, for Instance, the Nerves, and the Lympheducts, are not always of the same Number in all Livers; that their Deficiency, with regard to Number, was continually compensated by their Largeness; that there were some Livers which had two hepatic Arteries, but smaller than the usual Size; that he himself saw a Liver with three Nerves, a small Ramification of one of which ran to the Gall-bladder; that the Lympheducts themselves varied very much as to their Number in different Livers; and that, in his own Representation, he had only exhibited two Lympheducts, because in the Liver delineated, when boiled and prepar'd, he found no more, tho' in other Livers he had frequently observ'd a larger Number.

FIG. 1. & 2. Exhibit the Liver freed from its Parenchyma.

FIG. 1. Represents the flat Part of the Liver, together with the most conspicuous Vessels in it.

- A. That Part of the Liver which lies next to the Back.
 B. Its Right Side.
 C. Its anterior Edge.
 D. Its Left Side.
 E. The Vena Cava, where it passes thro' the Diaphragm.
 E. 1. E. 2. E. 3. E. 3. Its three principal Branches distributed almost thro' the whole Liver.
 F. The Vena Portæ turn'd upwards, that other Vessels may be the more easily seen.
 F. 1. F. 2. F. 3. F. 4. Four Branches of the Vena Portæ distributed to the several Quarters of the flat Part of the Liver, but the fifth Branch is not observ'd on this Side.
 G. The Gall-bladder.
 H. H. The Vena Umbilicalis become a Ligament.
 I. The Ductus Communis Choledochus.
 K. The Canalis Venosus, now performing the Office of a Ligament.
 L. The Trunk of the Vena Cava descendens.
 a. A small Portion of the Membrane investing the Liver.
 b. That

EXPLICATIONS of the TABLES in Volume the First.

- b. That Part of the Diaphragm which surrounds the Vena Cava.
- c. The Biliary Duct.
 - d. The Cyftic Duct.
 - e. The Place where these Vessels meet.
 - f. The Hepatic Artery.
 - o. o. The Hepatic Nerves.
 - p. p. p. The common Capsula laid open.
 - q. q. The Lympheducts.
 - m. m. m. &c. The smaller Branches of the Vena Portæ.
 - n. n. n. &c. The small Branches of the Vena Cava.

FIG. 2.

Represents the convex Part of the Liver, together with the Vessels situated in it.

A. The superior Part of the Liver which lies next to the Back.

B. Its Right Part.

C. Its lowest anterior Part.

D. The Left Part of the Liver.

E. The Trunk of the Vena Cava above the Diaphragm.

F. The Sinus of the Vena Portæ.

F. 1. F. 2. F. 3. F. 4. Four Branches of the Vena Portæ distributed in four different Directions thro' the Liver.

F. 5. The fifth Branch of the Vena Portæ, which could not be describ'd in the preceding Figure.

G. The Gall-bladder.

H. H. The umbilical Vein.

I. The Ductus communis Choledochus.

a. a. a. a. The small Ramifications of the fifth Branch of the Vena Portæ cut off, that the other Vessels may be the more distinctly seen.

b. That Portion of the Diaphragm where it is join'd to the Vena Cava.

c. The Biliary Duct.

d. d. The Cyftic Duct.

e. The Angle where these Vessels are join'd.

m. m. m. &c. The smaller Branches of the Vena Portæ.

n. n. n. &c. The smaller Branches of the Vena Cava.

FIG. 3.

A. The convex Part of the Liver.

B. Its Right Part.

C. The concave Part of the Liver.

D. Its Left Part.

E. The Trunk of the Vena Portæ turn'd upwards, that the other Vessels may be the more easily seen.

1. 2. 3. 4. 5. The five larger Branches of the Vena Portæ.

F. The Ductus communis Choledochus.

G. The Biliary Duct, and its first Division.

H. The Cyftic Duct.

I. The Gall-bladder.

a. a. a. a. &c. The common Capsula laid open.

b. b. b. b. b. The Subdivisions of the biliary Duct.

TABLE XVI.

FIG. 1. From EUSTACHIUS.

Represents the Kidneys, Glandulæ Succenturiatæ, Bladder, and Male Organs of Generation, with their Vessels.

A. A. The Kidneys.

B. B. The Glandulæ Succenturiatæ.

C. C. The emulgent Vessels, together with those which are distributed in the Membranes of the Kidneys.

D. D. The hypogastric Vessels, which, branching off from the Iliacs, are distributed in the urinary Bladder, and Penis.

E. E. The Course of the Ureters.

F. F. The Course of the spermatic Vein and Artery to the Testicles. In these, several Branches appear cut off, which are distributed in the Peritonæum.

G. The urinary Bladder.

H. H. The Vasa Deferentia.

I. I. The Testicles.

K. The Urachus cut off.

L. The Penis.

M. M. The Musculi Erectores Penis.

FIG. 2. From CHESELDEN.

1. The under Side of the Bladder.

2. 2. The Ureters.

3. 3. Vasa Deferentia.

4. 4. Vesciculæ Seminales.

5. The Prostate Gland.

6. The urinary Duct.

FIG. 3. From DE GRAAF.

A. A Portion of one of the Vasa Deferentia, in which there is a conspicuous Cavity.

Vol. I.

B. The Serpentine Flexures about the End of the Epididymis partly unravel'd.

C. A Piece of the Epididymis entirely unravel'd.

D. The Serpentine Flexures about the Middle of the Epididymis partly unravel'd.

E. The same Part of the Epididymis entirely unravel'd.

F. Another Part near the Middle of the Epididymis partly unravel'd.

G. The same Part of the Epididymis entirely unravel'd, so that it appears to be one continu'd Vessel, which, as it gradually approaches to the superior Part of the Testicle, becomes proportionably smaller.

H. The large Globe or Beginning of the Epididymis.

I. The Belly of the Testicle.

K. The Arteria Præparans, which ascends from the inferior Part of the Testicle thro' its Belly.

L. L. The Ramifications of the Venæ Præparantes.

FIG. 4. and 5.

Exhibit the Testicles of brute Animals, in which the Vessels belonging to the Testicles are not only, by the Assistance of Art, but also naturally, more easily and distinctly observ'd.

FIG. 4. From DE GRAAF.

A. A. A. The Tunica Vaginalis of the Testicles laid aside.

B. The preparing Artery, which, before it approaches to the Testicle, is twisted from one Side to the other, upwards and downwards.

C. The Vasa Præparantia, as yet connected by a certain slender Membrane.

D. D. The Arteria Præparans, ascending thro' the Belly of the Testicle.

E. The Branches of the Vena Præparans.

F. The Testicle and Epididymis of a Dog turgid with Seed.

G. The larger Globe of the Epididymis.

H. The lesser Globe of the Epididymis.

I. The Beginning of one of the Vasa Deferentia.

K. One of the Vasa Deferentia ty'd in a Dog before Copulation.

FIG. 5. From DE GRAAF.

A. The Vasa Præparantia cut.

B. The Vasa Præparantia too confusedly express'd by the Engraver, as they are also in the preceding Figure.

C. The Ramifications of the Vasa Præparantia going off to the Epididymes.

D. D. The largest Branch of the Arteria Præparans running thro' the Belly of the Testicle.

E. E. The Ramifications of the Venæ Præparantes.

F. The Testicle of a Dog turgid with the seminal Fluid.

G. The larger Globe of the Epididymis turgid with the seminal Fluid.

H. The smaller Globe of the Epididymis, in like manner distended by a large Quantity of the same Fluid.

I. The End of the Epididymis, or the Beginning of the Vas Deferens.

K. The Vas Deferens in like manner ty'd in the Groin of a Dog before Copulation, that the seminal Vessels, when fill'd with the seminal Fluid, may appear more distinctly.

FIG. 6. From DE GRAAF.

Exhibits an anterior Prospect of the genital, and some of the urinary, Parts, still cohering with each other.

A. The anterior Part of the urinary Bladder.

B. The Neck of the urinary Bladder.

C. C. Certain Portions of the Ureters.

D. D. Certain Portions of the Vasa Deferentia.

E. E. Vessels running off to the Vesciculæ Seminales.

F. F. The Vesciculæ Seminales.

G. G. The anterior Part of the Prostate, or Corpus Glandulosum.

H. The Urethra, adjoining to its spongy Part.

I. I. The spongy Part of the Urethra.

K. K. The Muscles which erect the Penis, call'd the *Musculi Erigentes, Extendentes, or Erectores*.

L. L. The Beginnings of the Corpora Nervosa, which, when the Penis is inflated, protuberate like so many small Bladders.

M. M. The Skin of the Penis laid aside.

N. N. The Duplication of the Skin, which constitutes the Prepuce.

O. O. The Duplication of the Skin, which forms the Prepuce.

P. P. The Dorsum Penis.

Q. The Glans Penis.

R. The Meatus Urinarius, with which the anterior Part of the Glans is perforated.

S. S. The

EXPLICATIONS of the TABLES in Volume the First.

- S. S. The Nerves running upon the Dorsum Penis.
 T. T. The Arteries running upon the Dorsum Penis.
 V. The Corpora Nervosa joining together.
 W. W. Two Veins which unite themselves, and run in one remarkable Branch along the Dorsum Penis.
 X. The same Vein laid open, that the small Valves may be observ'd in it.

FIG. 7. From DE GRAAF.

Represents both the Venæ Præparantes and Hypogastricæ with their Ramifications, as distended with Air blown into them, and running off to the Testes, the Tubes, the anterior Part of the Uterus, and its Vagina.

- A. The Bottom of the Uterus.
 B. The Neck of the Uterus.
 C. The Vagina.
 D. The Left Testicle, almost in its natural Situation.
 E. The Left Fallopian Tube, in its natural Situation.
 F. The Right Testicle, drawn downwards, out of its natural Situation.
 G. The Right Tube, drawn upwards, out of its natural Situation.
 H. H. The Venæ Præparantes cut.
 I. I. I. I. The Anastomoses between the Venæ Præparantes.
 K. K. K. K. The Branches of the Venæ Præparantes running to the Testes.
 L. L. The Branches of the Venæ Præparantes running off to the Tubes, and to their foliaceous Decoration.
 M. M. The Venæ Præparantes join'd by an Anastomosis to the Hypogastric Veins.
 N. N. The Hypogastric Veins ty'd to the Extremities of Pipes, in order to be inflated.
 O. O. O. O. Large Branches of the Hypogastric Veins running off to the Sides of the Uterus.
 P. P. P. P. P. P. Branches from them going to the Uterus.
 Q. Q. Branches of them reaching to the Venæ Præparantes.
 R. R. Branches going from them to the Tubes.
 S. S. Their Branches, reaching to the Ligamenta Rotunda of the Uterus, cut off.
 T. T. Their Branches going to the Ligamenta Lata of the Uterus.
 V. V. V. V. Their large Branches going to the Vagina.
 X. X. Their Branches going off to the Fat, and membranous Parts adjoining to the Sides of the Vagina.
 Y. The urinary Bladder cut about the Neck.
 Z. Z. The fleshy Fibres of the Sphincter Muscle.
 a. The Clitoris.
 b. b. Its Crura.
 c. c. Its Muscles.
 d. Its Prepuce.
 e. Its Glans.
 f. f. The Nymphæ.
 g. The Orifice of the Urethra.
 h. The Mouth of the Vagina.
 i. i. The Labia.
 k. k. Veins running along the Dorsum of the Clitoris, join'd to each other by an Anastomosis.
 l. l. The Branches of these Veins running out to all the Parts of the Pudendum.
 m. The Perinæum.
 n. n. The Anastomoses between the Veins of the Uterus and Vagina.
 o. o. o. The Anastomoses between the Hypogastric Veins of both Sides.

TABLE XVII.

From SWAMMERDAM, DE GRAAF, and CHESELDEN.

FIG. 1. The fore Prospect of the Uterus of a Woman after Delivery.

- A. A. The Spermatic Arteries.
 B. B. The Spermatic Veins distributed thro' the Tubes and Fundus of the Uterus.
 C. C. The Corpora Pyramidalia, composed of the Spermatic Arteries and Veins.
 D. D. The membranous or broad Ligaments of the Womb, thro' which the Blood-vessels pass to the Fallopian Tubes, call'd by some Alæ Vespertilionum.
 E. E. The Fallopian Tubes well express'd.
 F. F. Their Aperture at the Expansum Foliaceum, on each Side, call'd Morfus Diaboli.
 G. G. The round or inferior Ligaments of the Womb.
 H. The Origination of the Veins and Arteries of those Ligaments.
 I. The Valve in the Vein of the round Ligament, hindering the Relapse of the Blood to the Uterus.
 K. K. The two Hypogastric Arteries.
 L. L. L. The Hypogastric Veins variously contorted, and in their Progress implicated and perplex'd with the Arteries.

- M. Fundus Uteri.
 N. The Cervix, or Neck of it, at the End of which is the inner Orifice of the Womb.
 O. O. O. The Arteries on the Fundus or Bottom of the Womb, curl'd like the Tendrils of a Vine.
 P. P. A great Number of Veins running over the exterior Tunic of the Uterus, in which the Anastomoses are singularly remarkable.
 Q. The Vagina Uteri.
 R. The Bladder of Urine inverted, to shew the Tortuosity of the Arteries of the Vagina, by which means its proper Vessels are represented somewhat longer than they ought to be.
 S. The Orifice of the Urethra in the Vagina.
 T. T. The Ureters.
 V. V. Their Insertion into the Bladder, which is here turn'd downwards.
 X. Part of the Urachus.
 Y. Y. The Umbilical Arteries.

FIG. 2. From DE GRAAF.

Exhibits the anterior Part of the Uterus laid open by a crucial Incision.

- A. A. A. A. The Parts of the Uterus crucially divided, and so dispos'd, that its Cavities, and the Thickness of its spongy Substance, may appear.
 B. The Cavity of the Bottom of the Uterus.
 C. The Cavity of the Neck of the Uterus.
 D. The Coarctation for the most part observable between the Cavities of its Bottom and Neck.
 E. The Mouth of the Uterus.
 F. That Part of the Vagina which adheres to the Mouth of the Uterus.
 G. G. Certain Portions of the Tubes.
 H. H. Probes introduc'd thro' the Fallopian Tubes to the Bottom of the Uterus.
 I. I. I. I. The proper Membrane of the Uterus covering its internal Substance.
 K. K. The interior less spongy Substance of the Neck of the Uterus.

FIG. 3. From CHESELDEN.

1. That Side of the Uterus which is next the Gut.
2. 2. The Fallopian Tubes.
3. 3. The Fimbriæ.
4. 4. The Ovaria.
5. The Mouth of the Uterus.
6. 6. Ligamenta Rotunda.
7. The Inside of the Vagina.
8. The Orifice of the Meatus Urinarius.
9. The Glans Clitoridis.
10. 10. The external Labia of the Vagina.
11. 11. The Nymphæ which are continu'd from the Præputium Clitoridis.

TABLE XVIII.

This entire Table is explain'd under the Article AURIS.

TABLE XIX.

This Table is explain'd under the Article OCULUS.

TABLE XX. and XXI.

These are explain'd in the Tables.

TABLE XXII.

From HEISTER.

- A. B. Two Lancets of different Sizes. These are used, especially the smaller Sort, in opening Veins, for which Reason the Greeks call'd them Phlebotomi; but the larger Sort are used for opening Abscesses with.
 C. A Pair of strait Scissars, fit for many Uses. The Surgeon should be furnish'd with several Pair of these of different Sizes.
 D. A Pair of crooked Scissars, proper to be used in dividing Fistulas, and in many other Cases.
 E. A Pair of Forceps furnish'd with Teeth at one End. These are used to remove Dressings, and sometimes to extract Splinters or other Things; they are also serviceable in anatomical Dissections. Forceps of this kind are commonly made of Steel, but those of Silver are much neater.
 F. A Razor.
 G. A strait Incision-knife.
 H. A crooked Incision-knife.
 I. A strait double-edg'd Incision-knife.
 K. A Probe, one End of which is broad and thin, for discovering a Fissure in the Cranium, and other Uses; the other End is rounded, to examine the Depth and Situation of Wounds; for which Uses also the Probe L. may serve. The neatest Probes are made of Silver, tho' they are frequently also made of Steel, Ivory, or Whalebone.

EXPLICATIONS of the TABLES in Volume the First.

M. A groov'd Probe, or Conductor, to direct the Edge of the Knife or Scissars in opening Sinuses or Fistulæ, in order to preserve the subjacent Vessels, Nerves, and Tendons, from being injur'd; the Ornament at the upper Part of it is for a Handle, tho' sometimes that End is made in the Form of a Spoon, as you may see at N. that it may contain a Powder to sprinkle upon Wounds or Ulcers; sometimes also it is forked at the End, that it may be useful in the Operation for dividing the Frænum of the Tongue, as at O.

P. is a Spatula. The Use of this Instrument is to depress the Tongue, in order to examine the State of the Tonsils, Uvula, and Fauces, when they are affected with any Disorders; it is also used to elevate the Tongue, when the Frænum is to be divided; for which Purpose it has a Fissure at its Extremity, and should therefore be rather made of Silver than of any other Metal.

The following Spatulas also at Q. and R. resemble this: These are principally used in spreading Plaisters, Ointments, and Cataplasms; sometimes, with their sulcated Extremity, they are of Service in raising up fractur'd Bones of the Cranium.

In this Place also it will be proper to describe different sorts of Needles, strait and crooked, for stitching up of Wounds, taking up of Arteries, and many other Uses. Crooked ones, of different Sizes, are represented at S. T. V. X.

TABLE XXIII.

From HEISTER.

- A. B. Scrap'd Lint, commonly call'd Pledgets.
- C. D. E. Dossils, which are compos'd of Lint, work'd into the Shape of Olives, or Dactyle Stones.
- F. G. The same, with the Addition of a Thread ty'd round them.
- H. I. Larger Pledgets made of Tow.
- K. L. M. represents Tents of different Sizes made of Lint.
- N. A very large Tent, with a Thread annex'd to it.
- O. A conical Tent made of Linen.
- P. Q. R. S. T. V. X. Tubes or Canulas of different kinds, made of Silver or Lead.
- 1. 2. 3. 4. 5. 6. 7. 8. 9. 10. 11. 11. different Forms of Plaisters.
- 12. 13. 13. 14. 15. 16. 17. 18. 19. Different sorts of Compresses, amongst which the Fig. 16. represents three Compresses laid across in the Form of an Asterisk.
- N. B. The Reference to this Figure, in the Original of Heister, is wrong. I observe, however, the English Translation exactly follows the Original, as to the Reference; but has made Nonfense of the Explication.
- 20. A Ball of Lint, which is sometimes us'd as a Compress.
- 21. A small square Compress.
- 22. 22. Several small slender Compresses.
- a. A simple Roller, not roll'd up.
- b. A one-headed Roller, which is roll'd up at one End.
- c. A double-headed Roller, which is roll'd up at both Ends.
- d. A four-headed Roller.
- e. A small Roller, particularly intended for the Security of Dressings, which are applied to one of the Fingers, or the Penis.
- f. The uniting Roller, which is perforated in the Middle.
- g. The Scapular Roller.
- h. Heliodorus's, or the T. Roller.

TABLE XXIV.

From HEISTER.

- FIG. 1. A. describes how the grand Capital Roller is to be apply'd after the Operation of the Trepan, or after Wounds of the Head.
- B. The Belt, or Napkin, which is to surround the Body in Wounds of the Thorax or Abdomen.
- C. The Scapulary to support the Belt.
- D. The Method of making the Ligature after Bleeding in the Arm.
- E. The Manner of tying up the Foot after Bleeding, which, from the Similitude it has with a Stirrup, is call'd by that Name.
- F. shews the spiral Manner in which the Roller ought to ascend, when it is applied to the Leg or Arm.
- G. A serpentine Roller, where the Convolutions are not so frequent.
- H. A large Wound in the Thigh, which requires the true Suture.
- I. K. The Part where the Tourniquet is to be apply'd to the Arm, and the Manner of applying it.
- L. The Manner of applying the Tourniquet to the upper Part of the Thigh; the Fillet, which is roll'd up, and apply'd as a Bolster, lies upon the Crural Artery at M.
- N. Shews how the Tourniquet is to be apply'd to the lower Part of the Thigh, in which Case the roll'd Fillet is to be apply'd to the back Part of the Thigh.
- O. A large Wound of the Abdomen, with the Intestines falling out.
- FIG. 2. The common Tourniquet, before it is apply'd.

FIG. 3. Crooked Forceps, furnish'd with Teeth at the End; call'd the Crane's-bill.

FIG. 4. A Pair of strait Forceps.

FIG. 5. The Duck's-bill Forceps, furnish'd with a moveable Ring, A.

FIG. 6. The Goose-bill Forceps.

FIG. 7. The Instrument invented by Bartholomæus Maggius, to extract Bullets which are fix'd in a bony Part:

FIG. 8. A Hook to extract Bullets.

FIG. 9. 10. 11. 12. 13. 14. 15. 16. Different sorts of Cauteries:

FIG. 17. Shews, in some measure, the manner of performing the Operation call'd Gastroraphy, or the Suture of the Abdomen:

a. a. Describe the Wound.

b. b. Two crooked Needles, with the Threads hanging to them.

c. c. c. c. c. Two Threads drawn thro' the Lips of the Wound, and clear'd from their Needles.

TABLE XXV.

From HEISTER.

FIG. 1. Petit's triangular Needle, for making a Counter-opening in Wounds or Ulcers.

FIG. 2. Another crooked Needle, of Heister's Invention, which may be us'd in some Wounds and Ulcers, where the preceding is not so proper.

FIG. 3. Represents a Wound, the Lips of which are united by an adhesive Plaister on both Sides.

FIG. 4. Represents a Wound, to which two adhesive Plaisters are apply'd, with Indentations.

FIG. 5. A Wound of the like Nature, to which two adhesive Plaisters, without Indentations, are apply'd.

FIG. 6. Two Wounds crossing each other, A. A. A. A. and united by two Plaisters laid crossways, B. B. B. B.

FIG. 7. A. A. A Wound to which an adhesive Plaister is apply'd, with two Openings in the Middle, B. B.

FIG. 8. A Wound united by the Application of two Plaisters, with strong Threads fix'd to each of them, which are drawn together, and fasten'd with slip Knots, a. a. a.

FIG. 9. The same Wound, with Plaisters of the same kind, furnish'd with Hooks, a. a. a. a. a. instead of Threads, by which, with the Assistance of Threads fasten'd to them, the Lips of the Wound are drawn together.

FIG. 10. Represents in what manner, by the Assistance of the small Eyes, b. b. b. b. b. b. used instead of the Hooks in the preceding Figure, Plaisters of this kind may be form'd, and drawn, or, as it were, laid, together, as some of the Antients used to do.

FIG. 11. A transverse Wound, A. A. united by a double-knotted Suture, B. B.

FIG. 12. Shews in what manner a cross Wound is to be stitch'd up, and the Lips of it brought together, by drawing the Threads, A. B. C. D. tight.

FIG. 13. Represents how the Stitches are to be made in a triangular Wound, A. B. C.

FIG. 14. Represents how a Wound with two Angles is to be stitch'd with the knotted Suture, first at the Angles A. A. and then, if it is necessary, on each Side, at B. B.

FIG. 15. A large crooked Needle, with a double Thread, to make the quilled Suture:

A. The Needle.

B. The double Thread.

C. The bow End of the Thread.

FIG. 16. A large transverse Wound, A. A. united by a triple-knotted Suture, B. B. B.

FIG. 17. D. D. The same kind of Wound, which, besides the Threads at Fig. 16. is furnish'd also with small cylindrical Rolls of Silk, spread with some Wax or Plaister, A. A. and B. B. The Threads on the upper Lip of the Wound are ty'd in Slip-knots, C. C. C. whilst the Roll that lies on the under Lip is confin'd between the bow Ends of the Threads, E. E. E. This shews Palfyn's Method of making the quilled Suture.

FIG. 18. Shews another Method of making the quilled Suture in large Wounds, particularly in those of the Belly:

A. A. The Wound.

B. B. The upper Roll.

C. C. The lower Roll.

D. D. D. The single Knots which confine the upper Roll.

E. E. E. The Slip-knots which secure the lower Roll.

FIG. 19. Represents the Suture of Celsus, in which he used two Needles for stitching up transverse and penetrating Wounds of the Abdomen. The Method of performing it is directed in the sixteenth Chapter of his seventh Book. It is generally call'd the Gastroraphia Celsi, but is now diffus'd, on account of its not answering the End so well as Sutures of another kind.

A. A. Represent the Beginning of the Suture.

B. Its End, where it is secur'd by a Knot.

Fig.

EXPLICATIONS of the TABLES in Volume the First.

FIG. 20. The Glover's Suture, used for uniting Wounds of the Intestines.

A. A. The Intestine.
B. B. The Wound;
C. The Beginning of the Suture, with Part of the Thread hanging out.

D. The End of the Suture, where it is fasten'd in a Knot.

N. B. The Knot is not represented in the Figure.

FIG. 21. and FIG. 22. The Suture for the Hair-lip, which is made with two or three Needles.

A. A. The Wound.

B. B. B. Needles pass'd thro' the Lips of the Wound.

C. C. C. The Thread twisted round the Needles.

TABLE XXVI.

From HEISTER.

FIG. 1. Represents a blunt Iron Needle, to pass a fine Rag, or Skein of Silk, thro' gun-shot or other pervers Wounds, after the manner of a Seton.

FIG. 2. An Instrument to stop the Blood in Wounds of the large Arteries.

A. A. A Brass Plate, somewhat bent.

B. B. A strong Brass Screw.

C. A round Plate, of a Thumb's Breadth, to be fix'd upon the Wound.

D. The Handle by which the Screw is turn'd, and so presses the Plate C. strongly upon the Wound.

E. E. E. A strong Leather Belt to surround the wounded Part.

F. F. Part of the Belt pierc'd with several Holes, by which it may be fix'd upon the Hooks G. G. and lengthen'd or shorten'd, according to the Size of the Limb.

FIG. 3. A crooked Knife, with a round blunt Point, A. to enlarge Wounds of the Thorax or Abdomen, where such an Operation is requir'd.

FIG. 4. A strait Knife, with a Button on the Point.

FIG. 5. A crooked Knife, with a blunt Point.

FIG. 6. A Wooden Tourniquet of its proper Size.

A. A. The upper Part.

B. B. The lower Part.

C. The great Screw.

D. Two small Iron Screws, to which a Leather or Silk Belt is to be fix'd.

E. Hooks to fasten the other End of the Belt on, when it is brought round the Limb.

F. F. F. F. The Ends of the upper and lower Part of the Instrument hollow'd to receive the Belt, and to keep it steady in its Situation.

FIG. 7. Another kind of Tourniquet made of Iron; the Representation is less by half than the proper Size of the Instrument.

For the farther Explication of this and the above Figure, see the Article AMPUTATIO.

FIG. 8. A broad Roller, call'd the uniting Roller. This is perforated in the Middle, and rolls up with two Heads. It is used in treating Wounds of the Abdomen, which are made lengthways.

FIG. 9. A flexible Silver Tube, useful to discharge the Matter which is collected in Wounds of the Thorax, or in an Empyema.

A. The Openings at the Extremities, and on both Sides.

B. B. The Plate round it, with two Holes to pass a Thread thro'.

C. The Cavity which runs thro' the Tube A.

TABLE XXVII.

From HEISTER.

FIG. 1. A Brass Tourniquet after Petit's Manner, but with some Alterations. The Use of this Instrument, and Method of applying it, will easily appear, upon comparing it with what we have said under the Article AMPUTATIO.

FIG. 2. A Handle to fix Needles in, when Sutures are to be made. See ACUTENACULUM.

FIG. 3. Another of the same Sort, from Garengot.

N. B. These two are, by Mistake, represented also in Tab. 2. Fig. 36. and 37.

FIG. 4. Petit's Acutenaculum, or Handle for Needles.

FIG. 5. A Needle to perform Gastroraphy.

FIG. 6. Another of a larger Size.

FIG. 7. Another of a new Invention, to perform the same Operation.

FIG. 8. A Syringe for various Uses, furnish'd with Pipes of different Sorts: By the Help of this you may not only inject Fluids into Wounds of the Abdomen and Thorax, into the Fauces, into Abscesses, Ulcers, and into the Uterus; but you may also, by the Assistance of this Instrument, draw extravasated Blood from the Cavity of the Thorax, in which Case the Syringe should be twice as large; the Mouth of the Pipe, B. should be triangular, and about two Thumbs Breadth.

FIG. 9. Another Pipe with a round Mouth, intended for the same Uses.

FIG. 10. A smaller Pipe, which may be fasten'd to the Syringe, Fig. 8. for various Uses.

FIG. 11. Another somewhat curv'd, and perforated on both Sides: This will serve to suck Blood out of the Cavity of the Thorax, and to throw Injections into that Part, or into the Fauces.

FIG. 12. Another perforated at the End like a Cullender.

FIG. 13. Another like the former, but curv'd, to throw Injections into the Uterus, and for other Uses.

FIG. 14. An Iron Instrument, like an Ear-picker, or Probe, for various Uses.

TABLE XXVIII.

From HEISTER.

FIG. 1. An artificial Eye, made of Glass or Silver: This may be introduc'd into the Orbit, and supply the Place of the natural Eye, and prevent the Deformity which will otherwise be the Consequence of the Loss of an Eye.

FIG. 2. An Awl, or sharp Instrument, to perforate the external Table of the Cranium.

FIG. 3. 4. 5. Different Forms of Rugines, or Rasping-chisels, to scrape the Cranium, or other Bones.

FIG. 6. Shews how the Depression of the Cranium in Infants may be elevated by sticking Plaisters.

FIG. 7. A. A quadrangular or pointed Steel Instrument, to perforate the external Table of the Cranium.

B. A Terebra.

C. An Elevator, to raise depressed Bones of the Cranium.

FIG. 8. Another Elevator, accommodated to the same Uses as the former.

FIG. 9. A small fine Saw; and Fig. 10. a small Rugine, which may be used with or without the Handle, represented in that at Fig. 3.

FIG. 11. A Wooden Mallet, the Head of which is fill'd with Lead.

FIG. 12. An Elevator with three Feet.

As the Elevatories at Fig. 7. and 8. are so contriv'd, that where the neighbouring Bones are depress'd or fractur'd, these Instruments cannot be applied without Danger of increasing the Complaint, it appear'd necessary to the Surgeons amongst the Antients to invent another Instrument for this Purpose, which might be apply'd with more Safety. This they call'd, from the Number of its Feet, *Tripes*. It is near twice as big as the Figure we have given. The Feet, A. A. A. may be placed at farther Distances, or brought nearer to each other, as you shall see Occasion. The Manner of applying it is this: The Feet of this Instrument are apply'd to the sound Parts of the Head, and the Screw, B. C. by frequently turning round its Handle, D. D. will presently lay hold of the depressed Part of the Cranium, especially if you have beforehand made a small Hole in the Middle of it with the Awl at Fig. 2. upon turning the Screw, E. E. the Terebra, at B. is raised by Degrees, and with it the depressed Part of the Cranium. You will conceive this more clearly by examining Fig. 13. but if any Opening shall appear between the fractur'd Parts of the Cranium, it will be better to take off the pointed End of the Instrument, and, in its room, fix on the Elevatory, G. by the Screw, H. at the Part about the Letter F. and, by the Assistance of this, the depressed Part may be rais'd.

FIG. 13. Describes the Method of applying this Instrument.

FIG. 14. This should be furnish'd with the Terebra, A. and the Hook, at Fig. 15. thro' either of which, according as you shall see necessary, the Lever, B. C. may be pass'd, after the Instrument is fix'd upon the depressed Part of the Cranium. The Plate, D. is to be plac'd upon the sound Part of the Head, laying Bolsters under it to prevent Pain; then, by raising the End of the Lever, at B. the depressed Part of the Cranium will be gently elevated, and restor'd to its natural Situation. You will observe a Joint at the Extremity of the Lever, C. to accommodate the Plate, D. by inclining it to the Convexity of the Head, in some Parts of it, which may be also raised or depressed by the Screw, E. If you please, you may make the Lever longer than it is represented here, which will add to its Force.

FIG. 15. The Hook belonging to this Elevator.

TABLE XXIX.

From HEISTER.

FIG. 1. Is a Sort of long and sharp Forceps, proper to cut off the Splinters, or Fragments of Bones, which stick out; but to make them cut the easier, the Handles should be two or three Inches longer than the Figure.

FIG. 2. Is a simple Hook.

FIG. 3. Is a double Hook, serving for various Purposes in Surgery and Anatomy.

FIG. 4. Is a Needle for taking up Arteries, with a Ligature, in Hæmorrhages, and many other Cases.

EXPLICATIONS of the TABLES in Volume the First.

- A. is its blunt Point.
- B. its Eye, transmitting the Thread.
- C. its little Head.

FIG. 5. is a Case to hold the subsequent Instrument, which is used to hold and apply the Lapis Infernalis, or Caustic-stone.

FIG. 6. The Instrument itself, made of Steel, for holding and conducting the said Stone.

- a. The Nippers which lay hold of the Stone.
- b. The little Ring, which shuts and holds them fast upon the Stone.

- c. The other End of the Instrument, used in Chirurgical Sutures to support the Lips of Wounds.

FIG. 7. exhibits the Figure of a Splint, made of thin Wood, or PASTE-board, to be used in Fractures of the Arms and Feet: Its Breadth should be about three or four Fingers, and its Length suitable to the Size of the Limb.

FIG. 8. is a PASTE-board Splint, such as is sometimes used in Fractures of the Nose: Its Size is to correspond to that of the Nose.

FIG. 9. is a Splint of Paper, suited to the lower Jaw, when fractured only on one Side.

FIG. 10. is a double Splint of the same Kind, for the lower Jaw, when fractured on both Sides: It is to be applied so, that the Aperture *a.* in the Middle, may let in the Chin; but its two Extremities or Wings *b. b.* which may be folded together in the Middle *a.* are to be applied towards the Ears.

FIG. 11. is a Compress, in form of an X. to be used in Fractures of the Clavicle.

FIG. 12. is a PASTE-board Splint, to be laid over the former Compress, in the same Fracture.

FIG. 13. is an Iron or Steel Instrument in the Form of a T. useful to retain the Shoulders in a proper Posture, in Fractures of the Clavicle.

A. A. its transverse Part, to which are fasten'd Iron Rings, to retain and keep back the Shoulders.

B. its perpendicular Part, going down to the Back.

C. An Aperture in its lower End, by which it is to be fasten'd with a Ligature round the Waist, to be tied before on the Belly.

FIG. 14. is a PASTE-board Case, in which a fractured Arm is to be lodged, after it has been set and dress'd: Its Size is to be answerable to the Arm.

FIG. 15. is a Polyssaston, or compound Pulley, used to extend fractured Bones.

A. and B. are two Hooks, by which the Instrument is fasten'd at both Ends.

C. The Rope, by drawing which an Extension is made of the broken Limb.

D. and E. are two Pullies, consisting of several Wheels, by which the Force is very much increased.

FIG. 16. is a strong Iron Screw, whose Worm or Thread, B. is to be forced by the two Handles into some Beam or Rafter; and upon its Ring A. the Pulley E. is to be fix'd, as before said.

FIG. 17. is the Belt of *Hildanus*, sometimes necessary to make Extensions of the Bones of the Arms and Feet.

A. A. Two Hooks, upon which is hung the Sling or Rope B. B.

C. The Place where the extending Force is to be applied.

TABLE XXX.

From HEISTER.

FIG. 1. is a Compress, call'd, by the *French*, *Compresse graduée*, to be applied in Fractures of the Thigh, to make its small and inferior Part of the same Thickness with its other, that the Splints may more equally embrace it, and retain it in its proper Situation.

FIG. 2. Two lunar Plaisters, to include and hold firm the fractured Patella, after it has been set.

FIG. 3. A perforated Plaster for the same Use.

FIG. 4. Is a Fracture of the Leg, with an external Wound A. to be bound up with the Roller of eighteen Heads B. B. B. B. which commodious kind of Roller seems to have been unknown to the Antients.

FIG. 5. Is a Straw Couch or Case for a broken Thigh, called by the *French* *Fanon*. A. A. A. A. represent two Sticks cover'd with Straw, bound on with strong Packthread; to both Sides of these is also fasten'd a strong Cloth B. B. of about two Foot broad, and three long. This Couch is usually made twice the Length of the Thigh, so as to reach from the Groin and Os Ilium, to the End of the Foot.

FIG. 6. Is a Sole of thick PASTE-board, or Wood, fitted to the Size of the Patient's Foot: it is to be applied to the Bottom of the fractur'd Foot, and bound on by the three Tapers *a. a. a.* to retain or stay the Foot in its proper Posture, whence *Celsus* calls it *Mora*.

FIG. 7. Is a quilted Compress to be applied between the

VOL. I.

Foot and the Stay, to be soft, and defend it from any rough Action of the PASTE-board or Wood.

FIG. 8. Is a soft Linen Ring join'd to the foregoing Compress to let in, and hold the Heel; it is to be fasten'd to the Foot by the two Strings *b. b.*

FIG. 9. Is a brass Trunk for securely retaining a broken Leg; it consists of three Parts, A. B. C. which are join'd by the Hinges 1. 2. 3. 4. 5. 6. The middle Part B. is the Basis of the Machine, which like an hollow Pipe, receives the bound up Limb: the outer Parts A. C. are as moveable Sides or Wings, which may be turn'd back, or folded together: To each of these Sides A. C. are join'd three almost square Loops E. E. E. through which are pass'd Strings to draw them tight together, and keep them firm upon the fractur'd Leg: Its Size must agree with the Leg.

FIG. 10. Is a wooden Arch to put over a broken Leg, to keep it from being incommoded by the Bed Cloths.

FIG. 11. and FIG. 12. A very useful and proper Machine, or wooden Case, or Box, for retaining Fractures of the Leg, contriv'd and describ'd by *Petit*, a celebrated Surgeon of *Paris*, first in the Memoirs of the Royal Academy of Sciences for the Year 1718. and afterwards in his Treatise of Diseases of the Bones, from whence *Garengot* transferr'd it into his Account of Chirurgical Instruments: We chuse to exhibit the Machine rather from the Memoirs of the Academy, than from the Inventor's Book on the Bones, or *Garengot's* of Instruments; because, in the two latter, the Instrument is represented entire only, and with less Perspicuity. I shall, therefore, give it entire in *Fig. 11.* and then separated into its component Parts at *Fig. 12.*

The Basis, or principal Part of the Machine, A. A. A. *Fig. 12.* is to be gently put under the broken Leg, (after it has been first set, the Wound properly dress'd, the Whole bound up with the Roller of eighteen Heads, and defended with Splints, tied on with three Strings, as is usual) the two lateral Parts of the Case B. B. B. B. and its Front C. which serves as a Sole to the Foot, are fasten'd together by the Hinges D. D. D. D. and kept shut by the Hooks E. E. as may be seen at *Fig. 11.* by which means the Foot cannot slide or move, but is held firm, and easy to the Patient.

F. F. is the lower Part or Foot of the Machine, serving as a Foundation to the rest; at its End, G. G. it is joined by Hinges to the Part on which the Leg is to lie. N. B. The Engraver, has by Mistake, put *one* instead of *an* F. In the anterior Part there is a moveable wooden Fulcrum H. fix'd to the superior Part I. by the moveable Pins I. I. But the other Extremity of this Fulcrum at K. is moved backwards or forwards into the Notches or Sulci at L. L. and by this means the Machine, together with the Leg, is elevated or lower'd at pleasure. The superior Part A. A. is to be lined with strong Girthing and Linen, which are to be nailed tight to the Sides, upon which the Limb rests more easy than upon the Plank or Board. The other Parts of this Case seeming to be obvious from the Figure, we shall, for Brevity, omit any Explication of them, and only observe, its Size is to agree with that of the Limb.

But, by reason of the vast Numbers of Fractures which happen in a War, and the great Scarcity and Cumberfomeness of these Machines at such Times, the Camp-surgeons are generally obliged to substitute Cases of Straw in the room of them. At every Dressing of the Limb, the Hooks E. E. are to be undone, and the three Sides open'd; but when the Wound and Fracture are dress'd, and bound up, the Foot must be exactly placed, and the Case fasten'd as before.

FIG. 13. is a Compress folded at one End, to fill up the Small of the Leg, that the Splints may compress the more equally and firmly.

TABLE XXXI.

From HEISTER.

FIG. 1. is a Sling which may be used to make an Extension in Luxations of the Head.

FIG. 2. is another Sling, to retain the Patient's Body firm in the same Case.

FIG. 3. shews the most commodious Method of reducing a recent Luxation of the Humerus.

A. is the Patient, seated ready to undergo the Operation.

B. is the Assistant that holds the Patient firm in his Seat.

C. is the Assistant that distends the dislocated Humerus.

D. The Surgeon, reducing the dislocated Humerus.

E. A Napkin, whereby the Surgeon elevates the Arm, in order to its Reduction.

FIG. 4. Is a Machine commonly called the *Ambe* of *Hippocrates*, used formerly to reduce Luxations of the Humerus. It consists of the Fulcrum A. A. to which is fasten'd the moveable Lever B. C. join'd to each other by a Sort of moveable Articulation D. See this under the Article *AMBE*.

FIG. 5. Shews how the former Instrument is to be applied to a Luxation of the Humerus. There is some Difference between

EXPLANATIONS of the TABLES in Volume the First.

between the Structure of this and the former, at the Joint C. D. some think this is preferable to the other.

A. A. Is the Fulcrum.

B. C. The Lever, to which the luxated Arm is fasten'd by the three Ligatures E. E. E.

D. The Place where the Fulcrum and Lever are fasten'd together by a moveable Joint. When the End of the Lever B. is pressed downwards, the luxated Arm is extended, and elevated near its Scapula.

FIG. 6. Is *Petit's* Machine for reducing Luxations of the Humerus, and several other Luxations.

a. a. Are two Arms or Horns, by which the Patient, and particularly his Scapula, is held firm, from giving way in the Extension.

B. The other End of it, resting upon the Ground or Floor.

C. C. C. C. Pullies of the Machine.

d. d. d. The Rope, by winding up which, an Extension is made.

E. The Handle, which, being turn'd round, draws the Rope tight, and extends the Limb.

F. F. The Place where the two Horns are join'd to the Body of the Machine.

FIG. 7. Is a *Retinaculum* or Supporter, to be used in a Luxation of the Humerus.

A. An Opening or Slit in the Machine.

B. C. The Form of it at each End.

D. D. Two Apertures, thro' which the two Legs or Horns a. a. of the Instrument represented by Fig. 6. are to be passed.

FIG. 8. Is a particular Sling of Mr. *Petit's*, proper for extending luxated Limbs.

A. A. The Part made of Leather.

b. b. b. b. A Silk Ligature, sew'd to the Leather in three Places at 1. 2. 3. The Part A. A. is fasten'd round the Arm.

c. d. e. Is a strong Loop fasten'd to the Silk Ligature at f. f. so as to be moveable.

FIG. 9. Is an Instrument recommended by *Petit* for the Reduction of a luxated Femur, when dislocated inward. It is to be fasten'd at F. F. in the Machine, represented by Fig. 6. instead of the two Arms a. a.

A. Is apply'd to the Os Ilium.

B. To the middle of the Thigh; but C. C. are fixed into the Machine represented by Fig. 6. at F. F.

TABLE XXXII.

From HEISTER.

FIG. 1. Represents an Arm in which a Vein is to be open'd.

A. Denotes the Cephalic Vein.

B. The Basilic.

C. The Median Vein.

D. The Ligature fixed above the Elbow to make the Veins swell.

FIG. 2. Represents the several Forms of cutting a Vein with the Lancet.

A. Shews a longitudinal Incision.

B. A transverse one.

C. D. Oblique ones.

FIG. 3. Exhibits the ancient *German* Phlebotome or Fleam for opening a Vein.

A. The sharp Point to be fixed on the Vein.

B. The Handle to be held in one Hand, while the Part C. is to be struck by a Filipp of the Finger of the other Hand, so as to drive the Point A. into the Vein.

FIG. 4. Is a Spring Fleam, now in Use with some.

A. This Part being apply'd to the Vein, and the Part C. being elevated, depresses the Spring by the End B. which, by its Reaction or Elasticity, strikes the End C. upon the Fleam A. so as to drive it into the Vein.

D. D. Is a hollow Case of Brass or Silver, in which the Spring Part of the Instrument B. is included.

FIG. 5. Represents the Instrument used in Venesection, commonly called a Lancet, so bended into an obtuse Angle at the Joining A. as that it may be commodiously held for performing the Operation for which it is intended.

FIG. 6. Represents a certain Arm A. B. at the Bending of whose Elbow *Purmannus* found the terrible Aneurysm C. C. as large as one's Head.

FIG. 7. Shews the manner of applying the Ligatures above and below an Aneurysm, in the Operation for that Disorder.

A. B. The Artery.

C. The Aneurysm.

D. The upper Ligature.

E. The lower Ligature.

FIG. 8. Represents an Instrument design'd not only for preventing, but curing Aneurysms of the smaller Kind.

A. A. A. The Plate of Iron adapted to the Flexure of the Arm.

B. Its Fissure.

C. C. D. D. Cords or small Ligatures of Silk fix'd to the Plate at A. A. and extended to D. D.

E. Denotes a moveable Iron Lamina, join'd to the Plate by the Hinge I, and cover'd with a Cushion of Cotton or Silk, of a convex Form at F. which is to be apply'd to the Aneurysm.

G. G. Two small Hooks by which the Instrument is fix'd on the Arm, by means of the Cords C. C. D. D.

H. A Screw by which the Plate and Cushion E. F. are screw'd down upon the Tumor, that so the Aneurysm may be depressed, and the affected Artery strengthen'd.

FIG. 9. Represents an Instrument of the same Kind with the former, somewhat varied in its Figure, and with a larger Plate and Cushion E. F. and consequently accommodated to the Cure of larger Aneurysms. Almost the whole Machine is cover'd with Leather, but more particularly the inferior Part of the Plate E. is cover'd with Cotton and Leather. The Cords also C. D. are made of Leather, whereas in the former Instrument they were made of Silk. The other Letters denote the Parts represented by the same Letters in the former Figure.

FIG. 10. Shews the Apparatus, with a Bladder and Tube for Injection of Liquors into the Veins.

A. The Bladder and Tube.

B. A Vein of the Arm open'd, in which the Tube is inserted.

FIG. 11. Represents the Method used by some Physicians of the preceding Age, for conveying the Blood from one Man's Arm represented by A. to that of another exhibited by B.

FIG. 12. In some measure represents the manner in which a like Conveyance or Transfusion is made from one Hand to another.

FIG. 13. Shews the Transfusion of Blood from the crural Artery or Vein of an Animal into the Arm of a Man, by the Intervention of the Tube A.

TABLE XXXIII.

From HEISTER.

FIG. 1. Represents the Cupping-glass, used at present in Germany, and elsewhere, for dry Cupping, or for extracting Blood after Scarification.

FIG. 2. Is the Instrument or Scarificator, commonly used by the *German* Cuppers.

A. The Handle.

B. The Edge.

C. The Part which is struck extremely quick by the Finger, so as to make the Edge wound the Skin as often as they incline.

FIG. 3. Represents the Order or Position of the little Incisions made in the Skin by the Cupper, that they may all be entirely cover'd by the Cupping-glass, represented by Fig. 1.

FIG. 4. Exhibits the modern cubical Scarificator, making sixteen Incisions in the Order of Fig. 3. by one Stroke upon the Skin, and with very little Pain.

FIG. 5. Exhibits the Shape of a Leech, for the Information of such as may be ignorant of that Insect.

A. The Mouth or Head by which it bites.

B. The Body and posterior Parts; but it must be observ'd, that one and the same Leech may, by differently contracting and expanding itself, appear in a hundred Shapes, so that its Length and Thickness are very uncertain.

FIG. 6. Is the Needle used by the Inhabitants of *China* and *Japan*, for making their Acupuncture.

A. The Handle.

B. The Point which enters the Flesh.

FIG. 7. Is the little Hammer used by the *Indians* to strike the preceding Needle.

A. The Head of this Hammer.

B. Its Handle.

C. C. A Case in the latter to deposit the Needle in.

FIG. 8. Represents the actual and concealed Cautery, used formerly for making of Issues, and is by some denominated *Capula Casseriana*.

A. Denotes the End of the actual Cautery, or red-hot Iron, protruding itself beyond the Case.

B. B. B. B. Is the wooden Case concealing the red-hot Iron from terrifying the Patient.

C. The Handle, by depressing which the Cautery is forc'd into the Skin.

FIG. 9. Is a Machine to be used as a Bandage for Issues in the Arm, and to be made a little longer for those in the Neck or Foot.

A. A. Is a leathern Swath of about two or three Fingers Breadth.

B. A small Hook made of Brass or Copper.

C. Is a Brass Plate with several oblong and transverse Apertures, for receiving the Hook B. in the manner of a Clasp, in order to fix the Swath on the Foot, Neck, or Arm.

FIG.

EXPLICATIONS of the TABLES in Volume the First.

FIG. 10. Represents the small Syphon or Syringe proper for injecting Liquors into the Urethra of Males, and the Vagina of Females, for the Cure of Wounds and Ulcers.

A. A. The Body of the Syringe.

B. Its Extremity, ending with an obtuse Point instead of a small Tube, to prevent the injected Liquor from regurgitating.

C. The Ring or Handle of the Sucker, by which the Liquor is drawn into, and forced out of, the Cylindric Body.

FIG. 11. The Letters A. A. exhibit those Parts in the Soles of the Feet, which the Italian Physician *Mistichellius* directs to be cauteriz'd in Apoplexies.

B. The square Iron Cautery for the Operation, which in that Disorder, he says, is highly serviceable.

FIG. 12. Represents the Method of burning the Part affected in the Gout with the *Indian Moxa*.

A. denotes the Cone of Moxa not yet fired.

B. One that is burning.

FIG. 13. a. b. Give a View of several encysted Tumors.

c. d. Scirrhus Glands in the Neck.

e. A fleshy Excrescence or Mark from the Mother.

FIG. 14. Represents the small Knife, which I generally use for extirpating scirrhus Tumors, or Glands in the Neck, Wens, or even scirrhus Glands of the Breasts.

FIG. 15. Represents the Hand of an Infant with six Fingers, in which

A. Denotes the superfluous Finger with a Nail like a Cock's Spur, which I took off by a Pair of amputating Scissors or Pincers; which Instrument I also use in a Spina Ventosa, or Caries of the Fingers.

FIG. 16. Is a Hand with the whole Index A. carious and ulcerated, which I amputated close to the Metacarpus, with the Knife represented by FIG. 14. but then I also removed the Head of the first Phalanx, that the Wound might heal the sooner.

B. Denotes a Spina Ventosa in the middle Finger, and in the second Internode, which I amputated in the first Bone, or Phalanx.

C. Is a large Excrescence or Protuberance at the End of the little Finger from the same Disorder, which I successfully amputated in the second Bone, by the Mallet and Chisel.

FIG. 17. Shews the Method of amputating the great Toe with the Mallet and Chisel, used by *Roonhuijs*.

TABLE XXXIV.

From HEISTER.

FIG. 1. Exhibits a small-sized Knife, more commodious for dividing the Skin and Flesh in Amputations, than the large crooked one following.

FIG. 2. Is the large crooked Knife, commonly used for dividing the Flesh to the Bone in Amputations of the upper and lower Extremities; though, in most Cases, I prefer the small one, represented by FIG. 1.

FIG. 3. The double-edged Knife for dividing the Flesh and Ligament betwixt the Bones of the Arm and Leg, which may be also performed by a less and single-edged Knife like that in Tab. 22. Letter G. This Knife is also used in the Method of amputating the Leg, when the Calf is to be preserv'd.

FIG. 4. Represents the Saw used for amputating Bones of the Limbs. This Instrument is by many delineated as large again as our Figure of it; but a Saw of the same Size, or but little larger than our Figure, will perform the Operation as well, and even more commodiously, than a larger. This, and the two preceding Instruments, are usually embellished with various Ornaments, which may serve to encumber them, and enhance their Price, but can add nothing at all to their Usefulness.

FIG. 5. Represents a Pair of Pliers, furnished with Teeth at one End, and a Spring at the other, for taking hold of the Ends of divided Arteries, in order to secure them by Ligature with strong Thread, and stop their bleeding in Amputations of the upper and lower Extremities.

FIG. 6. Is another Pair of Pliers for the same Use, taken from Mr. *Garengeot*; which may be also made with very flat or no Teeth at the End, to avoid injuring the Coats of the Artery.

TABLE XXXV.

From HEISTER.

FIG. 1. Shews the Manner in which the Patient, Surgeon, and Assistants are to be placed, for amputating the Hand or Arm.

A. Denotes the Patient.

B. The Surgeon amputating with the Saw.

C. The Assistant extending the Hand.

D. Another Assistant holding the Arm.

E. The Assistant who holds the Patient's Body, and takes Care of the Tourniquet.

F. Denotes the Dish or Vessel placed underneath to receive the Blood.

FIG. 2. Represents the Position of the Patient, Surgeon, and his Assistants, in amputating the Leg.

A. Denotes the Patient seated in a Chair.

B. The Surgeon.

C. The Assistant who holds the Foot below the Calf.

D. The Assistant who holds the Leg above the Knee.

E. A Vessel placed on the Floor, to catch what little Blood may be spilt in the Operation.

FIG. 3. A. denotes the most convenient Part for amputating the Leg; and

B. That most proper for amputating the Thigh. But when the Disorder has extended itself higher up in the Thigh, it must be amputated proportionably above this Mark, though the Operation is then so much the more dangerous.

FIG. 4. A. Represents the Thigh, with the Leg, B. amputated. In the Thigh may be seen the Part for fixing the Tourniquet C. D. The Tourniquet, thus apply'd, may serve for amputating the Tarsus or Metatarsus; as also for amputating the Leg, though not so conveniently. In this Figure you have also a View of the divided Artery extended a little by the Pliers E. and about to be secured by the Ligature and Knot F. Some indeed do not approve of this manner of tying the Ligature; but I have often experienced, that it answers very well.

FIG. 5. Describes the Manner of amputating the Leg, so as to preserve the Calf.

The Line A. B. denotes the first Incision to be made by the Knife in Tab. 34. by FIG. 1. or FIG. 3.

The Line B. C. is the Course of the second Incision, by which the Flesh of the Calf is separated from the Bones of the Leg.

C. D. The Place where the rest of the Flesh being remov'd, the Amputation is to be perform'd. Some reverse this Course of Incision, and first perforate the Calf with a double-edged Knife, Tab. 34. FIG. 3. at C. and then they direct the Knife in the Course B. A. but the former Method is, in my Opinion, more eligible.

FIG. 6. A. Represents the Manner of turning back the Calf of the Leg towards the Ham, after it has been separated from the Bones of the Leg by a double Incision; which done, the Surgeon next cuts the Integuments, Flesh, and Periosteum, in the Line B. and then saws off the Bones there.

FIG. 7. Denotes a Leg just amputated, with the Calf A. hanging down, to see the Ends of the two Bones.

B. The Extremity of the Os Tibiæ.

C. The Extremity of the Os Fibulæ.

FIG. 8. Shews the Leg thus amputated, with

A. The Calf brought over, and joining to the Stump.

B.

C. Denotes Part of the Thigh.

FIG. 9. Represents the Method of applying the Screw Tourniquet (Tab. 26. FIG. 6. or Tab. 27. FIG. 1.) above the Knee, for amputating the Leg.

C. C. The Tourniquet, with its subjacent Pillow.

D. The Place where the leathern or silken Strop E. E. is fastened by Studs on one Side, and by two small Hooks, F. on the other Side.

G. The Screw, by turning which the subjacent Artery is compressed in the Ham.

FIG. 10. Is a large crooked Needle for making a Ligature on the Brachial Artery, before the Arm is amputated in its Articulation with the Scapula, though the same may be also performed by the straight Needle, Tab. 39. FIG. 12. either of which Needles will also serve for making Setons in the Neck.
